IEEE Computer Society**

Approved 6 February 2012

IEEE-SA Standards Board

Abstract: This revision specifies technical corrections and clarifications to IEEE Std 802.11 for wireless local area networks (WLANS) as well as enhancements to the existing medium access control (MAC) and physical layer (PHY) functions. It also incorporates Amendments 1 to 10 published in 2008 to 2011.

Keywords: 2.4 GHz, 3650 MHz, 4.9 GHz, 5 GHz, 5.9 GHz, advanced encryption standard, AES, carrier sense multiple access/collision avoidance, CCMP, channel switching, Counter mode with Cipher-block chaining Message authentication code Protocol, confidentiality, CSMA/CA, DFS, direct link, dynamic frequency selection, E911, emergency alert system, emergency services, forwarding, generic advertisement service, high throughput, IEEE 802.11, interface, international roaming, interworking, interworking with external networks, LAN, local area network, MAC, measurement, medium access control, media-independent handover, medium access controller, mesh, MIH, MIMO, MIMO-OFDM, multi-hop, multiple input multiple output, network advertisement, network discovery, network management, network selection, off-channel direct link, path-selection, PHY, physical layer, power saving, QoS, quality of service, PHY, physical layer, QoS mapping, radio, radio frequency, RF, radio resource, radio management, SSP, SSPN, subscriber service provider, temporal key integrity protocol, TKIP, TPC, transmit power control, tunneled direct link setup, wireless access in vehicular environments, wireless LAN, wireless local area network, WLAN, wireless network management, zero-knowledge proof

Notice and Disclaimer of Liability Concerning the Use of IEEE Documents: IEEE Standards documents are developed within the IEEE Societies and the Standards Coordinating Committees of the IEEE Standards Association (IEEE-SA) Standards Board. IEEE develops its standards through a consensus development process, approved by the American National Standards Institute, which brings together volunteers representing varied viewpoints and interests to achieve the final product. Volunteers are not necessarily members of the Institute and serve without compensation. While IEEE administers the process and establishes rules to promote fairness in the consensus development process, IEEE does not independently evaluate, test, or verify the accuracy of any of the information or the soundness of any judgments contained in its standards.

Use of an IEEE Standard is wholly voluntary. IEEE disclaims liability for any personal injury, property or other damage, of any nature whatsoever, whether special, indirect, consequential, or compensatory, directly or indirectly resulting from the publication, use of, or reliance upon any IEEE Standard document.

IEEE does not warrant or represent the accuracy or content of the material contained in its standards, and expressly disclaims any express or implied warranty, including any implied warranty of merchantability or fitness for a specific purpose, or that the use of the material contained in its standards is free from patent infringement. IEEE Standards documents are supplied "**AS IS**."

The existence of an IEEE Standard does not imply that there are no other ways to produce, test, measure, purchase, market, or provide other goods and services related to the scope of the IEEE standard. Furthermore, the viewpoint expressed at the time a standard is approved and issued is subject to change brought about through developments in the state of the art and comments received from users of the standard. Every IEEE standard is subjected to review at least every ten years. When a document is more than ten years old and has not undergone a revision process, it is reasonable to conclude that its contents, although still of some value, do not wholly reflect the present state of the art. Users are cautioned to check to determine that they have the latest edition of any IEEE standard.

In publishing and making its standards available, IEEE is not suggesting or rendering professional or other services for, or on behalf of, any person or entity. Nor is IEEE undertaking to perform any duty owed by any other person or entity to another. Any person utilizing any IEEE Standards document, should rely upon his or her own independent judgment in the exercise of reasonable care in any given circumstances or, as appropriate, seek the advice of a competent professional in determining the appropriateness of a given IEEE standard.

Translations: The IEEE consensus development process involves the review of documents in English only. In the event that an IEEE standard is translated, only the English version published by IEEE should be considered the approved IEEE standard.

Official Statements: A statement, written or oral, that is not processed in accordance with the IEEE-SA Standards Board Operations Manual shall not be considered the official position of IEEE or any of its committees and shall not be considered to be, nor be relied upon as, a formal position of IEEE. At lectures, symposia, seminars, or educational courses, an individual presenting information on IEEE standards shall make it clear that his or her views should be considered the personal views of that individual rather than the formal position of IEEE.

Comments on Standards: Comments for revision of IEEE Standards documents are welcome from any interested party, regardless of membership affiliation with IEEE. However, IEEE does not provide consulting information or advice pertaining to IEEE Standards documents. Suggestions for changes in documents should be in the form of a proposed change of text, together with appropriate supporting comments. Since IEEE standards represent a consensus of concerned interests, it is important to ensure that any responses to comments and questions also receive the concurrence of a balance of interests. For this reason, IEEE and the members of its societies and Standards Coordinating Committees are not able to provide an instant response to comments or questions except in those cases where the matter has previously been addressed. Any person who would like to participate in evaluating comments or revisions to an IEEE standard is welcome to join the relevant IEEE working group at http://standards.ieee.org/develop/wg/.

Comments on standards should be submitted to the following address:

Secretary, IEEE-SA Standards Board
445 Hoes Lane
Piscataway, NJ 08854
USA

Photocopies: Authorization to photocopy portions of any individual standard for internal or personal use is granted by The Institute of Electrical and Electronics Engineers, Inc., provided that the appropriate fee is paid to Copyright Clearance Center. To arrange for payment of licensing fee, please contact Copyright Clearance Center, Customer Service, 222 Rosewood Drive, Danvers, MA 01923 USA; +1 978 750 8400. Permission to photocopy portions of any individual standard for educational classroom use can also be obtained through the Copyright Clearance Center.

Notice to users

Laws and regulations

Users of IEEE Standards documents should consult all applicable laws and regulations. Compliance with the provisions of any IEEE standards document does not imply compliance to any applicable regulatory requirements. Implementers of the standard are responsible for observing or referring to the applicable regulatory requirements. IEEE does not, by the publication of its standards, intend to urge action that is not in compliance with applicable laws, and these documents may not be construed as doing so.

Copyrights

This document is copyrighted by the IEEE. It is made available for a wide variety of both public and private uses. These include both use, by reference, in laws and regulations, and use in private self-regulation, standardization, and the promotion of engineering practices and methods. By making this document available for use and adoption by public authorities and private users, the IEEE does not waive any rights in copyright to this document.

Updating of IEEE documents

Users of IEEE standards should be aware that these documents may be superseded at any time by the issuance of new editions or may be amended from time to time through the issuance of amendments, corrigenda, or errata. An official IEEE document at any point in time consists of the current edition of the document together with any amendments, corrigenda, or errata then in effect. In order to determine whether a given document is the current edition and whether it has been amended through the issuance of amendments, corrigenda, or errata, visit the IEEE-SA website or contact the IEEE at the address listed previously. For more information about the IEEE Standards Association or the IEEE standards development process, visit the IEEE-SA website.

Errata

Errata, if any, for this and all other standards can be accessed at the following URL: http://standards.ieee.org/findstds/errata/index.html. Users are encouraged to check this URL for errata periodically.

Patents

Attention is called to the possibility that implementation of this standard may require use of subject matter covered by patent rights. By publication of this standard, no position is taken by the IEEE with respect to the existence or validity of any patent rights in connection therewith. A patent holder or patent applicant has filed a statement of assurance via an Accepted Letter of Assurance, then the statement is listed on the IEEE-SA website http://standards.ieee.org/about/sasb/patcom/patents.html. Letters of Assurance may indicate whether the Submitter is willing or unwilling to grant licenses under patent rights without compensation or under reasonable rates, with reasonable terms and conditions that are demonstrably free of any unfair discrimination to applicants desiring to obtain such licenses.

Essential Patent Claims may exist for which a Letter of Assurance has not been received. The IEEE is not responsible for identifying Essential Patent Claims for which a license may be required, for conducting inquiries into the legal validity or scope of Patents Claims, or determining whether any licensing terms or conditions provided in connection with submission of a Letter of Assurance, if any, or in any licensing agreements are reasonable or nondiscriminatory. Users of this standard are expressly advised that determination of the validity of any patent rights, and the risk of infringement of such rights, is entirely their own responsibility. Further information may be obtained from the IEEE Standards Association.

Participants

At the time this revision was sent to sponsor ballot, the IEEE 802.11 Working Group had the following officers:

Bruce Kraemer, *Chair*
Jon Walter Rosdahl, *Vice-Chair and Treasurer*
Adrian P. Stephens, *Vice-Chair, Technical Editor and Assigned Number Authority*
Stephen McCann, *Secretary*
Peter Ecclesine, *Technical Editor*
Clint Chaplin, Chair, Wireless Next Generation Standing Committee
David Bagby, Chair, Architecture Standing Committee
Andrew Myles, Chair, JTC1 Ad hoc
Richard H. Kennedy, Chair, Regulatory Ad hoc and Task Group af
Hiroshi Mano, Chair, FIA Study Group
Dorothy Stanley, Chair, Task Group mb and Task Group v
Dee Denteneer, Chair, Task Group s
Menzo M. Wentink, Chair, Task Group z
Ganesh Venkatesan, Chair, Task Group aa
Osama S. Aboul-Magd, Chair, Task Group ac
Eldad Perahia, Chair, Task Group ad
Michael Montemurro, Chair, Task Group ae
Dave Halasz, Chair, Task Group ah

The officers and members of the Task Group mb Working Group ballot pool are as follows:

Matthew S. Gast, *Chair* (to March 2010)
Dorothy Stanley, *Chair* (from May 2010)
Michael Montemurro, *Vice Chair*
Jon Walter Rosdahl, *Secretary*
Adrian P. Stephens, *Editor*

*Member Emeritus

Also included are the following nonvoting IEEE-SA Standards Board liaisons:

Satish K. Aggarwal, *NRC Representative*
Richard DeBlasio, *DOE Representative*
Michael H. Kelly, *NIST Representative*

Michelle D. Turner
IEEE Standards Program Manager, Document Development

Patricia Gerdon
IEEE Standards Program Managers, Technical Program Development

Introduction

This introduction is not part of IEEE Std 802.11-2012, IEEE Standard for Information technology—Telecommunications and information exchange between systems—Local and metropolitan area network—Specific requirements—Part 11: Wireless LAN Medium Access Control (MAC) and Physical Layer (PHY) specifications.

This revision gives users, in one document, the IEEE 802.11 standard for wireless local area networks (WLANS) with all the amendments that have been published to date.

Incorporating published amendments

The original standard was published in 1999 and reaffirmed in 2003. A revision was published in 2007, which incorporated into the 1999 edition the following amendments: IEEE Std 802.11a™-1999, IEEE Std 802.11b™-1999, IEEE Std 802.11b-1999/Corrigendum 1-2001, IEEE Std 802.11d™-2001, IEEE Std 802.11g™-2003, IEEE Std 802.11h™-2003, IEEE Std 802.11i™-2004, IEEE Std 802.11j™-2004 and IEEE Std 802.11e™-2005.

The current revision, IEEE Std 802.11-2012, incorporates the following amendments into the 2007 revision:

— IEEE Std 802.11k™-2008: Radio Resource Measurement of Wireless LANs (Amendment 1)

— IEEE Std 802.11r™-2008: Fast Basic Service Set (BSS) Transition (Amendment 2)

— IEEE Std 802.11y™-2008: 3650–3700 MHz Operation in USA (Amendment 3)

— IEEE Std 802.11w™-2009: Protected Management Frames (Amendment 4)

— IEEE Std 802.11n™-2009: Enhancements for Higher Throughput (Amendment 5)

— IEEE Std 802.11p™-2010: Wireless Access in Vehicular Environments (Amendment 6)

— IEEE Std 802.11z™-2010: Extensions to Direct-Link Setup (DLS) (Amendment 7)

— IEEE Std 802.11v™-2011: IEEE 802.11 Wireless Network Management (Amendment 8)

— IEEE Std 802.11u™-2011: Interworking with External Networks (Amendment 9)

— IEEE Std 802.11s™-2011: Mesh Networking (Amendment 10)

As a result of publishing this revision, all of the previously published amendments and revisions are now retired.

Technical corrections, clarifications, and enhancements

In addition, this revision specifies technical corrections and clarifications to IEEE Std 802.11 as well as enhancements to the existing medium access control (MAC) and physical layer (PHY) functions. Such enhancements include incorporated interpretation requests.

Revised clause and annex numbering

In IEEE Std 802.11-2012, the order of clauses and annexes has also been revised. The result of this revised order on the numbering of clauses and annexes is summarized in Figure A.

IEEE Standard for Information technology— Telecommunications and information exchange between systems Local and metropolitan area networks— Specific requirements

Part 11: Wireless LAN Medium Access Control (MAC) and Physical Layer (PHY) Specifications

IMPORTANT NOTICE: This standard is not intended to assure safety, security, health, or environmental protection. Implementers of the standard are responsible for determining appropriate safety, security, environmental, and health practices or regulatory requirements.

This IEEE document is made available for use subject to important notices and legal disclaimers. These notices and disclaimers appear in all publications containing this document and may be found under the heading "Important Notice" or "Important Notices and Disclaimers Concerning IEEE Documents." They can also be obtained on request from IEEE or viewed at http://standards.ieee.org/IPR/disclaimers.html.

1. Overview

1.1 Scope

The scope of this standard is to define one medium access control (MAC) and several physical layer (PHY) specifications for wireless connectivity for fixed, portable, and moving stations (STAs) within a local area.

1.2 Purpose

The purpose of this standard is to provide wireless connectivity for fixed, portable, and moving stations within a local area. This standard also offers regulatory bodies a means of standardizing access to one or more frequency bands for the purpose of local area communication.

1.3 Supplementary information on purpose

Specifically, this standard

— Describes the functions and services required by an IEEE 802.11™-compliant device to operate within independent and infrastructure networks as well as the aspects of STA mobility (transition) within those networks.

— Describes the functions and services that allow an IEEE 802.11-compliant device to communicate directly with another such device outside of an independent or infrastructure network.

- Defines the MAC procedures to support the MAC service data unit (MSDU) delivery services.
- Defines several PHY signaling techniques and interface functions that are controlled by the IEEE 802.11 MAC.
- Permits the operation of an IEEE 802.11-conformant device within a wireless local area network (WLAN) that may coexist with multiple overlapping IEEE 802.11 WLANs.
- Describes the requirements and procedures to provide data confidentiality of user information and MAC management information being transferred over the wireless medium (WM) and authentication of IEEE 802.11-conformant devices.
- Defines mechanisms for dynamic frequency selection (DFS) and transmit power control (TPC) that may be used to satisfy regulatory requirements for operation in any band.
- Defines the MAC procedures to support local area network (LAN) applications with quality-of-service (QoS) requirements, including the transport of voice, audio, and video.
- Defines mechanisms and services for wireless network management of STAs that include BSS transition management, channel usage and coexistence, collocated interference reporting, diagnostic, multicast diagnostic and event reporting, flexible multicast, efficient beacon mechanisms, proxy ARP advertisement, location, timing measurement, directed multicast, extended sleep modes, traffic filtering, and management notification.
- Defines functions and procedures aiding network discovery and selection by STAs, information transfer from external networks using QoS mapping, and a general mechanism for the provision of emergency services.
- Defines the MAC procedures that are necessary for wireless multi-hop communication to support wireless LAN mesh topologies.

1.4 Word Usage

In this document, the word *shall* is used to indicate a mandatory requirement. The word *should* is used to indicate a recommendation. The word *may* is used to indicate a permissible action. The word *can* is used for statements of possibility and capability.

2. Normative references

The following referenced documents are indispensable for the application of this standard (i.e., they must be understood and used; therefore, each referenced document is cited in the text and its relationship to this document is explained). For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments or corrigenda) applies.

3. Definitions, acronyms, and abbreviations

3.1 Definitions

For the purposes of this standard, the following terms and definitions apply. The *IEEE Standards Dictionary: Glossary of Terms & Definitions* should be referenced for terms not defined in this clause.[10]

access category (AC): A label for the common set of enhanced distributed channel access (EDCA) parameters that are used by a quality-of-service (QoS) station (STA) to contend for the channel in order to transmit medium access control (MAC) service data units (MSDUs) with certain priorities.

access control: The prevention of unauthorized usage of resources.

access point (AP): An entity that contains one station (STA) and provides access to the distribution services, via the wireless medium (WM) for associated STAs.

access point (AP) path: Path between two tunneled direct-link setup (TDLS) peer stations (STAs) via the AP with which the STAs are currently associated.

[8] The numbers in brackets correspond to the numbers of the bibliography in Annex A.

[9] ITU publications are available from the International Telecommunications Union (http://www.itu.int/).

[10] The *IEEE Standards Dictionary: Glossary of Terms & Definitions* is available at http://shop.ieee.org/.

access point (AP) reachability: An AP is reachable by a station (STA) if preauthentication messages can be exchanged between the STA and the target AP via the distribution system (DS).

NOTE—Preauthentication is defined in 11.5.9.2.[11]

active mode: A mesh power mode in which the mesh station (STA) operates in the Awake state towards a neighbor mesh STA.

additional authentication data (AAD): Data that are not encrypted, but are cryptographically protected.

ad hoc network: Often used as a venacular term for an independent basic service set (IBSS).

admission control: An algorithm to ensure that admittance of a new flow into a resource constrained network does not violate parameterized service commitments made by the network to admitted flows.

aggregate medium access control (MAC) protocol data unit (A-MPDU): A structure containing multiple MPDUs, transported as a single physical layer convergence procedure (PLCP) service data unit (PSDU) by the physical layer (PHY).

aggregate medium access control (MAC) service data unit (A-MSDU): A structure containing multiple MSDUs, transported within a single (unfragmented) data medium access control (MAC) protocol data unit (MPDU).

aggregate medium access control (MAC) service data unit (A-MSDU) subframe: A portion of an A-MSDU containing a header and associated MSDU.

aggregated schedule: The aggregation of delivery and/or poll schedules by the quality-of-service (QoS) access point (AP) for a particular QoS station (STA) into a single service period (SP).

antenna connector: The measurement point of reference for radio frequency (RF) measurements in a station (STA). The antenna connector is the point in the STA architecture representing the input of the receiver (output of the antenna) for radio reception and the input of the antenna (output of the transmitter) for radio transmission. In systems using multiple antennas or antenna arrays, the antenna connector is a virtual point representing the aggregate output of (or input to) the multiple antennas. In systems using active antenna arrays with processing, the antenna connector is the output of the active array, which includes any processing gain of the active antenna subsystem.

antenna selection (ASEL) receiver: A station (STA) that performs receive ASEL.

antenna selection (ASEL) transmitter: A station (STA) that performs transmit ASEL.

association: The service used to establish access point/station (AP/STA) mapping and enable STA invocation of the distribution system services (DSSs).

authentication: The service used to establish the identity of one station (STA) as a member of the set of STAs authorized to associate with another STA.

authentication and key management (AKM) suite: A set of one or more algorithms designed to provide authentication and key management, either individually or in combination with higher layer authentication and key management algorithms outside the scope of this standard.

[11] Notes in text, tables, and figures of a standard are given for information only and do not contain requirements needed to implement the standard.

Authentication Server (AS): An entity that provides an authentication service to an Authenticator. This service determines, from the credentials provided by the Supplicant, whether the Supplicant is authorized to access the services provided by the Authenticator. (IEEE Std 802.1X-2004[12])

Authenticator: An entity at one end of a point-to-point LAN segment that facilitates authentication of the entity attached to the other end of that link. (IEEE Std 802.1X-2004)

Authenticator address (AA): The medium access control (MAC) address of the IEEE 802.1X Authenticator.

authorization: The act of determining whether a particular right, such as access to a resource, is granted to an entity.
NOTE—See IETF RFC 2903 [B32].[13]

authorized: To be explicitly allowed.

average noise power indicator (ANPI): A medium access control (MAC) indication of the average noise plus interference power measured when the channel is idle as defined by three simultaneous conditions: 1) the Virtual Carrier Sense (CS) mechanism indicates idle channel, 2) the station (STA) is not transmitting a frame, and 3) the STA is not receiving a frame.

azimuth: The horizontal orientation of the front surface of a station or of a radio antenna system’s main lobe measured clockwise from true north.

base channel: Channel on which the tunneled direct-link setup (TDLS) peer station (STA) is associated with an access point (AP).

basic service area (BSA): The area containing the members of a basic service set (BSS). It might contain members of other BSSs.

basic service set (BSS): A set of stations (STAs) that have successfully synchronized using the JOIN service primitives[14] and one STA that has used the START primitive. Alternatively, a set of STAs that have used the START primitive specifying matching mesh profiles where the match of the mesh profiles has been verified via the scanning procedure. Membership in a BSS does not imply that wireless communication with all other members of the BSS is possible.

basic service set (BSS) transition: A station (STA) movement from one BSS to another BSS in the same extended service set (ESS).

beamformee: A station (STA) that receives a physical layer convergence procedure (PLCP) protocol data unit (PPDU) that was transmitted using a beamforming steering matrix.

beamformer: A station (STA) that transmits a physical layer convergence procedure (PLCP) protocol data unit (PPDU) using a beamforming steering matrix.

beamforming: A spatial filtering mechanism used at a transmitter to improve the received signal power or signal-to-noise ratio (SNR) at an intended receiver. *Syn:* **beam steering**.

big endian: The concept that, for a given multi-octet numeric representation, the most significant octet has the lowest address.

[12] Information on references can be found in Clause 2.

[13] The numbers in brackets correspond to the numbers of the bibliography in Annex A.

[14] Description of these primitives can be found in 6.3.4.

broadcast address: A unique group address that specifies all stations (STAs).

BSS Max idle period: A time period during which the access point (AP) does not disassociate a station (STA) due to nonreceipt of frames from that STA.

calibration initiator: A station (STA) that initiates a calibration sequence.

calibration responder: A station (STA) that transmits during a calibration sequence in response to a transmission by a calibration initiator.

candidate peer mesh station (STA): A neighbor mesh STA to which a mesh peering has not been established but meets eligibility requirements to become a peer mesh STA.

channel: An instance of communications medium use for the purpose of passing protocol data units (PDUs) between two or more stations (STAs).

channel spacing: The difference between the center frequencies of two nonoverlapping and adjacent channels of the radio transmitter.

cipher suite: A set of one or more algorithms, designed to provide data confidentiality, data authenticity or integrity, and/or replay protection.

clear channel assessment (CCA) function: That logical function in the physical layer (PHY) that determines the current state of use of the wireless medium (WM).

collocated interference: Interference that is caused by another radio or station (STA) emitting radio energy located in the same physical device as the reporting STA, where the reported characteristics of the interference are known a priori without interference detection, measurement, or characterization by the reporting STA.

collocated radio: A radio capable of emitting radio-frequency energy located in the same physical device as the reporting station (STA), where the radio’s type and some link characteristics are known without signal detection or measurement by the reporting STA.

configuration profile: A collection of parameters identified by a profile identifier (ID) that represent a current or available configuration of a station (STA).

contention-free period (CFP): The time period during the operation of a point coordination function (PCF) when the right to transmit is assigned to stations (STAs) solely by a point coordinator (PC), allowing frame exchanges to occur between members of the basic service set (BSS) without contention for the wireless medium (WM).

contention period (CP): The time period outside of the contention-free period (CFP) in a point-coordinated basic service set (BSS). In a BSS where there is no point coordinator (PC), this corresponds to the entire time of operation of the BSS.

controlled access phase (CAP): A time period when the hybrid coordinator (HC) maintains control of the medium, after gaining medium access by sensing the channel to be idle for a point coordination function (PCF) interframe space (PIFS) duration. It might span multiple consecutive transmission opportunities (TXOPs) and can contain polled TXOPs.

coordination function: The logical function that determines when a station (STA) operating within a basic service set (BSS) is permitted to transmit protocol data units (PDUs) via the wireless medium (WM). The coordination function within a BSS might have one hybrid coordination function (HCF), or it might have one HCF and one point coordination function (PCF) and has one distributed coordination function (DCF). A quality-of-service (QoS) BSS has one DCF and one HCF.

contention-free (CF) pollable: A station (STA) that is able to respond to a CF poll with a data frame if such a frame is queued and able to be generated.

Counter mode with Cipher-block chaining Message authentication code (CCM): A symmetric key block cipher mode providing confidentiality using counter mode (CTR) and data origin authenticity using cipher-block chaining message authentication code (CBC-MAC).

NOTE—See IETF RFC 3610.

cryptographic encapsulation: The process of generating the cryptographic payload from the plaintext data. This comprises the cipher text as well as any associated cryptographic state required by the receiver of the data, e.g., initialization vectors (IVs), sequence numbers, message integrity codes (MICs), key identifiers.

data confidentiality: A property of information that prevents disclosure to unauthorized individuals, entities, or processes.

deauthentication service: The service that voids an existing authentication relationship.

decapsulate: To recover an unprotected frame from a protected one.

decapsulation: The process of generating plaintext data by decapsulating an encapsulated frame.

deep sleep mode: A mesh power mode in which the mesh station (STA) operates either in the Awake state or in the Doze state towards a neighbor mesh STA, and is not expected to receive beacons from this neighbor mesh STA.

delivery-enabled access category (AC): A quality-of-service (QoS) access point (AP) AC where the AP is allowed to use enhanced distributed channel access (EDCA) to deliver traffic from the AC to a QoS station (STA) in an unscheduled service period (SP) triggered by the STA.

dependent station (STA): A STA that is not registered and whose operational parameters are dictated by messages it receives from an enabling STA. Once enabled by the dynamic STA enablement (DSE) process, a dependent STA's continued operation becomes contingent upon being able to receive messages from its enabling STA over the air.

destination mesh station (STA): A mesh STA that is the final destination of a MAC service data unit (MSDU). This mesh STA might reside in a proxy mesh gate that might forward the MSDU to a STA outside of the MBSS. A destination mesh STA might be an end station as defined in IEEE Std 802.1.

directed frame: *See:* **individually addressed**.

direct link: A bidirectional link from one quality-of-service (QoS) station (STA) to another QoS STA operating in the same infrastructure QoS basic service set (BSS) that does not pass through a QoS access point (AP). Once a direct link has been set up, all frames between the two QoS STAs are exchanged directly.

directed multicast service (DMS): A service in which the access point (AP) transmits group addressed frames as individually addressed frames to the requesting non-AP station (STA).

disassociation service: The service that removes an existing association.

distributed coordination function (DCF): A class of coordination function where the same coordination function logic is active in every station (STA) in the basic service set (BSS) whenever the network is in operation.

distribution service: The service that, by using association information, delivers medium access control (MAC) service data units (MSDUs) within the distribution system (DS).

distribution system (DS): A system used to interconnect a set of basic service sets (BSSs) and integrated local area networks (LANs) to create an extended service set (ESS).

distribution system medium (DSM): The medium or set of media used by a distribution system (DS) for communications between access points (APs), mesh gates, and portals of an extended service set (ESS).

distribution system service (DSS): The set of services provided by the distribution system (DS) that enable the medium access control (MAC) to transport MAC service data units (MSDUs) between stations (STAs) that are not in direct communication with each other over a single instance of the wireless medium (WM). These services include transport of MSDUs between the access points (APs) of basic service sets (BSSs) within an extended service set (ESS), transport of MSDUs between portals and BSSs within an ESS, transport of MSDUs between mesh gates in the same or different mesh basic service sets (MBSSs), transport of MSDUs between mesh gates and APs, transport of MSDUs between mesh gates and portals, and transport of MSDUs between STAs in the same BSS in cases where the MSDU has a group destination address or where the destination is an individual address and the STA is associated with an AP.
NOTE—DSSs are provided between pairs of MACs not on the same instance of the WM.

downlink: A unidirectional link from an access point (AP) to one or more non-AP stations (STAs).

dynamic frequency selection (DFS): Facilities mandated to satisfy requirements in some regulatory domains for radar detection and uniform channel spreading in the 5 GHz band. These facilities might also be used for other purposes, such as automatic frequency planning.

dynamic frequency selection (DFS) owner: A station (STA) in an independent basic service set (IBSS) or off-channel TDLS direct link that takes responsibility for selecting the next channel after radar is detected operating in a channel. Due to the nature of IBSSs, it cannot be guaranteed that there is a single DFS owner at any particular time and the protocol is robust to this situation.

dynamic station (STA) enablement (DSE): The process by which an enabling STA grants permission and dictates operational procedures to STAs that are subject to its control.

effective isotropic radiated power (EIRP): The equivalent power of a transmitted signal in terms of an isotropic (omnidirectional) radiator. The EIRP equals the product of the transmitter power and the antenna gain (reduced by any coupling losses between the transmitter and antenna).

emergency alert system (EAS): A U.S. national public warning system.

enabling station (STA): A registered STA that has the authority to control when and how a dependent STA can operate. An enabling STA communicates an enabling signal to its dependents over the air. An enabling STA chooses whether other dynamic STA enablement (DSE) messages are exchanged over the air, over the distribution system (DS), or by mechanisms that rely on transport via higher layers.

encapsulate: To construct a protected frame from an unprotected frame.

encapsulation: The process of generating a protected frame by encapsulating plaintext data.

enhanced distributed channel access (EDCA): The prioritized carrier sense multiple access with collision avoidance (CSMA/CA) access mechanism used by quality-of-service (QoS) stations (STAs) in a QoS basic service set (BSS). This access mechanism is also used by the QoS access point (AP) and operates concurrently with hybrid coordination function (HCF) controlled channel access (HCCA).

enhanced distributed channel access function (EDCAF): A logical function in a quality-of-service (QoS) station (STA) that determines, using enhanced distributed channel access (EDCA), when a frame in the transmit queue with the associated access category (AC) is permitted to be transmitted via the wireless medium (WM). There is one EDCAF per AC.

extended service area (ESA): The area within which members of an extended service set (ESS) can communicate. An ESA is larger than or equal to a basic service area (BSA) and might involve several basic service sets (BSSs) in overlapping, disjointed, or both configurations.

extended service set (ESS): A set of one or more interconnected basic service sets (BSSs) that appears as a single BSS to the logical link control (LLC) layer at any station (STA) associated with one of those BSSs.

extended service set (ESS) transition: A station (STA) movement from one basic service set (BSS) in one ESS to another BSS in a different ESS.

fast basic service set (BSS) transition: A station (STA) movement that is from one BSS in one extended service set (ESS) to another BSS within the same ESS and that minimizes the amount of time that data connectivity is lost between the STA and the distribution system (DS).

fast basic service set (BSS) transition (FT) 4-Way Handshake: A pairwise key management protocol used during FT initial mobility domain association. This handshake confirms mutual possession of a pairwise master key, the PMK-R1, by two parties and distributes a group temporal key (GTK).

fast basic service set (BSS) transition (FT) initial mobility domain association: The first association or first reassociation procedure within a mobility domain, during which a station (STA) indicates its intention to use the FT procedures.

fixed station (STA): A STA that is physically attached to a specific location. In licensed bands, a fixed STA might be authorized to operate only at a specific location.

flexible multicast service (FMS): A service that enables a non-access-point (non-AP) station (STA) to request a multicast delivery interval longer than the delivery traffic indication map (DTIM) interval for the purposes of lengthening the period of time a STA can be in a power save state.

flexible multicast stream identifier (FMSID): An identifier assigned by the access point (AP) to a particular group addressed stream subsequent to a successful FMS Request.

flexible multicast service (FMS) stream: A succession of frames transmitted by the access point (AP) that correspond to a single flexible multicast stream identifier (FMSID).

flexible multicast service (FMS) stream set: A collection of FMS streams identified by an FMS Token, used during the FMS Request procedure.

forwarding information: The information maintained by a mesh station (STA) that allows the mesh STA to perform its path selection and forwarding functions.

fragmentation: The process of segmenting a medium access control (MAC) service data unit (MSDU) or MAC management protocol data unit (MMPDU) into a sequence of smaller MAC protocol data units

(MPDUs) prior to transmission. The process of recombining a set of fragment MPDUs into an MSDU or MMPDU is known as defragmentation. These processes are described in 5.8.1.9 of ISO/IEC 7498-1:1994.

Gaussian frequency shift keying (GFSK): A modulation scheme in which the data are first filtered by a Gaussian filter in the baseband and then modulated with a simple frequency modulation.

group: The entities in a wireless network, e.g., an access point (AP) and its associated stations (STAs), or all the STAs in an independent basic service set (IBSS) network.

group address: A medium access control (MAC) address that has the group bit equal to 1. *Syn*: multicast address.

group addressed: When applied to a medium access control (MAC) service data unit (MSDU), it is an MSDU with a group address as the destination address (DA). When applied to a MAC protocol data unit (MPDU), it is an MPDU with a group address in the Address 1 field. *Syn*: **multicast**.

Group Key Handshake: A group key management protocol defined by this standard. It is used only to issue a new group temporal key (GTK) to peers with whom the local station (STA) has already formed security associations.

group master key (GMK): An auxiliary key that might be used to derive a group temporal key (GTK).

group temporal key (GTK): A random value, assigned by the group source, which is used to protect group addressed medium access control (MAC) protocol data units (MPDUs) from that source. The GTK might be derived from a group master key (GMK).

hidden station (STA): A STA whose transmissions are not detected using carrier sense (CS) by a second STA, but whose transmissions interfere with transmissions from the second STA to a third STA

homogenous extended service set (ESS): A collection of basic service sets (BSSs), within the same extended service set (ESS), in which every subscription service provider network (SSPN) or other external network reachable at one BSS is reachable at all of them.

hybrid coordination function (HCF): A coordination function that combines and enhances aspects of the contention-based and contention-free access methods to provide quality-of-service (QoS) stations (STAs) with prioritized and parameterized QoS access to the wireless medium (WM), while continuing to support non-QoS STAs for best-effort transfer. The HCF includes the functionality provided by both enhanced distributed channel access (EDCA) and HCF controlled channel access (HCCA). The HCF is compatible with the distributed coordination function (DCF) and the point coordination function (PCF). It supports a uniform set of frame formats and exchange sequences that STAs might use during both the contention period (CP) and the contention-free period (CFP).

hybrid coordinator (HC): A type of coordinator, defined as part of the quality-of-service (QoS) facility, that implements the frame exchange sequences and medium access control (MAC) service data unit (MSDU) handling rules defined by the hybrid coordination function (HCF). The HC operates during both the contention period (CP) and contention-free period (CFP). The HC performs bandwidth management including the allocation of transmission opportunities (TXOPs) to QoS stations (STAs). The HC is collocated with a QoS access point (AP).

hybrid coordination function (HCF) controlled channel access (HCCA): The channel access mechanism utilized by the hybrid coordinator (HC) to coordinate contention-free media use by quality-of-service (QoS) stations (STAs) for downlink individually addressed, uplink, and direct-link transmissions.

idle power indicator (IPI): A physical layer (PHY) indication of the total channel power (noise and interference) as measured in the channel at the receiving antenna connector while the station (STA) is idle, i.e., neither transmitting nor receiving a frame.

IEEE 802.1X authentication: Extensible Authentication Protocol (EAP) authentication transported by the IEEE 802.1X protocol.

independent basic service set (IBSS): A basic service set (BSS) that forms a self-contained network, and in which no access to a distribution system (DS) is available.

individual address: A medium access control (MAC) address in which the group bit is 0. *Syn:* **directed address**, **unicast address**.

individually addressed: When applied to a medium access control (MAC) service data unit (MSDU), it is an MSDU with an individual address as the destination address (DA). When applied to a MAC protocol data unit (MPDU), it is an MPDU with an individual address in the Address 1 field. *Syn:* **directed, unicast.**

infrastructure: The infrastructure includes the distribution system medium (DSM), access point (AP), and portal entities. It is also the logical location of distribution and integration service functions of an extended service set (ESS). An infrastructure contains one or more APs and zero or more portals in addition to the distribution system (DS).

infrastructure authorization information: The information that specifies the access rights of the user of a non-access-point (non-AP) station (STA). This information might include the rules for routing the user traffic, a set of permissions about services that a user is allowed to access, quality-of-service (QoS) configuration information, or the accounting policy to be applied by the infrastructure.

integration service: The service that enables delivery of medium access control (MAC) service data units (MSDUs) between the distribution system (DS) and a local area network (LAN) (via a portal).

integrity GTK (IGTK): A random value, assigned by the broadcast/multicast source STA, which is used to protect group addressed medium access control (MAC) management protocol data units (MMPDUs) from that source STA.

light sleep mode: A mesh power mode in which the mesh station (STA) operates either in the Awake state or in the Doze state towards a neighbor mesh STA, and is expected to receive beacons from this neighbor peer mesh STA.

link: In the context of an IEEE 802.11 medium access control (MAC) entity, a physical path consisting of exactly one traversal of the wireless medium (WM) that is used to transfer an MAC service data unit (MSDU) between two stations (STAs).

link margin: Ratio of the received signal power to the minimum required by the station (STA). The STA might incorporate rate information and channel conditions, including interference, into its computation of link margin. The specific algorithm for computing the link margin is implementation dependent.

link metric: A criterion used to characterize the performance, quality, and eligibility of a link.

little endian: The concept that, for a given multi-octet numeric representation, the least significant octet has the lowest address.

liveness: A demonstration that the peer is actually participating in this instance of communication.

location configuration information (LCI): As defined in IETF RFC 3825: includes latitude, longitude, and altitude, with resolution indicators for each.

location subject local: The term used when a location request is for the location of the requesting STA, i.e., when the requesting STA asks, "Where am I?"

location subject remote: The term used when a location request is for the location of the reporting STA, i.e., when the requesting STA asks, "Where are you?"

location subject third party: The term used when the location request is for the location of a station (STA) other than the requesting STA or the requested STA, (i.e., when the requesting STA asks, "Where is he/she?")

master session key (MSK): Keying material that is derived between the Extensible Authentication Protocol (EAP) peer and exported by the EAP method to the Authentication Server (AS).
NOTE—In this standard, this key is at least 64 octets in length.

medium access control (MAC) management protocol data unit (MMPDU): The unit of data exchanged between two peer MAC entities, using services of the physical layer (PHY), to implement the MAC management protocol.

medium access control (MAC) protocol data unit (MPDU): The unit of data exchanged between two peer MAC entities using the services of the physical layer (PHY). *Syn:* **frame**.

medium access control (MAC) service data unit (MSDU): Information that is delivered as a unit between MAC service access points (SAPs).

mesh basic service set (MBSS): A basic service set (BSS) that forms a self-contained network of mesh stations (STAs) that use the same mesh profile. An MBSS contains zero or more mesh gates, and can be formed from mesh STAs that are not in direct communication.

mesh facility: The set of enhanced functions, channel access rules, frame formats, mutual authentication methods, and managed objects used to provide data transfer among autonomously operating stations (STAs) that might not be in direct communication with each other over a single instance of the wireless medium. Communication between STAs using the mesh facility takes place using only the wireless medium. The mesh facility transports an MSDU between source and destination STAs over potentially multiple hops of the wireless medium without transiting the MAC_SAP at intermediate STAs.

mesh gate: Any entity that has mesh station (STA) functionality and provides access to one or more distribution systems, via the wireless medium (WM) for the mesh basic service set (MBSS).

mesh link: A link from one mesh station (STA) to a neighbor mesh STA that have a mesh peering with each other.

mesh neighborhood: The set of all neighbor mesh stations (STAs) relative to a particular mesh STA.

mesh path: A concatenated set of mesh links from a source mesh station (STA) to a destination mesh STA.

mesh path selection: The process of selecting a mesh path.

mesh peer service period (MPSP): A contiguous period of time during which one or more individually addressed frames are transmitted between two peer mesh stations (STAs) with at least one of those mesh STAs operating in light sleep or deep sleep mode. A mesh peer service period is directional and may contain one or more transmission opportunities (TXOPs). A mesh STA may have multiple mesh peer service periods ongoing in parallel. No more than one mesh peer service period may be set up in each direction with each peer mesh STA.

mesh peer service period (MPSP) owner: A mesh station (STA) that obtains transmission opportunities (TXOPs), transmits individually addressed frames to the recipient mesh STA in the mesh peer service period, and terminates the mesh peer service period.

mesh peering: A relationship between two mesh stations (STAs) that is required for direct communication over a single instance of the wireless medium (WM). A mesh peering is established with a mesh peering protocol.

mesh peering management: A group of protocols to facilitate the mesh peering establishment and closure of the mesh peerings.

mesh power mode: The activity level identifier of a mesh station (STA) set per mesh peering or for nonpeer neighbor STAs. A lower activity level enables a mesh STA to reduce its power consumption.

mesh power mode tracking: Operation to observe the peering-specific mesh power modes from the peer mesh STAs and to maintain the peering-specific mesh power modes for each peer mesh STA.

mesh profile: A set of values of parameters that identifies the attributes of the mesh basic service set (MBSS) and that is used in a single mesh BSS. The mesh profile consists of the identifiers that are the values for the parameters: mesh ID, active path selection protocol, active path selection metric, congestion control mode, synchronization method, and authentication protocol.

mesh services: The set of services that enable the creation and operation of a mesh basic service set (MBSS).

mesh station (STA): A quality-of-service (QoS) STA that implements the mesh facility.

message integrity code (MIC): A value generated by a cryptographic function. If the input data are changed, a new value cannot be correctly computed without knowledge of the cryptographic key(s) used by the cryptographic function.

NOTE—This is traditionally called a *message authentication code* (MAC), but the acronym MAC is already reserved for another meaning in this standard.

mobile station (STA): A type of STA that uses network communications while in motion.

mobility domain: A set of basic service sets (BSSs), within the same extended service set (ESS), that support fast BSS transitions between themselves and that are identified by the set's mobility domain identifier (MDID).

mobility domain identifier (MDID): An identifier that names a mobility domain.

multi-level precedence and preemption (MLPP): A framework used with admission control for the treatment of traffic streams based on precedence, which supports the preemption of an active traffic stream by a higher precedence traffic stream when resources are limited. Preemption is the act of forcibly removing a traffic stream in progress in order to free up resources for another higher precedence traffic stream.

multicast: *See:* **group addressed**.

multicast address: *See:* **group address**.

multicast-group address: A medium access control (MAC) address associated by higher level convention with a group of logically related stations (STAs).

multiple BSSID capability: The capability to advertise information for multiple basic service set identifiers (BSSIDs) using a single Beacon or Probe Response frame instead of using multiple Beacon or Probe Response frames, each corresponding to a single BSSID, and the capability to indicate buffered frames for these multiple BSSIDs using a single traffic indication map (TIM) element in a single Beacon.

multiple input, multiple output (MIMO): A physical layer (PHY) configuration in which both transmitter and receiver use multiple antennas.

neighbor access point (AP): Any AP that is a potential service set transition candidate.

neighbor station (STA): A STA in the following relationship: STA A is a neighbor to STA B if STA A can both directly transmit to and receive from STA B over the wireless medium.

network access identifier (NAI): The user identity submitted by the Supplicant during IEEE 802.1X authentication.
NOTE—See IETF RFC 4282.[15]

network access server (NAS) client: The client component of a NAS that communicates with the Authentication Server (AS).

network allocation vector (NAV): An indicator, maintained by each station (STA), of time periods when transmission onto the wireless medium (WM) is not initiated by the STA regardless of whether the STA's clear channel assessment (CCA) function senses that the WM is busy.

next-hop mesh station (STA): The next peer mesh STA on the mesh path to the destination mesh STA.

nonce: A numerical value, used in cryptographic operations associated with a given cryptographic key, that is not to be reused with that key, including over all reinitializations of the system through all time.

non-access-point (non-AP) station (STA): A STA that is not contained within an AP.

nonoperating channel: A channel that is not the operating channel of the basic service set (BSS) of which the station (STA) is a member.

nonpeer mesh power mode: The activity level identifier of a mesh station (STA) towards nonpeer neighbor mesh STAs. Two nonpeer mesh power modes are defined: active mode and deep sleep mode.

non-quality-of-service (non-QoS) access point (AP): An AP that does not support the quality-of-service (QoS) facility.

non-quality-of-service (non-QoS) basic service set (BSS): A BSS that does not support the quality-of-service (QoS) facility.

non-quality-of-service (non-QoS) station (STA): A STA that does not support the quality-of-service (QoS) facility.

nontransmitted BSSID: A basic service set identifier (BSSID) corresponding to one of the basic service sets (BSSs) when the multiple BSSID capability is supported, where the BSSID is not announced explicitly but can be derived from the information encoded in the transmitted beacon frames.

[15] Information on references can be found in Clause 2.

null data packet (NDP): A physical layer convergence procedure (PLCP) protocol data unit (PPDU) that carries no Data field.

off-channel: Channel that is not the base channel.

operating channel: The operating channel is the channel used by the serving AP of the BSS to transmit beacons. In an IBSS the operating channel is the channel used by the IBSS DFS owner to transmit beacons.

operating channel width: The channel width in which the station (STA) is currently able to receive.

overlapping basic service set (OBSS): A basic service set (BSS) operating on the same channel as the station's (STA's) BSS and within (either partly or wholly) its basic service area (BSA).

over-the-air fast basic service set (BSS) transition (FT): An FT method in which the station (STA) communicates over a WM link to the target access point (AP).

over-the-DS (distribution system) fast basic service set (BSS) transition (FT): An FT method in which the station (STA) communicates with the target access point (AP) via the current AP.

pairwise: Referring to, or an attribute of, two entities that are associated with each other, e.g., an access point (AP) and an associated station (STA), or two STAs in an independent basic service set (IBSS) network. This term is used to refer to a type of encryption key hierarchy pertaining to keys shared by only two entities.

pairwise master key (PMK): The key derived from a key generated by an Extensible Authentication Protocol (EAP) method or obtained directly from a preshared key (PSK).

pairwise master key R0 (PMK-R0): The key at the first level of the fast basic service set (BSS) transition (FT) key hierarchy.

pairwise master key (PMK) R0 name (PMKR0Name): An identifier that names the PMK-R0.

pairwise master key (PMK) R0 key holder identifier (R0KH-ID): An identifier that names the holder of the PMK-R0 in the Authenticator.

pairwise master key R1 (PMK-R1): A key at the second level of the fast basic service set (BSS) transition (FT) key hierarchy.

pairwise master key (PMK) R1 name (PMKR1Name): An identifier that names a PMK-R1.

pairwise master key (PMK) R1 key holder identifier (R1KH-ID): An identifier that names the holder of a PMK-R1 in the Authenticator.

pairwise master key (PMK) S0 key holder identifier (S0KH-ID): An identifier that names the holder of the PMK-R0 in the Supplicant.

pairwise master key (PMK) S1 key holder identifier (S1KH-ID): An identifier that names the holder of the PMK-R1 in the Supplicant.

pairwise transient key (PTK): A concatenation of session keys derived from the pairwise master key (PMK) or from the PMK-R1. Its components include a key confirmation key (KCK), a key encryption key (KEK), and one or more temporal keys that are used to protect information exchanged over the link.

pairwise transient key (PTK) name (PTKName): An identifier that names the PTK.

parameterized quality of service (QoS): The treatment of the medium access control (MAC) protocol data units (MPDUs) depends on the parameters associated with the MPDU. Parameterized QoS is primarily provided through the hybrid coordination function (HCF) controlled channel access (HCCA) mechanism, but is also provided by the enhanced distributed channel access (EDCA) mechanism when used with a traffic specification (TSPEC) for admission control.

pass-phrase: A secret text string employed to corroborate the user's identity.

password: A shared, secret, and potentially low-entropy word, phrase, code, or key used as a credential for authentication purposes.
NOTE—The method of distribution of a password to the units in the system is outside the scope of this standard.

path metric: An aggregate multi-hop criterion used to characterize the performance, quality, and eligibility of a mesh path.

peer mesh station (STA): A mesh STA to which a mesh peering has been established.

peer trigger frame: A Mesh Data or quality-of-service (QoS) Null frame that initiates a mesh peer service period.

peer-specific mesh power mode: The activity level identifier of a mesh station (STA) set per mesh peering. Three peer-specific mesh power modes are defined: active mode, light sleep mode, and deep sleep mode.

peer-to-peer link: A direct link within a quality-of-service (QoS) basic service set (BSS), a tunnelled direct-link setup (TDLS) link, or a STA-to-STA communication in an independent basic service set (IBSS).

PeerKey Handshake: A key management protocol composed of the station-to-station link (STSL) master key (SMK) Handshake and the 4-Way STSL transient key (STK) Handshake. This is used to create new SMK security associations (SMKSAs) and STK security associations (STKSAs) to secure the STSLs.

per-frame encryption key: A unique encryption key constructed for each medium access control (MAC) protocol data unit (MPDU).
NOTE—A per-frame encryption key is employed by some security protocols defined in this standard.

piggyback: The overloading of a data frame with an acknowledgment of a previously received medium access control (MAC) protocol data unit (MPDU) and/or a poll to the station (STA) to which the frame is directed.

point coordinator (PC): The entity within the STA in an AP that performs the point coordination function.

point coordination function (PCF): A class of possible coordination functions in which the coordination function logic is active in only one station (STA) in a basic service set (BSS) at any given time that the network is in operation.

portable station (STA): A type of station (STA) that might be moved from location to location, but that only uses network communications while at a fixed location.

portal: The logical point at which the integration service is provided.

precursor mesh station (STA): A neighbor peer mesh STA on the mesh path to the destination mesh STA, that identifies the mesh STA as the next-hop mesh STA.

preshared key (PSK): A static key that is distributed to the units in the system by some out-of-band means.

primary channel: The common channel of operation for all stations (STAs) that are members of the basic service set (BSS).

prioritized quality of service (QoS): The provisioning of service in which the medium access control (MAC) protocol data units (MPDUs) with higher priority are given a preferential treatment over MPDUs with a lower priority. Prioritized QoS is provided through the enhanced distributed channel access (EDCA) mechanism.

protection mechanism: Any procedure that attempts to update the network allocation vector (NAV) of all receiving stations (STAs) prior to the transmission of a frame that might or might not be detected as valid network activity by the PHY entities at those receiving STAs.

protection mechanism frame: Any frame that is sent as part of a protection mechanism procedure.

protocol instance: An execution of a particular protocol that consists of the state of the communicating parties as well as the messages exchanged.

proxy mesh gate: A mesh gate acting as an intermediary for IEEE 802 stations (STAs) outside the mesh basic service set (MBSS).

pseudorandom function (PRF): A function that hashes various inputs to derive a pseudorandom value. In order to ensure liveness of a communication in which a pseudorandom value is used, a nonce is used as one of the inputs to the function.

public safety answering point (PSAP): A physical location where emergency calls are received and routed to the appropriate emergency service dispatch center.
NOTE—See NENA 08-002 [B52].

quadrature binary phase shift keying (QBPSK): A binary phase shift keying modulation in which the binary data is mapped onto the imaginary (Q) axis.

quality-of-service (QoS) access point (AP): An AP that supports the QoS facility. The functions of a QoS AP are a superset of the functions of a non-QoS AP, and thus a QoS AP is able to function as a non-QoS AP to non-QoS stations (STAs).

quality-of-service (QoS) basic service set (BSS): A BSS that provides the QoS facility. An infrastructure QoS BSS contains a QoS access point (AP).

quality-of-service (QoS) facility: The set of enhanced functions, channel access rules, frame formats, frame exchange sequences and managed objects used to provide parameterized and prioritized QoS.

quality-of-service (QoS) independent basic service set (IBSS): An IBSS in which one or more of its stations (STAs) support the QoS facility.

quality-of-service (QoS) station (STA): A STA that implements the QoS facility. A QoS STA acts as a non-QoS STA when associated in a non-QoS basic service set (BSS).

reassociation service: The service that enables an established association [between access point (AP) and station (STA)] to be transferred from one AP to another (or the same) AP.

receive chain: The physical entity that implements any necessary signal processing to provide the received signal to the digital baseband. Such signal processing includes filtering, amplification, down-conversion, and sampling.

receive power: Mean power measured at the antenna connector.

received channel power indicator (RCPI): An indication of the total channel power (signal, noise, and interference) of a received frame measured on the channel and at the antenna connector used to receive the frame.

received power indicator (RPI): A quantized measure of the received power level as seen at the antenna connector.

received signal to noise indicator (RSNI): An indication of the signal to noise plus interference ratio of a received frame. RSNI is defined by the ratio of the received signal power (RCPI-ANPI) to the noise plus interference power (ANPI) as measured on the channel and at the antenna connector used to receive the frame.

NOTE—RCPI and ANPI might not be measured simultaneously; see 10.11.9.4 for details.

registered station (STA): A STA for which information needs to be submitted to an appropriate regulatory or coordination authority before it is allowed to transmit.

remote request broker (RRB): The component of the station management entity (SME) of an access point (AP) that supports fast basic service set (BSS) transitions over the distribution system (DS).

resource information container (RIC): A sequence of elements that include resource request and response parameters.

restricted channel: A radio channel in which transmission is restricted to stations (STAs) that operate under the control of licensed operators.

roaming consortium: A group of subscription service providers (SSPs) having inter-SSP roaming agreements.

Robust Management frame: A management frame that is eligible for protection.

scheduled service period (SP): The SP that is scheduled by the quality-of-service (QoS) access point (AP). Scheduled SPs start at fixed intervals of time.

service interval (SI): The interval between the start of two successive scheduled service periods (SPs).

service period (SP): A contiguous time during which one or more downlink individually addressed frames are transmitted to a quality-of-service (QoS) station (STA) and/or one or more transmission opportunities (TXOPs) are granted to the same STA. SPs are either scheduled or unscheduled. For a non-access-point (non-AP) STA, there can be at most one SP active at any time.

service set transition: A STA movement from one BSS to another BSS, i.e., either a BSS transition or an ESS transition.

serving AP: The AP to which the STA is associated.

sounding: The use of preamble training fields to measure the channel for purposes other than demodulation of the Data portion of the physical layer convergence procedure (PLCP) protocol data unit (PPDU) containing the training fields.

NOTE—These uses include calculation of transmit steering, calculation of recommended MCS, and calculation of calibration parameters.

source mesh station (STA): A mesh STA from which a MAC service data unit (MSDU) enters the mesh basic service set (MBSS). A source mesh STA may be a mesh STA that is the source of an MSDU or a proxy mesh gate that receives an MSDU from a STA outside of the MBSS and forwards the MSDU on a mesh path.

space-time block coding/spatial multiplexing (STBC/SM): A combination of STBC and SM where one spatial stream is transmitted using STBC and one or two additional spatial streams are transmitted using SM.

space-time streams: Streams of modulation symbols created by applying a combination of spatial and temporal processing to one or more spatial streams of modulation symbols.

spatial multiplexing (SM): A transmission technique in which data streams are transmitted on multiple spatial channels that are provided through the use of multiple antennas at the transmitter and the receiver.

spatial stream: One of several streams of bits or modulation symbols that might be transmitted over multiple spatial dimensions that are created by the use of multiple antennas at both ends of a communications link.

station (STA): A logical entity that is a singly addressable instance of a medium access control (MAC) and physical layer (PHY) interface to the wireless medium (WM).

station service (SS): The set of services that support transport of medium access control (MAC) service data units (MSDUs) between stations (STAs) within a basic service set (BSS).

subscription service provider (SSP): An organization (operator) offering connection to network services, perhaps for a fee.

subscription service provider network (SSPN): The network controlled by a subscription service provider (SSP). The network maintains user subscription information.

Supplicant: An entity at one end of a point-to-point LAN segment that is being authenticated by an Authenticator attached to the other end of that link. (IEEE Std 802.1X-2004)

Supplicant address (SPA): The medium access control (MAC) address of the IEEE 802.1X Supplicant.

temporal encryption key: The portion of a pairwise transient key (PTK) or group temporal key (GTK) used directly or indirectly to encrypt data in medium access control (MAC) protocol data units (MPDUs).

temporal key (TK): The combination of temporal encryption key and temporal message integrity code (MIC) key.

temporal message integrity code (MIC) key: The portion of a transient key used to ensure the integrity of medium access control (MAC) service data units (MSDUs) or MAC protocol data units (MPDUs).

time unit (TU): A measurement of time equal to 1024 µs.

traffic category (TC): A label for medium access control (MAC) service data units (MSDUs) that have a distinct user priority (UP), as viewed by higher layer entities, relative to other MSDUs provided for delivery over the same link. Traffic categories are meaningful only to MAC entities that support quality of service (QoS) within the MAC data service. These MAC entities determine the UP for MSDUs belonging to a particular traffic category using the priority value provided with those MSDUs at the MAC service access point (MAC_SAP).

traffic classification (TCLAS): The specification of certain parameter values to identify the medium access control (MAC) service data units (MSDUs) belonging to a particular traffic stream (TS). The classification process, performed above the MAC service access point (MAC_SAP) at a quality-of-service (QoS) access point (AP), uses the parameter values for a given TS to examine each incoming MSDU and determine whether this MSDU belongs to that TS. TCLAS might also occur at non-access-point (non-AP) QoS station (STA) with multiple streams.
NOTE—However, such classification is beyond the scope of this standard.

traffic filter: A set of traffic specifications defined by the use of traffic classification (TCLAS) elements that are utilized by the traffic filtering service (TFS) to identify specific allowed frames.

traffic filtering service (TFS): A service provided by an access point (AP) to a non-AP station (STA) to reduce the number of frames sent to the non-AP STA by not forwarding individually addressed frames addressed to the non-AP STA that do not match traffic filters specified by the non-AP STA.

traffic identifier (TID): Any of the identifiers usable by higher layer entities to distinguish medium access control (MAC) service data units (MSDUs) to MAC entities that support quality of service (QoS) within the MAC data service. There are 16 possible TID values; eight identify TCs, and the other eight identify parameterized TSs. The TID is assigned to an MSDU in the layers above the MAC.

traffic indication map (TIM) broadcast: A service that enables a non-access-point (non-AP) station (STA) to request periodic transmission of a TIM frame by the AP. TIM frames have shorter duration than Beacon frames and can be transmitted at a higher physical layer (PHY) rate, which allows the STA to save additional power while periodically checking for buffered traffic in standby mode, relative to the power consumed if the station (STA) were to periodically wake up to receive a beacon frame.

traffic specification (TSPEC): The quality-of-service (QoS) characteristics of a data flow to and from a QoS station (STA).

traffic stream (TS): A set of medium access control (MAC) service data units (MSDUs) to be delivered subject to the quality-of-service (QoS) parameter values provided to the MAC in a particular traffic specification (TSPEC). TSs are meaningful only to MAC entities that support QoS within the MAC data service. These MAC entities determine the TSPEC applicable for delivery of MSDUs belonging to a particular TS using the priority parameter provided with those MSDUs at the MAC service access point (MAC_SAP).

traffic stream identifier (TSID): Any of the identifiers usable by higher layer entities to distinguish medium access control (MAC) service data units (MSDUs) to MAC entities for parameterized quality of service (QoS) [i.e., the traffic stream (TS) with a particular traffic specification (TSPEC)] within the MAC data service. The TSID is assigned to an MSDU in the layers above the MAC.

transmission opportunity (TXOP): An interval of time when a particular quality-of-service (QoS) station (STA) has the right to initiate frame exchange sequences onto the wireless medium (WM). A TXOP is defined by a starting time and a maximum duration. The TXOP is either obtained by the STA by successfully contending for the channel or assigned by the hybrid coordinator (HC).

transmission opportunity (TXOP) holder: A quality-of-service (QoS) station (STA) that has either been granted a TXOP by the hybrid coordinator (HC) or successfully contended for a TXOP.

transmission opportunity (TXOP) responder: A station (STA) that transmits a frame in response to a frame received from a TXOP holder during a frame exchange sequence, but that does not acquire a TXOP in the process.

transmitted basic service set identifier (BSSID): The BSSID included in the MAC Header transmitter address field of a Beacon frame when the multiple BSSID capability is supported.

tunneled direct-link setup (TDLS): A protocol that uses a specific Ethertype encapsulation to TDLS frames through an access point (AP) to establish a TDLS direct link.

tunneled direct-link setup (TDLS) direct link: Direct link between two non-AP stations (STAs) that has been established using the TDLS protocol.

tunneled direct-link setup (TDLS) initiator station (STA): A STA that transmits a TDLS Setup Request frame or a TDLS Discovery Request frame.

tunneled direct-link setup (TDLS) peer power save mode (PSM): A power save mode that is based on periodically scheduled service periods, which can be used between two stations (STAs) that have set up a TDLS direct link.

tunneled direct-link setup (TDLS) peer power save mode (PSM) initiator: A station (STA) that transmits a TDLS Peer PSM request frame.

tunneled direct-link setup (TDLS) peer power save mode (PSM) responder: A station (STA) that transmits a TDLS Peer PSM response frame.

tunneled direct-link setup (TDLS) peer station (STA): A STA with a TDLS direct link.

tunneled direct-link setup (TDLS) peer unscheduled automatic power save delivery (U-APSD) [TDLS peer U-APSD (TPU)]: A power save mode based on unscheduled service periods that can be used between two stations (STAs) that have set up a TDLS direct link.

tunneled direct-link setup (TDLS) peer unscheduled automatic power save delivery (U-APSD) [TDLS peer U-APSD (TPU)] buffer station (STA): A TDLS peer STA that buffers traffic for a TPU sleep STA.

tunneled direct-link setup (TDLS) peer unscheduled automatic power save delivery (U-APSD) [TDLS peer U-APSD (TPU)] sleep station (STA): A TDLS STA that entered power save mode on a TDLS direct link and that is using TPU for the delivery of buffered traffic.

tunneled direct-link setup (TDLS) power save mode (PSM): TDLS peer PSM or peer unscheduled automatic power save delivery (U-APSD).

tunneled direct-link setup (TDLS) responder station (STA): A STA that receives or is the intended recipient of a TDLS Setup Request frame or TDLS Discovery Request frame.

unauthorized disclosure: The process of making information available to unauthorized individuals, entities, or processes.

unauthorized resource use: Use of a resource not consistent with the defined security policy.

unicast: *See:* **individually addressed**.

unicast address: *See:* **individual address**.

uniform spreading: A regulatory requirement for a channel selection mechanism that provides uniform usage across a minimum set of channels in the regulatory domain.

unreachable destination: A destination mesh station (STA) for which the link to the next hop of the mesh path to this destination mesh STA is no longer usable.

unreachable star: A star that cannot be reached. Often associated with impossible dreams.

unscheduled service period (SP): The period that is started when a quality-of-service (QoS) station (STA) transmits a trigger frame to the QoS access point (AP).

uplink: A unidirectional link from a non-access-point (non-AP) station (STA) to an access point (AP).

user priority (UP): A value associated with an medium access control (MAC) service data unit (MSDU) that indicates how the MSDU is to be handled. The UP is assigned to an MSDU in the layers above the MAC.

validated AP: An AP that has either been explicitly configured as a Neighbor or learned through a mechanism like the Beacon Report.

wildcard BSSID: A BSSID value (all binary 1s) used to represent all BSSIDs.

wildcard SSID: A SSID value (null) used to represent all SSIDs.

wireless distribution system (WDS): Often used as a vernacular term for a mechanism for wireless communication among nonmesh stations (STAs) using a four address frame format.

NOTE—This standard specifies such a frame format and its use only for a mesh basic service set (MBSS). Because of this, the term WDS is obsolete and subject to removal in a subsequent revision of this standard.

wireless local area network (WLAN) system: A system that includes the distribution system (DS), access points (APs), and portal entities. It is also the logical location of distribution and integration service functions of an extended service set (ESS). A WLAN system contains one or more APs and zero or more portals in addition to the DS.

wireless medium (WM): The medium used to implement the transfer of protocol data units (PDUs) between peer physical layer (PHY) entities of a wireless local area network (LAN).

3.2 Definitions specific to IEEE 802.11

The following terms and definitions are specific to terms or references in this standard and are not appropriate for inclusion in the *IEEE Standards Dictionary: Glossary of Terms & Definitions*.

20 MHz basic service set (BSS): A BSS in which the Secondary Channel Offset field is equal to SCN.

20 MHz high-throughput (HT): A Clause 20 transmission using FORMAT=HT_MF or HT_GF and CH_BANDWIDTH=HT_CBW20.

20 MHz mask physical layer convergence procedure (PLCP) protocol data unit (PPDU): A Clause 18 PPDU, a Clause 19 orthogonal frequency division multiplexing (OFDM) PPDU, or a Clause 20 20 MHz high-throughput (HT) PPDU with the TXVECTOR parameter CH_BANDWIDTH equal to HT_CBW20 and the CH_OFFSET parameter equal to CH_OFF_20. The PPDU is transmitted using a 20 MHz transmit spectral mask defined in Clause 18, Clause 19, or Clause 20, respectively.

20 MHz physical layer convergence procedure (PLCP) protocol data unit (PPDU): A Clause 16 PPDU, Clause 18 PPDU, Clause 17 PPDU, Clause 19 orthogonal frequency division multiplexing (OFDM) PPDU, or Clause 20 20 MHz high-throughput (HT) PPDU with the TXVECTOR parameter CH_BANDWIDTH equal to HT_CBW20.

20/40 MHz basic service set (BSS): A BSS in which the supported channel width of the access point (AP) or dynamic frequency selection (DFS) owner (DO) station (STA) is 20 MHz and 40 MHz (Channel Width field is equal to 1) and the Secondary Channel Offset field is equal to a value of SCA or SCB.

40-MHz-capable (FC) high-throughput (HT) access point (AP): An HT AP that included a value of 1 in the Supported Channel Width Set subfield (indicating its capability to operate on a 40 MHz channel) of its most recent transmission of a frame containing an HT Capabilities element.

40-MHz-capable (FC) high-throughput (HT) access point (AP) 2G4: An HT AP 2G4 that is also an FC HT AP.

40-MHz-capable (FC) high-throughput (HT) access point (AP) 5G: An HT AP 5G that is also an FC HT AP.

40-MHz-capable (FC) high-throughput (HT) station (STA): An HT STA that included a value of 1 in the Supported Channel Width Set subfield (indicating its capability to operate on a 40 MHz channel) of its most recent transmission of a frame containing an HT Capabilities element.

40-MHz-capable (FC) high-throughput (HT) station (STA) 2G4: An HT STA 2G4 that is also an FC HT STA.

40-MHz-capable (FC) high-throughput (HT) station (STA) 5G: An HT STA 5G that is also an FC HT STA.

40 MHz high throughput (HT): A Clause 20 transmission using FORMAT=HT_MF or HT_GF and CH_BANDWIDTH=HT_CBW40.

40 MHz mask physical layer convergence procedure (PLCP) protocol data unit (PPDU): One of the following PPDUs: 1) a 40 MHz high-throughput (HT) PPDU (TXVECTOR parameter CH_BANDWIDTH equal to HT_CBW40); 2) a 40 MHz non-HT duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to NON_HT_CBW40); or 3) a Clause 20 20 MHz HT PPDU with the TXVECTOR parameter CH_BANDWIDTH equal to HT_CBW20 and the CH_OFFSET parameter equal to either CH_OFF_20U or CH_OFF_20L. The PPDU is transmitted using a 40 MHz transmit spectral mask defined in Clause 20.

40 MHz physical layer convergence procedure (PLCP) protocol data unit (PPDU): A 40 MHz high-throughput (HT) PPDU (TXVECTOR parameter CH_BANDWIDTH equal to HT_CBW40) or a 40 MHz non-HT duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to NON_HT_CBW40) as defined in Clause 20.

4-Way Handshake: A pairwise key management protocol defined by this standard. This handshake confirms mutual possession of a pairwise master key (PMK) by two parties and distributes a group temporal key (GTK).

4-Way station-to-station link (STSL) transient key (STK) Handshake: A key management protocol between two parties that confirms mutual possession of an STSL master key (SMK) and distributes an STK.

Access Network Query Protocol (ANQP): The query protocol for access network information retrieval transported by generic advertisement service (GAS) Public Action frames.

advertisement protocol: Access Network Query Protocol (ANQP) and higher layer protocols defined external to this standard that are used for network and service discovery.

advertisement server: A logical server that provides the information repository for a specific advertisement protocol. The location of the physical server that instantiates the advertisement server is outside the scope of this specification.

basic space-time block coding (STBC) modulation and coding scheme (MCS): An MCS value and STBC encoder specification used in the transmission of STBC-encoded control frames and STBC-encoded group addressed frames. The value is defined in 9.7.3.

BSSBasicMCSSet: The set of modulation and coding scheme (MCS) values that are supported by all high-throughput (HT) stations (STAs) that are members of an HT basic service set (BSS).

bufferable management frame: Either an individually addressed Probe Response frame that is sent in an IBSS in response to an individually addressed Probe Request frame, or an Action, Disassociation, or Deauthentication frame.

bufferable medium access control (MAC) management protocol data unit (MMPDU): An MMPDU that is transmitted using one or more bufferable management frames.

bufferable unit (BU): An MSDU, A-MSDU (HT STAs only) or bufferable MMPDU that is buffered to operate the power saving protocol.

delivery traffic indication message (DTIM) interval: The interval between the consecutive TBTTs of beacons containing a DTIM. The value, expressed in time units, is equal to the product of the value in the Beacon Interval field and the value in the DTIM Period subfield in the TIM element in Beacon frames.

direct sequence spread spectrum orthogonal frequency division multiplexing (DSSS-OFDM): A PHY using DSSS-OFDM modulation under 19.7 rules.

direct sequence spread spectrum/complementary code keying (DSSS/CCK): A Clause 16 or Clause 17 transmission.

dynamic frequency selection (DFS) owner (DO) station (STA): A STA that is the DFS Owner of an IBSS or off-channel tunneled direct-link setup (TDLS) direct link that is operating on a channel within an operating class that has a value of 20 or 40 for the entry in the “Channel spacing” column and that has a value of 5 for the entry in the “Channel starting frequency” column of any of the tables found in E.1.

EAPOL-Key confirmation key (KCK): A key used to integrity-check an EAPOL-Key frame.

EAPOL-Key encryption key (KEK): A key used to encrypt the Key Data field in an EAPOL-Key frame.

emergency services association: A robust security network association (RSNA) between an access point (AP) and a non-AP station (STA) without security credentials; the non-AP STA is granted access to emergency services using unprotected frames via this association.

extended channel switching (ECS): A procedure that is used to announce a pending change of operating channel, operating class, or both.

extended rate PHY (ERP): A PHY conforming to Clause 19

extended rate PHY using CCK modulation (ERP-CCK): A PHY operating under Clause 19 rules.

extended rate PHY using DSSS modulation (ERP-DSSS): A PHY operating under Clause 19 rules.

extended rate PHY using DSSS or CCK modulation (ERP-DSSS/CCK): A PHY operating under Clause 19 rules.

extended rate PHY using OFDM modulation (ERP-OFDM): A PHY operating under 19.5 rules.

extended rate PHY using extended rate PBCC modulation (ERP-PBCC): A PHY operating under 19.6 rules.

extended service set (ESS) link: In the context of an IEEE 802.11 medium access control (MAC) entity, a connection path through the wireless medium between a non-access-point (non-AP) station (STA) and one of the APs that is a member of the ESS.

fast BSS transition (FT) originator: A STA that initiates the FT protocol by sending an FT Request frame or an Authentication frame with Authentication Algorithm equal to Fast BSS Transition.

IEEE 802.11 station (STA): Any station that is conformant to IEEE 802.11. Any reference to the term station (STA) in this standard where not qualified by the term IEEE 802.11 implicitly refers to an IEEE 802.11 station.

generic advertisement service (GAS): An over-the-air transportation service that provides over-the-air transportation for frames of higher layer advertisements between stations (STAs) or between an advertisement server and a non-access-point (non-AP) STA. The protocol(s) used to relay frames between an AP, portal, and advertisement server is outside the scope of this standard. GAS supports higher layer protocols that employ a query/response mechanism.

group addressed bufferable unit (BU): A group addressed MSDU or group addressed bufferable MMPDU.

group temporal key security association (GTKSA): The context resulting from a successful group temporal key (GTK) distribution exchange via either a Group Key Handshake or a 4-Way Handshake.

high-throughput (HT) basic service set (BSS): A BSS in which Beacon frames transmitted by an HT station (STA) include the HT Capabilities element.

high-throughput-delayed (HT-delayed) block acknowledgment (Ack): A Delayed Block Ack mechanism that requires the use of the compressed BlockAck frame and the No Acknowledgement ack policy setting within both BlockAckReq and BlockAck frames. This Block Ack scheme is negotiated between two HT stations (STAs) that both support HT Delayed Block Ack.

high-throughput-immediate (HT-immediate) block acknowledgment (Ack): An Immediate Block Ack mechanism that requires the use of the compressed BlockAck frame and an implicit Block Ack request and allows partial-state operation at the recipient. This Block Ack scheme is negotiated between two HT stations (STAs).

high-throughput-greenfield (HT-greenfield) format: A physical layer convergence procedure (PLCP) protocol data unit (PPDU) format of the HT physical layer (PHY) using the HT-greenfield format preamble. This format is represented at the PHY data service access point (SAP) by the TXVECTOR/RXVECTOR FORMAT parameter being equal to HT_GF.

high-throughput-mixed (HT-mixed) format: A physical layer convergence procedure (PLCP) protocol data unit (PPDU) format of the HT physical layer (PHY) using the HT-mixed format preamble. This format is represented at the PHY data service access point (SAP) by the TXVECTOR/RXVECTOR FORMAT parameter being equal to HT_MF.

high-throughput (HT) physical layer convergence procedure (PLCP) protocol data unit (PPDU): A Clause 20 PPDU with the TXVECTOR FORMAT parameter equal to HT_MF or HT_GF.

high-throughput (HT) station (STA) 2G4: An HT STA that is also a STA 2G4.

high-throughput (HT) station (STA) 5G: An HT STA that is also a STA 5G.

individually addressed bufferable unit (BU): An individually addressed MSDU, individually addressed A-MSDU (HT STAs only) or individually addressed bufferable MMPDU.

interworking service: A service that supports use of an IEEE 802.11 network with non-IEEE 802.11 networks. Functions of the interworking service assist non-access-point (non-AP) stations (STAs) in discovering and selecting IEEE 802.11 networks, in using appropriate quality-of-service (QoS) settings for transmissions, in accessing emergency services, and in connecting to subscription service providers (SSPs).

key counter: A 256-bit (32-octet) counter that is used in the pseudorandom function (PRF) to generate initialization vectors (IVs). There is a single key counter per station (STA) that is global to that STA.

key data encapsulation (KDE): Format for data other than elements in the EAPOL-Key Data field.

key management service: A service to distribute and manage cryptographic keys within a robust security network (RSN).

mesh awake window: A period of time during which the mesh station (STA) operates in awake state after its Beacon or Probe Response frame transmission that contained the Mesh Awake Window element.

mesh coordination function (MCF): A coordination function that combines aspects of the contention-based and scheduled access methods. The MCF includes the functionality provided by both enhanced distributed channel access (EDCA) and MCF controlled channel access (MCCA).

mesh coordination function (MCF) controlled channel access (MCCA): A coordination function for the mesh basic service set (MBSS).

mesh coordination function (MCF) controlled channel access opportunity (MCCAOP): A period of time scheduled for frame transmissions between mesh stations (STAs) using MCF controlled channel access (MCCA).

Mesh Data frame: An individually addressed Data frame with both the From DS and To DS bits set to 1 and that is transmitted from a mesh station (STA) to a peer mesh STA, or a group addressed Data frame that has From DS set to 1 and To DS set to 0 that is transmitted by a mesh STA.

Michael: The message integrity code (MIC) for the Temporal Key Integrity Protocol (TKIP).

minimum downlink transmission time (DTT) to uplink transmission time (UTT) [DTT2UTT] spacing: The minimum time within a power save multi-poll (PSMP) sequence between the end of a station's (STA's) PSMP-DTT and the start of its PSMP-UTT.

modulation and coding scheme (MCS): A specification of the high-throughput (HT) physical layer (PHY) parameters that consists of modulation order (e.g., BPSK, QPSK, 16-QAM, 64-QAM) and forward error correction (FEC) coding rate (e.g., 1/2, 2/3, 3/4, 5/6).

modulation and coding scheme 32 (MCS 32) format: A physical layer convergence procedure (PLCP) protocol data unit (PPDU) format of the high-throughput (HT) physical layer (PHY) in which signals in two halves of the occupied channel width contain the same information. This HT PPDU format supports the lowest rate.

modulation and coding scheme (MCS) feedback (MFB) requester: A station (STA) that transmits a physical layer convergence procedure (PLCP) protocol data unit (PPDU) containing an HT Control field in which the modulation and coding scheme (MCS) request (MRQ) subfield is equal to 1.

modulation and coding scheme (MCS) feedback (MFB) responder: A station (STA) that transmits a physical layer convergence procedure (PLCP) protocol data unit (PPDU) containing an HT Control field with the MFB field containing an MCS index or the value 127 in response to a PPDU containing an HT Control field in which the modulation and coding scheme (MCS) request (MRQ) subfield is equal to 1.

multiple basic service set identifier (BSSID) set: A collection of cooperating APs, such that all the APs use a common operating class, channel, and antenna connector.

non-40-MHz-capable (non-FC) high-throughput (HT) station (STA): A STA that is not an FC HT STA.

nonaggregate medium access control (MAC) protocol data unit (non-A-MPDU) frame: A frame that is transmitted in a physical layer convergence procedure (PLCP) protocol data unit (PPDU) with the TXVECTOR AGGREGATION parameter either absent or equal to NOT_AGGREGATED.

nonbufferable medium access control (MAC) management protocol data unit (MMPDU): An MMPDU that is not a bufferable MMPDU.

nonextended rate PHY (NonERP): A PHY conforming to Clause 16 or Clause 17, but not to Clause 19

non-high-throughput (non-HT) duplicate: A transmission format of the physical layer (PHY) that duplicates a 20 MHz non-HT transmission in two adjacent 20 MHz channels and allows a station (STA) in a non-HT basic service set (BSS) on either channel to receive the transmission.

non-high-throughput (non-HT) duplicate frame: A frame transmitted in a non-HT duplicate physical layer convergence procedure (PLCP) protocol data unit (PPDU).

non-high-throughput (non-HT) duplicate physical layer convergence procedure (PLCP) protocol data unit (PPDU): A PPDU transmitted by a Clause 20 physical layer (PHY) with the TXVECTOR FORMAT parameter equal to NON_HT and the CH_BANDWIDTH parameter equal to NON_HT_CBW40.

non-high-throughput (non-HT) physical layer convergence procedure (PLCP) protocol data unit (PPDU): A Clause 20 physical layer (PHY) PPDU with the TXVECTOR FORMAT parameter equal to NON_HT.

Non-High-Throughput (non-HT) SIGNAL field (L-SIG) transmit opportunity (TXOP) protection: A protection mechanism in which protection is established by the non-HT SIG Length and Rate fields indicating a duration that is longer than the duration of the PPDU itself.

non-phased-coexistence-operation-capable (non-PCO-capable) 20/40 station (STA): A high-throughput (HT) STA that included a value of 1 in the Supported Channel Width Set subfield (indicating its capability to operate on a 40 MHz channel) of its most recent transmission of a frame containing an HT Capabilities element and that sets the PCO field in the HT Extended Capabilities field to 0.

non-space-time-block-coding (non-STBC) frame: A frame that is transmitted in a physical layer convergence procedure (PLCP) protocol data unit (PPDU) that has the TXVECTOR STBC parameter equal to 0, or a frame that is received in a PPDU that has the RXVECTOR STBC parameter equal to 0.

null data packet (NDP) announcement: A physical layer convergence procedure (PLCP) protocol data unit (PPDU) that contains one or more +HTC frames (i.e., frames with an HT (high-throughput) Control field) that have the NDP Announcement subfield equal to 1.

operating class: An E.1 index into a set of values for radio operation in a regulatory domain.

pairwise master key (PMK) R0 key holder (R0KH): The component of robust security network association (RSNA) key management of the Authenticator that is authorized to derive and hold the PMK-R0, derive the PMK-R1s, and distribute the PMK-R1s to the R1KHs.

pairwise master key (PMK) R1 key holder (R1KH): The component of robust security network association (RSNA) key management of the Authenticator that receives a PMK-R1 from the R0KH, holds the PMK-R1, and derives the PTKs.

pairwise master key (PMK) S0 key holder (S0KH): The component of robust security network association (RSNA) key management of the Supplicant that derives and holds the PMK-R0, derives the PMK-R1s, and provides the PMK-R1s to the S1KH.

pairwise master key (PMK) S1 key holder (S1KH): The component of robust security network association (RSNA) key management in the Supplicant that receives a PMK-R1 from the S0KH, holds the PMK-R1, and derives the PTKs.

pairwise master key security association (PMKSA): The context resulting from a successful IEEE 802.1X authentication exchange between the peer and Authentication Server (AS) or from a preshared key (PSK).

pairwise transient key security association (PTKSA): The context resulting from a successful 4-Way Handshake exchange between the peer and Authenticator.

payload protected (PP) aggregate medium access control (MAC) service data unit (A-MSDU): An A-MSDU that is protected with CTR with CBC-MAC Protocol (CCMP) but does not include the A-MSDU Present field (bit 7 of the QoS Control field) in the construction of the additional authentication data (AAD).

per-frame sequence counter: For Temporal Key Integrity Protocol (TKIP), the counter that is used as the nonce in the derivation of the per-frame encryption key. For Counter mode with Cipher-block chaining Message authentication code Protocol (CCMP), the per-frame initialization vector (IV).

phased coexistence operation (PCO): A basic service set (BSS) mode with alternating 20 MHz and 40 MHz phases controlled by an access point (AP).

phased coexistence operation (PCO) active access point (AP): A high-throughput (HT) AP that is operating PCO.

phased coexistence operation (PCO) active basic service set (BSS): A BSS in which a PCO active access point (AP) has the PCO Active field in the HT Operation element equal to 1.

phased coexistence operation (PCO) active non-access-point (non-AP) station (STA): A high-throughput (HT) non-AP STA that is associated with a PCO basic service set (BSS) and following PCO.

phased coexistence operation (PCO) active station (STA): A STA that is either a PCO active access point (AP) or a PCO active non-AP STA.

phased-coexistence-operation-capable (PCO-capable) access point (AP): A high-throughput (HT) AP that sets the PCO field in the HT Extended Capabilities field to 1.

phased-coexistence-operation-capable (PCO-capable) non-access-point (non-AP) station (STA): A high-throughput (HT) non-AP STA that sets the PCO field in the HT Extended Capabilities field to 1.

phased-coexistence-operation-capable (PCO-capable) station (STA): A STA that is either a PCO capable access point (AP) or a PCO capable non-AP STA.

phased coexistence operation (PCO) inactive basic service set (BSS): A 20/40 MHz BSS in which an access point (AP) has the PCO Active field in the HT Operation element equal to 0.

power save multi-poll (PSMP): A mechanism that provides a time schedule that is used by an access point (AP) and its stations (STAs) to access the wireless medium. The mechanism is controlled using the PSMP frame.

power save multi-poll (PSMP) burst: A series of one or more PSMP sequences, separated by short interframe space (SIFS).

power save multi-poll downlink transmission time (PSMP-DTT): A period of time described by a PSMP frame during which the access point (AP) transmits.

power save multi-poll (PSMP) sequence: A sequence of frames where the first frame is a PSMP frame that is followed by transmissions in zero or more power save multi-poll downlink transmission times (PSMP-DTTs) and then by transmissions in zero or more power save multi-poll uplink transmission times (PSMP-UTTs). The schedule of the PSMP-DTTs and PSMP-UTTs is defined in the PSMP frame.

power save multi-poll (PSMP) session: The periodic generation of a PSMP burst aligned to its service period (SP).

power save multi-poll uplink transmission time (PSMP-UTT): A period of time described by a PSMP frame during which a non-access-point (non-AP) station (STA) can transmit.

power save multi-poll uplink transmission time (PSMP-UTT) spacing (PUS): The period of time between the end of one PSMP-UTT and the start of the following PSMP-UTT within the same PSMP sequence.

pre-robust security network association (pre-RSNA): The type of association used by a pair of stations (STAs) if the procedure for establishing authentication or association between them did not include the 4-Way Handshake.

pre-robust security network association (pre-RSNA) equipment: A device that is not able to create robust security network associations (RSNAs).

Protected Dual of Public Action frame: An Action frame with the category value specified in 8.4.1.11 Table 8-38. For each Protected Dual of Public Action frame, there is a dual Action frame in a category that is specified with “No” in the “Robust” column of Table 8-38.

quality-of-service (QoS) frame: A frame containing the QoS control field.

reverse direction (RD) initiator: A station (STA) that is a transmit opportunity (TXOP) holder that transmits a medium access control (MAC) protocol data unit (MPDU) in which the RDG/More PPDU subfield is equal to 1.

reverse direction (RD) responder: A station (STA) that is not the RD initiator and whose medium access control (MAC) address matches the value of the Address 1 field of a received MAC protocol data unit (MPDU) in which the RDG/More PPDU subfield is equal to 1.

Robust Action frame: An Action frame with a category value specified in 8.4.1.11 Table 8-38 with “Yes” in the “Robust” column.

robust security network (RSN): A security network that allows only the creation of robust security network associations (RSNAs). An RSN can be identified by the indication in the RSN element (RSNE) of Beacon frames that the group cipher suite specified is not wired equivalent privacy (WEP).

robust security network association (RSNA): The type of association used by a pair of stations (STAs) if the procedure to establish authentication or association between them includes the 4-Way Handshake. Note that existence of an RSNA between two STAs does not of itself provide robust security. Robust security is provided when all STAs in the network use RSNAs.

robust-security-network-association- (RSNA-) capable equipment: A device that contains a station (STA) that is able to create RSNAs. Such a device might use pre-RSNAs because of configuration. Notice that RSNA-capable does not imply full compliance with the RSNA Protocol Implementation Conformance Statement (PICS). A legacy device that has been upgraded to support Temporal Key Integrity Protocol (TKIP) might be RSNA-capable, but is not compliant with the PICS if it does not also support Counter mode with Cipher-block chaining Message authentication code Protocol (CCMP).

robust-security-network-association- (RSNA-) enabled equipment: A station (STA) when it is RSNA-capable and dot11RSNAActivated is true.

robust security network association (RSNA) key management: Key management that includes the 4-Way Handshake, the Group Key Handshake, and the PeerKey Handshake. If fast basic service set (BSS) transition (FT) is enabled, the FT 4-Way Handshake and FT authentication sequence are also included.

secondary channel: A 20 MHz channel associated with a primary channel used by high-throughput (HT) stations (STAs) for the purpose of creating a 40 MHz channel.

security network: A basic service set (BSS) where the station (STA) starting the BSS provides information about the security capabilities and configuration of the BSS by including the robust security network element (RSNE) in Beacon frames.

Self-protected Action frame: An Action frame that is not eligible for protection by the Robust Management frame service. The protection on each Self-protected Action frame is provided by the protocol that uses the frame.

signaling and payload protected (SPP) aggregate medium access control (MAC) service data unit (A-MSDU): An A-MSDU that is protected with CTR with CBC-MAC Protocol (CCMP) and that includes the A-MSDU Present field (bit 7 of the QoS Control field) in the construction of the additional authentication data (AAD).

sounding physical layer convergence procedure (PLCP) protocol data unit (PPDU): A PPDU that is intended by the transmitting station (STA) to enable the receiving STA to estimate the channel between the transmitting STA and the receiving STA. The Not Sounding field in the High-Throughput SIGNAL field (HT-SIG) is equal to 0 in sounding PPDUs.

space-time block coding (STBC) beacon: A beacon that is transmitted using the basic STBC modulation and coding scheme (MCS) to enable discovery of the basic service set (BSS) by high-throughput (HT) stations (STAs) that support the HT STBC feature in order to extend the range of the BSS.

space-time block coding (STBC) delivery traffic indication map (DTIM): An STBC beacon transmission that is a DTIM beacon.

space-time block coding (STBC) frame: A frame that is transmitted in a physical layer convergence procedure (PLCP) protocol data unit (PPDU) that has a nonzero value of the TXVECTOR STBC parameter, or a frame that is received in a PPDU that has a nonzero value of the RXVECTOR STBC parameter.

staggered preamble: A physical layer convergence procedure (PLCP) preamble in a sounding PLCP protocol data unit (PPDU) that is not a null data packet (NDP) and that includes one or more Data Long Training fields (DLTFs) and one or more Extension Long Training fields (ELTFs).

staggered sounding: The use of a sounding physical layer convergence procedure (PLCP) protocol data unit (PPDU) that is not a null data packet (NDP) and that includes one or more Data Long Training fields (DLTFs) and one or more Extension Long Training fields (ELTFs).

station (STA) 2G4: A STA that is operating on a channel that belongs to any operating class that has a value of 25 or 40 for the entry in the “Channel spacing” column and that has a value of 2.407 or 2.414 for the entry in the “Channel starting frequency” column of any of the tables found in E.1.

station (STA) 5G: A STA that is operating on a channel that belongs to any operating class that has a value of 20 or 40 for the entry in the “Channel spacing” column and that has a value of 5 for the entry in the “Channel starting frequency” column of any of the tables found in E.1.

station-to-station link (STSL): A direct link established between two stations (STAs) while associated to a common access point (AP). This term refers to a generic mechanism that allows direct station-to-station communication while remaining in the infrastructure mode. Establishment of this type of link includes an initialization step. The STSL is terminated by specific teardown procedures under the conditions prescribed in this standard. The only example of this procedure currently specified is direct link established by the direct-link setup (DLS).

station-to-station link (STSL) master key (SMK): A random value generated by an access point (AP) during an SMK Handshake. It is used for deriving an STSL transient key (STK).

station-to-station link (STSL) master key (SMK) Handshake: A key management protocol between two parties that creates a new SMK.

station-to-station link (STSL) master key security association (SMKSA): The context resulting from a successful STSL master key (SMK) Handshake.

station-to-station link (STSL) transient key (STK): A value that is derived from the STSL master key (SMK), initiator MAC address (MAC_I), peer MAC address (MAC_P), initiator nonce (INonce), and peer nonce (PNonce), using the pseudorandom function (PRF). The value is split into as many as five keys, i.e., temporal encryption key, two temporal message integrity code (MIC) keys, EAPOL-Key encryption key (KEK), and EAPOL-Key confirmation key (KCK).

station-to-station link (STSL) transient key security association (STKSA): The context resulting from a successful 4-Way STSL transient key (STK) exchange.

subscription service provider (SSP) roaming: The act when a station (STA) uses an SSP’s IEEE 802.11 infrastructure, with which the terminal has no direct agreement, based on a subscription and formal agreement with the STA’s own SSP.

time priority management frame: a management frame that is transmitted using specific frame type channel access rules.

transition security network (TSN): A security network that allows the creation of pre-robust security network associations (pre-RSNAs) as well as RSNAs. A TSN is identified by the indication in the robust security network element (RSNE) of Beacon frames that the group cipher suite in use is wired equivalent privacy (WEP).

transmit power: The effective isotropic radiated power (EIRP) when referring to the operation of an orthogonal frequency division multiplexing (OFDM) physical layer (PHY) in a country where so regulated.

trigger-enabled access category (AC): A quality-of-service (QoS) station (STA) AC where frames of subtype QoS Data and QoS Null from the STA that map to the AC trigger an unscheduled service period (SP) if one is not in progress.

wired equivalent privacy (WEP): A deprecated cryptographic data confidentiality algorithm specified by this standard.

wireless-network-management-sleep (WNM-sleep) mode: An extended power save mode for non-access-point (non-AP) stations (STAs) whereby a non-AP STA need not listen for every delivery traffic indication map (DTIM) Beacon frame and does not perform group temporal key/integrity group temporal key (GTK/IGTK) updates.

3.3 Abbreviations and acronyms

3GPP	3rd Generation Partnership Project
802.x LAN	IEEE 802-based local area networks such as IEEE 802.3 and IEEE 802.11
AA	Authenticator address
AAA	authentication, authorization, and accounting
AAD	additional authentication data
AC	access category
ACI	access category index
ACK	acknowledgment
ACM	admission control mandatory
ACU	admission control unit
ADDBA	add Block Acknowledgment
ADDTS	add traffic stream
AES	advanced encryption standard
AES-128-CMAC	advanced encryption standard (with 128-bit key) cipher-based message authentication code
AFC	Automatic Frequency Control
AGC	Automatic Gain Control
AID	association identifier
AIFS	arbitration interframe space
AIFSN	arbitration interframe space number
AKM	authentication and key management
AKMP	Authentication and Key Management Protocol
AMPE	authenticated mesh peering exchange
A-MPDU	aggregate MAC protocol data unit
A-MSDU	aggregate MAC service data unit
ANonce	Authenticator nonce
ANPI	average noise power indicator
ANQP	Access Network Query Protocol
AP	access point

APSD	automatic power save delivery
ARP	Address Resolution Protocol
AS	Authentication Server
ASEL	antenna selection
ASN.1	Abstract Syntax Notation One
ASRA	additional step required for access
ATIM	announcement traffic indication message
BA	Block Acknowledgment
BAR	Block Acknowledgment request
BCC	binary convolutional code
BIP	Broadcast/Multicast Integrity Protocol
BPSK	binary phase shift keying
BSA	basic service area
BSS	basic service set
BSSID	basic service set identifier
BT	bit time
BU	bufferable unit
CAP	controlled access phase
CBC	cipher-block chaining
CBP	contention-based protocol
CBC-MAC	cipher-block chaining message authentication code
CCA	clear channel assessment
CCK	complementary code keying
CCM	CTR with CBC-MAC
CCMP	CTR with CBC-MAC Protocol
CF	contention-free
CFP	contention-free period
C-MPDU	coded MPDU
CP	contention period
C-PSDU	coded PSDU
CRC	cyclic redundancy code
CS	carrier sense
CSD	cyclic shift diversity
CSI	channel state information
CSMA/CA	carrier sense multiple access with collision avoidance
CTR	counter mode
CTS	clear to send
CTS1	clear to send 1
CTS2	clear to send 2
CW	contention window
DA	destination address
DBPSK	differential binary phase shift keying
DCF	distributed coordination function
DCLA	dc level adjustment
DELBA	delete Block Acknowledgment
DELTS	delete traffic stream

DFS	dynamic frequency selection
DFT	discrete Fourier transform
DIFS	distributed (coordination function) interframe space
DLL	data link layer
DLS	direct-link setup
DLTF	Data Long Training field
DMS	directed multicast service
DMSID	directed multicast service identifier
DN	destination network
DO	DFS owner
Dp	desensitization
DQPSK	differential quadrature phase shift keying
DR	data rate
DS	distribution system
DSCP	differentiated services code point
DSE	dynamic station enablement
DSM	distribution system medium
DSS	distribution system service
DSSDU	distribution system service data unit
DSSS	direct sequence spread spectrum
DSSS-OFDM	Direct sequence spread spectrum orthogonal frequency division multiplexing
DST	daylight saving time
DTIM	delivery traffic indication map
EAP	Extensible Authentication Protocol (IETF RFC 3748-2004 [B38])
EAPOL	Extensible Authentication Protocol over LANs (IEEE Std 802.1X-2004)
EAS	emergency alert system
EBR	expedited bandwidth request
ECS	extended channel switching
ED	energy detection
EDCA	enhanced distributed channel access
EDCAF	enhanced distributed channel access function
EDT	eastern daylight time
EHCC	extended hyperbolic congruence code
EIFS	extended interframe space
EIRP	equivalent isotropically radiated power
ELTF	Extension Long Training field
EOSP	end of service period
ERP	extended rate PHY
ERP-CCK	extended rate PHY using CCK modulation
ERP-DSSS	extended rate PHY using DSSS modulation
ERP-DSSS/CCK	extended rate PHY using DSSS or CCK modulation
ERP-OFDM	extended rate PHY using OFDM modulation
ERP-PBCC	extended rate PHY using extended rate PBCC modulation
ESA	extended service area
ESR	emergency services reachable
ESS	extended service set

EST	eastern standard time
EVM	error vector magnitude
FC	frame control
FCS	frame check sequence
FEC	forward error correction
FER	frame error ratio
FFT	Fast Fourier Transform
FH	frequency hopping
FHSS	frequency-hopping spread spectrum
FIFO	first in first out
FMS	flexible multicast service
FMSID	flexible multicast stream identifier
FOV	field of view
FSM	finite state machine
FT	fast BSS transition
FTAA	fast BSS transition authentication algorithm
FTE	fast BSS transition element
FTO	fast BSS transition originator
GANN	gate announcement
GAS	generic advertisement service
GFSK	Gaussian frequency shift key or keying
GI	guard interval
GMK	group master key
GNonce	group nonce
GPRS	general packet radio service
GPS	Global Positioning System
GTK	group temporal key
GTKSA	group temporal key security association
HC	hybrid coordinator
HCC	hyperbolic congruence code
HCCA	HCF controlled channel access
HCF	hybrid coordination function
HEC	header error check
HEMM	HCCA, EDCA mixed mode
HESSID	homogenous extended service set identifier
HIPERLAN	high-performance radio local area network
HPA	high power amplifier
HR/DSSS	High Rate direct sequence spread spectrum using the long preamble and header
HR/DSSS/PBCC	High Rate direct sequence spread spectrum using the optional packet binary convolutional coding mode and the long preamble and header
HR/DSSS/PBCC/short	High Rate direct sequence spread spectrum using the optional packet binary convolutional coding mode and the optional short preamble and header
HR/DSSS/short	High Rate direct sequence spread spectrum using the optional short preamble and header mode
HT	high throughput
HTC	high throughput control
HT-GF-STF	High-Throughput Greenfield Short Training field

HT-SIG	High-Throughput SIGNAL field
HT-STF	High-Throughput Short Training field
HWMP	hybrid wireless mesh protocol
HWMP SN	hybrid wireless mesh protocol sequence number
IBSS	independent basic service set
ICMP	Internet Control Message Protocol
ICV	integrity check value
IDFT	inverse discrete Fourier transform
IFFT	inverse Fast Fourier Transform
IFS	interframe space
IGTK	integrity group temporal key
IGTKSA	integrity group temporal key security association
IMp	intermodulation protection
INonce	initiator nonce
IPI	idle power indicator
IPN	IGTK packet number
I/Q	in phase and quadrature
IR	infrared
IrDA	infrared data association
ISM	industrial, scientific, and medical
IUT	implementation under test
IV	initialization vector
KCK	EAPOL-Key confirmation key
KDE	key data encapsulation
KDF	key derivation function
KEK	EAPOL-Key encryption key
LAN	local area network
LCI	location configuration information
LDPC	low-density parity check
LED	light-emitting diode
LFSR	linear feedback shift register
LLC	logical link control
L-LTF	Non-HT Long Training field
LME	layer management entity
LNA	low noise amplifier
LRC	long retry count
LSB	least significant bit
L-SIG	Non-HT SIGNAL field
L-STF	Non-HT Short Training field
LTF	Long Training field
MAC	medium access control
MAC_I	initiator mac address
MAC_P	peer mac address
MAF	MCCA access fraction
MBCA	mesh beacon collision avoidance
MBSS	mesh basic service set

MCCA	MCF controlled channel access
MCCAOP	MCF controlled channel access opportunity
MCF	mesh coordination function
MCS	modulation and coding scheme
MDE	Mobility Domain element
MDID	mobility domain identifier
MFB	MCS feedback
MFPC	management frame protection capable
MFPR	management frame protection required
MGTK	mesh group temporal key
MIB	management information base
MIC	message integrity code
MIH	media-independent handover
MIMO	multiple input, multiple output
MLME	MAC sublayer management entity
MLPP	multi-level precedence and preemption
MME	Management MIC element
MMPDU	MAC management protocol data unit
MPDU	MAC protocol data unit
MPM	mesh peering management
MPSP	mesh peer service period
MRQ	MCS request
MSB	most significant bit
MSDU	MAC service data unit
MSGCF	MAC state generic convergence function
MSK	master session key
MTK	mesh temporal key
MUI	message unique identifier
N/A	not applicable
NAI	network access identifier
NAS	network access server
NAV	network allocation vector
NDP	null data packet
NonERP	nonextended rate PHY
NTP	Network Time Protocol (IETF RFC 1305-1992 [B25])
OBSS	overlapping basic service set
OCB	outside the context of a BSS
OFDM	orthogonal frequency division multiplexing
OI	organization identifier
OSI	Open Systems Interconnection (ISO/IEC 7498-1:1994)
OUI	organizationally unique identifier
PAE	port access entity (IEEE Std 802.1X-2004)
PBAC	protected block ack agreement capable
PBCC	packet binary convolutional code
PC	point coordinator
PCF	point coordination function

PCO	phased coexistence operation
PDU	protocol data unit
PER	packet error ratio
PERR	path error
PHB	per-hop behavior
PHY	physical layer
PHYCS	PHY carrier sense
PHYED	PHY energy detection
PICS	protocol implementation conformance statement
PIFS	point (coordination function) interframe space
PLCP	physical layer convergence procedure
PLME	physical layer management entity
PLW	PSDU length word
PMD	physical medium dependent
PMK	pairwise master key
PMK-R0	pairwise master key, first level
PMK-R1	pairwise master key, second level
PMKID	pairwise master key identifier
PMKSA	pairwise master key security association
PN	packet number
PN	pseudonoise (code sequence)
PNonce	peer nonce
PP A-MSDU	payload protected aggregate MAC service data unit
PPDU	PLCP protocol data unit
PPM	pulse position modulation
PREP	path reply
PREQ	path request
PRF	pseudorandom function
PRNG	pseudorandom number generator
PS	power save (mode)
PSAP	public safety answering point
PSDU	PLCP service data unit
PSF	PLCP Signaling field
PSK	preshared key
PSMP	power save multi-poll
PSMP-DTT	power save multi-poll downlink transmission time
PSMP-UTT	power save multi-poll uplink transmission time
PTI	peer traffic indication
PTK	pairwise transient key
PTKSA	pairwise transient key security association
PXU	proxy update
PXUC	proxy update confirmation
QAM	quadrature amplitude modulation
QBPSK	quadrature binary phase shift keying
QLRC	QoS long retry counter
QoS	quality of service

QPSK	quadrature phase shift keying
QSRC	QoS short retry counter
R0KH	PMK-R0 key holder in the Authenticator
R0KH-ID	PMK-R0 key holder identifier in the Authenticator
R1KH	PMK-R1 key holder in the Authenticator
R1KH-ID	PMK-R1 key holder identifier in the Authenticator
RA	receiver address or receiving station address
RADIUS	remote authentication dial-in user service (IETF RFC 2865-2000 [B31])
RANN	root announcement
RAV	resource allocation vector
RCPI	received channel power indicator
RD	reverse direction
RDE	RIC Data element
RDG	reverse direction grant
RF	radio frequency
RFC	request for comments
RIC	resource information container
RIFS	reduced interframe space
RLAN	radio local area network
RPI	receive power indicator
RRB	remote request broker
RSC	receive sequence counter
RSN	robust security network
RSNA	robust security network association
RSNE	Robust Security Network element
RSNI	received signal to noise indicator
RSPI	receiver service period initiated
RSSI	receive signal strength indicator
RTS	request to send
RX	receive or receiver
RXASSI	receive antenna selection sounding indication
RXASSR	receive antenna selection sounding request
S0KH	PMK-R0 key holder in the Supplicant
S0KH-ID	PMK-R0 key holder identifier in the Supplicant
S1KH	PMK-R1 key holder in the Supplicant
S1KH-ID	PMK-R1 key holder identifier in the Supplicant
SA	source address
SAE	simultaneous authentication of equals
SAP	service access point
S-APSD	scheduled automatic power save delivery
SA Query	Security Association Query
SDL	specification and description language
SDU	service data unit
SFD	start frame delimiter
SKCK	STSL key confirmation key
SKEK	STSL key encryption key

SI	service interval
SIFS	short interframe space
SLRC	station long retry count
SM	spatial multiplexing
SME	station management entity
SMK	STSL master key
SMKSA	STSL master key security association
SMT	station management
SNAP	Sub-Network Access Protocol
SNonce	Supplicant nonce
SNR	signal-to-noise ratio
SP	service period
SPA	Supplicant address
SPP A-MSDU	signaling and payload protected aggregate MAC service data unit
SQ	signal quality (PN code correlation strength)
SRC	short retry count
SS	station service
SSID	service set identifier
SSP	subscription service provider
SSPN	subscription service provider network
SSRC	station short retry count
STA	station
STBC	space-time block coding
STK	STSL transient key
STKSA	STSL transient key security association
STSL	station-to-station link
STT	selective translation table
SYNC	synchronization
TA	transmitter address or transmitting station address
TAI	Temps Atomique International (International Atomic Time)
TBTT	target beacon transmission time
TC	traffic category
TCLAS	traffic classification
TDLS	tunneled direct-link setup
TDLS peer PSM	tunneled direct-link setup peer power save mode
TFS	traffic filtering service
TID	traffic identifier
TIE	Timeout Interval element
TIM	traffic indication map
TK	temporal key
TKIP	Temporal Key Integrity Protocol
TMPTT	target measurement pilot transmission time
TOA	time of arrival
TOD	time of departure
TPC	transmit power control
TPK	TDLS Peer Key

TPKSA	TDLS Peer Key Security Association
TPU	TDLS Peer U-APSD
TS	traffic stream
TSC	TKIP sequence counter
TSF	timing synchronization function
TSID	traffic stream identifier
TSN	transition security network
TSPEC	traffic specification
TTAK	TKIP-mixed transmit address and key
TTL	time to live
TTTT	target TIM transmission time
TU	time unit
TX	transmit or transmitter
TXASSI	transmit antenna selection sounding indication
TXASSR	transmit antenna selection sounding request
TXE	transmit enable
TXOP	transmission opportunity
U-APSD	unscheduled automatic power save delivery
UCT	unconditional transition
UESA	unauthenticated emergency service accessible
ULS	Universal Licensing System
U-NII	unlicensed national information infrastructure
UP	user priority
URI	uniform resource identifier
URL	universal resource locator
URN	Uniform Resource Name
UTC	Coordinated Universal Time
VLAN	virtual local area network
VoIP	voice over Internet Protocol (IP)
WLAN	wireless local area network
WDS	wireless distribution system
WEP	wired equivalent privacy
WM	wireless medium
WNM	wireless network management

4. General description

4.1 General description of the architecture

This clause presents the concepts and terminology used within this standard. Specific terms are defined in Clause 3. Illustrations convey key IEEE 802.11 concepts and the interrelationships of the architectural components. IEEE Std 802.11 uses an architecture to describe functional components of an IEEE 802.11 LAN. The architectural descriptions are not intended to represent any specific physical implementation of IEEE Std 802.11.

4.2 How WLAN systems are different

4.2.1 Introduction

Wireless networks have fundamental characteristics that make them significantly different from traditional wired LANs.

4.2.2 Wireless station (STA)

In the design of wired LANs it is implicitly assumed that an address is equivalent to a physical location. In wireless networks, this is not always the case. In IEEE Std 802.11, the addressable unit is a station (STA). The term implies no more than the origin or/and destination of a message. Physical and operational characteristics are defined by modifiers that are placed in front of the term STA. For example, in the case of location and mobility, the addressable units are the fixed STA, the portable STA, and the mobile STA. The STA is a message destination, but not (in general) a fixed location.

A STA might take on multiple distinct characteristics, each of which shape its function. For example, a single addressable unit might simultaneously be a portable STA, a quality-of-service (QoS) STA, a dependent STA, and a hidden STA.

4.2.3 Media impact on design and performance

The PHYs used in IEEE Std 802.11 are fundamentally different from wired media. Thus IEEE 802.11 PHYs:

a) Use a medium that has neither absolute nor readily observable boundaries outside of which STAs with conformant PHY transceivers are known to be unable to receive network frames
b) Are unprotected from other signals that are sharing the medium
c) Communicate over a medium significantly less reliable than wired PHYs
d) Have dynamic topologies
e) Lack full connectivity, and therefore the assumption normally made that every STA can hear every other STA is invalid (i.e., STAs might be “hidden” from each other)
f) Have time-varying and asymmetric propagation properties
g) Might experience interference from logically disjoint IEEE 802.11 networks operating in overlapping areas

Because of limitations on wireless PHY ranges, WLANs intended to cover reasonable geographic distances may be built from basic coverage building blocks. When providing QoS services, the MAC endeavors to provide QoS “service guarantees” within the limitations of the medium properties identified above. In other words, particularly in unlicensed spectrum, true guarantees are often not possible. However, gradations of service are always possible; and in sufficiently controlled environments, QoS guarantees are possible.

4.2.4 The impact of handling mobile STAs

One of the requirements of IEEE Std 802.11 is to handle *mobile* as well as *portable* STAs. A *portable* STA is one that is moved from location to location, but that is only used while at a fixed location. *Mobile* STAs actually access the LAN while in motion.

For technical reasons, it is not sufficient to handle only portable STAs. Propagation effects blur the distinction between portable and mobile STAs; stationary STAs often appear to be mobile due to propagation effects.

Another aspect of mobile STAs is that they may often be battery powered. Hence power management is an important consideration. For example, it cannot be presumed that a STA's receiver is always powered on.

4.2.5 Interaction with other IEEE 802® layers

IEEE Std 802.11 is required to appear to higher layers [logical link control (LLC)] as a wired IEEE 802 LAN. This requires that the IEEE 802.11 network handle STA mobility within the MAC sublayer. To meet reliability assumptions (that LLC makes about lower layers), it is necessary for IEEE Std 802.11 to incorporate functionality that is untraditional for MAC sublayers.

In a robust security network association (RSNA), IEEE Std 802.11 provides functions to protect data frames, IEEE Std 802.1X-2004 provides authentication and a Controlled Port, and IEEE Std 802.11 and IEEE Std 802.1X-2004 collaborate to provide key management. All STAs in an RSNA have a corresponding IEEE 802.1X entity that handles these services. This standard defines how an RSNA utilizes IEEE Std 802.1X-2004 to access these services.

When used to support applications with QoS requirements, each IEEE 802.11 LAN provides a link within an end-to-end QoS environment that may be established between, and managed by, higher layer entities. To handle QoS traffic in a manner comparable to other IEEE 802 LANs, the IEEE 802.11 QoS facility requires the IEEE 802.11 MAC sublayers to incorporate functionality that is not traditional for MAC sublayers. In addition, it may be necessary for certain higher layer management entities to be "WLAN aware" at least to the extent of understanding that the available bandwidth and other QoS characteristics of a WLAN are subject to frequent, and sometimes substantial, dynamic changes due to causes other than traffic load and are outside the direct control of network management entities.

4.2.6 Interaction with non-IEEE-802 protocols

An RSNA utilizes non-IEEE-802 protocols for its authentication and key management (AKM) services. Some of these protocols are defined by other standards organizations, such as the Internet Engineering Task Force (IETF).

4.3 Components of the IEEE 802.11 architecture

4.3.1 General

The IEEE 802.11 architecture consists of several components that interact to provide a WLAN that supports STA mobility transparently to upper layers.

The basic service set (BSS) is the basic building block of an IEEE 802.11 LAN. Figure 4-1 shows two BSSs, each of which has two STAs that are members of the BSS.

It is useful to think of the ovals used to depict a BSS as the coverage area within which the member STAs of the BSS may remain in communication. (The concept of area, while not precise, is often good enough.) This area is called the Basic Service Area (BSA). If a STA moves out of its BSA, it can no longer directly communicate with other STAs present in the BSA.

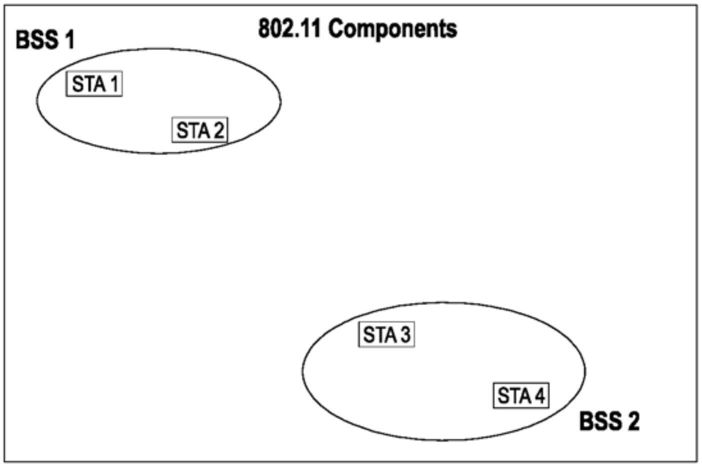

Figure 4-1—BSSs

4.3.2 The independent BSS (IBSS) as an ad hoc network

The IBSS is the most basic type of IEEE 802.11 LAN. A minimum IEEE 802.11 LAN may consist of only two STAs. Since the BSSs shown in Figure 4-1 are simple and lack other components (contrast this with Figure 4-2), the two can be taken to be representative of two IBSSs.

This mode of operation is possible when IEEE 802.11 STAs are able to communicate directly. Because this type of IEEE 802.11 LAN is often formed without preplanning, for only as long as the LAN is needed, this type of operation is often referred to as an *ad hoc network*.

4.3.3 STA membership in a BSS is dynamic

A STA's membership in a BSS is dynamic (STAs turn on, turn off, come within range, and go out of range). To become a member of an infrastructure BSS or an IBSS, a STA joins the BSS using the synchronization procedure described in 10.1.4.5. To start a new mesh BSS or to become a member of a mesh BSS, a STA starts the transmission of Beacons and performs the synchronization maintenance procedure described in 13.13. To access all the services of an infrastructure BSS, a STA becomes "associated." These associations are dynamic and involve the use of the distribution system service (DSS), which is described in 4.4.3. A mesh STA does not become associated as there is no central entity in a mesh BSS (MBSS). Instead, a mesh STA peers with other mesh STAs.

4.3.4 Distribution system (DS) concepts

4.3.4.1 Overview

PHY limitations determine the direct station-to-station distance that may be supported. For some networks this distance is sufficient; for other networks, increased coverage is required.

Instead of existing independently, an infrastructure BSS may also form a component of an extended form of network that is built with multiple BSSs. The architectural component used to interconnect infrastructure BSSs is the DS.

IEEE Std 802.11 logically separates the WM from the distribution system medium (DSM). Each logical medium is used for different purposes, by a different component of the architecture. The IEEE 802.11 definitions neither preclude, nor demand, that the multiple media be either the same or different.

Recognizing that the multiple media are *logically* different is key to understanding the flexibility of the architecture. The IEEE 802.11 LAN architecture is specified independently of the physical characteristics of any specific implementation.

The DS enables mobile device support by providing the logical services necessary to handle address to destination mapping and seamless integration of multiple BSSs.

An access point (AP) is any entity that has STA functionality and enables access to the DS, via the WM for associated STAs.

Figure 4-2 adds the DS, DSM and AP components to the IEEE 802.11 architecture picture.

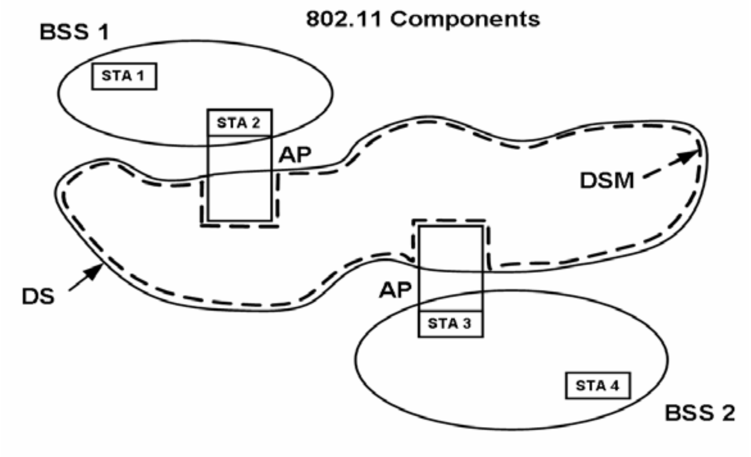

Figure 4-2—DSs and APs

Data move between a BSS and the DS via an AP. Note that all APs are also STAs; thus they are addressable entities. The addresses used by an AP for communication on the WM and on the DSM are not necessarily the same.

Data sent to the AP's STA address by one of the STAs associated with it are always received at the uncontrolled port for processing by the IEEE 802.1X port access entity. In addition, if the controlled port is authorized, these frames conceptually transit the DS.

4.3.4.2 Extended service set (ESS): The large coverage network

The DS and infrastructure BSSs allow IEEE Std 802.11 to create a wireless network of arbitrary size and complexity. IEEE Std 802.11 refers to this type of network as the ESS network. An ESS is the union of the infrastructure BSSs with the same SSID connected by a DS. The ESS does not include the DS.

The key concept is that the ESS network appears the same to an LLC layer as an IBSS network. STAs within an ESS may communicate and mobile STAs may move from one BSS to another (within the same ESS) transparently to LLC.

Owing to its distributed nature, a mesh BSS (MBSS) has no central entity like the AP of an infrastructure BSS. Instead, an MBSS forms a single set of independent mesh STAs. This set is indivisible and cannot be further unified. The ESS concept does not apply to the MBSS. However, it is possible to use a Mesh BSS as all or part of the DS that connects an ESS.

Nothing is assumed by IEEE Std 802.11 about the relative physical locations of the BSSs in Figure 4-3.

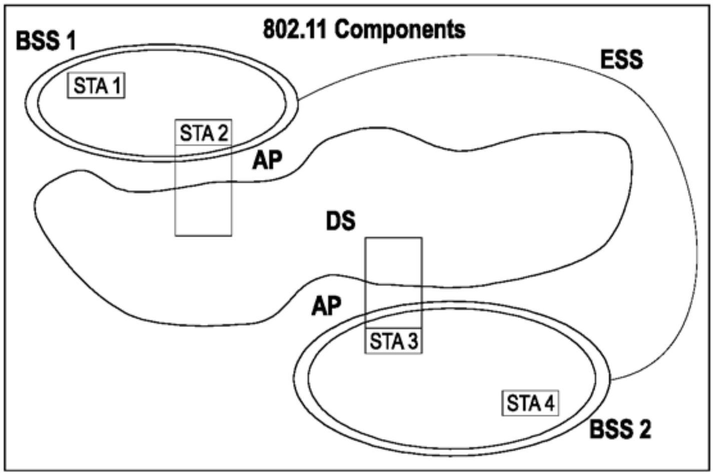

Figure 4-3—ESS

All of the following are possible

a) The BSSs partially overlap. This is commonly used to arrange contiguous coverage within a physical volume.
b) The BSSs could be physically disjoint. Logically there is no limit to the distance between BSSs.
c) The BSSs are physically collocated. This could be done to provide redundancy.
d) One (or more) IBSS or ESS networks are physically present in the same location as one (or more) ESS networks. This could arise for a number of reasons. Some examples are when an IBSS network is operating in a location that also has an ESS network, when physically overlapping IEEE 802.11 networks have been set up by different organizations, and when two or more different access and security policies are needed in the same location.

4.3.4.3 Robust security network association (RSNA)

An RSNA defines a number of security features in addition to wired equivalent privacy (WEP) and IEEE 802.11 authentication. These features include the following:

- Enhanced authentication mechanisms for STAs
- Key management algorithms
- Cryptographic key establishment
- Enhanced data cryptographic encapsulation mechanisms, such as Counter mode with Cipher-block chaining Message authentication code Protocol (CCMP), and, optionally, Temporal Key Integrity Protocol (TKIP).
- Fast basic service set (BSS) transition (FT) mechanism
- Enhanced cryptographic encapsulation mechanisms for robust management frames

An RSNA may rely on components external to the IEEE 802.11 architecture.

The first component is an IEEE 802.1X port access entity (PAE). PAEs are present on all STAs in an RSNA and control the forwarding of data to and from the medium access control (MAC). An AP always implements the Authenticator PAE and Extensible Authentication Protocol (EAP) Authenticator roles, and a non-AP STA always implements the Supplicant PAE and EAP peer roles. In an IBSS each STA implements both the Authenticator PAE and Supplicant PAE roles and both EAP Authenticator and EAP peer roles.

A second component is the Authentication Server (AS). The AS may authenticate the elements of the RSNA itself, i.e., the STAs may provide material that the RSNA elements use to authenticate each other. The AS communicates through the IEEE 802.1X Authenticator with the IEEE 802.1X Supplicant on each STA, enabling the STA to be authenticated to the AS and vice versa. An RSNA depends upon the use of an EAP method that supports mutual authentication of the AS and the STA, such as those that meet the requirements in IETF RFC 4017. In certain applications, the AS may be integrated into the same physical device as the AP, or into a STA in an IBSS.

In some applications, there is no need for a PAE or AS, and a STA and AP, or two STAs in an IBSS, or two mesh STAs in an MBSS, may authenticate each other using a password.

An RSNA using fast BSS transition relies on an external protocol to distribute keys between the pairwise master key (PMK) R0 key holder (R0KH) and PMK-R1 key holder (R1KH) Authenticator components. The requirements for this protocol are described in 12.2.2.

4.3.5 Area concepts

For wireless PHYs, well-defined coverage areas simply do not exist. Propagation characteristics are dynamic and unpredictable. Small changes in position or direction may result in dramatic differences in signal strength. Similar effects occur whether a STA is stationary or mobile (as moving objects may impact station-to-station propagation).

Figure 4-4 shows a signal strength map for a simple square room with a standard metal desk and an open doorway. Figure 4-4 is a static snapshot; the propagation patterns change dynamically as STAs and objects in the environment move. In Figure 4-4 the dark (solid) blocks in the lower left are a metal desk and there is a doorway at the top right of the figure. The figure indicates relative differences in field strength with different intensities and indicates the variability of field strength even in a static environment. The difference between the greatest signal strength and the least signal strength in Figure 4-4 is 50 dB.

While the architecture diagrams show sharp boundaries for BSSs, this is an artifact of the pictorial representation, not a physical reality. Because dynamic three-dimensional field strength pictures are difficult to draw, well-defined shapes are used by IEEE 802.11 architectural diagrams to represent the coverage of a BSS.

Further description difficulties arise when attempting to describe collocated coverage areas. Consider Figure 4-5, in which STA 6 could belong to BSS 2 or BSS 3.

While the concept of sets of STAs is correct, it is often convenient to talk about areas. For many topics the concept of area is sufficient. *Volume* is a more precise term than area, though still not technically correct. For historical reasons and convenience, this standard uses the common term *area*.

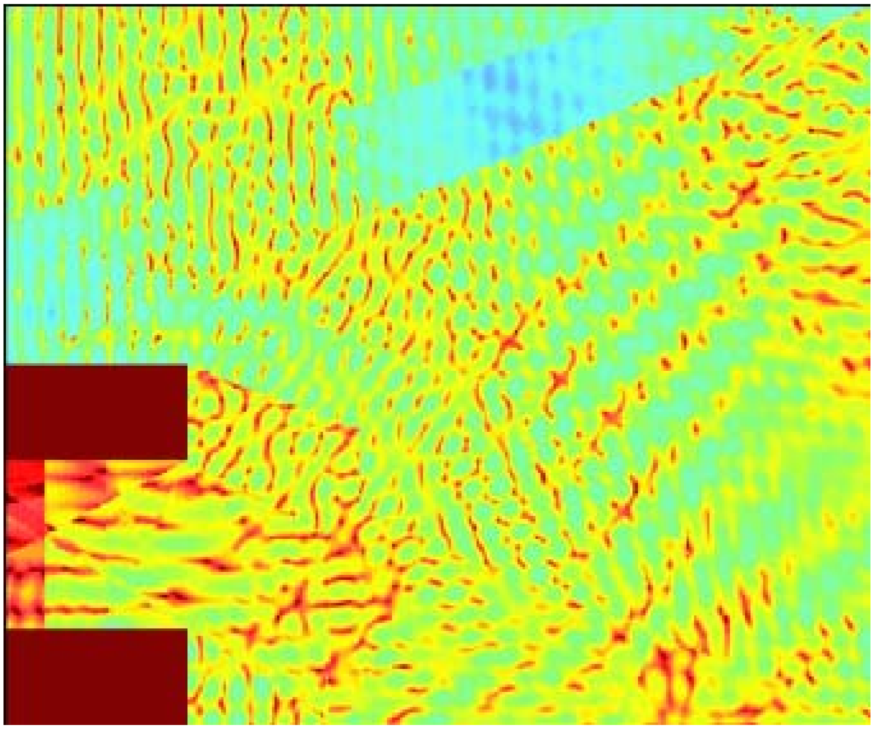

Figure 4-4—A representative signal intensity map

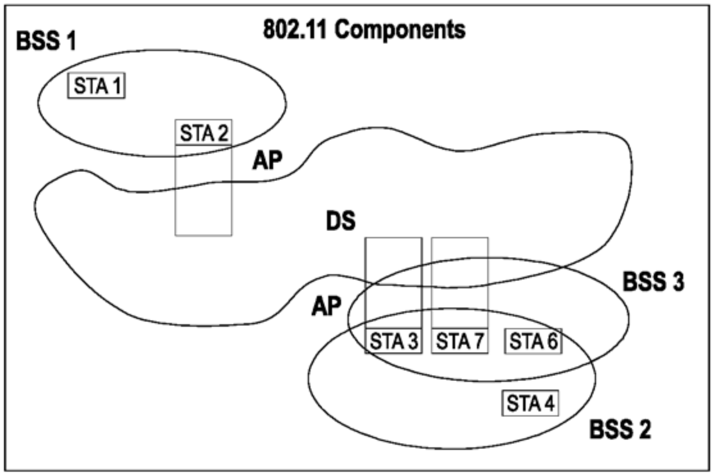

Figure 4-5—Collocated coverage areas

4.3.6 Integration with wired LANs

To integrate the IEEE 802.11 architecture with a traditional wired LAN, a final *logical* architectural component is introduced—a *portal*.

A portal is the logical point at which MSDUs from an integrated non-IEEE-802.11 LAN enter the IEEE 802.11 DS. For example, a portal is shown in Figure 4-6 connecting to a wired IEEE 802 LAN.

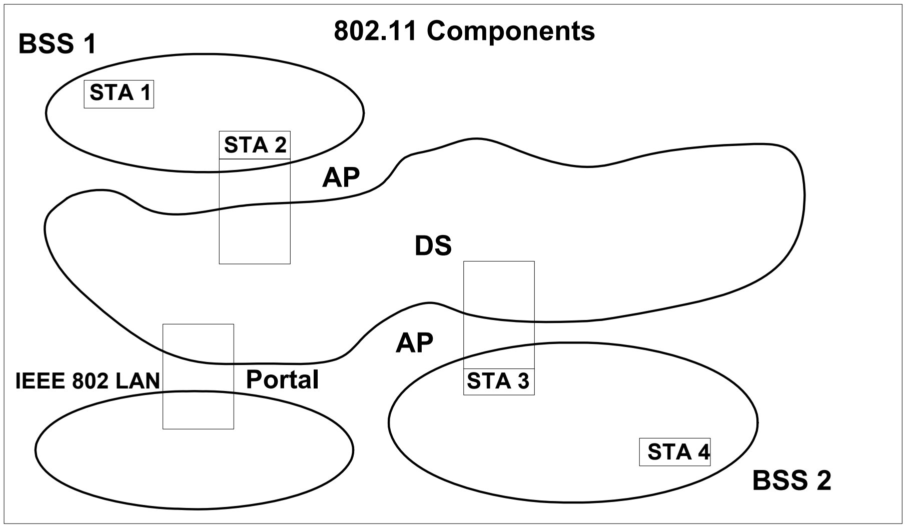

Figure 4-6—Connecting to other IEEE 802 LANs

All data from non-IEEE-802.11 LANs enter the IEEE 802.11 architecture via a portal. The portal is the logical point at which the integration service is provided. The integration service is responsible for any addressing changes that might be required when MSDUs pass between the DS and the integrated LAN. It is possible for one device to offer both the functions of an AP and a portal.

4.3.7 QoS BSS: The QoS network

The IEEE 802.11 QoS facility provides MAC enhancements to support LAN applications with QoS requirements. The QoS enhancements are available to QoS STAs associated with a QoS access point in a QoS BSS. A subset of the QoS enhancements is available for use between STAs that are members of the same QoS IBSS. Similarly, a subset of the QoS enhancements is available for use between neighbor peer mesh STAs. A mesh BSS is one type of QoS BSS and it is described in 4.3.15. Because a nonmesh QoS STA implements a superset of STA functionality, as defined in this standard, the STA might associate with a non-QoS access point in a non-QoS BSS, to provide non-QoS MAC data service when there is no QoS BSS with which to associate. As a mesh STA does not implement the necessary service, the mesh STA does not associate with any access point.

The enhancements that distinguish QoS STAs from non-QoS STAs and QoS APs from non-QoS APs are collectively termed the *QoS facility*. Which of the QoS-specific mechanisms a QoS STA supports might vary among QoS implementations, as well as between QoS STAs and QoS APs, over ranges specified in subsequent clauses. All service primitives, frame formats, coordination function and frame exchange rules, and management interface functions except for the Block Acknowledgment (Block Ack) function, direct-link setup (DLS), and automatic power save delivery (APSD) are part of the core QoS facilities. A QoS STA or QoS AP implements those core QoS facilities necessary for its QoS functions to interoperate with other QoS STAs. Functions such as the Block Ack, DLS, and APSD are separate from the core QoS facilities; and the presence of these functions is indicated by STAs separately from the core QoS facilities.

For infrastructure BSS and IBSS, this standard provides two mechanisms for the support of applications with QoS requirements.

The first mechanism, designated the *enhanced distributed channel access* (EDCA), delivers traffic based on differentiating user priorities (UPs). This differentiation is achieved by varying the following for different UP values:

— Amount of time a STA senses the channel to be idle before backoff or transmission, or

- The length of the contention window to be used for the backoff, or
- The duration a STA may transmit after it acquires the channel.

These transmissions may also be subject to certain channel access restrictions in the form of admission control. Details of this mechanism are provided in 9.19.2.

The second mechanism, designated the *hybrid coordination function* (HCF) *controlled channel access* (HCCA), allows for the reservation of transmission opportunities (TXOPs) with the hybrid coordinator (HC). A STA based on its requirements requests the HC for TXOPs, both for its own transmissions as well as for transmissions from the AP to itself.[16] The request is initiated by the station management entity (SME) of the STA. The HC, which is collocated at the AP, either accepts or rejects the request based on an admission control policy. If the request is accepted, the HC schedules TXOPs for both STAs (both the AP and the non-AP STA). For transmissions from the non-AP STA, the HC polls the STA based on the parameters supplied by the STA at the time of its request. For transmissions to the STA, the AP directly obtains TXOPs from the collocated HC and delivers the queued frames to the STA, again based on the parameters supplied by the STA. Details of the mechanism are provided in 9.19.3 and 10.4. This mechanism may be used for applications such as voice and video, which may need periodic service from the HC. If the application constraints dictate the use of this mechanism, the application initiates this mechanism by using the management service primitives.

Non-QoS STAs may associate in a QoS BSS, if allowed to associate by the AP. All individually addressed frames that are sent to non-QoS STAs by an AP do not use the frame formats associated with the QoS facility.

A QoS STA associated in a non-QoS BSS acts as a non-QoS STA.

4.3.8 Wireless LAN Radio Measurements

4.3.8.1 General

Wireless LAN (WLAN) Radio Measurements enable STAs to understand the radio environment in which they exist. WLAN Radio Measurements enable STAs to observe and gather data on radio link performance and on the radio environment. A STA may choose to make measurements locally, request a measurement from another STA, or may be requested by another STA to make one or more measurements and return the results. Radio Measurement data is made available to STA management and upper protocol layers where it may be used for a range of applications. The measurements enable adjustment of STA operation to better suit the radio environment. The Radio Measurement service includes measurements that extend the capability, reliability, and maintainability of WLANs by providing standard measurements across vendors, and the service provides the resulting measurement data to upper layers in the communications stack.

In addition to featuring standard measurements and delivering measurement information to upper layers, there are applications that require quantifiable radio environment measurements in order to attain the necessary performance levels. These applications include VoIP, video over IP, location based applications, as well as applications requiring mitigation of harsh radio environments (multifamily dwellings, airplanes, factories, municipalities, etc.). Radio Measurements address most of the existing issues in using unlicensed radio spectrum to meet the requirements of these emerging technologies.

To address the mobility requirements of technologies, such as VoIP and video streaming, Radio Measurements, such as Channel Load request/report and the Neighbor request/report, may be used to collect transition information, which can drastically speed up handoffs between BSSs within the same ESS. By accessing and using this information, the STAs (either in APs or in non-AP STAs) can make intelligent

[16] In the case of downlink traffic streams (TSs).

decisions about the most effective way to utilize the available spectrum, power, and bandwidth for their communications.

The request/report measurements are as follows:

- beacon
- frame
- channel load
- noise histogram
- STA statistics
- location configuration information (LCI)
- neighbor report
- link measurement
- transmit stream/category measurement

The request-only mechanism is as follows:

- measurement pause

The report-only mechanism is as follows:

- measurement pilot

These measurement mechanisms provide the capability for a STA to manage and query its radio environment, and to make appropriate assessments about its health and efficiency. It is the first step in making WLAN smart and capable of making appropriate decisions for fast transition, for mesh connectivity, and for managing the radio environment for all wireless devices.

4.3.8.2 Beacon

The Beacon request/report pair enables a STA to request from another STA a list of APs whose beacons it can receive on a specified channel or channels. This measurement may be done by active mode (like active scan), passive mode (like passive scan), or beacon table modes. If the measurement request is accepted and is in passive mode, a duration timer is set. Then the measuring STA monitors the requested channel; measures beacon, probe response, and measurement pilot power levels (received channel power indicator (RCPI)); and logs all beacons, probe responses, and measurement pilots received within the measurement duration. If the measurement request is in active mode, the measuring STA sends a probe request on the requested channel at the beginning of the measurement duration; then monitors the requested channel; measures beacon, probe response, and measurement pilot power levels (RCPI); and logs all beacons, probe responses, and measurement pilots received within the measurement duration. If the request is beacon table mode, then the measuring STA returns a Beacon Report containing the current contents of any stored beacon information for any supported channel with the requested service set identifier (SSID) and basic service set identifier (BSSID) without performing additional measurements.

4.3.8.3 Measurement Pilot

The Measurement Pilot frame provides a subset of the information provided in a Beacon frame, is smaller than a Beacon, and is transmitted more often than a Beacon. The purpose of the Measurement Pilot frame is to assist a STA with scanning.

4.3.8.4 Frame

The frame request/report pair returns a picture of all the channel traffic and a count of all the frames received at the measuring STA. For each unique Transmitter Address, the STA reports the Transmitter Address, number of frames received from this transmitter, average power level (RCPI) for these frames, and BSSID of the transmitter.

4.3.8.5 Channel load

The channel load request/report pair returns the channel utilization measurement as observed by the measuring STA.

4.3.8.6 Noise histogram

The noise histogram request/report pair returns a power histogram measurement of non-IEEE 802.11 noise power by sampling the channel when virtual carrier sense indicates idle and the STA is neither transmitting nor receiving a frame.

4.3.8.7 STA statistics

The STA statistics request/report pair returns groups of values for STA counters and for BSS Average Access Delay. The STA counter group values include transmitted fragment counts, group addressed transmitted frame counts, failed counts, retry counts, multiple retry counts, frame duplicate counts, Request to Send (RTS) success counts, RTS failure counts, Acknowledgement (ACK) failure counts, received fragment counts, group addressed received frame counts, FCS error counts, and transmitted frame counts. BSS Average Access Delay group values include AP average access delay, average access delay for each access category, associated STA count, and channel utilization.

4.3.8.8 Location

The Location request/report pair returns a requested location in terms of latitude, longitude, and altitude. It includes types of altitude such as floors and permits various reporting resolutions. The requested location may be the location of the requestor (e.g., Where am I?) or the location of the reporting STA (e.g., Where are you?)

4.3.8.9 Measurement pause

The measurement pause request is defined, but no report comes back from this request. The measurement pause permits the inclusion of a quantified delay between the execution of individual measurements that are provided in a series within a measurement request frame. The measurement pause used as the last measurement in a frame provides control of the measurement period when measurement request frames are to be repeated.

4.3.8.10 Neighbor report

The neighbor report request is sent to an AP, which returns a neighbor report containing information about known neighbor APs that are candidates for a service set transition. Neighbor reports contain information from the table dot11RMNeighborReportTable in the MIB concerning neighbor APs. This request/report pair enables a STA to gain information about the neighbors of the associated AP to be used as potential roaming candidates.

4.3.8.11 Link measurement

The link measurement request/report exchange provides measurements of the RF characteristics of a STA-to-STA link. This measurement indicates the instantaneous quality of a link.

4.3.8.12 Transmit stream/category measurement

The Transmit Stream/Category measurement is a request/report pair that enables a QoS STA to inquire of a peer QoS STA the condition of an ongoing traffic stream between them. The Transmit Stream/Category Measurement Report provides the transmit-side performance metrics for the measured traffic stream. Trigger conditions included in the Transmit Stream/Category Measurement Request may initiate triggered Transmit Stream/Category Measurement Reports upon detection of the trigger condition.

4.3.9 Operation in licensed frequency bands

4.3.9.1 General

IEEE 802.11 devices can operate on frequencies that are licensed by national regulatory bodies. Although this standard has been generalized so that it is independent of license type, band, and country of operation, only the bands and associated regulations listed in Annex D have been specifically considered.

4.3.9.2 Dynamic STA enablement (DSE) in licensed bands

The DSE operating procedures are used to automate the channel provisioning and regulatory controls needed for unregistered IEEE 802.11 STAs to operate as dependent STAs in licensed spectrum.[17]

4.3.9.3 Contention-Based Protocol (CBP) in nonexclusively licensed bands

The granting of licenses on a nonexclusive, uncoordinated basis in the same area leads to the possibility of overlapping networks. When overlapping networks cause co-channel interference, regulations, such as those governing the 3650 MHz band in the United States, require the use of a CBP "by which a transmitter provides reasonable opportunities for other transmitters to operate."[18] IEEE 802.11 carrier sense multiple access with collision avoidance (CSMA/CA) is suitable for this purpose in most situations.

4.3.9.4 Using DSE STA identification to resolve interference

When CSMA/CA is not able to sufficiently sense the presence of another licensee's STA (i.e., a hidden STA) or if a secondary licensee causes inference to a primary licensee, the licensee is obliged to resolve complaints that result from interference caused by any STA under its control (including dependent STAs). In order to facilitate the interference resolution processes, all STAs operating in nonexclusively licensed spectrum use the DSE STA and location information procedures.

The STA identification and location information procedures are inherently tied because, by default, registered STAs broadcast their actual location as their unique identifier. Dependent STAs broadcast the location of the STA that has enabled them as well as a unique code selected by the licensee. This method puts a victim of the interference in contact with the party responsible for rectifying the problem, and, at the same time, it protects the privacy of the dependent STA's operator.

4.3.9.5 Further coexistence enhancements in nonexclusively licensed bands

While not explicitly required to meet specific rules, a number of optional IEEE 802.11 mechanisms, when used together, are able to meet general requirements for spectrum sharing, incumbent detection, and other cognitive radio functions in licensed bands. The specific mechanisms for each band are detailed in E.2.

[17] In some licensed frequency bands, wireless equipment can be owned and operated by individuals who do not hold a license. In such instances, devices are permitted to operate only if they are either communicating with, or receiving permission to transmit from, a STA that is maintained by a licensed operator. The Japanese 4.9 GHz band and the U.S. 4.94–4.99 GHz public safety band are examples in which IEEE 802.11 STAs operate under such arrangements.

[18] Definition of CBP from FCC 05-56, Report and Order and Memorandum Opinion and Order, clause 58.

4.3.10 High-throughput (HT) STA

The IEEE 802.11 HT STA provides PHY and MAC features that can support a throughput of 100 Mb/s and greater, as measured at the MAC data service access point (SAP). An HT STA supports HT features as identified in Clause 9 and Clause 20. An HT STA operating in the 5 GHz band supports transmission and reception of frames that are compliant with mandatory PHY specifications as defined in Clause 18. An HT STA operating in the 2.4 GHz band supports transmission and reception of frames that are compliant with mandatory PHY specifications as defined in Clause 17 and Clause 19. An HT STA is also a QoS STA. The HT features are available to HT STAs associated with an HT AP in a BSS. A subset of the HT features is available for use between two HT STAs that are members of the same IBSS. Similarly, a subset of the HT features is available for use between two HT STAs that have established mesh peering (see 8.4.2.58 for details).

An HT STA has PHY features consisting of the modulation and coding scheme (MCS) set described in 20.3.5 and physical layer convergence procedure (PLCP) protocol data unit (PPDU) formats described in 20.1.4. Some PHY features that distinguish an HT STA from a non-HT STA are referred to as multiple input, multiple output (MIMO) operation; spatial multiplexing (SM); spatial mapping (including transmit beamforming); space-time block coding (STBC); low-density parity check (LDPC) encoding; and antenna selection (ASEL). The allowed PPDU formats are non-HT format, HT-mixed format, and HT-greenfield format. The PPDUs may be transmitted with 20 MHz or 40 MHz bandwidth.

An HT STA has MAC features that include frame aggregation, some Block Ack features, power save multi-poll (PSMP) operation, reverse direction (RD), and protection mechanisms supporting coexistence with non-HT STAs.

4.3.11 STA transmission of data frames outside the context of a BSS

In addition to defining procedures for STA communication within a BSS, this standard also allows a STA that is not a member of a BSS to transmit data frames. Such data frames are defined as being transmitted outside the context of a BSS. A STA transmits a data frame outside the context of a BSS only if dot11OCBActivated is true.

NOTE—The specific frame subtypes that a STA is allowed to send when it has dot11OCBActivated true are specified in 10.20.

When dot11OCBActivated is true, a data frame can be sent to either an individual or a group destination MAC address. This type of communication is only possible between STAs that are able to communicate directly over the wireless medium. It allows immediate communication, avoiding the latency associated with establishing a BSS. When dot11OCBActivated is true, a STA is not a member of a BSS and it does not utilize the IEEE 802.11 authentication, association, or data confidentiality services. This capability is particularly well-suited for use in rapidly varying communication environments such as those involving mobile STAs in which the interval over which the communication exchanges take place may be of very short-duration (e.g., on the order of tens or hundreds of milliseconds). Since IEEE 802.11 MAC sublayer authentication services are not used when dot11OCBActivated is true, any required authentication services are provided by the station management entity (SME) or by applications outside of the MAC sublayer.

A STA whose MIB does not include the dot11OCBActivated attribute operates as if the attribute is false.

Communication of data frames when dot11OCBActivated is true might take place in a frequency band that is dedicated for its use, and such a band might require licensing depending on the regulatory domain. A STA for which dot11OCBActivated is true initially transmits and receives on a channel known in advance, either through regulatory designation or some other out-of-band communication. A STA's SME determines PHY layer parameters, as well as any changes in the operating channel, e.g., using information obtained via out-of-band communication or over-the-air frame exchange. When dot11OCBActivated is true, a sending STA sets the BSSID field to the wildcard BSSID value (see 8.2.4.3.4).

The Vendor Specific frame (see 8.5.6) provides one means for STAs to exchange management information prior to communicating data frames outside the context of a BSS.

4.3.12 Tunneled direct-link setup

Tunneled direct-link setup (TDLS) is characterized by the use of signaling frames that are encapsulated in data frames so that the signaling frames are transmitted through an AP transparently. Therefore, unlike with DLS, the AP does not need to be direct-link aware, nor does it have to support the same set of capabilities that are used on the direct link, in order for TDLS to be used. To allow a STA to enter a TDLS power save mode, TDLS provides two power save mechanisms: TDLS peer U-APSD and TDLS peer PSM. TDLS allows STAs to use the TDLS Peer Key Handshake to provide data confidentiality and message authentication. STAs that set up a TDLS direct link remain associated with the AP and transmit frames directly to the other TDLS peer STA.

4.3.13 Wireless network management

4.3.13.1 Overview

Wireless network management (WNM) enables STAs to exchange information for the purpose of improving the overall performance of the wireless network. STAs use WNM protocols to exchange operational data so that each STA is aware of the network conditions, allowing STAs to be more cognizant of the topology and state of the network. WNM protocols provide a means for STAs to be aware of the presence of collocated interference, and enable STAs to manage RF parameters based on network conditions.

In addition to providing information on network conditions, WNM also provides a means to exchange location information, provide support for the multiple BSSID capability on the same wireless infrastructure, support efficient delivery of group addressed frames, and enable a WNM-Sleep mode in which a STA can sleep for long periods of time without receiving frames from the AP.

The WNM service includes the following:

- BSS Max idle period management
- BSS transition management
- Channel usage
- Collocated interference reporting
- Diagnostic reporting
- Directed multicast service (DMS)
- Event reporting
- Flexible multicast service (FMS)
- Location services
- Multicast diagnostic reporting
- Multiple BSSID capability
- Proxy ARP
- QoS traffic capability
- SSID list
- Triggered STA statistics
- TIM broadcast
- Timing measurement
- Traffic filtering service
- U-APSD Coexistence

- WNM-Notification
- WNM-Sleep mode

4.3.13.2 BSS Max idle period management

BSS Max idle period management enables an AP to indicate a time period during which the AP does not disassociate a STA due to nonreceipt of frames from the STA. This supports improved STA power saving and AP resource management.

4.3.13.3 BSS transition management

BSS transition management enables an AP to request non-AP STAs to transition to a specific AP, or to indicate to a non-AP STA a set of preferred APs, due to network load balancing or BSS Termination.

4.3.13.4 Channel usage

Channel usage information is provided by the AP to the non-AP STA to recommend channels for noninfrastructure networks or an off-channel TDLS direct link. The non-AP STAs can use the channel usage information as part of channel selection processing for a noninfrastructure network or an off-channel TDLS direct link.

4.3.13.5 Collocated interference reporting

Collocated interference reporting enables the requesting STA to obtain information on interference due to collocated radios at the reporting STA. The requesting STA can use that information to schedule its transmissions to minimize the effects of the interference.

4.3.13.6 Diagnostic reporting

Diagnostic requests enable a STA to request a non-AP STA to report on information that may be helpful in diagnosing and resolving problems with the WLAN network. Diagnostic reports include information on hardware, configuration, and STA capabilities.

4.3.13.7 Directed multicast service (DMS)

The DMS enables a non-AP STA to request the AP to transmit group addressed frames destined to the requesting STA as individually addressed frames.

4.3.13.8 Event reporting

Event requests enable a STA to request a non-AP STA to send particular real-time event messages. The types of events include Transition, RSNA, WNM Log, and Peer-to-Peer Link events. A transition event is transmitted after a non-AP STA successfully completes a BSS Transition. Transition events are used to diagnose transition performance problems. An RSNA event report describes the type of Authentication used for the RSNA. RSNA events are used to diagnose security and authentication performance problems. A WNM Log event report enables a non-AP STA to transmit a set of WNM Log event messages to the requesting STA. WNM Log event reports are used to access the contents of a STA's WNM Log. A Peer-to-Peer Link event report enables a non-AP STA to inform the requesting STA that a Peer-to-Peer link has been established. Peer-to-Peer Link event reports are used to monitor the use of Peer-to-Peer links in the network.

4.3.13.9 FMS

The flexible multicast service enables a non-AP STA to request an alternate delivery traffic indication map (DTIM) delivery interval for one or more sets of group addressed streams that the non-AP STA receives. This enables the non-AP STA to wake up at the alternate DTIM interval rather than every DTIM and enables significant power saving when a non-AP STA receives group addressed traffic. The FMS also enables a STA to establish a data rate and delivery interval for group addressed traffic higher than the minimum data rate available.

Delivery of group addressed data to power saving STAs using a DTIM beacon is described in 10.2.1.4.

4.3.13.10 Location services

Location Configuration Request and Response frames enable STAs to configure a collection of location related parameters for Location Track Notification frames. The AP can indicate that it can provide location data to support applications such as emergency services. Location services also provide the ability for STAs to exchange location information using Radio Measurement Request and Report frames. The protocol supports exchange-by-value and exchange-by-reference mechanisms. The location value can be exchanged in Geospatial (LCI) and Civic formats. The location reference is a URL that defines from where the location value is retrieved.

4.3.13.11 Multicast diagnostic reporting

Multicast diagnostic reports enable a non-AP STA to report statistics for multicast traffic it received from a transmitting STA. This can be used by an AP to measure quality of multicast reception by a non-AP STA.

4.3.13.12 Multiple BSSID capability

The Multiple BSSID capability enables the advertisement of information for BSSIDs using a single Beacon or Probe Response frame instead of multiple Beacon and Probe Response frames, each corresponding to a single BSSID. The Multiple BSSID capability also enables the indication of buffered frames for multiple BSSIDs using a single TIM element in a single beacon.

4.3.13.13 Proxy ARP

The Proxy ARP capability enables an AP to indicate that the non-AP STA does not receive ARP frames. The Proxy ARP capability enables the non-AP STA to remain in power save for longer periods of time.

4.3.13.14 QoS traffic capability

QoS traffic capability procedures enable the QoS STA to indicate that it is capable of transmitting traffic belonging to the corresponding user priority (UP) from applications that require generation of such traffic. The QoS Traffic Capability might be used for example as an input to estimate the blocking probability of a voice application based on the number of voice capable non-AP STAs.

4.3.13.15 SSID list

The SSID List element enables the non-AP STA to request information on a list of SSIDs. This is intended to reduce the number of Probe Request frames sent by the non-AP STA.

4.3.13.16 Triggered STA statistics

The Triggered STA Statistics reporting capability enables generation of a STA statistics report (see 4.3.8.9) when the statistics of interest reach a predefined threshold.

4.3.13.17 TIM broadcast

The TIM broadcast protocol defines a mechanism to enable a STA to receive an indication of buffered individually addressed traffic, independent of the Beacon frame, reducing the wake time of the STA.

4.3.13.18 Timing measurement

Timing Measurement frames allow a recipient STA to accurately measure the offset of its clock relative to a clock in the sending STA. With the regular transfer of Timing Measurement frames from one STA to another, it is possible for the recipient STA to track changes in the offset of its clock with respect to the sending STA over time and thus detect and compensate for any drift between the clocks.

4.3.13.19 Traffic filtering service

Traffic filtering is a service that may be provided by an AP to its associated STAs, where the AP examines MSDUs and management frames destined for a STA. The AP determines if any of those frames match a specific set of traffic filters that may be enabled at the AP per the request of the STA. Individually addressed frames that do not match any of the traffic filters in the set are discarded. Individually addressed frames that do match at least one of the set of the enabled traffic filters are delivered to the STA. The STA may also negotiate to have a notification frame sent prior to the delivery of the frame matching the traffic filter.

4.3.13.20 U-APSD Coexistence

The U-APSD Coexistence capability enables the non-AP STA to indicate a requested transmission duration to the AP for use of U-APSD service periods. Use of the transmission duration enables the AP to transmit frames during the service period and improve the likelihood that the non-AP STA receives the frames when the non-AP STA is experiencing interference. The U-APSD Coexistence capability reduces the likelihood that the AP transmits frames during the service period that are not received successfully.

4.3.13.21 WNM-Notification

WNM-Notification provides a mechanism for a STA to notify another STA of a management event. One event is defined: firmware update notification.

4.3.13.22 WNM-Sleep mode

WNM-Sleep mode is an extended power save mode for non-AP STAs in which a non-AP STA need not listen for every DTIM Beacon frame, and need not perform GTK/IGTK updates. WNM-Sleep mode enables a non-AP STA to signal to an AP that it will be sleeping for a specified length of time. This enables a non-AP STA to reduce power consumption and remain associated while the non-AP STA has no traffic to send to or receive from the AP.

4.3.14 Subscription service provider network (SSPN) interface

An AP can interact with external networks using a SSPN interface for the purpose of authenticating users and provisioning services, as shown in Figure 4-7. The exchange of authentication and provisioning information between the SSPN and the AP passes transparently through the Portal. The protocol used to exchange this information is outside the scope of this standard. The logical SSPN interface provides the means for an AP to consult an SSPN for authenticating and authorizing a specific non-AP STA and to report statistics and status information to the SSPN. Authentication and provisioning information for non-AP STAs received from the SSPN are stored in the AP management information base (MIB) and are used to limit layer-2 services provided to that non-AP STA. Detailed interactions describing the SSPN interface are provided in 10.24.5.

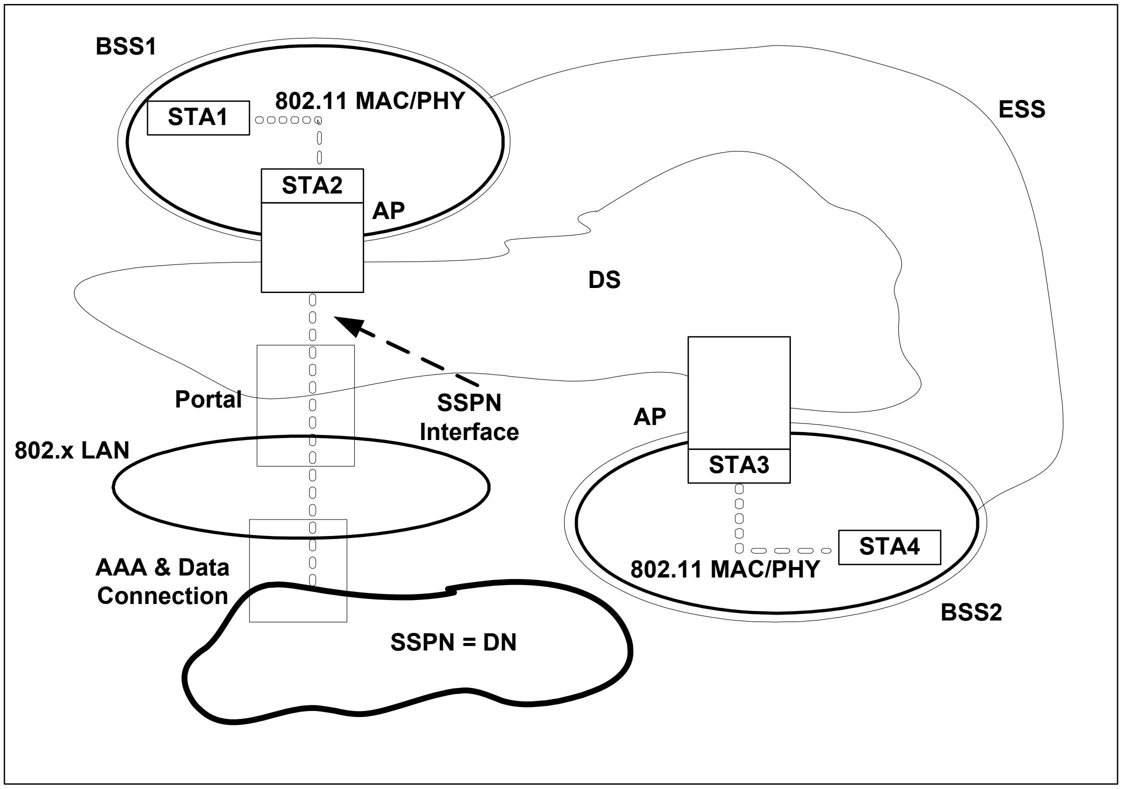

Figure 4-7—SSPN interface service architecture

The SSPN interface provides the non-AP STA access to the services provisioned in the SSPN via the currently associated BSS. SSPN access may involve virtual local area network (VLAN) mapping or tunnel establishment that are transparent to the non-AP STA and outside the scope of this standard. The SSPN interface also allows the non-AP STA to access services in destination networks (DNs) other than the SSPN. An example of a DN other than SSPN is the provision of Internet access via the IEEE 802 LAN, or an intermediary network that connects the IEEE 802.11 infrastructure and the SSPN.

NOTE—The SSPN Interface Service is not supported in an IBSS.

4.3.15 Mesh BSS: IEEE 802.11 wireless mesh network

4.3.15.1 General

The IEEE 802.11 mesh facility provides MAC enhancements to support wireless LAN mesh topologies. The mesh facilities are available to mesh STAs that belong to a mesh BSS (MBSS). For a mesh STA that has not become a member of an MBSS, only the mesh discovery service is available. The enhancements that distinguish mesh STAs from nonmesh STAs are collectively termed the “mesh facility.” The mesh-specific mechanisms vary among implementations.

4.3.15.2 Overview of the mesh BSS

A mesh BSS is an IEEE 802.11 LAN consisting of autonomous STAs. Inside the mesh BSS, all STAs establish wireless links with neighbor STAs to mutually exchange messages. Further, using the multi-hop capability, messages can be transferred between STAs that are not in direct communication with each other over a single instance of the wireless medium. From the data delivery point of view, it appears as if all STAs in a mesh BSS are directly connected at the MAC layer even if the STAs are not within range of each other. The multi-hop capability enhances the range of the STAs and benefits wireless LAN deployments.

STAs in a mesh BSS might be sources, sinks, or propagators of traffic; some mesh STAs might only propagate traffic for other STAs. As described in 4.3.15.4, a mesh BSS might have interfaces to external networks and can be a DSM for infrastructure BSSs.

Within a mesh BSS, STAs utilize the mesh coordination function (MCF) to access the channel. MCF is based on the core QoS facilities specified in 4.3.7, and a mesh BSS is categorized as one type of QoS BSS. MCF is described in 9.20.

4.3.15.3 Mesh STA

A STA that belongs to a mesh BSS is termed a "mesh station" (mesh STA). Mesh STAs are QoS STAs that support mesh services, i.e., they participate in formation and operation of a mesh basic service set (MBSS). A mesh STA implements a subset of the QoS functionality:

- Use of QoS frame format
- EDCA (as a part of MCF)
- Block acknowledgement (optional)
- No acknowledgement (optional)

A mesh BSS does not incorporate the full hybrid coordinator (HC) and BSS QoS functionality. MBSSs do not incorporate the following:

- HCCA
- Traffic specifications (TSPECs)
- Traffic stream (TS) management
- Admission control
- Automatic power save delivery (APSD)
- Direct-link setup (DLS)
- Tunneled direct-link setup (TDLS)

4.3.15.4 IEEE 802.11 components and mesh BSS

Example mesh and infrastructure BSSs are illustrated in Figure 4-8. Only mesh STAs participate in mesh functionalities such as formation of the mesh BSS, path selection, and forwarding. Accordingly, a mesh STA is not a member of an IBSS or an infrastructure BSS. Consequently, mesh STAs do not communicate with nonmesh STAs.

However, instead of existing independently, an MBSS might also access the distribution system (DS). The MBSS interconnects with other BSSs through the DS. Then, mesh STAs can communicate with nonmesh STAs. Therefore, a logical architectural component is introduced in order to integrate the MBSS with the DS—the mesh gate. Data move between an MBSS and the DS via one or more mesh gates. Thus, the mesh gate is the logical point at which MSDUs from an MBSS enter the IEEE 802.11 DS. Once an MBSS contains a mesh gate that connects it to the IEEE 802.11 DS, the MBSS can be integrated with other infrastructure BSSs too, given that their APs connect to the same DS. Several mesh gates are shown in Figure 4-8 connecting different MBSSs to the DS.

When an MBSS accesses the IEEE 802.11 DS through its mesh gate, the MBSS can be integrated with a non-IEEE-802.11 LAN. To integrate the IEEE 802.11 DS to which this MBSS connects, the DS needs to contain a portal. See 4.3.6. Consequently, mesh gate and portal are different entities. The portal integrates the IEEE 802.11 architecture with a non-IEEE-802.11 LAN (e.g., a traditional wired LAN), whereas the mesh gate integrates the MBSS with the IEEE 802.11 DS.

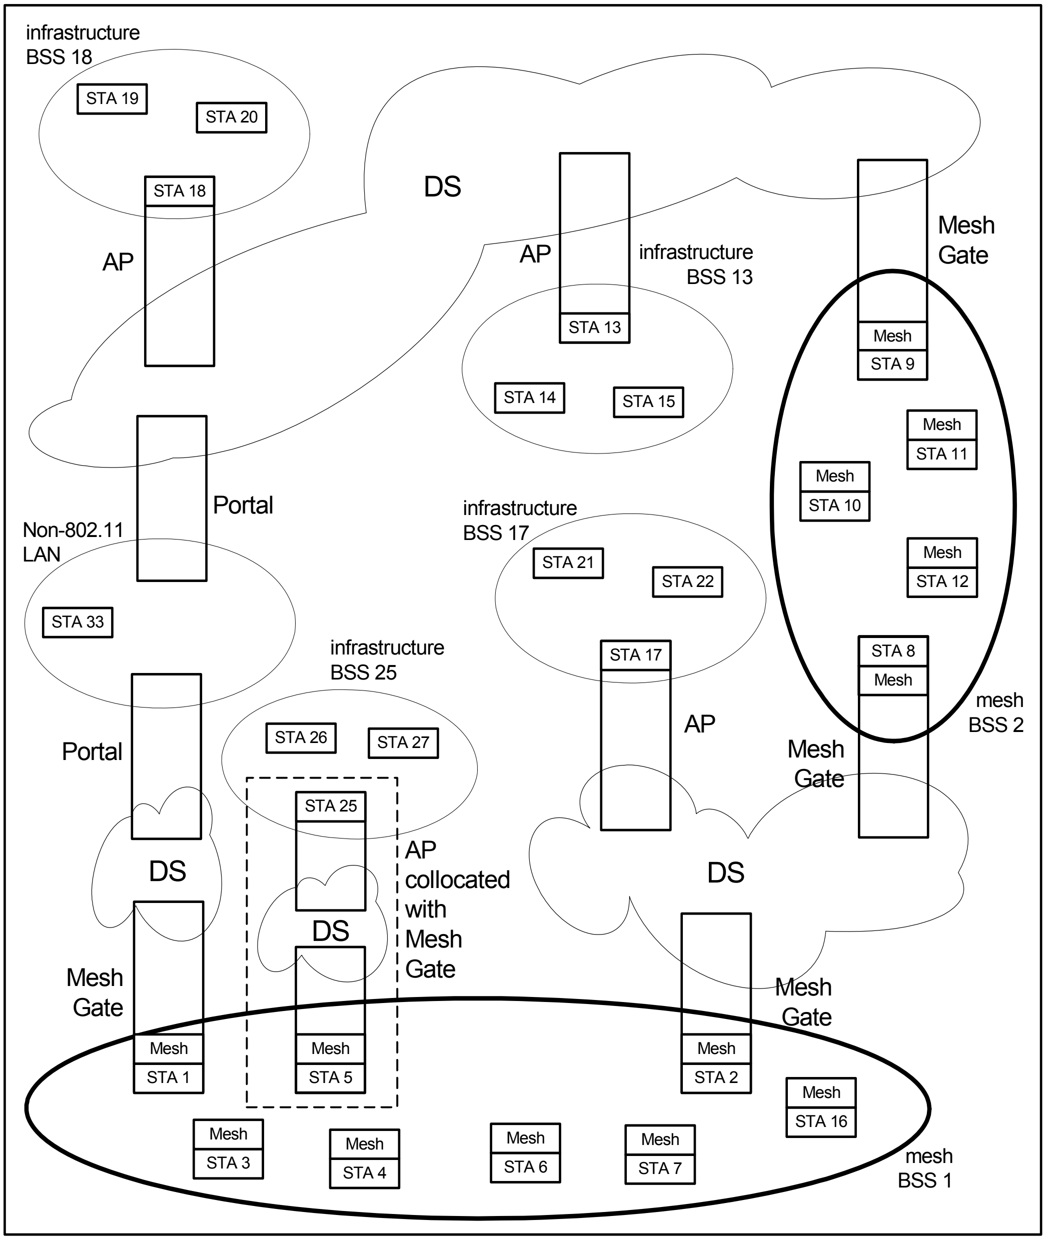

Figure 4-8—Example MBSS containing mesh STAs, mesh gates, APs, and portals

It is possible for one device to offer any combination of the functions of an AP, a portal, and a mesh gate; see 13.11.5. An example device combining the functions of an AP and a mesh gate is shown in Figure 4-9. The implementation of such collocated entities is beyond the scope of this standard. The configuration of a mesh gate that is collocated with an access point allows the utilization of the mesh BSS as a distribution system medium. In this case, two different entities (mesh STA and access point) exist in the collocated device and the mesh BSS is hidden to STAs that associate to the access point. The mesh STA collocation is outlined in 13.11.5, which states that the usage of a distinct MAC address for each collocated STA avoids ambiguities.

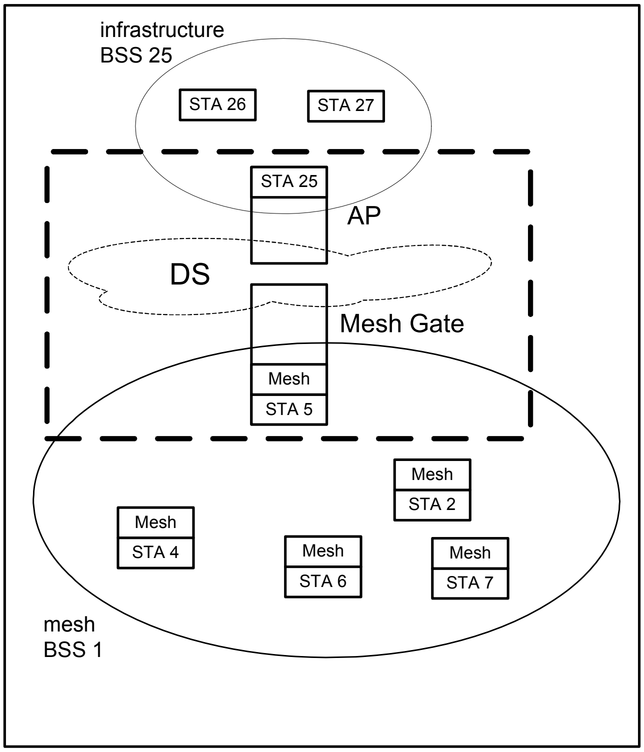

Figure 4-9—Example device consisting of mesh STA and AP STA to connect an MBSS and an infrastructure BSS

4.3.15.5 Introduction to mesh functions

4.3.15.5.1 General

A mesh BSS is formed and operated by the set of services called mesh services. Mesh services are provided by the following major mesh facilities:

- Mesh discovery
- Mesh peering management
- Mesh security
- Mesh beaconing and synchronization
- Mesh coordination function
- Mesh power management
- Mesh channel switching
- Three address, four address, and extended address frame formats
- Mesh path selection and forwarding
- Interworking with external networks
- Intra-mesh congestion control
- Emergency service support in mesh BSS

4.3.15.5.2 Mesh discovery

A mesh STA performs either active scanning or passive scanning to discover an operating mesh BSS. Each mesh STA transmits Beacon frames periodically and responds with Probe Response frames when a Probe Request frame is received, so that neighbor mesh STAs can perform mesh discovery appropriately. The identification of the mesh BSS is given by the Mesh ID element contained in the Beacon and the Probe Response frames. The details for the mesh discovery facility are described in 13.2.

4.3.15.5.3 Mesh peering management (MPM)

Within a mesh BSS, direct communication between neighbor mesh STAs is allowed only when they are peer mesh STAs. After mesh discovery, two neighbor mesh STAs agree to establish a mesh peering to each other, and, after successfully establishing the mesh peering, they become peer mesh STAs. A mesh STA can establish a mesh peering with multiple neighbor mesh STAs. The mesh peering management (MPM) facilitates the mesh peering establishment and closure of the mesh peerings. The details of MPM are described in 13.3.

4.3.15.5.4 Mesh security

In an MBSS, mesh link security protocols are used to authenticate a pair of mesh STAs and to establish session keys between them. Mesh authentication protocols establish a shared, common pairwise master key (PMK), and authenticate a peer mesh STA. The authenticated mesh peering exchange protocol relies on the existence of the PMK between the two mesh STAs to establish an authenticated peering and derive session keys. The details of mesh security are described in 11.3, 13.3.3, 13.5, and 13.6.

4.3.15.5.5 Mesh beaconing and synchronization

In order to assist mesh discovery, mesh power management, and synchronization in a mesh BSS, all mesh STAs periodically transmit Beacon frames. Synchronization in a mesh BSS is maintained by the MBSS's active synchronization method. The default synchronization method is the neighbor offset synchronization method. Mesh beacon collision avoidance (MBCA) mitigates collisions of Beacon frames among hidden nodes. The details of mesh beaconing and synchronization are described in 13.13.

4.3.15.5.6 Mesh coordination function (MCF)

A mesh STA uses the mesh coordination function (MCF) for channel access. MCF consists of EDCA (contention-based channel access defined in 9.20.2) and MCCA (controlled channel access defined in 9.20.3). MCCA is a reservation based channel access method and aims to optimize the efficiency of frame exchanges in a mesh BSS.

4.3.15.5.7 Mesh power management

A mesh STA can manage the activity level of its links per mesh peering. A mesh STA sets the activity level of each of its mesh peerings to either active mode, light sleep mode, or deep sleep mode. The mesh STA performs mesh power mode tracking for each of its neighbor peer mesh STAs, and delivers the frames based on the rules defined in 13.14.

4.3.15.5.8 Mesh channel switching

When a mesh STA switches the operating channel, it uses the channel switch protocol defined in 10.9.8 and 10.10. The channel switch protocol enables the propagation of channel switching messages throughout the mesh BSS, prior to the channel switch execution.

4.3.15.5.9 Frame addressing in an MBSS

Three address, four address, and extended address frame formats enable the distribution of messages over multiple instances of the wireless medium within a mesh BSS and integration to the ESS. Frame format details are described in Clause 8 and 9.32.3.

4.3.15.5.10 Mesh path selection and forwarding

Mesh path selection enables path discovery over multiple instances of the wireless medium within a mesh BSS. The overview of the mesh path selection framework is described in 13.8. The hybrid wireless mesh protocol (HWMP) is defined as the default path selection protocol for the mesh BSS. HWMP provides both proactive path selection and reactive path selection. The details of HWMP are described in 13.10. The path selection protocol uses link metrics in the assessment of a mesh path to the destination. The airtime link metric is the default link metric. It is defined in 13.9.

Once the mesh path of a particular pair of the source mesh STA and the destination mesh STA is found through the mesh path selection function, mesh STAs propagate the data by the forwarding function. The details of the forwarding function are described in 9.32.

As a result of the mesh path selection and forwarding, MSDUs are transmitted among all the mesh STAs in a mesh BSS, even if the mesh STAs are not neighbor STAs of each other. Figure 4-10 depicts the MSDU transfer within a mesh BSS.

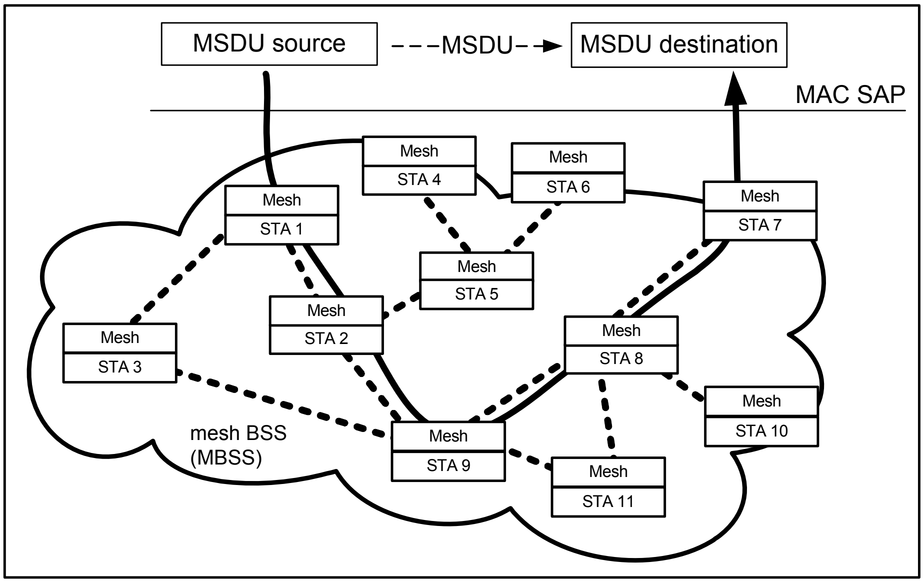

Figure 4-10—MAC data transport over an MBSS

4.3.15.5.11 Interworking with the DS

A mesh BSS might contain one or more mesh gates that connect to one or more distribution systems. A mesh gate can announce its presence in the mesh BSS by sending Gate Announcement frames. Alternatively a mesh gate can announce its presence in the mesh BSS by sending HWMP Path Selection frames with the RANN element or the PREQ element indicating mesh gate announcement, when it is configured as a root mesh STA. Typically a mesh gate announces its presence when it is collocated with a portal or it has access to a portal. Gate announcements allow mesh STAs to select the appropriate mesh gate and build a path towards it. It should be noted that, when multiple mesh gates that have access to the same DS are present in the mesh BSS, proper configuration is necessary.

When a mesh gate has access to IEEE 802 STAs outside the mesh BSS, the mesh gate acts as a proxy for the IEEE 802 STAs outside the MBSS. Such a mesh gate is called a proxy mesh gate. The details of the proxy functionality are described in 13.11.3.

The details of the mesh BSS interworking are described in 13.11.

4.3.15.5.12 Intra-mesh congestion control

Intra-mesh congestion control is used to provide flow control over the multi-hop communication. Intra-mesh congestion control is useful to mitigate wasteful wireless medium utilization caused by buffer overflow at mesh STAs. Intra-mesh congestion control consists of three main mechanisms: local congestion monitoring and congestion detection, congestion control signaling, and local rate control. The details of the intra-mesh congestion control are described in 13.12.

4.3.15.5.13 Emergency service support in mesh BSS

Depending on regulations, emergency services support might be mandated over the mesh network. In this case the Beacon and Probe Response frames inform whether a mesh STA supports emergency services, advertising to other mesh STAs that mesh peering for emergency services is possible. If a mesh STA subsequently requires emergency services, an emergency indication is then set within the Mesh Peering Open frame. Mesh STAs that support emergency services, accept peering from other mesh STAs requiring emergency services, transferring frames to an emergency server (such as a PSAP).

4.4 Logical service interfaces

4.4.1 General

A DS may be created from many different technologies including current IEEE 802 wired LANs. IEEE Std 802.11 does not constrain the DS to be either data link or network layer based. Nor does IEEE Std 802.11 constrain a DS to be either centralized or distributed in nature.

IEEE Std 802.11 explicitly does not specify the details of DS implementations. Instead, IEEE Std 802.11 specifies *services*. The services are associated with different components of the architecture. There are two categories of IEEE 802.11 service—the station service (SS) and the distribution system service (DSS). Both categories of service are used by the IEEE 802.11 MAC sublayer.

The complete set of IEEE 802.11 architectural services are as follows:

a) Authentication
b) Association
c) Deauthentication
d) Disassociation
e) Distribution
f) Integration
g) Data confidentiality
h) Reassociation
i) MSDU delivery
j) DFS

k) TPC
l) Higher layer timer synchronization (QoS facility only)
m) QoS traffic scheduling (QoS facility only)
n) Radio measurement
o) DSE

This set of services is divided into two groups: the SS and the DSS. The SS is part of every STA. The DSS is provided by the DS.

4.4.2 SS

The service provided by STAs is known as the SS.

The SS is present in every IEEE 802.11 STA (including APs, as APs include STA functionality). The SS is specified for use by MAC sublayer entities. All conformant STAs provide SS.

The SS is as follows:

a) Authentication (not used when dot11OCBActivated is true)
b) Deauthentication (not used when dot11OCBActivated is true)
c) Data confidentiality (not used when dot11OCBActivated is true)
d) MSDU delivery
e) DFS
f) TPC
g) Higher layer timer synchronization (QoS facility only)
h) QoS traffic scheduling (QoS facility only)
i) Radio measurement
j) DSE

4.4.3 DSS

The service provided by the DS is known as the DSS.

This service is represented in the IEEE 802.11 architecture by arrows within APs and mesh gates, indicating that the service is used to cross media and possibly address space logical boundaries. An AP and a mesh gate are logical entities, and the functions described may be shared by one or more physical entities.

The services that comprise the DSS are as follows:

a) Association (not mesh facility)
b) Disassociation (not mesh facility)
c) Distribution
d) Integration
e) Reassociation (not mesh facility)
f) QoS traffic scheduling (QoS facility only)
g) DSE
h) Interworking with the DS (mesh facility only)

DSSs are specified for use by MAC sublayer entities.

Figure 4-11 combines the components from previous figures with both types of services to show the complete IEEE 802.11 architecture.

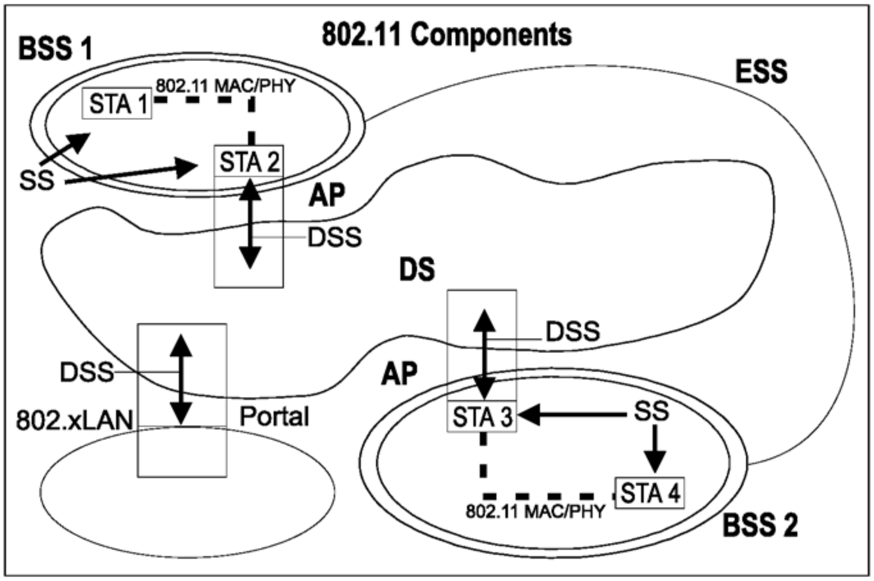

Figure 4-11—Complete IEEE 802.11 architecture

4.5 Overview of the services

4.5.1 General

There are many services specified by IEEE Std 802.11. Six of the services are used to support medium access control (MAC) service data unit (MSDU) delivery between STAs. Three of the services are used to control IEEE 802.11 LAN access and confidentiality. Two of the services are used to provide spectrum management. One of the services provides support for LAN applications with QoS requirements. Another of the services provides support for higher layer timer synchronization. One of the services is used for radio measurement.

This subclause presents the services, an overview of how each service is used, and a description of how each service relates to other services and the IEEE 802.11 architecture. The services are presented in an order designed to help build an understanding of the operation of an IEEE 802.11 ESS network. As a result, the services that comprise the SS and DSS are intermixed in order (rather than being grouped by category).

Each of the services is supported by one or more MAC frame types. Some of the services are supported by MAC management messages and some by MAC data messages. All of the messages gain access to the WM via the IEEE 802.11 MAC sublayer medium access method specified in Clause 9.

The IEEE 802.11 MAC sublayer uses three types of messages—*data*, *management*, and *control* (see Clause 8). The data messages are handled via the MAC data service path.

MAC management messages are used to support the IEEE 802.11 services and are handled via the MAC management service path.

MAC control messages are used to support the delivery of IEEE 802.11 data and management messages.

The examples here assume an ESS network environment. The differences between the ESS and the IBSS network environments are discussed separately in 4.7.

4.5.2 Distribution of messages within a DS

4.5.2.1 Distribution

This is the primary service used by IEEE 802.11 STAs. It is conceptually invoked by every data message to or from an IEEE 802.11 STA operating in an ESS (when the frame is sent via the DS). Distribution is via the DSS.

Refer to the ESS network in Figure 4-11 and consider a data message being sent from STA 1 to STA 4. The message is sent from STA 1 and received by STA 2 (the "input" AP). The AP gives the message to the distribution service of the DS. It is the job of the distribution service to deliver the message within the DS in such a way that it arrives at the appropriate DS destination for the intended recipient. In this example, the message is distributed to STA 3 (the "output" AP) and STA 3 accesses the WM to send the message to STA 4 (the intended destination).

How the message is distributed within the DS is not specified by IEEE Std 802.11. All IEEE Std 802.11 is required to do is to provide the DS with enough information for the DS to be able to determine the "output" point that corresponds to the intended recipient. The necessary information is provided to the DS by the three association related services (association, reassociation, and disassociation).

The previous example was a case in which the AP that invoked the distribution service was different from the AP that received the distributed message. If the message had been intended for a STA that was a member of the same BSS as the sending STA, then the "input" and "output" APs for the message would have been the same.

In either example, the distribution service was logically invoked. Whether the message actually had to traverse the physical DSM or not is a DS implementation matter and is not specified by this standard.

While IEEE Std 802.11 does not specify DS implementations, it does recognize and support the use of the WM as one possible DSM. This is specifically supported by the IEEE 802.11 frame formats. (Refer to Clause 8 for details.) A mesh BSS might form an entire DS or a part of a DS using the WM, as shown in Figure 4-8. Mesh services are used to form a mesh BSS and distribute messages. Clause 13 defines how mesh BSSs are formed and how messages are distributed through a mesh BSS.

4.5.2.2 Integration

If the distribution service determines that the intended recipient of a message is a member of an integrated LAN, the "output" point of the DS would be a portal instead of an AP.

Messages that are distributed to a portal cause the DS to invoke the Integration function (conceptually after the distribution service). The Integration function is responsible for accomplishing whatever is needed to deliver a message from the DSM to the integrated LAN media (including any required media or address space translations). Integration is one of the services in the DSS.

Messages received from an integrated LAN (via a portal) by the DS for an IEEE 802.11 STA invoke the Integration function before the message is distributed by the distribution service.

The details of an Integration function are dependent on a specific DS implementation and are outside the scope of this standard.

4.5.2.3 QoS traffic scheduling

QoS traffic scheduling provides intra-BSS QoS frame transfers under the HCF, using either contention-based or controlled channel access. At each TXOP, a traffic scheduling entity at the STA selects a frame for transmission, from the set of frames at the heads of a plurality of traffic queues, based on requested UP and/or parameter values in the traffic specification (TSPEC) for the requested MSDU. Additional information is available in 9.19.

4.5.3 Services that support the distribution service

4.5.3.1 General

The primary purpose of a MAC sublayer is to transfer MSDUs between MAC sublayer entities. The information required for the distribution service to operate is provided by the association services. Before a data message can be handled by the distribution service, a STA is “associated.”

To understand the concept of association, it is necessary first to understand the concept of mobility.

4.5.3.2 Mobility types

The three transition types of significance to this standard that describe the mobility of STAs within a network are as follows:

a) ***No-transition:*** In this type, two subclasses that are usually indistinguishable are identified:
   1) Static—no motion.
   2) Local movement—movement within the PHY range of the communicating STAs, i.e., movement within a basic service area (BSA).

b) ***BSS-transition:*** This type is defined as a STA movement from one BSS in one ESS to another BSS within the same ESS. A fast BSS transition is a BSS transition that establishes the state necessary for data connectivity before the reassociation rather than after the reassociation.

c) ***ESS-transition:*** This type is defined as STA movement from a BSS in one ESS to a BSS in a different ESS. This case is supported only in the sense that the STA may move. Maintenance of upper-layer connections cannot be guaranteed by IEEE Std 802.11; in fact, disruption of service is likely to occur.

The FT Protocol provides a mechanism for a STA to perform a BSS transition between access points (APs) in a robust security network (RSN) or when quality-of-service (QoS) admission control is enabled in the ESS.

The different association services support the different categories of mobility.

4.5.3.3 Association

To deliver a message within a DS, the distribution service needs to know which AP to access for the given IEEE 802.11 STA. This information is provided to the DS by the concept of association. Association is necessary, but not sufficient, to support BSS-transition mobility. Association is sufficient to support no-transition mobility. Association is one of the services in the DSS.

Before a STA is allowed to send a data message via an AP, it first becomes associated with the AP. The act of becoming associated invokes the association service, which provides the STA to AP mapping to the DS. The DS uses this information to accomplish its message distribution service. How the information provided by the association service is stored and managed within the DS is not specified by this standard.

Within a robust security network (RSN), association is handled differently. In an RSNA, the IEEE 802.1X Port determines when to allow data traffic across an IEEE 802.11 link. A single IEEE 802.1X Port maps to one association, and each association maps to an IEEE 802.1X Port. An IEEE 802.1X Port consists of an IEEE 802.1X Controlled Port and an IEEE 802.1X Uncontrolled Port. The IEEE 802.1X Controlled Port is blocked from passing general data traffic between two STAs until an IEEE 802.1X authentication procedure completes successfully over the IEEE 802.1X Uncontrolled Port. Once the AKM completes successfully, data protection is enabled to prevent unauthorized access, and the IEEE 802.1X Controlled Port unblocks to allow protected data traffic. IEEE 802.1X Supplicants and Authenticators exchange protocol information via the IEEE 802.1X Uncontrolled Port. It is expected that most other protocol exchanges will make use of the IEEE 802.1X Controlled Ports. However, a given protocol might need to bypass the authorization function and make use of the IEEE 802.1X Uncontrolled Port.

NOTE—See IEEE Std 802.1X-2004 for a discussion of Controlled Port and Uncontrolled Port.

At any given instant, a STA is associated with no more than one AP. This allows the DS to determine a unique answer to the question, “Which AP is serving STA X?” Once an association is completed, a STA may make full use of a DS (via the AP) to communicate. Association is always initiated by the mobile STA, not the AP.

An AP may be associated with many STAs at one time.

A STA learns what APs are present and what operational capabilities are available from each of those APs and then invokes the association service to establish an association. For details of how a STA learns about what APs are present, see 10.1.4.

4.5.3.4 Reassociation

Association is sufficient for no-transition message delivery between IEEE 802.11 STAs. Additional functionality is needed to support BSS-transition mobility. The additional required functionality is provided by the reassociation service. Reassociation is one of the services in the DSS.

The reassociation service is invoked to “move” a current association from one AP to another. This keeps the DS informed of the current mapping between AP and STA as the STA moves from BSS to BSS within an ESS. Reassociation also enables changing association attributes of an established association while the STA remains associated with the same AP. Reassociation is always initiated by the mobile STA.

No facilities are provided to move an RSNA during reassociation. Therefore, the old RSNA is deleted, and a new RSNA is constructed.

4.5.3.5 Disassociation

The disassociation service is invoked when an existing association is to be terminated. Disassociation is one of the services in the DSS.

In an ESS, this tells the DS to void existing association information. Attempts to send messages via the DS to a disassociated STA will be unsuccessful.

The disassociation service may be invoked by either party to an association (non-AP STA or AP). Disassociation is a notification, not a request. Disassociation cannot be refused by the receiving STA except when management frame protection is negotiated and the message integrity check fails.

APs may disassociate STAs to enable the AP to be removed from a network for service or for other reasons.

STAs attempt to disassociate when they leave a network. However, the MAC protocol does not depend on STAs invoking the disassociation service. (MAC management is designed to accommodate loss of communication with an associated STA.)

4.5.4 Access control and data confidentiality services

4.5.4.1 General

Two services are required for IEEE Std 802.11 to provide functionality equivalent to that which is inherent to wired LANs. The design of wired LANs assumes the physical attributes of wire. In particular, wired LAN design assumes the physically closed and controlled nature of wired media. The physically open medium nature of an IEEE 802.11 LAN violates those assumptions.

In a WLAN that does not support RSNA, two services, authentication and data confidentiality, are defined. IEEE 802.11 authentication is used instead of the wired media physical connection. WEP encryption was defined to provide the data confidentiality aspects of closed wired media.

An RSNA uses the IEEE 802.1X authentication service along with enhanced data cryptographic encapsulation mechanisms, such as TKIP and CCMP to provide access control. The IEEE 802.11 station management entity (SME) provides key management via an exchange of IEEE 802.1X EAPOL-Key frames. Data confidentiality and data integrity are provided by RSN key management together with the enhanced data cryptographic encapsulation mechanisms.

4.5.4.2 Authentication

IEEE 802.11 authentication operates at the link level between IEEE 802.11 STAs. IEEE Std 802.11 does not provide either end-to-end (message origin to message destination) or user-to-user authentication.

IEEE Std 802.11 attempts to control LAN access via the authentication service. IEEE 802.11 authentication is an SS. This service may be used by all STAs to establish their identity to STAs with which they communicate, in both ESS and IBSS networks. If a mutually acceptable level of authentication has not been established between two STAs, an association is not established.

IEEE Std 802.11 defines four 802.11 authentication methods: Open System authentication, Shared Key authentication, FT authentication, and simultaneous authentication of equals (SAE). Open System authentication admits any STA to the DS. Shared Key authentication relies on WEP to demonstrate knowledge of a WEP encryption key. FT authentication relies on keys derived during the initial mobility domain association to authenticate the stations as defined in Clause 12. SAE authentication uses finite field cryptography to prove knowledge of a shared password. The IEEE 802.11 authentication mechanism also allows definition of new authentication methods.

An RSNA might support SAE authentication. An RSNA also supports authentication based on IEEE Std 802.1X-2004, or preshared keys (PSKs) after Open System authentication. IEEE 802.1X authentication utilizes the EAP to authenticate STAs and the AS with one another. This standard does not specify an EAP method that is mandatory to implement. See 11.5.5 for a description of the IEEE 802.1X authentication and PSK usage within an IEEE 802.11 IBSS.

In an RSNA, IEEE 802.1X Supplicants and Authenticators exchange protocol information via the IEEE 802.1X Uncontrolled Port. The IEEE 802.1X Controlled Port is blocked from passing general data traffic between two STAs until an IEEE 802.1X authentication procedure completes successfully over the IEEE 802.1X Uncontrolled Port.

SAE authentication or Open System 802.11 authentication is used in an RSN for infrastructure BSS. SAE authentication, Open System 802.11 authentication, or no 802.11 authentication is used in an RSN for IBSS. SAE authentication is used in an MBSS. An RSNA disallows the use of Shared Key 802.11 authentication.

A STA may be authenticated with many other STAs at any given instant.

Because the IEEE 802.1X authentication process could be time-consuming (depending on the authentication protocol in use), the authentication service can be invoked independently of the association service.

This type of preauthentication is typically done by a STA while it is already associated with an AP (with which it previously authenticated). IEEE Std 802.11 does not require that STAs preauthenticate with APs. However, authentication is required before an association establishment is complete.

If the authentication is left until reassociation time, this might impact the speed with which a STA reassociates between APs, limiting BSS-transition mobility performance. The use of preauthentication takes the authentication service overhead out of the time-critical reassociation process.

SAE authentication is performed prior to association and a STA can take advantage of the fact that it can be IEEE 802.11 authenticated to many APs simultaneously by completing the SAE protocol with any number of APs while still being associated to another AP. RSNA security can be established after association using the resulting shared key.

4.5.4.3 Deauthentication

The deauthentication service is invoked when an existing Open System, Shared Key, or SAE authentication is to be terminated. Deauthentication is an SS.

When the deauthentication service is terminating SAE authentication any PTKSA, GTKSA, mesh TKSA, or mesh GTKSA related to this SAE authentication is destroyed. If PMK caching is not enabled, deauthentication also destroys any PMKSA created as a result of this successful SAE authentication.

In an ESS, because authentication is a prerequisite for association, the act of deauthentication causes the STA to be disassociated. The deauthentication service may be invoked by either authenticated party (non-AP STA or AP). Deauthentication is not a request; it is a notification. The association at the transmitting STA is terminated when the STA sends a deauthentication notice to an associated STA. Deauthentication, and if associated, disassociation cannot be refused by the receiving STA except when management frame protection is negotiated and the message integrity check fails.

In an RSN ESS, Open System 802.11 authentication is required. In an RSN ESS, deauthentication results in termination of any association for the deauthenticated STA. It also results in the IEEE 802.1X Controlled Port for that STA being disabled and deletes the pairwise transient key security association (PTKSA). The deauthentication notification is provided to IEEE Std 802.1X-2004 via the MAC layer.

In an RSNA, deauthentication also destroys any related pairwise transient key security association (PTKSA), group temporal key security association (GTKSA), station-to-station link (STSL) master key security association (SMKSA), STSL transient key security association (STKSA), and integrity group temporal key security association (IGTKSA) that exist in the STA and closes the associated IEEE 802.1X Controlled Port. If pairwise master key (PMK) caching is not enabled, deauthentication also destroys the pairwise master key security association (PMKSA) from which the deleted PTKSA was derived.

In an RSN IBSS, Open System authentication is optional, but a STA is required to recognize Deauthentication frames. Deauthentication results in the IEEE 802.1X Controlled Port for that STA being disabled and deletes the PTKSA.

4.5.4.4 Data confidentiality

In a wired LAN, only those STAs physically connected to the wire can send or receive LAN traffic. With a wireless shared medium, there is no physical connection, and all STAs and certain other RF devices in or near the LAN might be able to send, receive, and/or interfere with the LAN traffic. An IEEE 802.11-compliant STA can receive like-PHY IEEE 802.11 traffic that is within range and can transmit to any other IEEE 802.11 STA within range. Thus, the connection of a single wireless link (without data confidentiality) to an existing wired LAN may seriously degrade the security level of the wired LAN.

To bring the security of the WLAN up to the level implicit in wired LAN design, IEEE Std 802.11 provides the ability to protect the contents of messages. This functionality is provided by the data confidentiality service. Data confidentiality is an SS.

IEEE Std 802.11 provides several cryptographic algorithms to protect data traffic, including: WEP, TKIP, and CCMP. WEP and TKIP are based on the ARC4[19] algorithm, and CCMP is based on the advanced encryption standard (AES). A means is provided for STAs to select the algorithm(s) to be used for a given association.

IEEE Std 802.11 provides one security protocol, CCMP, for protection of individually addressed robust management frames. This standard does not provide data confidentiality for group addressed robust management frames.

IEEE Std 802.11 provides one security protocol, CCMP, for protection of individually addressed and group addressed data frames between mesh STAs.

The default data confidentiality state for all IEEE 802.11 STAs is “in the clear,” i.e., without protection. If the data confidentiality service is not invoked, all frames are sent unprotected. If this policy is unacceptable to the sender, it does not send data frames; and if the policy is unacceptable to the receiver, it discards any received data frames. Unprotected data frames and unprotected robust management frames received at a STA configured for mandatory data confidentiality, as well as protected data frames and protected robust management frames using a key not available at the receiving STA, are discarded without an indication to LLC (or without indication to distribution services in the case of “To DS” frames received at an AP). These frames are acknowledged on the WM [if received without frame check sequence (FCS) error] to avoid wasting WM bandwidth on retries of frames that are being discarded.

4.5.4.5 Key management

The enhanced data confidentiality, data authentication, and replay protection mechanisms require fresh cryptographic keys and corresponding security associations. The procedures defined in this standard provide fresh keys by means of protocols called the 4-Way Handshake, FT 4-Way Handshake, FT Protocol, FT Resource Request Protocol, and Group Key Handshake.

4.5.4.6 Data origin authenticity

The data origin authenticity mechanism defines a means by which a STA that receives a data or protected Robust Management frame can determine which STA transmitted the MAC protocol data unit (MPDU). This feature is required in an RSNA to prevent one STA from masquerading as a different STA.

[19] Details of the ARC4 algorithm are available from RSA Security, Inc. Contact RSA Security, 174 Middlesex Turnpike, Bedford, MA 01730 (http://www.rsasecurity.com/), for algorithm details and the uniform ARC4 license terms that RSA offers to anyone wishing to use ARC4 for the purpose of implementing the IEEE 802.11 WEP option. If necessary, contact the IEEE Standards Department Intellectual Property Rights Administrator for details on how to communicate with RSA.

Data origin authenticity is only applicable to individually addressed data frames, and individually addressed robust management frames. The protocols do not guarantee data origin authenticity for group addressed frames, as this cannot be accomplished using symmetric keys and public key methods are too computationally expensive.

4.5.4.7 Replay detection

The replay detection mechanism defines a means by which a STA that receives a data or protected Robust Management frame from another STA can detect whether the received frame is an unauthorized retransmission. This replay protection mechanism is provided for data frames for STAs that use enhanced data cryptographic encapsulation mechanisms. The replay protection mechanism is also provided for robust management frames for STAs that use CCMP and Broadcast/Multicast Integrity Protocol (BIP).

4.5.4.8 Fast BSS transition

The FT mechanism defines a means for a STA to set up security and QoS parameters prior to reassociation to a new AP. This mechanism allows time-consuming operations to be removed from the time-critical reassociation process.

4.5.4.9 Robust management frame protection

Robust management frames are a set of management frames that can be protected by the management frame protection service. The robust management frames are Disassociation, Deauthentication, and robust Action frames. Action frames specified with “No” in the “Robust” column of Table 8-38 are not robust management frames and are not protected.

Management frame protection protocols in an infrastructure BSS or IBSS apply to robust management frames after RSNA PTK establishment for protection of individually addressed frames is completed and after delivery of the IGTK to protect group addressed frames. Robust management frame protection is implemented by CCMP, BIP, and the SA Query procedure.

Management frame protection protocols in an MBSS apply to individually addressed frames after establishment of the RSNA MTK, and to group addressed frames indicated as "Group Addressed Privacy" in Table 8-38. Robust management frame protection is implemented by CCMP.

4.5.5 Spectrum management services

4.5.5.1 General

Two services are required to satisfy requirements in some regulatory domains (see Annex D and Annex E) for operation in the 5 GHz band. These services are called transmit power control (TPC) and dynamic frequency selection (DFS).

4.5.5.2 TPC

Radio regulations may require radio local area networks (RLANs) operating in the 5 GHz band to use transmitter power control, involving specification of a regulatory maximum transmit power and a mitigation requirement for each allowed channel, to reduce interference with satellite services. The TPC service is used to satisfy this regulatory requirement.

The TPC service provides for the following:

- Association of STAs with an AP in a BSS based on the STAs' power capability.
- Specification of regulatory and local maximum transmit power levels for the current channel.
- Selection of a transmit power for each transmission in a channel within constraints imposed by regulatory requirements.
- Adaptation of transmit power based on a range of information, including path loss and link margin estimates.

4.5.5.3 DFS

Radio regulations might require RLANs operating in the 5 GHz band to implement a mechanism to avoid co-channel operation with radar systems and to provide uniform utilization of available channels. The DFS service is used to satisfy these regulatory requirements.

The DFS service provides for the following:

- Association of STAs with an AP in a BSS based on the STAs' supported channels.
- Quieting the current channel so it can be tested for the presence of radar with less interference from other STAs.
- Testing channels for radar before using a channel and while operating in a channel.
- Discontinuing operations after detecting radar in the current channel to avoid interference with radar.
- Detecting radar in the current and other channels based on regulatory requirements.
- Requesting and reporting of measurements in the current and other channels.
- Selecting and advertising a new channel to assist the migration of a BSS after radar is detected.

4.5.6 Traffic differentiation and QoS support

IEEE Std 802.11 uses a shared medium and provides differentiated control of access to the medium to handle data transfers with QoS requirements. The QoS facility (per MSDU traffic category and TSPEC negotiation) allows an IEEE 802.11 LAN to become part of a larger network providing end-to-end QoS delivery or to function as an independent network providing transport on a per-link basis with specified QoS commitments. The specifications regarding the integration and operability of the QoS facility in IEEE 802.11 specification with any other end-to-end QoS delivery mechanism like Resource Reservation Protocol (RSVP) are beyond the scope of this standard.

4.5.7 Support for higher layer timer synchronization

Some applications, e.g., the transport and rendering of audio or video streams, require synchronized timers shared among different STAs. Greater accuracy (in terms of jitter bounds) or finer timer granularity than that provided by a BSS timing synchronization function (TSF) may be an additional requirement. In support of such applications, this standard defines a MAC service that enables layers above the MAC to accurately synchronize application-dependent timers shared among STAs. The service is usable by more than one application at a time.

Although the timer synchronization methods and accuracy requirements are application-dependent and are beyond the scope of this standard, they rely on an indication from each MAC that is provided essentially simultaneously, via group addressed transmissions, to the STAs. The MAC accomplishes this by indicating the occurrence of the end of the last symbol of particular data frames; the data frames of interest are identified by their MAC header Address 1 field when it contains a group address previously registered with the MAC. The last symbol is observed[20] on the air by STAs within a BSS while the delay between the observation and the delivery of the indication is known within a MAC by design (and communicated to the application by implementation-dependent means). The common reference point in time provided by the end of last symbol indication is the essential building block upon which a variety of application-dependent timer synchronization methods may be based.

4.5.8 Radio Measurement service

The Radio Measurement service provides the following:

- The ability to request and report radio measurements in supported channels.
- The ability to perform radio measurements in supported channels.
- An interface for upper layer applications to retrieve radio measurements using MLME primitives and/or MIB access.
- Information about neighbor APs.

4.5.9 Interworking with external networks

The interworking service allows non-AP STAs to access services provided by an external network according to the subscription or other characteristics of that external network. An IEEE 802.11 non-AP STA may have a subscription relationship with an external network, e.g., with an SSPN.

An overview of the interworking functions addressed in this standard is provided below:

- Network discovery and selection
    - Discovery of suitable networks through the advertisement of access network type, roaming consortium and venue information, via management frames
    - Selection of a suitable IEEE 802.11 infrastructure using advertisement services (e.g., Access Network Query Protocol (ANQP) or an IEEE 802.21 Information Server) in the BSS or in an external network reachable via the BSS.
    - Selection of an SSPN or external network with its corresponding IEEE 802.11 infrastructure
- Emergency services
    - Emergency Call and Network Alert support at the link level
- QoS Map distribution
- SSPN interface service between the AP and the SSPN

The generic advertisement service (GAS), described in 4.11, provides both support for a STA’s network selection and a conduit for communication by a non-AP STA with other information resources in a network before joining the wireless LAN.

The interworking service supports emergency services by providing methods for users to access emergency services via the IEEE 802.11 infrastructure, advertising that emergency services are supported (see 10.24.6) and identifying that a traffic stream is used for emergency services.

[20] The synchronization indication (observed time) within the BSS varies slightly due to propagation.

The interworking service provides QoS mapping for SSPNs and other external networks. Since each SSPN or other external network may have its own layer-3 end-to-end packet marking practice (e.g., differentiated services code point (DSCP) usage conventions), a means to remap the layer-3 service levels to a common over-the-air service level is necessary. The QoS Map service provides STAs a mapping of network-layer QoS packet marking to over-the-air QoS frame marking (i.e., user priority).

The SSPN Interface service supports service provisioning and transfer of user permissions from the SSPN to the AP. The method and protocol by which these permissions are transferred from the SSPN are outside the scope of this standard.

4.6 Multiple logical address spaces

Just as the IEEE 802.11 architecture allows for the possibility that the WM, DSM, and an integrated wired LAN may all be different physical media, it also allows for the possibility that each of these components may be operating within different address spaces. IEEE Std 802.11 only uses and specifies the use of the WM address space.

Each IEEE 802.11 PHY operates in a single medium—the WM. The IEEE 802.11 MAC operates in a single address space. MAC addresses are used on the WM in the IEEE 802.11 architecture. Therefore, it is unnecessary for the standard to explicitly specify that its addresses are “WM addresses.” This is assumed throughout this standard.

IEEE Std 802.11 has chosen to use the IEEE 802 48-bit address space (see 8.2.4.3.2). Thus IEEE 802.11 addresses are compatible with the address space used by the IEEE 802 LAN family.

The IEEE 802.11 choice of address space implies that for many instantiations of the IEEE 802.11 architecture, the wired LAN MAC address space and the IEEE 802.11 MAC address space may be the same. In those situations where a DS that uses MAC level IEEE 802 addressing is appropriate, all three of the logical address spaces used within a system could be identical. While this is a common case, it is not the only combination allowed by the architecture. The IEEE 802.11 architecture allows for all three logical address spaces to be distinct.

A multiple address space example is one in which the DS implementation uses network layer addressing. In this case, the WM address space and the DS address space would be different.

Note that IEEE 802.11 STAs within a single ESS share the same address space, fulfilling the transparency requirement from the definition of the DS. The DSS uses this same address space, even in the case where the DSM uses a different address space.

The ability of the architecture to handle multiple logical media and address spaces is key to the ability of IEEE Std 802.11 to be independent of the DS implementation and to interface cleanly with network layer mobility approaches. The implementation of the DS is unspecified and is beyond the scope of this standard.

4.7 Differences between ESS and IBSS LANs

In 4.3.2 the concept of the IBSS LAN was introduced. In an IBSS network, a STA communicates directly with one or more other STAs.

Consider the full IEEE 802.11 architecture as shown in Figure 4-12.

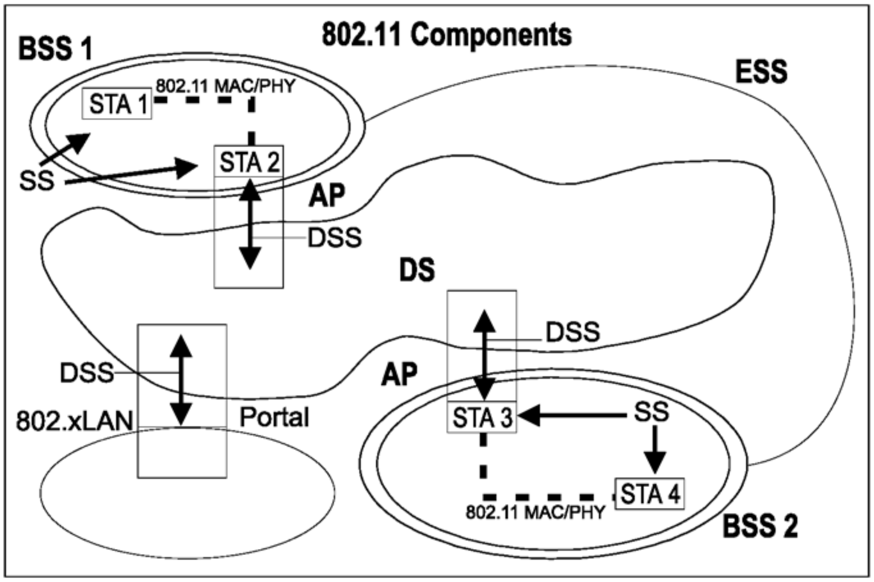

Figure 4-12—IEEE 802.11 architecture (again)

An IBSS consists of STAs that are directly connected. Thus there is (by definition) only one BSS. Further, because there is no physical DS, there is no portal, integrated wired LAN, or DSS. The logical picture reduces to Figure 4-13.

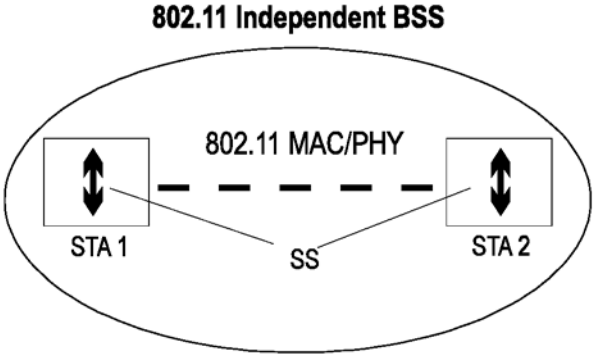

Figure 4-13—Logical architecture of an IBSS

Only the minimum two STAs are shown in Figure 4-13. An IBSS may have an arbitrary number of members. In an IBSS only Class 1 and Class 2 frames are allowed because there is no DS in an IBSS.

The services that apply to an IBSS are the SSs. A QoS IBSS supports operation under the HCF using TXOPs gained through the EDCA mechanism. The parameters that control differentiation of the delivery of MSDUs with different priority using EDCA are fixed. A QoS IBSS has no HC and does not support polled TXOP operation and setting up of TSPEC.

In an IBSS each STA enforces its own security policy. In an ESS, an AP can enforce a uniform security policy across all STAs.

4.8 Differences between ESS and MBSS LANs

In 4.3.15, the concept of the MBSS LAN was introduced. It was noted that using the multi-hop capability it appears as if all mesh STAs are directly connected at the MAC layer even if the STAs are not within range of each other. This is different from an IBSS network, where STAs cannot communicate if they are not within range of each other.

Unlike the IBSS, an MBSS might have access to the DS. An MBSS connects through one or more mesh gates to the DS. Since in an MBSS it appears as if all mesh STAs are directly connected at the MAC layer, the MBSS can be used as a DSM. APs, portals, and mesh gates might use the MBSS as a DSM to provide the DSS. Thus, different infrastructure BSSs can unite over the MBSS to form an ESS for example.

An AP identifies the infrastructure BSS that it forms. This is different from the MBSS where no such central entity exists. Whereas infrastructure BSSs need the ESS and thus the DS to unite, the MBSS network appears the same to an LLC layer without the need for access to a DS. However, if an MBSS has one or more mesh gates providing access to the DS, the MBSS might exist in disjointed areas and yet form a single network.

4.9 Reference model

4.9.1 General

This standard presents the architectural view, emphasizing the separation of the system into two major parts: the MAC of the data link layer (DLL) and the PHY. These layers are intended to correspond closely to the lowest layers of the ISO/IEC basic reference model of Open Systems Interconnection (OSI) (ISO/IEC 7498-1: 1994). The layers and sublayers described in this standard are shown in Figure 4-14.

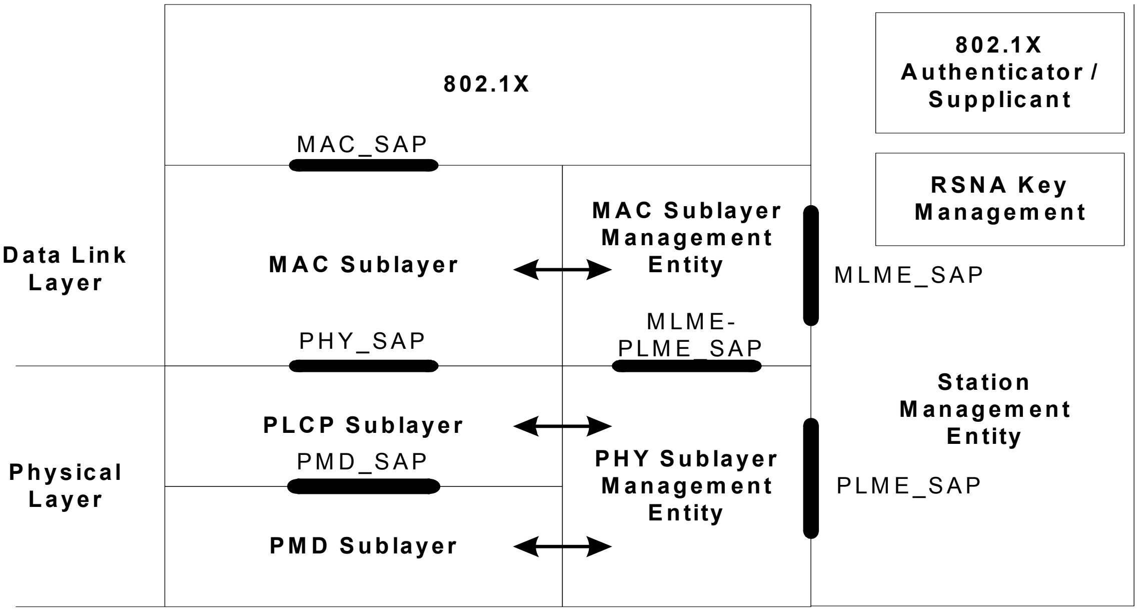

Figure 4-14—Portion of the ISO/IEC basic reference model covered in this standard

There is an interface between the IEEE 802.1X Supplicant/Authenticator and the SME not shown in Figure 4-14. This interface is described in IEEE Std 802.1X-2004.

4.9.2 Interworking reference model

The MAC state generic convergence function (MSGCF) provides services to higher layer protocols based on MAC state machines and interactions between the layers.

Interworking functions may require correlating information from multiple management entities. It is the function of the MSGCF to correlate information for higher layer entities. The MSGCF observes the interactions between the MLME and SME, and between the PLME and SME. After correlation of lower-layer MLME and PLME events, the MSGCF may synthesize indications to higher layer entities.

Figure 4-15 shows an entity, the MSGCF, defined in 6.4, that has access to all management information through exposure to the MAC and PHY Sublayer Management Entities, and provides management information to higher level entities, such as Mobility Managers, supporting heterogeneous medium mobility.

An example of how the MSGCF interfaces to these higher layer entities, is provided by the media-independent handover (MIH) interface, as defined in IEEE 802.21-2008.

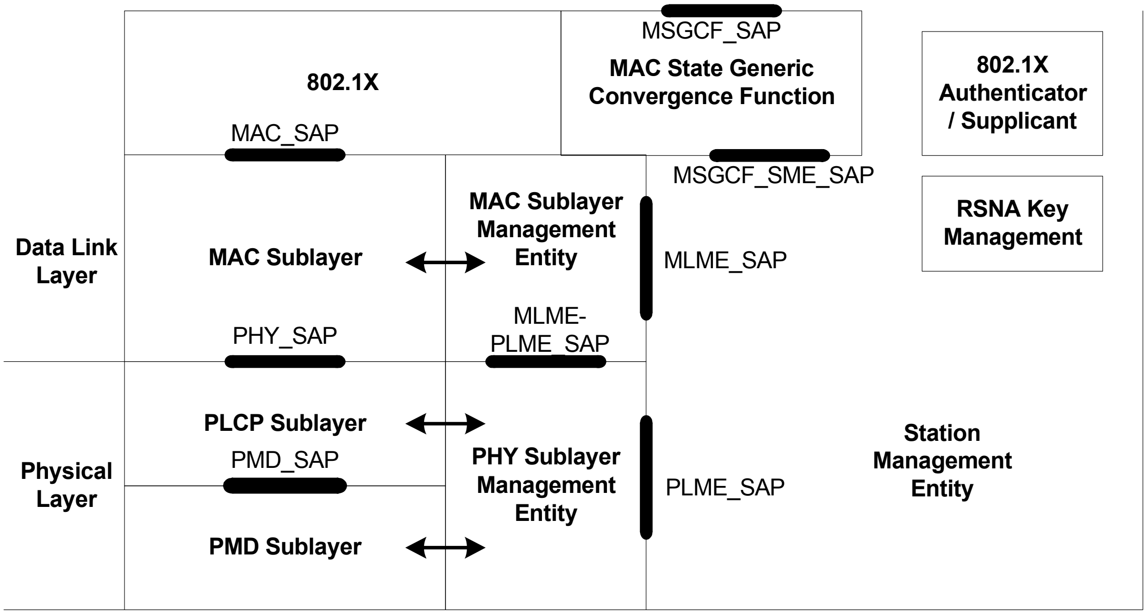

Figure 4-15—Interworking reference model

The MSGCF is designed to provide the status of the connection of a non-AP STA to a set of BSSs comprising a single ESS. Figure 4-16 illustrates the concept of an ESS Link. This reflects the state of a connection to an ESS independent of any particular access point. In Figure 4-16, STA3 is associated with either AP1 or AP2. The state of the ESS Link is up when STA3 is associated with any of the APs comprising an ESS.

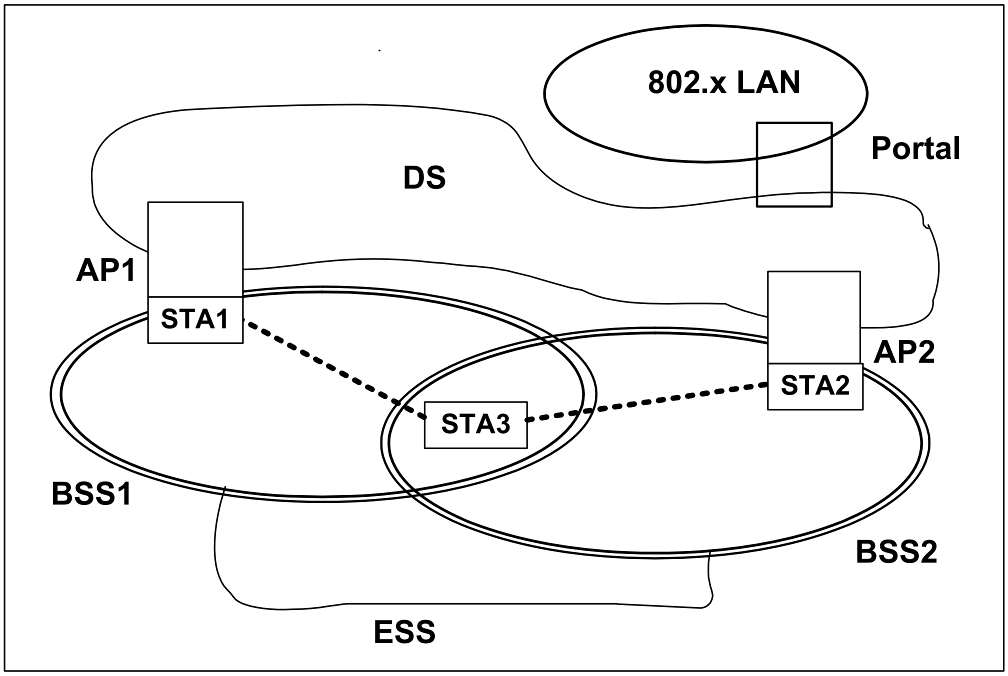

Figure 4-16—ESS link illustration

4.10 IEEE Std 802.11 and IEEE Std 802.1X-2004

4.10.1 General

An RSNA relies on IEEE Std 802.1X-2004 to provide authentication services and uses the IEEE 802.11 key management scheme defined in 11.6. The IEEE 802.1X access control mechanisms apply to the association between a STA and an AP and to the relationship between the IBSS STA and STA peer. The AP's SME performs the Authenticator and, optionally, the Supplicant and AS roles. In an ESS, a non-AP STA's SME performs the Supplicant role. In an IBSS the SME takes on both the Supplicant and Authenticator roles and may take on the AS role.

4.10.2 IEEE 802.11 usage of IEEE Std 802.1X-2004

IEEE Std 802.11 depends upon IEEE Std 802.1X-2004 to control the flow of MAC service data units (MSDUs) between the DS and STAs by use of the IEEE 802.1X Controlled/Uncontrolled Port model. IEEE 802.1X authentication frames are transmitted in IEEE 802.11 data frames and passed via the IEEE 802.1X Uncontrolled Port. The IEEE 802.1X Controlled Port is blocked from passing general data traffic between two STAs until an IEEE 802.1X authentication procedure completes successfully over the IEEE 802.1X Uncontrolled Port. It is the responsibility of both the Supplicant and the Authenticator to implement port blocking. Each association between a pair of STAs creates a unique pair of IEEE 802.1X Ports, and authentication takes place relative to those ports alone.

IEEE Std 802.11 depends upon IEEE Std 802.1X-2004 and the 4-Way Handshake, FT 4-Way Handshake, FT Protocol, FT Resource Request Protocol, and Group Key Handshake, described in Clause 11 and Clause 12, to establish and change cryptographic keys. Keys are established after authentication has completed. Keys may change for a variety of reasons, including expiration of an IEEE 802.1X authentication timer, key compromise, danger of compromise, or policy.

4.10.3 Infrastructure functional model overview

4.10.3.1 General

This subclause summarizes the system setup and operation of an RSN, in three cases: when a password or PSK is used during IEEE 802.11 authentication, when an IEEE 802.1X AS is used after Open System authentication, and when a PSK is used after Open System authentication. For an ESS, the AP includes an Authenticator, and each associated STA includes a Supplicant.

4.10.3.2 AKM operations with AS

The following AKM operations are carried out when an IEEE 802.1X AS is used:

a) Prior to any use of IEEE Std 802.1X-2004, IEEE Std 802.11 assumes that the Authenticator and AS have established a secure channel. The security of the channel between the Authenticator and the AS is outside the scope of this standard.

   Authentication credentials are distributed to the Supplicant and AS prior to association.

b) A STA discovers the AP’s security policy through passively monitoring Beacon frames or through active probing (shown in Figure 4-17). If IEEE 802.1X authentication is used, the EAP authentication process starts when the Authenticator sends the EAP-Request (shown in Figure 4-18) or the Supplicant sends the EAPOL-Start message. EAP authentication frames pass between the Supplicant and AS via the Authenticator and Supplicant’s Uncontrolled Ports. This is shown in Figure 4-18.

Figure 4-18—IEEE 802.1X EAP authentication

A 4-Way Handshake or FT 4-Way Handshake utilizing EAPOL-Key frames is initiated by the Authenticator to do the following:

- Confirm that a live peer holds the PMK.
- Confirm that the PMK is current.
- In the case of fast BSS transition, derive PMK-R0s and PMK-R1s.
- Derive a fresh pairwise transient key (PTK) from the PMK or, in the case of fast BSS transition, from the PMK-R1.
- Install the pairwise encryption and integrity keys into IEEE Std 802.11.
- Transport the group temporal key (GTK) and GTK sequence number from Authenticator to Supplicant and install the GTK and GTK sequence number in the STA and, if not already installed, in the AP.
- If management frame protection is negotiated, transport the IGTK and the IGTK packet number (IPN) from the Authenticator to the Supplicant and install these values in the STA and, if not already installed, in the AP.
- Verify that the RSN capabilities negotiated are valid as defined in 8.4.2.27.4.
- Confirm the cipher suite selection.

Installing the PTK, and where applicable the GTK keys, causes the MAC to encrypt and decrypt all subsequent MSDUs irrespective of their path through the controlled or uncontrolled ports.

Upon successful completion of the 4-Way Handshake, the Authenticator and Supplicant have authenticated each other; and the IEEE 802.1X Controlled Ports are unblocked to permit general data traffic. See Figure 4-19.

Figure 4-19—Establishing pairwise and group keys

If the Authenticator later changes the GTK, it sends the new GTK and GTK sequence number to the Supplicant using the Group Key Handshake to allow the Supplicant to continue to receive group addressed messages and, optionally, to transmit and receive individually addressed frames. EAPOL-Key frames are used to carry out this exchange. See Figure 4-20.

When management frame protection is negotiated, the Authenticator also uses the Group Key Handshake with all associated STAs to change the IGTK. The Authenticator encrypts the GTK and IGTK values in the EAPOL-Key frame as described in 11.6.

4.10.3.3 AKM Operations with a Password or PSK

The following AKM operations are carried out when authentication is accomplished using a Password or PSK:

— A STA discovers the AP's security policy through passively monitoring the Beacon frames or through active probing. After discovery the STA performs SAE authentication using IEEE 802.11 Authentication frames with the AP (see Figure 4-21).

— Upon the successful conclusion of SAE, both the STA and AP generate a PMK. The STA then associates to an AP and negotiate security policy. The AKM confirmed in the Association Request and Response is the AKM of SAE or Fast BSS Transition.

— The PMK generated by SAE is used in a 4-Way Handshake using EAPOL-Key frames, just as with IEEE 802.1X authentication when an AS is present. See Figure 4-19.

- The GTK and GTK sequence number are sent from the Authenticator to the Supplicant just as in the AS case. See Figure 4-19 and Figure 4-20.

4.10.3.4 Alternate operations with PSK

The following AKM operations represent an alternate operation of using a PSK. This operation has security vulnerabilities when used with a low-entropy key and is recommended to be used only after taking that into account. When this operation is carried out, the PMK is a PSK:

- A STA discovers the AP’s security policy through passively monitoring Beacon frames or through active probing (shown in Figure 4-17). A STA associates with an AP and negotiates a security policy. The PMK is the PSK.

- The 4-Way Handshake using EAPOL-Key frames is used, just as with IEEE 802.1X authentication, when an AS is present. See Figure 4-19.
- The GTK and GTK sequence number are sent from the Authenticator to the Supplicant just as in the AS case. See Figure 4-19 and Figure 4-20.
- If management frame protection is negotiated, the IGTK and IGTK packet number are sent from the Authenticator to the Supplicant just as in the AS case. See Figure 4-19 and Figure 4-20.

4.10.3.5 Disassociation

Disassociation initiated by either STA in an RSNA causes the deletion of the PTKSA at both ends and the deletion of the GTKSA in a non-AP STA. The controlled and uncontrolled ports created for this association are also deleted.

4.10.4 IBSS functional model description

4.10.4.1 General

This subclause summarizes the system setup and operation of an RSNA in an IBSS. An IBSS RSNA is specified in 11.5.10.

4.10.4.2 Key usage

In an IBSS the individually addressed data frames between two STAs are protected with a pairwise key. The key is part of the PTK, which is derived during a 4-Way Handshake. In an IBSS the 4-Way Handshake may follow IEEE 802.11 authentication of one STA to another. Such authentication may be used by the peer to cause deletion of the PTKSA and Block the Controlled Port thus resetting any previous handshake.

In an IBSS group addressed data frames are protected by a key, e.g., named B1, that is generated by the STA transmitting the group addressed frame. To allow other STAs to decrypt group addressed frames, B1 is sent to all the other STAs in the IBSS. B1 is sent in an EAPOL-Key frame, encrypted under the EAPOL-Key encryption key (KEK) portion of the PTK, and protected from modification by the EAPOL-Key confirmation key (KCK) portion of the PTK.

In an IBSS the SME responds to Deauthentication frames from a STA by deleting the PTKSA associated with that STA.

4.10.4.3 Sample IBSS 4-Way Handshakes

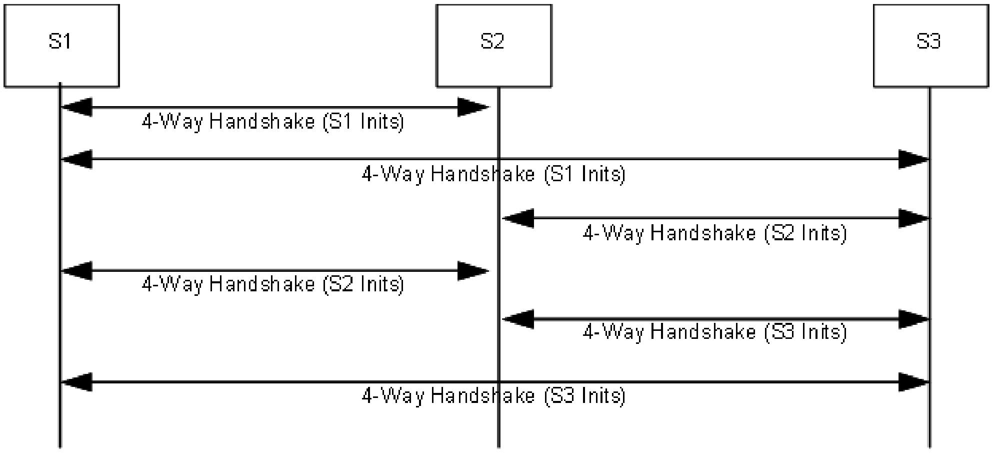
In this example (see Figure 4-22), there are three STAs: S1, S2, S3. The group addressed frames sent by S1 are protected by B1; similarly B2 for S2, and B3 for S3.

For STAs S2 and S3 to decrypt group addressed frames from S1, B1 is sent to S2 and S3. This is done using the 4-Way Handshake initially and using the Group Key Handshake for GTK updates.

The 4-Way Handshake from S1 to S2 allows S1 to send group addressed frames to S2, but does not allow S2 to send group addressed frames to S1 because S2 has a different transmit GTK. Therefore, S2 needs to initiate a 4-Way Handshake to S1 to allow S1 to decrypt S2's group addressed frames. Similarly, S2 also needs to initiate a 4-Way Handshake to S3 to enable S3 to receive group addressed messages from S2.

In a similar manner S3 needs to complete the 4-Way Handshake with S1 and S2 to deliver B3 to S1 and S2.

In this example, there are six 4-Way Handshakes. In general, N Supplicants require $N(N–1)$ 4-Way Handshakes.



S1
S2
S3
4-Way Handshake (S1 Inits)
4-Way Handshake (S1 Inits)
4-Way Handshake (S2 Inits)
4-Way Handshake (S2 Inits)
4-Way Handshake (S3 Inits)
4-Way Handshake (S3 Inits)

Figure 4-22—Sample 4-Way Handshakes in an IBSS

NOTE—In principle the KCK and KEK from a single 4-Way Handshake can be used for the Group Key Handshake in both directions, but using two 4-Way Handshakes means the Authenticator key state machine does not need to be different between IBSS and ESS.

The Group Key Handshake can be used to send the GTKs to the correct STAs. The 4-Way Handshake is used to derive the pairwise key and to send the initial GTK. Because in an IBSS there are two 4-Way Handshakes between any two Supplicants and Authenticators, the pairwise key used between any two STAs is from the 4-Way Handshake initiated by the STA Authenticator with the higher MAC address (see 11.6.1 for the notion of address comparison). The KCK and KEK used for a Group Key Handshake are the KCK and KEK derived by the 4-Way Handshake initiated by the same Authenticator that is initiating the Group Key Handshake.

In an IBSS a secure link exists between two STAs when both 4-Way Handshakes have completed successfully. The Supplicant and Authenticator 4-Way Handshake state machines interact so the IEEE 802.1X variable portValid is not set to 1 until both 4-Way Handshakes complete.

If a fourth STA comes within range and its SME decides to initiate a security association with the three peers, its Authenticator initiates 4-Way Handshakes with each of the other three Supplicants. Similarly, the original three STA Authenticators in the IBSS need to initiate 4-Way Handshakes to the fourth STA Supplicant. A STA learns that a peer STA is RSNA-enabled and the peer’s security policy (e.g., whether the Authentication and Key Management Protocol (AKMP) is SAE, PSK, or IEEE 802.1X authentication) from the Beacon or Probe Response frame. The initiation might start for a number of reasons:

a) The fourth STA receives a Beacon or Probe Response frame from a MAC address with which it has not completed a 4-Way Handshake.

b) An SME receives a MLME-PROTECTEDFRAMEDROPPED.indication primitive from a MAC address with which it has not completed a 4-Way Handshake. This could be a group addressed data frame transmitted by any of the STAs. In order to set up a security association to the peer STA, an SME that does not know the security policy of the peer can send a Probe Request frame to the peer STA to find its security policy before setting up a security association to the peer STA.

c) An SME receives Message 1 of the 4-Way Handshake sent to a STA because the initiator received a broadcast data frame, Beacon frame, or Probe Response frame from that STA. In order to set up a security association to the peer STA, a STA that received a 4-Way Handshake but does not know the security policy of the peer can send a Probe Request frame to the peer STA to find its security policy before setting up a security association to the peer STA.

4.10.4.4 IBSS IEEE 802.1X example

When IEEE 802.1X authentication is used, each STA needs to include an IEEE 802.1X Authenticator and AS. A STA learns that a peer STA is RSNA-enabled and the peer's security policy (e.g., whether the AKMP is PSK or IEEE 802.1X authentication) from the Beacon or Probe Response frame.

Each Supplicant sends an EAPOL-Start message to every other STA to which it intends to authenticate, and each STA's Authenticator responds with the identity of the credential it intends to use.

The EAPOL-Start and EAP-Request/Identity messages are initiated when a protected data frame (indicated via a MLME-PROTECTEDFRAMEDROPPED.indication primitive), an IEEE 802.1X message, Beacon frame, or Probe Response frame is received from a MAC address with which the STA has not completed IEEE 802.1X authentication. In order to set up a security association to the peer STA, an SME that does not know the security policy of the peer can send a Probe Request frame to the peer STA to find its security policy before setting up a security association to the peer STA.

Although Figure 4-23 shows the two IEEE 802.1X exchanges serialized, they may occur interleaved.

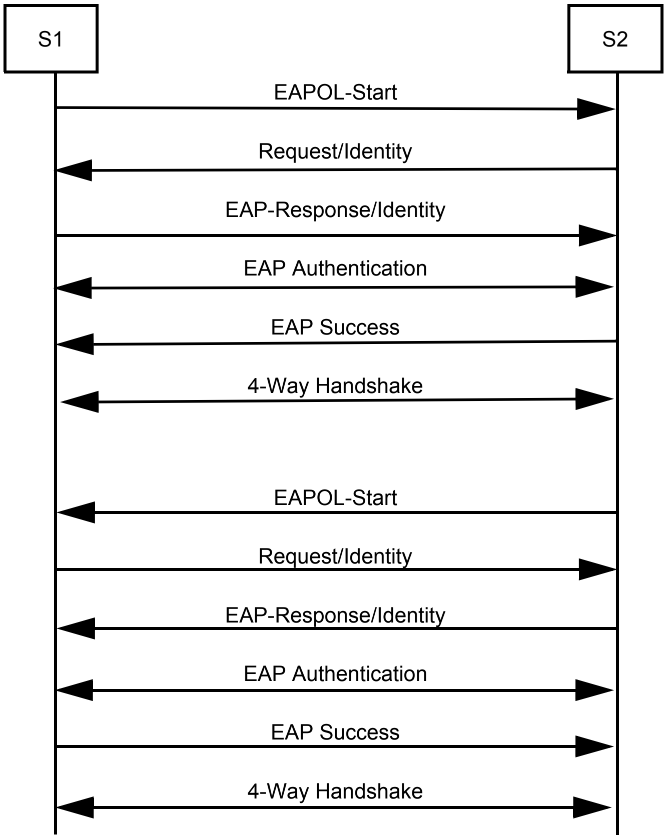


Figure 4-23—Example using IEEE 802.1X authentication

4.10.5 Authenticator-to-AS protocol

The Authenticator-to-AS authentication definition is out of the scope of this standard, but, to provide security assurances, the protocol needs to support the following functions:

a) Mutual authentication between the Authenticator and AS

b) A channel for the Supplicant/AS authentication

c) The ability to pass the generated key from the AS to the Authenticator in a manner that provides authentication of the key source, preserves integrity of the key transfer, and preserves data confidentiality of the key from all other parties

Suitable protocols include, but are not limited to, remote authentication dial-in user service (RADIUS) (IETF RFC 2865-2000 [B31]) and Diameter (IETF RFC 3588-2003 [B36]).

4.10.6 PMKSA caching

The Authenticator and Supplicant may cache PMKSAs, which include the IEEE 802.1X state. A PMKSA can be deleted from the cache for any reason and at any time.

The STA may supply a list of PMK or PSK key identifiers in the (Re)Association Request frame. Each key identifier names a PMKSA; the PMKSA may contain a single PMK. The Authenticator specifies the selected PMK or PSK key identifier in Message 1 of the 4-Way Handshake. The selection of the key identifiers to be included within the (Re)Association Request frame and Message 1 of the 4-Way Handshake is out of the scope of this standard.

4.10.7 Protection of group addressed robust management frames

When management frame protection is negotiated, all group addressed robust management frames are encapsulated using the procedures defined in 10.13. This service provides integrity protection of group addressed robust management frames using BIP.

4.11 Generic advertisement service (GAS)

GAS provides functionality that enables STAs to discover the availability of information related to desired network services, e.g., information about services such as provided in an IBSS, local access services, available subscription service providers (SSPs) and/or SSPNs or other external networks. GAS uses a generic container to advertise network services' information over an IEEE 802.11 network. Public Action frames are used to transport this information.

While the specification of network services information is outside the scope of this standard, in an infrastructure BSS there is a need for STAs to query for information on network services provided by SSPNs or other external networks beyond an AP, before they associate with the wireless LAN. The exchange of information may also be performed after associating to the BSS.

In an IBSS GAS functionality enables a STA to access the availability and information related to desired services provided by other STAs in the IBSS.

There are a number of reasons why providing information to a STA in a preassociated state is beneficial:

— It supports more informed decision making about an IEEE 802.11 infrastructure with which to associate. This is generally more efficient than requiring a non-AP STA to associate with an AP before discovering the information and then deciding whether to stay associated.

— It is possible for the non-AP STA to query multiple networks in parallel.

— The non-AP STA can discover information about APs that are not part of the same administrative group as the AP with which it is associated, supporting the selection of an AP belonging to a different IEEE 802.11 infrastructure that has an appropriate SSP roaming agreement in place.

5. MAC service definition

5.1 Overview of MAC services

5.1.1 Data service

5.1.1.1 General

This service provides peer LLC entities with the ability to exchange MSDUs. To support this service, the local MAC uses the underlying PHY-level services to transport an MSDU to a peer MAC entity, where it is delivered to the peer LLC. Such asynchronous MSDU transport is performed on a connectionless basis. By default, MSDU transport is on a best-effort basis. However, the QoS facility uses a traffic identifier (TID) to specify differentiated services on a per-MSDU basis. The QoS facility also permits more synchronous behavior to be supported on a connection-oriented basis using TSPECs. There are no guarantees that the submitted MSDU will be delivered successfully. Group addressed transport is part of the data service provided by the MAC. Due to the characteristics of the WM, group addressed MSDUs may experience a lower QoS, compared to that of individually addressed MSDUs. All STAs support the data service, but only QoS STAs in a QoS BSS differentiate their MSDU delivery according to the designated traffic category or traffic stream (TS) of individual MSDUs.

Because operation of certain functions of the MAC may cause reordering of some MSDUs, as discussed in more detail below, in non-QoS STAs, there are two service classes within the data service. By selecting the desired service class, each LLC entity initiating the transfer of MSDUs is able to control whether MAC entities are or are not allowed to reorder those MSDUs.

There are two service classes available in a QoS STA: QoSAck and QoSNoAck. The service classes are used to signal if the MSDU is to be transmitted with or without using the MAC-level acknowledgment.

In QoS STAs either associated in a BSS or having membership in an IBSS, the MAC uses a set of rules that tends to cause higher UP MSDUs in a BSS to be sent before lower UP MSDUs in the BSS. The MAC sublayer entities determine the UPs for MSDUs based on the TID values provided with those MSDUs. If a TSPEC has been provided for a TS, via the MAC sublayer management entity, the MAC attempts to deliver MSDUs belonging to that TS in accordance with the QoS parameter values contained in the TSPEC. In a BSS with some STAs supporting the QoS facility and others not supporting the QoS facility, in delivering an MSDU to a non-QoS STA, the QoS STA uses the access category (AC) corresponding to the UP of the MSDU.

5.1.1.2 Determination of UP

The QoS facility supports eight priority values, referred to as *UPs*. The values a UP may take are the integer values from 0 to 7 and are identical to the IEEE 802.1D priority tags. An MSDU with a particular UP is said to belong to a traffic category (TC) with that UP. The UP is provided with each MSDU at the medium access control service access point (MAC_SAP) either directly, in the UP parameter, or indirectly, in a TSPEC designated by the UP parameter.

5.1.1.3 Determination of UP of received frames at the AP sent by other STAs in the BSS

The received individually addressed frames at the AP may be as follows:

a) Non-QoS subtypes, in which case the AP shall assign to them a priority of Contention, if they are received during the contention period (CP), or ContentionFree, if they are received during the contention-free period (CFP).
b) QoS subtypes, in which case the AP shall infer the UP value from the TID in the QoS Control field directly for TID values between 0 and 7. For TID values between 8 and 15 the AP shall extract the

UP value in the UP subfield of the TS Info field in the associated TSPEC or from the UP field in the associated TCLAS (traffic classification) element, as applicable.

QoS APs deliver the UP with the received MSDUs to the DS.

5.1.1.4 Interpretation of priority parameter in MAC service primitives

The value of the priority parameter in the MAC service primitives (see 5.2) may be a noninteger value of either Contention or ContentionFree or may be any integer value in the range 0 to 15.

When the priority parameter has an integer value, it is used in the TID subfields that appear in certain frames that are used to deliver and to control the delivery of QoS data across the WM.

Priority parameter and TID subfield values 0 to 7 are interpreted as UPs for the MSDUs. Outgoing MSDUs with UP values 0 to 7 are handled by MAC entities at STAs in accordance with the UP.

Priority parameter and TID subfield values 8 to 15 specify TIDs that are also TS identifiers (TSIDs) and select the TSPEC for the TS designated by the TID. Outgoing MSDUs with priority parameter values 8 to 15 are handled by MAC entities at STAs in accordance with the UP value determined from the UP subfield as well as other parameter values in the selected TSPEC. When an MSDU arrives with a priority value between 8 and 15 and for which there is no TSPEC defined, then the MSDU shall be sent with priority parameter set to 0.

The noninteger values of the priority parameter are allowed at all non-QoS STAs. The use of priority value of ContentionFree is deprecated at QoS STAs. The integer values of the priority parameter (i.e., TID) are supported only at QoS STAs that are either associated in an infrastructure QoS BSS or members of a QoS IBSS. A range of 0 to 15 is supported by QoS STAs associated in a QoS BSS; whereas a range of 0 to 7 is supported by QoS STAs that are members of a QoS IBSS. If a QoS STA is associated in a non-QoS BSS, the STA is functioning as a non-QoS STA, so the priority value is always Contention or ContentionFree.

At QoS STAs associated in a QoS BSS, MSDUs with a priority of Contention are considered equivalent to MSDUs with TID 0, and those with a priority of ContentionFree are delivered using the contention-free delivery if a point coordinator (PC) is present in the AP. If a PC is not present, MSDUs with a priority of ContentionFree shall be delivered using an UP of 0. At STAs associated in a non-QoS BSS, all MSDUs with an integer priority are considered equivalent to MSDUs with a priority of Contention.

If a STA is associated in a QoS BSS, the MSDUs it receives in QoS data frames are reported with the TID value contained in the MAC header of that frame. The MSDUs such a STA receives in non-QoS data frames are reported to LLC with a priority of Contention, if they are received during the CP, or ContentionFree, if they are received during the CFP.

5.1.1.5 Interpretation of service class parameter in MAC service primitives in a STA

In QoS STAs, the value of the service class parameter in the MAC service primitive (see 5.2) may be a noninteger value of QoSAck or QoSNoAck.

When an MSDU is received from the MAC_SAP and the recipient STA is a QoS STA with the service class set to

- QoSAck, the MSDU is transmitted using a QoS data frame with the Ack Policy subfield in the QoS Control field set to either Normal Ack (normal acknowledgement) or Block Ack.
- QoSNoAck, the MSDU is transmitted using a QoS data frame with the Ack Policy subfield in the QoS Control field set to No Ack (no acknowledgement). If the sender STA is contained within an AP and the frame has a group DA, then the MSDU is buffered for transmission and is also sent to the DS.

When an MSDU is received from the MAC_SAP and the recipient STA is not a QoS STA, the MSDU is transmitted using a non-QoS data frame.

When a QoS data frame is received from another STA, the service class parameter in the MA-UNITDATA.indication primitive is set to

- QoSAck, if the frame is a QoS data frame with the Ack Policy subfield in the QoS Control field equal to either Normal Ack or Block Ack.
- QoSNoAck, if the frame is a QoS data frame with the Ack Policy subfield in the QoS Control field equal to No Ack. This service class is also used where the DA parameter is a group address.

When a non-QoS data frame is received from a STA, the service class parameter in the MA-UNITDATA.indication primitive is set to

- QoSAck, if the frame is an individually addressed frame and is acknowledged by the STA.
- QoSNoAck, if the frame is a group addressed frame and is not acknowledged by the STA.

Note that the group addressed frames sent by a non-QoS STA are not acknowledged regardless of the value of the service class parameter in the MA-UNITDATA.indication primitive.

5.1.2 Security services

Security services in IEEE Std 802.11 are provided by the authentication service and the CCMP and BIP mechanisms. The scope of the security services provided is limited to station-to-station data and robust management frame transmissions. When CCMP is used, the data confidentiality service is provided for data frames and individually addressed robust management frames. For the purposes of this standard, CCMP is viewed as a logical service located within the MAC sublayer as shown in the reference model, Figure 4-14 (in 4.9). Actual implementations of CCMP are transparent to the LLC and other layers above the MAC sublayer.

The security services provided by CCMP in IEEE Std 802.11 are as follows:

a) Data Confidentiality;
b) Authentication; and
c) Access control in conjunction with layer management.

BIP provides message integrity and access control for group addressed robust management frames.

During the authentication exchange, both parties exchange authentication information as described in Clause 11 and Clause 12.

The MAC sublayer security services provided by CCMP and BIP rely on information from nonlayer-2 management or system entities. Management entities communicate information to CCMP and BIP through a set of MAC sublayer management entity (MLME) interfaces and MIB attributes; in particular, the decision tree for CCMP and BIP defined in 11.8 is driven by MIB attributes.

The use of WEP for confidentiality, authentication, or access control is deprecated. The WEP algorithm is unsuitable for the purposes of this standard.

The use of TKIP is deprecated. The TKIP algorithm is unsuitable for the purposes of this standard.

A STA that has associated with management frame protection enabled shall not use pairwise cipher suite selectors WEP-40, WEP-104, TKIP, or “Use Group cipher suite.”

A mesh STA with dot11MeshSecurityActivated equal to true shall not use the pairwise cipher suite selectors WEP-40, WEP-104, or TKIP.

5.1.3 MSDU ordering

The services provided by the MAC sublayer permit, and may in certain cases require, the reordering of MSDUs.

In a non-QoS STA, the MAC does not intentionally reorder MSDUs except as may be necessary to improve the likelihood of successful delivery based on the current operational ("power management," FMS, DMS) mode of the designated recipient STA(s). The sole effect of this reordering (if any), for the set of MSDUs received at the MAC service interface of any single STA, is a change in the delivery order of group addressed MSDUs, relative to individually addressed MSDUs, originating from a single source STA address. If a higher layer protocol using the data service cannot tolerate this possible reordering, the optional StrictlyOrdered service class should be used. MSDUs transferred between any pair of STAs using the StrictlyOrdered service class are not subject to the relative reordering that is possible when the ReorderableGroupAddressed service class is used. However, the desire to receive MSDUs sent using the StrictlyOrdered service class at a STA precludes simultaneous use of the MAC power management facilities at that STA.

In QoS STAs operating in a BSS, there are two service classes, designated as QoSAck and QoSNoAck (see 5.1.1.5 for more information). The MSDUs are reordered, not only to improve the likelihood of successful delivery based on the current operational mode of the designated recipient STA(s), but also to honor the priority parameters, specified in the MA-UNITDATA.request primitive, of the individual MSDUs. The effects of this reordering (if any), for the set of MSDUs received at the MAC service interface of any single STA, are:

a) A change in the delivery order of group addressed MSDUs, relative to individually addressed MSDUs,
b) The reordering of MSDUs with different TID values, originating from a single source STA address, and
c) The reordering of group addressed MSDUs with the same TID but different service classes.

There shall be no reordering of individually addressed MSDUs with the same TID value and addressed to the same destination.

STAs operating in a non-QoS BSS shall follow the reordering rules as defined for a non-QoS STA.

In order for the MAC to operate properly, the DS needs to meet the requirements of ISO/IEC 15802-1:1995.

Operational restrictions that provide the appropriate ordering of MSDUs are specified in 9.8.

5.1.4 MSDU format

This standard is part of the IEEE 802 family of LAN standards, and as such all MSDUs are LLC PDUs as defined in ISO/IEC 8802-2: 1998. In order to achieve interoperability, implementers are recommended to apply the procedures described in ISO/IEC Technical Report 11802-5:1997(E) (previously known as IEEE Std 802.1H-1997 [B21]), along with a selective translation table (STT) that handles a few specific network protocols, with specific attention to the operations required when passing MSDUs to or from LANs or operating system components that use the Ethernet frame format. Note that such translations may be required in a STA.

5.1.5 MAC data service architecture

The MAC data plane architecture (i.e., processes that involve transport of all or part of an MSDU) is shown in Figure 5-1. During transmission, an MSDU goes through some or all of the following processes: MSDU rate limiting, aggregate MSDU (A-MSDU) aggregation, frame delivery deferral during power save mode, sequence number assignment, fragmentation, encryption, integrity protection, frame formatting, and aggregate MAC protocol data unit (A-MPDU) aggregation. IEEE Std 802.1X-2004 may block the MSDU at the Controlled Port. At some point, the data frames that contain all or part of the MSDU are queued per AC/TS.

During reception, a received data frame goes through processes of possible A-MPDU deaggregation, MPDU header and cyclic redundancy code (CRC) validation, duplicate removal, possible reordering if the Block Ack mechanism is used, decryption, defragmentation, integrity checking, and replay detection. After replay detection (or defragmentation if security is not used), possible A-MSDU deaggregation, and possible MSDU rate limiting, one or more MSDUs are, delivered to the MAC_SAP or to the DS. The IEEE 802.1X Controlled/Uncontrolled Ports discard any received MSDU if the Controlled Port is not enabled and if the MSDU does not represent an IEEE 802.1X frame. Frame order enforcement provided by the enhanced data cryptographic encapsulation mechanisms occurs after decryption, but prior to MSDU defragmentation; therefore, defragmentation fails if MPDUs arrive out of order.

Figure 5-1—MAC data plane architecture

5.2 MAC data service specification

5.2.1 General

The IEEE 802.11 MAC supports the following service primitives as defined in ISO/IEC 8802-2: 1998:

- MA-UNITDATA.request
- MA-UNITDATA.indication
- MA-UNITDATA-STATUS.indication

The LLC definitions of the primitives and specific parameter value restrictions imposed by IEEE Std 802.11 are given in 5.2.2 to 5.2.4.

5.2.2 MA-UNITDATA.request

5.2.2.1 Function

This primitive requests a transfer of an MSDU from a local LLC sublayer entity to a single peer LLC sublayer entity, or multiple peer LLC sublayer entities in the case of group addresses.

5.2.2.2 Semantics of the service primitive

The parameters of the primitive are as follows:

```
MA-UNITDATA.request(
                        source address,
                        destination address,
                        routing information,
                        data,
                        priority,
                        service class
                        )
```

The source address (SA) parameter specifies an individual MAC sublayer address of the sublayer entity from which the MSDU is being transferred.

The destination address (DA) parameter specifies either an individual or a group MAC sublayer entity address.

The routing information parameter specifies the route desired for the data transfer (a null value indicates source routing is not to be used). For IEEE Std 802.11, the routing information parameter shall be null.

The data parameter specifies the MSDU to be transmitted by the MAC sublayer entity. For IEEE Std 802.11, the length of the MSDU shall be less than or equal to 2304 octets.

The priority parameter specifies the priority desired for the data unit transfer. The allowed values of priority are described in 5.1.1.4.

The service class parameter specifies the service class desired for the data unit transfer. The allowed values of service class are described in 5.1.1.5 and 5.1.3.

5.2.2.3 When generated

This primitive is generated by the LLC sublayer entity when an MSDU is to be transferred to a peer LLC sublayer entity or entities.

5.2.2.4 Effect of receipt

On receipt of this primitive, the MAC sublayer entity determines whether it is able to fulfill the request according to the requested parameters. A request that cannot be fulfilled according to the requested parameters is discarded, and this action is indicated to the LLC sublayer entity using an MA-UNITDATA-STATUS.indication primitive that describes why the MAC was unable to fulfill the request. If the request can be fulfilled according to the requested parameters, the MAC sublayer entity appends all MAC specified fields (including DA, SA, FCS, and all fields that are unique to IEEE Std 802.11), passes the properly formatted frame to the lower layers for transfer to a peer MAC sublayer entity or entities (see 5.1.4), and indicates this action to the LLC sublayer entity using an MA-UNITDATA-STATUS.indication primitive with transmission status set to Successful.

At an AP for which dot11SSPNInterfaceActivated is true, upon receipt of an MA-UNITDATA.request primitive having an individually addressed destination address and a priority of Contention or ContentionFree, the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationMaxAuthBestEffortRate in the dot11InterworkingEntry identified by the destination MAC address of the frame to be transmitted. The specific mechanism to perform rate limiting is outside the scope of this specification.

— If the rate limiting mechanism does not discard the frame, then dot11NonAPStationBestEffortMSDUCount shall be incremented by 1 and dot11NonAPStationBestEffortOctetCount shall be incremented by the number of octets in the MSDU.
— If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedBestEffortMSDUCount shall be incremented by 1 and dot11NonAPStationDroppedBestEffortOctetCount shall be incremented by the number of octets in the MSDU.

At an AP for which dot11SSPNInterfaceActivated is true, upon receipt of an MA-UNITDATA.request primitive having an individually addressed destination address for which the priority is an integer in the range of 0 to 7, inclusive, then the AP's MAC sublayer shall derive the access category from the priority using the mapping in Table 9-1. The AP's MAC sublayer shall retrieve the MIB variables listed below from the dot11InterworkingEntry identified by the destination MAC address of the frame to be transmitted and perform the following operations:

— If the access category is AC_VO, then the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationMaxAuthVoiceRate; the specific mechanism to perform rate limiting is outside the scope of this specification. If the rate limiting mechanism does not discard the frame, then dot11NonAPStationVoiceMSDUCount shall be incremented by 1 and dot11NonAPStationVoiceOctetCount shall be incremented by the number of octets in the MSDU. If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedVoiceMSDUCount shall be incremented by 1 and dot11NonAPStationDroppedVoiceOctetCount shall be incremented by the number of octets in the MSDU.
— If the access category is AC_VI, then the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationMaxAuthVideoRate; the specific mechanism to perform rate limiting is outside the scope of this specification. If the rate-limiting mechanism does not discard the frame, then dot11NonAPStationVideoMSDUCount shall be incremented by 1 and dot11NonAPStationVideoOctetCount shall be incremented by the number of octets in the MSDU. If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedVideoMSDUCount shall be incremented by 1 and dot11NonAPStationDroppedVideoOctetCount shall be incremented by the number of octets in the MSDU.
— If the access category is AC_BE, then the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationMaxAuthBestEffortRate; the specific mechanism to perform rate limiting is outside the scope of this specification. If the rate-limiting mechanism does not discard the frame, then dot11NonAPStationBestEffortMSDUCount shall be incremented by 1 and dot11NonAPStationBestEffortOctetCount shall be incremented by the number of octets in the MSDU. If the rate limiting mechanism discards the frame, then

dot11NonAPStationDroppedBestEffortMSDUCount shall be incremented by 1 and dot11NonAPStationDroppedBestEffortOctetCount shall be incremented by the number of octets in the MSDU.

- If the access category is AC_BK, then the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationMaxAuthBackgroundRate; the specific mechanism to perform rate limiting is outside the scope of this specification. If the rate-limiting mechanism does not discard the frame, then dot11NonAPStationBackgroundMSDUCount shall be incremented by 1 and dot11NonAPStationBackgroundOctetCount shall be incremented by the number of octets in the MSDU. If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedBackgroundMSDUCount shall be incremented by 1 and dot11NonAPStationDroppedBackgroundOctetCount shall be incremented by the number of octets in the MSDU.

At an AP for which dot11SSPNInterfaceActivated is true, upon receipt of an MA-UNITDATA.request primitive having an individually addressed destination address whose priority is an integer in the range of 8 to 15, inclusive, then the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationAuthMaxHCCAHEMMRate; the specific mechanism to perform rate limiting is outside the scope of this specification.

- If the rate-limiting mechanism does not discard the frame, then dot11NonAPStationHCCAHEMM-MSDUCount shall be incremented by 1, and dot11NonAPStationHCCAHEMMOctetCount shall be incremented by the number of octets in the MSDU.
- If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedHCCAHEMM-MSDUCount shall be incremented by 1 and dot11NonAPStationDroppedHCCAHEMMOctetCount shall be incremented by the number of octets in the MSDU.

5.2.3 MA-UNITDATA.indication

5.2.3.1 Function

This primitive defines the transfer of an MSDU from the MAC sublayer entity to the LLC sublayer entity, or entities in the case of group addresses. In the absence of error, the contents of the data parameter are logically complete and unchanged relative to the data parameter in the associated MA-UNITDATA.request primitive.

5.2.3.2 Semantics of the service primitive

The parameters of the primitive are as follows:

```
MA-UNITDATA.indication(
                        source address,
                        destination address,
                        routing information,
                        data,
                        reception status,
                        priority,
                        service class
                        )
```

The SA parameter is an individual address as specified by the SA field of the incoming frame.

The DA parameter is either an individual or a group address as specified by the DA field of the incoming frame.

The routing information parameter specifies the route that was used for the data transfer. The MAC sublayer entity shall set this field to null.

The data parameter specifies the MSDU as received by the local MAC entity.

The reception status parameter indicates the success or failure of the received frame for those frames that IEEE Std 802.11 reports via a MA-UNITDATA.indication primitive. This MAC always reports "success" because all failures of reception are discarded without generating MA-UNITDATA.indication primitive.

The priority parameter specifies the receive processing priority that was used for the data unit transfer. The allowed values of priority are described in 5.1.1.4.

The service class parameter specifies the receive service class that was used for the data unit transfer. The allowed values of service class are described in 5.1.1.5 and 5.1.3.

5.2.3.3 When generated

The MA-UNITDATA.indication primitive is passed from the MAC sublayer entity to the LLC sublayer entity or entities to indicate the arrival of a frame at the local MAC sublayer entity. Frames are reported only if they are validly formatted at the MAC sublayer, received without error, received with valid (or null) security and integrity information, and their destination address designates the local MAC sublayer entity.

5.2.3.4 Effect of receipt

The effect of receipt of this primitive by the LLC sublayer is dependent on the content of the MSDU.

At an AP for which dot11SSPNInterfaceActivated is true, upon receipt of a frame of type data having a group DA, the AP's MAC sublayer shall discard the frame if dot11NonAPStationAuthSourceMulticast is false in the dot11InterworkingEntry identified by the source MAC address of the received frame. If dot11NonAPStationAuthSourceMulticast is true, the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationAuthMaxSourceMulticastRate in the dot11InterworkingEntry identified by the source MAC address of the received frame. The specific mechanism to perform rate limiting is outside the scope of this specification.

— If the rate limiting mechanism does not discard the frame, then dot11NonAPStationMulticast-MSDUCount shall be incremented by 1 and dot11NonAPStationMulticastOctetCount shall be incremented by the number of octets in the MSDU.
— If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedMulticast-MSDUCount. shall be incremented by 1 and dot11NonAPStationDroppedMulticastOctetCount. shall be incremented by the number of octets in the MSDU.

At an AP for which dot11SSPNInterfaceActivated is true, upon receipt of an individually addressed frame of type data and a priority of Contention or ContentionFree, then the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationMaxAuthBestEffortRate in the dot11InterworkingEntry identified by the source MAC address of the received frame. The specific mechanism to perform rate limiting is outside the scope of this specification.

— If the rate limiting mechanism does not discard the frame, then dot11NonAPStationBestEffort-MSDUCount shall be incremented by 1 and dot11NonAPStationBestEffortOctetCount shall be incremented by the number of octets in the MSDU.
— If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedBestEffort-MSDUCount shall be incremented by 1 and dot11NonAPStationDroppedBestEffortOctetCount shall be incremented by the number of octets in the MSDU.

At an AP for which dot11SSPNInterfaceActivated is true, upon receipt of an individually addressed frame of type data, for which the priority is an integer in the range of 0 to 7, inclusive, then the AP's MAC sublayer shall derive the access category from the priority using the mapping in Table 9-1. The AP's MAC sublayer shall retrieve the MIB variables from the dot11InterworkingEntry identified by the source MAC address of the received frame and perform the following operations:

- If the access category is AC_VO, then the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationMaxAuthVoiceRate; the specific mechanism to perform rate limiting is outside the scope of this specification. If the rate-limiting mechanism does not discard the frame, then dot11NonAPStationVoiceMSDUCount shall be incremented by 1 and dot11NonAPStationVoiceOctetCount shall be incremented by the number of octets in the MSDU. If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedVoiceMSDUCount shall be incremented by 1 and dot11NonAPStationDroppedVoiceOctetCount shall be incremented by the number of octets in the MSDU.
- If the access category is AC_VI, then the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationMaxAuthVideoRate; the specific mechanism to perform rate limiting is outside the scope of this specification. If the rate-limiting mechanism does not discard the frame, then dot11NonAPStationVideoMSDUCount shall be incremented by 1 and dot11NonAPStationVideoOctetCount shall be incremented by the number of octets in the MSDU. If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedVideoMSDUCount shall be incremented by 1 and dot11NonAPStationDroppedVideoOctetCount shall be incremented by the number of octets in the MSDU.
- If the access category is AC_BE, then the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationMaxAuthBestEffortRate; the specific mechanism to perform rate limiting is outside the scope of this specification. If the rate-limiting mechanism does not discard the frame, then dot11NonAPStationBestEffortMSDUCount shall be incremented by 1 and dot11NonAPStationBestEffortOctetCount shall be incremented by the number of octets in the MSDU. If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedBestEffortMSDUCount shall be incremented by 1 and dot11NonAPStationDroppedBestEffortOctetCount shall be incremented by the number of octets in the MSDU.
- If the access category is AC_BK, then the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationMaxAuthBackgroundRate; the specific mechanism to perform rate limiting is outside the scope of this specification. If the rate-limiting mechanism does not discard the frame, then dot11NonAPStationBackgroundMSDUCount shall be incremented by 1 and dot11NonAPStationBackgroundOctetCount shall be incremented by the number of octets in the MSDU. If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedBackgroundMSDUCount shall be incremented by 1 and dot11NonAPStationDroppedBackgroundOctetCount shall be incremented by the number of octets in the MSDU.

At an AP for which dot11SSPNInterfaceActivated is true, upon receipt of an individually addressed frame of type data for which the priority is an integer in the range of 8 to 15, inclusive, the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationAuthMaxHCCAHEMMRate; the specific mechanism to perform rate limiting is outside the scope of this specification.

- If the rate-limiting mechanism does not discard the frame, then dot11NonAPStationHCCAHEMMMSDUCount shall be incremented by 1, and dot11NonAPStationHCCAHEMMOctetCount shall be incremented by the number of octets in the MSDU.
- If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedHCCAHEMMMSDUCount shall be incremented by 1 and dot11NonAPStationDroppedHCCAHEMMOctetCount shall be incremented by the number of octets in the MSDU.

5.2.4 MA-UNITDATA-STATUS.indication

5.2.4.1 Function

This primitive has local significance and provides the LLC sublayer with status information for the corresponding preceding MA-UNITDATA.request primitive.

5.2.4.2 Semantics of the service primitive

The parameters of the primitive are as follows:

```
MA-UNITDATA-STATUS.indication(
                                   source address,
                                   destination address,
                                   transmission status,
                                   provided priority,
                                   provided service class
                                   )
```

The SA parameter is an individual MAC sublayer entity address as specified in the associated MA-UNITDATA.request primitive.

The DA parameter is either an individual or group MAC sublayer entity address as specified in the associated MA-UNITDATA.request primitive.

The transmission status parameter is used to pass status information back to the local requesting LLC sublayer entity. IEEE Std 802.11 specifies the following values for transmission status:

a) Successful.

b) Undeliverable (excessive data length).

c) Undeliverable (non-null source routing).

d) Undeliverable: unsupported priority (for priorities other than Contention or ContentionFree at a non-QoS STA; or for priorities other than Contention, ContentionFree, or an integer between and including 0 and 15 at a QoS STA).

e) Undeliverable: unsupported service class (for service classes other than ReorderableGroupAddressed or StrictlyOrdered for non-QoS STAs and service classes other than QoSAck or QoSNoAck for QoS STAs).

f) Unavailable priority (for ContentionFree when no PC or HC is available, or an integer between and including 1 and 15 at a STA that is associated in a non-QoS BSS, or an integer between and including 8 and 15 at a STA that is a member of an IBSS, in which case the MSDU is transmitted with a provided priority of Contention).

g) Undeliverable: unavailable service class (for StrictlyOrdered service when the STA's power management mode is other than "active" for non-QoS STAs; QoS STAs do not return this value as they do not provide the StrictlyOrdered service).

h) Undeliverable (no BSS available).

i) Undeliverable (cannot encrypt with a null key).

j) At a STA where dot11RejectUnadmittedTraffic is true, Undeliverable: un-admitted traffic (for a requested priority between and including 0 and 7 at a STA because there is no admitted TS for this priority and admission control is required for the AC).

k) For an AP in which dot11SSPNInterfaceActivated is true, Undeliverable (violation of limit specified by dot11NonAPStationMaxAuthVoiceRate in the dot11InterworkingTable for the non-AP STA identified by the destination address of the MA-UNITDATA.request primitive).

l) For an AP in which dot11SSPNInterfaceActivated is true, Undeliverable (violation of limit specified by dot11NonAPStationMaxAuthVideoRate in the dot11InterworkingTable for the non-AP STA identified by the destination address of the MA-UNITDATA.request primitive).

m) For an AP in which dot11SSPNInterfaceActivated is true, Undeliverable (violation of limit specified by dot11NonAPStationMaxAuthBestEffortRate in the dot11InterworkingTable for the non-AP STA identified by the destination address of the MA-UNITDATA.request primitive).

n) For an AP in which dot11SSPNInterfaceActivated is true, Undeliverable (violation of limit specified by dot11NonAPStationBackgroundRate in the dot11InterworkingTable for the non-AP STA identified by the destination address of the MA-UNITDATA.request primitive).

o) For an AP in which dot11SSPNInterfaceActivated is true, Undeliverable (violation of limit specified by dot11nonAPStationAuxMaxHCCAHEMMrate in the dot11InterworkingTable for the non-AP STA identified by the destination address of the MA-UNITDATA.request primitive).

If the transmission status parameter is Successful, the provided priority parameter specifies the priority used for the associated data unit transfer (Contention, ContentionFree, or an integer between and including 0 and 15); otherwise the provided priority parameter is not present.

If the transmission status parameter is Successful, the provided service class parameter specifies the class of service for the associated data unit transfer; otherwise the provided service class parameter is not present. In non-QoS STAs, the value of this parameter is ReorderableGroupAddressed or StrictlyOrdered. In QoS STAs, it is QoSAck or QoSNoAck.

5.2.4.3 When generated

The MA-UNITDATA-STATUS.indication primitive is passed from the MAC sublayer entity to the LLC sublayer entity to indicate the status of the service provided for the corresponding MA-UNITDATA.request primitive.

5.2.4.4 Effect of receipt

The effect of receipt of this primitive by the LLC sublayer is dependent upon the type of operation employed by the LLC sublayer entity.

6. Layer management

6.1 Overview of management model

Both the MAC sublayer and PHY conceptually include management entities, called MLME and PLME, respectively. These entities provide the layer management service interfaces through which layer management functions are invoked.

In order to provide correct MAC operation, an SME is present within each STA. The SME is a layer-independent entity that resides in a separate management plane or resides "off to the side." Some of the functions of the SME are specified in this standard. Typically this entity is responsible for such functions as the gathering of layer-dependent status from the various layer management entities (LMEs), and similarly setting the value of layer-specific parameters. The SME would typically perform such functions on behalf of general system management entities and would implement standard management protocols. Figure 4-14 (in 4.9) depicts the relationship among management entities.

The various entities within this model interact in various ways. Certain of these interactions are defined explicitly within this standard, via a SAP across which defined primitives are exchanged. This definition includes the GET and SET operations between MLME, PLME and SME as well as other individually defined service primitives, represented as double arrows within Figure 6-1. Other interactions are not defined explicitly within this standard, such as the interfaces between the MAC and MLME and between the PLME and PLCP and PMD; the specific manner in which these MAC and PHY LMEs are integrated into the overall MAC sublayer and PHY is not specified within this standard.

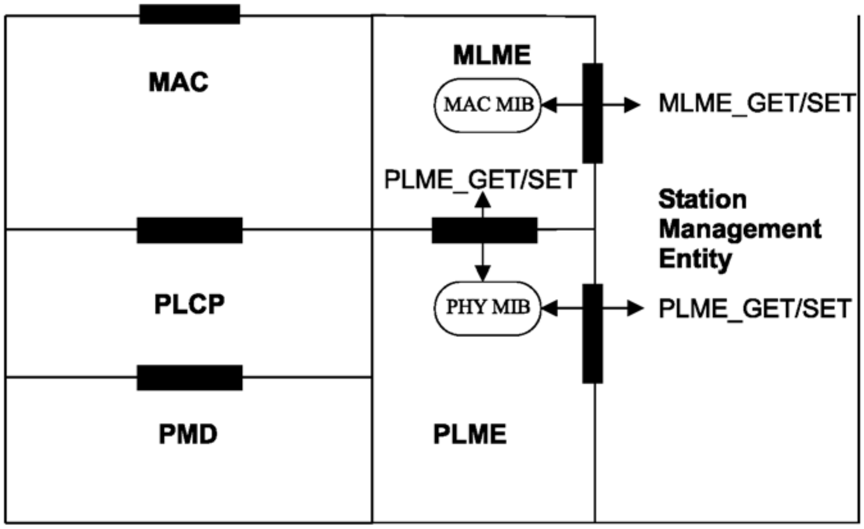

Figure 6-1—GET and SET operations

The management SAPs within this model are the following:

- SME-MLME SAP
- SME-PLME SAP
- MLME-PLME SAP

The latter two SAPs support identical primitives, and in fact might be viewed as a single SAP (called the PLME SAP) that is used either directly by MLME or by SME. In this fashion, the model reflects what is anticipated to be a common implementation approach in which PLME functions are controlled by the MLME (on behalf of SME).

6.2 Generic management primitives

The management information specific to each layer is represented as a MIB for that layer. The MLME and PLME are viewed as "containing" the MIB for that layer. The generic model of MIB-related management primitives exchanged across the management SAPs is to allow the SAP user-entity to either GET the value of a MIB attribute, or to SET the value of a MIB attribute. The invocation of a SET.request primitive might require that the layer entity perform certain defined actions.

Figure 6-1 depicts these generic primitives.

The GET and SET primitives are represented as REQUESTs with associated CONFIRM primitives. These primitives are prefixed by MLME or PLME depending upon whether the MAC sublayer or PHY management SAP is involved. In the following, XX denotes MLME or PLME:

XX-GET.request(MIBattribute)

Requests the value of the given MIBattribute.

XX-GET.confirm(status, MIBattribute, MIBattributevalue)

Returns the appropriate MIB attribute value if status = "success," otherwise returns an error indication in the Status field. Possible error status values include "invalid MIB attribute" and "attempt to get write-only MIB attribute."

XX-SET.request(MIBattribute, MIBattributevalue)

Requests that the indicated MIB attribute be set to the given value. If this MIBattribute implies a specific action, then this requests that the action be performed.

XX-SET.confirm(status, MIBattribute)

If status = "success," this confirms that the indicated MIB attribute was set to the requested value; otherwise it returns an error condition in status field. If this MIBattribute implies a specific action, then this confirms that the action was performed. Possible error status values include "invalid MIB attribute" and "attempt to set read-only MIB attribute."

Additionally, there are certain requests that can be invoked across a given SAP that do not involve the setting or getting of a specific MIB attribute. One of these is supported by each SAP, as follows:

- XX-RESET.request: where XX is MLME or PLME as appropriate

This service is used to initialize the management entities, the MIBs, and the datapath entities. It might include a list of attributes for items to be initialized to nondefault values.

Other SAP-specific primitives are identified in 6.3.

6.3 MLME SAP interface

6.3.1 Introduction

The services provided by the MLME to the SME are specified in this subclause. These services are described in an abstract way (following the model described in ITU-T Recommendation X.210 [B50]) and do not imply any particular implementation or exposed interface. MLME SAP primitives are of the general form ACTION.request followed by ACTION.confirm (for an exchange initiated by the SAP client) and

ACTION.indication followed by ACTION.response (for an exchange initiated by the MLME). The SME uses the services provided by the MLME through the MLME SAP.

6.3.2 Power management

6.3.2.1 Introduction

This mechanism supports the process of establishment and maintenance of the power management mode of a STA.

6.3.2.2 MLME-POWERMGT.request

6.3.2.2.1 Function

This primitive requests a change in the power management mode.

6.3.2.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-POWERMGT.request(
                              PowerManagementMode,
                              WakeUp,
                              ReceiveDTIMs
                              )
```

Name	Type	Valid range	Description
PowerManagementMode	Enumeration	ACTIVE, POWER_SAVE	An enumerated type that describes the desired power management mode of the STA.
WakeUp	Boolean	true, false	When true, the MAC is forced immediately into the Awake state. This parameter has no effect if the current power management mode is ACTIVE.
ReceiveDTIMs	Boolean	true, false	When true, this parameter causes the STA to awaken to receive all DTIM frames. When false, the STA is not required to awaken for every DTIM frame.

6.3.2.2.3 When generated

This primitive is generated by the SME to implement the power-saving strategy of an implementation.

6.3.2.2.4 Effect of receipt

This request sets the STA’s power management parameters. The MLME subsequently issues a MLME-POWERMGT.confirm primitive that reflects the results of the power management change request.

6.3.2.3 MLME-POWERMGT.confirm

6.3.2.3.1 Function

This primitive confirms the change in power management mode.

6.3.2.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-POWERMGT.confirm(
    ResultCode
)

Name	Type	Valid range	Description
ResultCode	Enumeration	SUCCESS, NOT_SUPPORTED	Indicates the result of the MLME-POWERMGT.request.

6.3.2.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-POWERMGT.request primitive to establish a new power management mode. It is not generated until the change has completed as defined in 10.2.1.

6.3.2.3.4 Effect of receipt

The SME is notified of the change of power management mode.

6.3.3 Scan

6.3.3.1 Introduction

This mechanism supports the process of determining the characteristics of the available BSSs.

6.3.3.2 MLME-SCAN.request

6.3.3.2.1 Function

This primitive requests a survey of potential BSSs that the STA can later elect to try to join.

6.3.3.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-SCAN.request(
    BSSType,
    BSSID,
    SSID,
    ScanType,
    ProbeDelay,
    ChannelList,
    MinChannelTime,
    MaxChannelTime,
    RequestInformation,
    SSID List,
    ChannelUsage,
    AccessNetworkType,
    HESSID,
    MeshID,
    VendorSpecificInfo
)

Name	Type	Valid range	Description
BSSType	Enumeration	INFRASTRUCTURE, INDEPENDENT, MESH, ANY_BSS	Determines whether infrastructure BSS, IBSS, MBSS, or all, are included in the scan.
BSSID	MACAddress	Any valid individual or broadcast MAC address	Identifies a specific or wildcard BSSID.
SSID	Octet string	0–32 octets	Specifies the desired SSID or the wildcard SSID.
ScanType	Enumeration	ACTIVE, PASSIVE	Indicates either active or passive scanning.
ProbeDelay	Integer	N/A	Delay (in microseconds) to be used prior to transmitting a Probe frame during active scanning.
ChannelList	Ordered set of integers	Each channel is selected from the valid channel range for the appropriate PHY and carrier set.	Specifies a list of channels that are examined when scanning for a BSS.
MinChannelTime	Integer	N/A	The minimum time (in TU) to spend on each channel when scanning.
MaxChannelTime	Integer	≥ MinChannelTime	The maximum time (in TU) to spend on each channel when scanning.
RequestInformation	As defined in 8.4.2.13	As defined in 8.4.2.13	This element is optionally present if dot11RadioMeasurementActivated is true and is placed in a Probe Request frame to request that the responding STA include the requested information in the Probe Response frame.
SSID List	A set of SSID Element	As defined in 8.4.2.2.	One or more SSID elements that are optionally present when dot11MgmtOptionSSIDListActivated is true.
ChannelUsage	A set of Channel Usage element	As defined in 8.4.2.88	Specifies request types for the Channel Usage request.
AccessNetworkType	As defined in Table 8-174	0 to 15	Specifies a desired specific access network type or the wildcard access network type. This field is present when dot11InterworkingServiceActivated is true.
HESSID	MAC Address	Any valid individual MAC address or the broadcast MAC address	Specifies the desired specific HESSID network identifier or the wildcard network identifier. This field is present when dot11InterworkingServiceActivated is true.
Mesh ID	Octet string	0–32 octets	Only present if BSSType = MESH or BSSType = ANY_BSS. Specifies the desired Mesh ID or wildcard Mesh ID.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.3.2.3 When generated

This primitive is generated by the SME for a STA to determine if there are other BSSs that it can join.

6.3.3.2.4 Effect of receipt

This request initiates the scan process when the current frame exchange sequence is completed.

6.3.3.3 MLME-SCAN.confirm

6.3.3.3.1 Function

This primitive returns the descriptions of the set of BSSs detected by the scan process.

6.3.3.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-SCAN.confirm(
                              BSSDescriptionSet,
                              BSSDescriptionFromMeasurementPilotSet,
                              ResultCode,
                              VendorSpecificInfo
                              )
```

Name	Type	Valid range	Description
BSSDescriptionSet	Set of BSSDescriptions	N/A	The BSSDescriptionSet is returned to indicate the results of the scan request. It is a set containing zero or more instances of a BSSDescription.
BSSDescriptionFromMeasurementPilotSet	Set of BSS DescriptionFrom MeasurementPilots	N/A	The BSSDescriptionFromMeasurementPilotSet is returned to indicate the results of the scan request derived from measurement pilots. It is a set containing zero or more instances of a BSSDescriptionFrom-MeasurementPilot. Present only if the value of dot11RMMeasurementPilotActivated is nonzero.
ResultCode	Enumeration	SUCCESS, NOT_SUPPORTED	Indicates the result of the MLME-SCAN.confirm primitive.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

Each BSSDescription consists of the elements shown in the following table, in which the term *peer STA* refers to the STA transmitting the Beacon frame or Probe Response frame from which the BSSDescription was determined and the term *local STA* refers to the STA performing the scan, and in which the “IBSS adoption” column indicates whether

a) This parameter is adopted by a STA that is joining an IBSS.

b) This parameter is adopted by a STA that is a member of an IBSS that receives a beacon from a STA that is a member of the same IBSS and that has a timestamp value that is greater than the local TSF value (see 10.1.5).

Name	Type	Valid range	Description	IBSS adoption
BSSID	MACAddress	N/A	The BSSID of the found BSS or the MAC address of the found mesh STA.	Adopt
SSID	Octet string	0–32 octets	The SSID of the found BSS.	Adopt
BSSType	Enumeration	INFRASTRUCTURE, INDEPENDENT, MESH	The type of the found BSS.	Adopt

Name	Type	Valid range	Description	IBSS adoption
Beacon Period	Integer	N/A	The Beacon period (in TU) of the found BSS if the BSSType is not MESH, or of the found mesh STA if the BSSType = MESH.	Adopt
DTIM Period	Integer	As defined in 8.4.2.7	The DTIM period (in beacon periods) of the BSS if the BSSType is not MESH, or of the mesh STA if the BSSType = MESH.	Adopt
Timestamp	Integer	N/A	The timestamp of the received frame (probe response/beacon) from the found BSS.	Adopt
Local Time	Integer	N/A	The value of the local STA's TSF timer at the start of reception of the first octet of the timestamp field of the received frame (probe response or beacon) from the found BSS.	Do not adopt
PHY Parameter Set	As defined in frame format or according to the relevant PHY clause.	As defined in frame format or according to the relevant PHY clause.	The parameter sets relevant to the PHY from the received Beacon or Probe Response frame. If no PHY Parameter Set element is present in the received frame, this parameter contains the channel number on which the frame was received. Valid channel numbers are defined in the relevant PHY clause.	Adopt
CF Parameter Set	CF Parameter Set element	As defined in 8.4.2.6	The parameter set for the CF periods, if found BSS supports CF mode.	Do not adopt
IBSS Parameter Set	IBSS Parameter Set element	As defined in 8.4.2.8	The parameter set for the IBSS, if found BSS is an IBSS.	Adopt
CapabilityInformation	Capability Information field	As defined in 8.4.1.4	The advertised capabilities of the BSS.	Do not adopt
BSSBasicRateSet	Set of integers	1–127 inclusive (for each integer in the set)	The set of data rates that shall be supported by all STAs that desire to join this BSS.	Adopt
OperationalRateSet	Set of integers	1–127 inclusive (for each integer in the set)	The set of data rates that the peer STA desires to use for communication within the BSS. This set is a superset of the rates contained in the BSSBasicRateSet parameter.	Do not adopt

Name	Type	Valid range	Description	IBSS adoption
Country	As defined in the Country element	As defined in the Country element	The information required to identify the regulatory domain in which the peer STA is located and to configure its PHY for operation in that regulatory domain. Present only if TPC functionality is required, as specified in 10.8, or dot11MultiDomainCapabilityActivated is true or dot11RadioMeasurementActivated is true.	Adopt
IBSS DFS Recovery Interval	Integer	1–255	The time interval that is used for DFS recovery. Present only if DFS functionality is required, as specified in 10.9. Present only if BSSType = INDEPENDENT.	Adopt
RSN	RSN element (RSNE)	As defined in 8.4.2.27	A description of the cipher suites and AKM suites supported in the BSS.	Do not adopt
Load	BSS Load element	As defined in 8.4.2.30	The values from the BSS Load element if such an element was present in the probe response or Beacon frame, else null.	Do not adopt
EDCAParameterSet	EDCA Parameter Set element	As defined in 8.4.2.31	The values from the EDCA Parameter Set element if such an element was present in the probe response or Beacon frame, else null.	Adopt
QoSCapability	QoS Capability element	As defined in 8.4.2.37	The values from the QoS Capability element if such an element was present in the probe response or Beacon frame, else null.	Adopt
AP Channel Report	AP Channel Report element	As defined in 8.4.2.38	The values from the AP Channel Report element if such an element was present in the probe response or Beacon frame, else null.	Adopt
BSS Average Access Delay	BSS Average Access Delay element	As defined in 8.4.2.41	The values from the BSS Average Access Delay element if such an element was present in the probe response or Beacon frame, else null.	Adopt
Antenna	Antenna element	As defined in 8.4.2.42	The values from the Antenna element if such an element was present in the probe response or Beacon frame, else null.	Adopt
BSS Available Admission Capacity	BSS Available Admission Capacity element	As defined in 8.4.2.45	The values from the BSS Available Admission Capacity element if such an element was present in the probe response or Beacon frame, else null.	Adopt

Name	Type	Valid range	Description	IBSS adoption
BSS AC Access Delay	BSS AC Access Delay element	As defined in 8.4.2.46	The values from the BSS AC Access Delay element if such an element was present in the probe response or Beacon frame, else null.	Adopt
Measurement Pilot Transmission Information	Measurement Pilot Transmission element	As defined in 8.4.2.44	The values from the Measurement Pilot Transmission element if such an element was present in the probe response or Beacon frame, else null.	Adopt
Multiple BSSID	As defined in Multiple BSSID element	As defined in 8.4.2.48	The values from the Multiple BSSID element if such an element was present in the probe response or Beacon frame, else null.	Do not adopt
RM Enabled Capabilities	RM Enabled Capabilities element	As defined in 8.4.2.47	The values from the RM Enabled Capabilities element if such an element was present in the probe response or Beacon frame, else null.	Adopt
RCPIMeasurement	Integer	As defined in 16.4.8.6, or 18.3.10.7, or 17.4.8.6	The RCPI of the received frame.	Adopt
RSNIMeasurement	Integer	As defined in 8.4.2.43	The RSNI of the received frame.	Adopt
Requested elements	Set of elements	As defined in 8.4.1.35	Elements requested by the Request element of the Probe Request frame.	Adopt
DSERegisteredLocation	DSE Registered Location element	As defined in 8.4.2.54	The information from the DSE Registered Location element, if such a field is present in Probe Response or Beacon, else null. Present only if DSE functionality is required, as specified in 10.12, or dot11LCIDSERequired is true.	Adopt
HT Capabilities	As defined in frame format	As defined in 8.4.2.58	The values from the HT Capabilities element if such an element was present in the Probe Response or Beacon frame, else null. The parameter is optionally present only if dot11HighThroughputOptionImplemented is true.	Do not adopt
HT Operation	As defined in frame format	As defined in 8.4.2.59	The values from the HT Operation element if such an element was present in the Probe Response or Beacon frame, else null. The parameter is optionally present only if dot11HighThroughputOptionImplemented is true.	Adopt

Name	Type	Valid range	Description	IBSS adoption
BSSMembershipSelectorSet	Set of integers	A value from Table 8-55 for each member of the set	The BSS membership selectors that represent the set of features that shall be supported by all STAs to join this BSS.	Adopt
BSSBasicMCSSet	Set of integers	Each member of the set takes a value in the range 0 to 76, representing an MCS index value	The set of MCS values that shall be supported by all HT STAs to join this BSS. The STA that is creating the BSS shall be able to receive and transmit at each of the MCS values listed in the set.	Adopt
HTOperationalMCSSet	Set of integers	Each member of the set takes a value in the range 0 to 76, representing an MCS index value	The set of MCS values that the peer STA desires to use for communication within the BSS. The STA shall be able to receive at each of the data rates listed in the set. This set is a superset of the MCS values contained in the BSSBasicMCSSet parameter.	Do not adopt
Extended Capabilities	As defined in frame format	As defined in 8.4.2.29	Specifies the parameters within the Extended Capabilities element that are supported by the MAC entity.	Do not adopt
20/40 BSS Coexistence	As defined in frame format	As defined in 8.4.2.62	Specifies the parameters within the 20/40 BSS Coexistence element that are indicated by the MAC entity. The parameter is present if dot112040BSSCoexistence-ManagementSupport is true.	Do not adopt
Overlapping BSS Scan Parameters	As defined in frame format	As defined in 8.4.2.61	Specifies the parameters within the Overlapping BSS Scan Parameters element that are indicated by the MAC entity. This parameter is optionally present if dot11FortyMHzOptionImplemented is true and is not present if dot11FortyMHzOptionImplemented is false.	Adopt
FMSDescriptor	FMS Descriptor element	As defined in 8.4.2.77	The values from the FMS Descriptor element if such an element was present in the Probe Response or Beacon frame, else null.	Do not adopt
QoSTrafficCapability	QoS Traffic Capability element	As defined in 8.4.2.80	The values from the QoS Traffic Capability element if such an element was present in the Probe Response or Beacon frame, else null.	Do not adopt
ChannelUsage	A set of Channel Usage element	As defined in 8.4.2.88	Specifies parameters for the Channel Usage.	Do not adopt

Name	Type	Valid range	Description	IBSS adoption
TimeAdvertisement	Time Advertisement element	As defined in 8.4.2.63	The values from the Time Advertisement element if such an element was present in the Probe Response or Beacon frame, else null.	Do not adopt
TimeZone	Time Zone element	As defined in 8.4.2.89	The values from the Time Zone element if such an element was present in the Probe Response or Beacon frame, else null.	Do not adopt
MeshID	Mesh ID element	As defined in 8.4.2.101	The value of MeshID element if such element was present in the probe response or Beacon frame, else null.	Do not adopt
MeshConfiguration	Mesh Configuration element	As defined in 8.4.2.100	The values from the Mesh Configuration element if such an element was present in the probe response or Beacon frame, else null.	Do not adopt
Mesh Awake Window	Mesh Awake Window element	As defined in 8.4.2.106	The values from the Mesh Awake Window element if such an element was present in the Probe response or Beacon frame, else null.	Do not adopt
BeaconTiming	Beacon Timing element	As defined in 8.4.2.107	The values from the Beacon Timing element if such an element was present in the Probe response or Beacon frame, else null.	Do not adopt
MCCAOP Advertisement Overview	MCCAOP Advertisement Overview element	As defined in frame format	The values from the Beacon Timing element if such an element was present in the Probe response or Beacon frame, else null.	Do not adopt
MCCAOP Advertisement	MCCAOP Advertisement	As defined in frame format	The values from the Beacon Timing element if such an element was present in the Probe response or Beacon frame, else null.	Do not adopt

Each BSSDescriptionFromMeasurementPilot consists of the following elements, in which the term *peer STA* refers to the STA transmitting the Measurement Pilot frame from which the BSSDescription was determined and the term *local STA* refers to the STA performing the scan:

Name	Type	Valid range	Description
BSSID	MACAddress	N/A	The BSSID of the found BSS.
BSS Type	Enumeration	INFRASTRUCTURE	The type of the found BSS.
Local Time	Integer	N/A	The value of the local STA's TSF timer at the start of reception of the first octet of the timestamp field of the received frame from the found BSS.
Condensed Capability Information	Condensed Capability Information field	As defined in 8.5.8.3	The advertised condensed capabilities of the BSS.

Name	Type	Valid range	Description
Condensed Country String	Condensed Country String field	As defined in 8.5.8.3	Together with the Operating Class, the information required to identify the regulatory domain in which the peer STA is located and to configure its PHY for operation in that regulatory domain.
Operating Class	Operating Class field	The field is defined in 8.5.8.3, valid values for the field are defined in Annex E.	Together with the Condensed Country String, the information required to identify the regulatory domain in which the peer STA is located and to configure its PHY for operation in that regulatory domain.
Channel	Channel field	The field is defined in 8.5.8.3, valid values for the field are defined in Annex E.	The operating channel of the BSS indicated in the received frame
Measurement Pilot Interval	Measurement Pilot Interval field	As defined in 8.5.8.3	The Measurement Pilot interval of the BSS indicated in the received frame
Multiple BSSID element	Multiple BSSID element	As defined in 8.4.2.48	Indicates that the BSS is within a Multiple BSSID Set (see 10.11.14). The range of BSSIDs is determined by the BSSID and Multiple BSSID element.
PHY Type	Integer	As defined in Annex C	The dot11PHYType of the received frame.
RCPIMeasurement	Integer	As defined in 16.4.8.6, or 18.3.10.7, or 17.4.8.6	The RCPI of the received frame.
RSNIMeasurement	Integer	As defined in 16.4.8.6, or 18.3.10.7, or 17.4.8.6	The RSNI of the received frame.

6.3.3.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-SCAN.request primitive to ascertain the operating environment of the STA.

6.3.3.3.4 Effect of receipt

The SME is notified of the results of the scan procedure.

6.3.4 Synchronization

6.3.4.1 Introduction

This mechanism supports the process of selection of a peer in the authentication process.

6.3.4.2 MLME-JOIN.request

6.3.4.2.1 Function

This primitive requests synchronization with a BSS, of which type is infrastructure or independent.

6.3.4.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-JOIN.request(
                        SelectedBSS,
                        JoinFailureTimeout,
                        ProbeDelay,
                        OperationalRateSet,
                        HTOperationalMCSSet,
                        VendorSpecificInfo
                        )
```

Name	Type	Valid range	Description
SelectedBSS	BSSDescription	N/A	The BSSDescription of the BSS to join. The SelectedBSS is a member of the set of descriptions that was returned as a result of a MLME-SCAN.request primitive.
JoinFailureTimeout	Integer	≥ 1	The time limit, in units of beacon intervals, after which the join procedure is terminated.
ProbeDelay	Integer	N/A	Delay (in microseconds) to be used prior to transmitting when changing from Doze to Awake, if no frame sequence is detected by which the NAV can be set.
OperationalRateSet	Set of integers	1–127 inclusive (for each integer in the set)	The set of data rates that the STA desires to use for communication within the BSS. The STA shall be able to receive at each of the data rates listed in the set. This set is a superset of the rates contained in the BSSBasicRateSet parameter.
HTOperationalMCS Set	Set of integers	0–76, representing an MCS index value (for each member of the set)	The set of MCS values that the STA desires to use for communication within the BSS. The STA shall be able to receive at each of the data rates listed in the set. This set is a superset of the MCS values contained in the BSSBasicMCSSet parameter.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.4.2.3 When generated

This primitive is generated by the SME for a STA to establish synchronization with a BSS.

6.3.4.2.4 Effect of receipt

This primitive initiates a synchronization procedure once the current frame exchange sequence is complete. The MLME synchronizes its timing with the specified BSS based on the elements provided in the SelectedBSS parameter. The MLME subsequently issues a MLME-JOIN.confirm primitive that reflects the results.

If an MLME receives an MLME-JOIN.request primitive with the SelectedBSS parameter containing a BSSBasicRateSet element that contains any unsupported rates, the MLME response in the resulting MLME-JOIN.confirm primitive shall contain a ResultCode parameter that is not set to the value SUCCESS.

If the MLME of an HT STA receives an MLME-JOIN.request primitive with the SelectedBSS parameter containing a BSSBasicMCSSet value that contains any unsupported MCSs, the MLME response in the resulting MLME-JOIN.confirm primitive shall contain a ResultCode parameter that is not set to the value SUCCESS.

6.3.4.3 MLME-JOIN.confirm

6.3.4.3.1 Function

This primitive confirms synchronization with a BSS.

6.3.4.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
  MLME-JOIN.confirm(
                                    ResultCode,
                                    VendorSpecificInfo
                                    )
```

Name	Type	Valid range	Description
ResultCode	Enumeration	SUCCESS, INVALID_PARAMETERS	Indicates the result of the MLME-JOIN.request primitive.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.4.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-JOIN.request primitive to establish synchronization with a BSS.

6.3.4.3.4 Effect of receipt

The SME is notified of the results of the synchronization procedure.

6.3.5 Authenticate

6.3.5.1 Introduction

This mechanism supports the process of establishing an authentication relationship with a peer MAC entity.

6.3.5.2 MLME-AUTHENTICATE.request

6.3.5.2.1 Function

This primitive requests authentication with a specified peer MAC entity.

6.3.5.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
  MLME-AUTHENTICATE.request(
                                    PeerSTAAddress,
                                    AuthenticationType,
                                    AuthenticateFailureTimeout,
```

Content of FT Authentication elements,
Content of SAE Authentication Frame,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerSTAAddress	MACAddress	Any valid individual MAC address	Specifies the address of the peer MAC entity with which to perform the authentication process.
AuthenticationType	Enumeration	OPEN_SYSTEM, SHARED_KEY, FAST_BSS_TRANSITION, SAE	Specifies the type of authentication algorithm to use during the authentication process.
AuthenticationFailureTimeout	Integer	≥ 1	Specifies a time limit (in TU) after which the authentication procedure is terminated.
Content of FT Authentication elements	Sequence of elements	As defined in 12.8	The set of elements to be included in the first message of the FT authentication sequence, as described in 12.8.2. Present only if dot11FastBSSTransitionActivated is true.
Content of SAE Authentication Frame	Sequence of elements and fields	As defined in 8.4.1.37, 8.4.1.38, 8.4.1.39, 8.4.1.40, 8.4.1.41, and 8.4.1.42	The set of elements and fields to be included in the SAE Commit Message or SAE Confirm Message. Present only if AuthenticationType indicates SAE authentication.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.5.2.3 When generated

This primitive is generated by the SME for a STA to establish authentication with a specified peer MAC entity in order to permit Class 2 frames, or Mesh Peering Management frames for AMPE utilizing SAE authentication (when dot11AuthenticationAlgorithm is simultaneousAuthEquals (4)), to be exchanged between the two STAs. During the authentication procedure, the SME might generate additional MLME-AUTHENTICATE.request primitives.

6.3.5.2.4 Effect of receipt

This primitive initiates an authentication procedure. The MLME subsequently issues a MLME-AUTHENTICATE.confirm primitive that reflects the results.

6.3.5.3 MLME-AUTHENTICATE.confirm

6.3.5.3.1 Function

This primitive reports the results of an authentication attempt with a specified peer MAC entity.

6.3.5.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-AUTHENTICATE.confirm(
PeerSTAAddress,
AuthenticationType,
ResultCode,

Content of FT Authentication elements,
Content of SAE Authentication Frame,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerSTAAddress	MACAddress	Any valid individual MAC address	Specifies the address of the peer MAC entity with which the authentication process was attempted. This value matches the peerSTAAddress parameter specified in the corresponding MLME-AUTHENTICATE.request primitive.
AuthenticationType	Enumeration	OPEN_SYSTEM, SHARED_KEY FAST_BSS_TRANSITION, SAE	Specifies the type of authentication algorithm that was used during the authentication process. This value matches the authenticationType parameter specified in the corresponding MLME-AUTHENTICATE.request primitive.
ResultCode	Enumeration	SUCCESS, REFUSED, ANTI-CLOGGING TOKEN REQUIRED, FINITE CYCLIC GROUP NOT SUPPORTED, AUTHENTICATION REJECTED	Indicates the result of the MLME-AUTHENTICATE.request primitive.
Content of FT Authentication elements	Sequence of elements	As defined in 12.8	The set of elements included in the second message of the FT authentication sequence, as described in 12.8.3. Present only if dot11FastBSSTransitionActivated is true.
Content of SAE Authentication Frame	Sequence of elements	As defined in 8.4.1.37, 8.4.1.38, 8.4.1.39, 8.4.1.40, 8.4.1.41, and 8.4.1.42	The set of elements to be included in the SAE Commit Message or SAE Confirm Message. Present only if AuthenticationType indicates SAE authentication.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.5.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-AUTHENTICATE.request primitive to authenticate with a specified peer MAC entity.

6.3.5.3.4 Effect of receipt

The SME is notified of the results of the authentication procedure.

6.3.5.4 MLME-AUTHENTICATE.indication

6.3.5.4.1 Function

This primitive indicates receipt of a request from a specific peer MAC entity to establish an authentication relationship with the STA processing this primitive.

6.3.5.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
   MLME-AUTHENTICATE.indication(
                              PeerSTAAddress,
                              AuthenticationType,
                              Content of FT Authentication elements,
                              Content of SAE Authentication Frame,
                              VendorSpecificInfo
                              )
```

Name	Type	Valid range	Description
PeerSTAAddress	MACAddress	Any valid individual MAC address	Specifies the address of the peer MAC entity with which the authentication relationship was established.
AuthenticationType	Enumeration	OPEN_SYSTEM, SHARED_KEY, FAST_BSS_ TRANSITION, SAE	Specifies the type of authentication algorithm that was used during the authentication process.
Content of FT Authentication elements	Sequence of elements	As defined in 12.8	The set of elements included in the first message of the FT authentication sequence, as described in 12.8.2. Present only if dot11FastBSSTransitionActivated is true.
Content of SAE Authentication Frame	Sequence of elements	As defined in 8.4.1.37, 8.4.1.38, 8.4.1.39, 8.4.1.40, 8.4.1.41, and 8.4.1.42	The set of elements to be included in the SAE Commit Message or SAE Confirm Message. Present only if AuthenticationType indicates SAE authentication.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.5.4.3 When generated

This primitive is generated by the MLME as a result of the receipt of an authentication request from a specific peer MAC entity.

6.3.5.4.4 Effect of receipt

The SME is notified of the receipt of the authentication request.

6.3.5.5 MLME-AUTHENTICATE.response

6.3.5.5.1 Function

This primitive is used to send a response to a specific peer MAC entity that requested authentication with the STA that issued this primitive.

6.3.5.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
   MLME-AUTHENTICATE.response(
                                 PeerSTAAddress,
                                 ResultCode,
```

Content of FT Authentication elements,
Content of SAE Authentication Frame,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerSTAAddress	MACAddress	Any valid individual MAC address	Specifies the address of the peer MAC entity from which the authentication request was received.
ResultCode	Enumeration	SUCCESS, REFUSED, ANTI-CLOGGING TOKEN REQUIRED, FINITE CYCLIC GROUP NOT SUPPORTED, AUTHENTICATION REJECTED	Indicates the result response to the authentication request from the peer MAC entity.
Content of FT Authentication elements	Sequence of elements	As defined in 12.8	The set of elements to be included in the second message of the FT authentication sequence, as described in 12.8.3. Present only if dot11FastBSSTransitionActivated is true.
Content of SAE Authentication Frame	Sequence of elements	As defined in 8.4.1.37, 8.4.1.38, 8.4.1.39, 8.4.1.40, 8.4.1.41, and 8.4.1.42	The set of elements to be included in the SAE Commit Message or SAE Confirm Message. Present only if the AuthenticationType of the MLME-AUTHENTICATE.indication primitive that generated this response indicated SAE authentication.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.5.5.3 When generated

This primitive is generated by the SME of a STA as a response to an MLME-AUTHENTICATE.indication primitive.

6.3.5.5.4 Effect of receipt

This primitive initiates transmission of a response to the specific peer MAC entity that requested authentication.

6.3.6 Deauthenticate

6.3.6.1 Introduction

This mechanism supports the process of invalidating an authentication relationship with a peer MAC entity.

6.3.6.2 MLME-DEAUTHENTICATE.request

6.3.6.2.1 Function

This primitive requests that the authentication relationship with a specified peer MAC entity be invalidated.

6.3.6.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-DEAUTHENTICATE.request(
                                        PeerSTAAddress,
                                        ReasonCode,
                                        VendorSpecificInfo
                                        )
```

Name	Type	Valid range	Description
PeerSTAAddress	MACAddress	Any valid individual MAC address	Specifies the address of the peer MAC entity with which to perform the deauthentication process.
ReasonCode	Reason Code field	As defined in 8.4.1.7	Specifies the reason for initiating the deauthentication procedure.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.6.2.3 When generated

This primitive is generated by the SME for a STA to invalidate authentication with a specified peer MAC entity in order to prevent the exchange of Class 2 frames, or Mesh Peering Management frames for AMPE utilizing SAE authentication (when dot11AuthenticationAlgorithm is simultaneousAuthEquals (4)), between the two STAs. During the deauthentication procedure, the SME might generate additional MLME-DEAUTHENTICATE.request primitives.

6.3.6.2.4 Effect of receipt

This primitive initiates a deauthentication procedure. The MLME subsequently issues a MLME-DEAUTHENTICATE.confirm primitive that reflects the results.

6.3.6.3 MLME-DEAUTHENTICATE.confirm

6.3.6.3.1 Function

This primitive reports the results of a deauthentication attempt with a specified peer MAC entity.

6.3.6.3.2 Semantics of the service primitive

The primitive parameter is as follows:

```
MLME-DEAUTHENTICATE.confirm(
                                        PeerSTAAddress
                                        )
```

Name	Type	Valid range	Description
PeerSTAAddress	MACAddress	Any valid individual MAC address	Specifies the address of the peer MAC entity with which the deauthentication process was attempted.

6.3.6.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-DEAUTHENTICATE.request primitive to invalidate the authentication relationship with a specified peer MAC entity.

6.3.6.3.4 Effect of receipt

The SME is notified of the results of the deauthentication procedure.

6.3.6.4 MLME-DEAUTHENTICATE.indication

6.3.6.4.1 Function

This primitive reports the invalidation of an authentication relationship with a specific peer MAC entity.

6.3.6.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-DEAUTHENTICATE.indication(
                                    PeerSTAAddress,
                                    ReasonCode,
                                    VendorSpecificInfo
                                    )
```

Name	Type	Valid range	Description
PeerSTAAddress	MACAddress	Any valid individual MAC address	Specifies the address of the peer MAC entity with which the authentication relationship was invalidated.
ReasonCode	Reason Code field	As defined in 8.4.1.7	Specifies the reason the deauthentication procedure was initiated.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.6.4.3 When generated

This primitive is generated by the MLME as a result of the invalidation of an authentication relationship with a specific peer MAC entity.

6.3.6.4.4 Effect of receipt

The SME is notified of the invalidation of the specific authentication relationship.

6.3.7 Associate

6.3.7.1 Introduction

The following primitives describe how a STA becomes associated with an AP.

6.3.7.2 MLME-ASSOCIATE.request

6.3.7.2.1 Function

This primitive requests association with a specified peer MAC entity that is within an AP.

6.3.7.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-ASSOCIATE.request(
                                PeerSTAAddress,
```

AssociateFailureTimeout,
CapabilityInformation,
ListenInterval,
Supported Channels,
RSN,
QoSCapability,
Content of FT Authentication elements,
SupportedOperatingClasses,
HT Capabilities,
Extended Capabilities,
20/40 BSS Coexistence,
QoSTrafficCapability,
TIMBroadcastRequest,
EmergencyServices,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerSTAAddress	MACAddress	Any valid individual MAC address	Specifies the address of the peer MAC entity with which to perform the association process.
AssociateFailureTimeout	Integer	≥ 1	Specifies a time limit (in TU) by dot11AssociationResponseTimeOut, after which the associate procedure is terminated.
CapabilityInformation	Capability Information field	As defined in 8.4.1.4	Specifies the requested operational capabilities to the AP.
ListenInterval	Integer	≥ 0	Specifies how often the STA awakens and listens for the next Beacon frame, if it enters power save mode.
Supported Channels	As defined in the Supported Channels element	As defined in the Supported Channels element	The list of channels in which the STA is capable of operating. Present only if DFS functionality is required, as specified in 10.9.
RSN	RSNE	As defined in 8.4.2.27	A description of the cipher suites and AKM suites selected by the STA.
QoSCapability	QoS Capability element	As defined in 8.4.2.37	Specifies the parameters within the QoS Capability element that are supported by the MAC entity. The parameter is present only if dot11QosOptionImplemented is true.
Content of FT Authentication elements	Sequence of elements	As defined in 12.4	The set of elements to be included in the initial mobility domain association request, as described in 12.4. Present only if dot11FastBSSTransitionActivated is true.
SupportedOperating Classes	As defined in the Supported Operating Classes element	As defined in 8.4.2.56	Specifies the supported operating classes capabilities of the STA. This parameter is present if dot11ExtendedChannelSwitchActivated is true.
HT Capabilities	As defined in frame format	As defined in 8.4.2.58	Specifies the parameters within the HT Capabilities element that are supported by the MAC entity. The parameter is present if dot11HighThroughputOption-Implemented is true and is absent otherwise.

Name	Type	Valid range	Description
Extended Capabilities	As defined in frame format	As defined in 8.4.2.29	Specifies the parameters within the Extended Capabilities element that are supported by the MAC entity.
20/40 BSS Coexistence	As defined in frame format	As defined in 8.4.2.62	Specifies the parameters within the 20/40 BSS Coexistence element that are indicated by the MAC entity. The parameter is present if dot112040BSSCoexistence-ManagementSupport is true.
QoS Traffic Capability	As defined in the QoS Traffic Capability element	As defined in 8.4.2.80	Specifies the QoS Traffic Capability flags of the non-AP STA. This parameter is optionally present if dot11MgmtOptionACStationCountActivated is true, and is not present otherwise.
TIMBroadcastRequest	As defined in the TIM Broadcast Request element	As defined in 8.4.2.85	Specifies the proposed service parameters for TIM Broadcast. This parameter is optionally present if dot11MgmtOptionTIMBroadcastActivated is true, and is not present otherwise.
EmergencyServices	Boolean	True, False	Specifies that the non-AP STA intends to associate for the purpose of unauthenticated access to emergency services. The parameter shall only be present if dot11InterworkingServiceActivated is true.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

Additional parameters needed to perform the association procedure are not included in the primitive parameter list since the MLME already has that data (maintained as internal state).

6.3.7.2.3 When generated

This primitive is generated by the SME when a STA wishes to establish association with an AP.

6.3.7.2.4 Effect of receipt

This primitive initiates an association procedure. The MLME subsequently issues an MLME-ASSOCIATE.confirm primitive that reflects the results.

6.3.7.3 MLME-ASSOCIATE.confirm

6.3.7.3.1 Function

This primitive reports the results of an association attempt with a specified peer MAC entity that is within an AP.

6.3.7.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-ASSOCIATE.confirm(
                                ResultCode,
                                CapabilityInformation,
                                AssociationID,
```

SupportedRates,
EDCAParameterSet,
RCPI.request,
RSNI.request,
RCPI.response,
RSNI.response,
RMEnabledCapabilities,
Content of FT Authentication elements,
SupportedOperatingClasses,
HT Capabilities,
Extended Capabilities,
20/40 BSS Coexistence,
TimeoutInterval,
BSSMaxIdlePeriod,
TIMBroadcastResponse,
QosMapSet,
VendorSpecificInfo
)

Name	Type	Valid range	Description
ResultCode	Enumeration	SUCCESS, REFUSED_REASON_UNSPECIFIED, REFUSED_NOT_AUTHENTICATED, REFUSED_CAPABILITIES_MISMATCH, REFUSED_EXTERNAL_REASON, REFUSED_AP_OUT_OF_MEMORY, REFUSED_BASIC_RATES_MISMATCH, REJECTED_EMERGENCY_SERVICES_NOT_SUPPORTED, Association request rejected temporarily; try again later	Indicates the result of the MLME-ASSOCIATE.request primitive.
Capability-Information	Capability Information field	As defined in 8.4.1.4	Specifies the operational capabilities advertised by the AP.
AssociationID	Integer	1–2007 inclusive	If the association request result was SUCCESS, then AssociationID specifies the association ID value assigned by the AP.
SupportedRates	Set of integers	2–127 inclusive (for each integer in the set), bit 7 is set to 1 to indicate that a rate is a member of the BBSBasicRateSet.	The set of data rates (in units of 500 kb/s) that are supported by AP, including indication of which rates are part of the BSSBasicRateSet (according to 8.4.2.3).
EDCAParameter Set	EDCA Parameter Set element	As defined in 8.4.2.31	Specifies the EDCA parameter set that the STA should use. The parameter is present only if dot11Qos-OptionImplemented is true.
RCPI.request	Integer	As defined in 16.4.8.6, or 18.3.10.7, or 17.4.8.6	The RCPI value represents the measured RCPI of the corresponding Association Request frame. The element is optionally present only if dot11RMRCPIMeasurementActivated is true.

Name	Type	Valid range	Description
RSNI.request	Integer	As defined in 8.4.2.43	RSNI at the time the corresponding Association Request frame was received. The element is optionally present only if dot11RMRSNIMeasurementActivated is true.
RCPI.response	Integer	As defined in 16.4.8.6, or 18.3.10.7, or 17.4.8.6	The RCPI value represents the measured RCPI of the corresponding Association Response frame. The element is optionally present only if dot11RMRCPIMeasurementActivated is true.
RSNI.response	Integer	As defined in 8.4.2.43	RSNI at the time the corresponding Association Response frame was received. The element is optionally present only if dot11RMRSNIMeasurementActivated is true.
RMEnabledCapabilities	RM Enabled Capabilities element	As defined in 8.4.2.47	Specifies the RM enabled capabilities advertised by the AP. The element is present only if dot11RadioMeasurementActivated is true.
Content of FT Authentication elements	Sequence of elements	As defined in 12.4	The set of elements included in the initial mobility domain association response, as described in 12.4. Present only if dot11FastBSSTransitionActivated is true.
SupportedOperatingClasses	As defined in the Supported Operating Classes element	As defined in 8.4.2.56	Specifies the supported operating classes capabilities of the STA. This parameter is present only if dot11ExtendedChannelSwitchActivated is true.
HT Capabilities	As defined in frame format	As defined in 8.4.2.58	Specifies the parameters within the HT Capabilities element that are supported by the MAC entity. The parameter is optionally present if dot11HighThroughputOption-Implemented is true; this parameter is not present otherwise.
Extended Capabilities	As defined in frame format	As defined in 8.4.2.29	Specifies the parameters within the Extended Capabilities element that are supported by the MAC entity.
20/40 BSS Coexistence	As defined in frame format	As defined in 8.4.2.62	Specifies the parameters within the 20/40 BSS Coexistence element that are indicated by the MAC entity. The parameter is present if dot112040BSSCoexistence-ManagementSupport is true.

Name	Type	Valid range	Description
TimeoutInterval	Timeout Interval element, as defined in frame format	As defined in 8.4.2.51	This parameter is present when ResultCode is "Association request rejected temporarily; try again later."
BSSMaxIdlePeriod	As defined in BSS Max Idle Period element	As defined in 8.4.2.81	Indicates the BSS Max idle period parameters of the AP. This parameter is present if dot11WirelessManagementImplemented is true, and is not present otherwise.
TIMBroadcastResponse	As defined in TIM Broadcast Response element	As defined in 8.4.2.86	Specifies the service parameters for TIM Broadcast. This parameter is optionally present if dot11MgmtOptionTIMBroadcastActivated is true and the TIM Broadcast Request element is present in corresponding Association Request frame, and is not present otherwise.
QoSMapSet	As defined in frame format	As defined in 8.4.2.97	Specifies the QoS Map Set the non-AP STA should use.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.7.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-ASSOCIATE.request primitive or receipt of an association response frame from the peer MAC entity to associate with a specified peer MAC entity that is within an AP.

6.3.7.3.4 Effect of receipt

The SME is notified of the results of the association procedure.

6.3.7.4 MLME-ASSOCIATE.indication

6.3.7.4.1 Function

This primitive indicates that a specific peer MAC entity is requesting association with the local MAC entity, which is within an AP.

6.3.7.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-ASSOCIATE.indication(
                                PeerSTAAddress,
                                CapabilityInformation,
                                ListenInterval,
                                SSID,
                                SupportedRates,
                                RSN,
                                QoSCapability,
                                RCPI,
                                RSNI,
```

RMEnabledCapabilities,
Content of FT Authentication elements,
SupportedOperatingClasses,
DSERegisteredLocation,
HT Capabilities,
Extended Capabilities,
20/40 BSS Coexistence,
QoSTrafficCapability,
TIMBroadcastRequest,
EmergencyServices,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerSTAAddress	MACAddress	Any valid individual MAC address	Specifies the address of the peer MAC entity from which the association was received.
Capability-Information	Capability Information field	As defined in 8.4.1.4	Specifies the operational capability definitions provided by the peer MAC entity as part of the association request.
ListenInterval	Integer	≥ 0	Specifies the listen interval value provided by the peer MAC entity as part of the association request.
SSID	Octet string	0–32 octets	Specifies the SSID provided by the peer MAC entity as part of the association request.
SupportedRates	Set of integers	2–127 inclusive (for each integer in the set)	The set of data rates (in units of 500 kb/s) that are supported by the STA that is requesting association.
RSN	RSNE	As defined in 8.4.2.27	A description of the cipher suites and AKM suites selected by the STA.
QoSCapability	QoS Capability element	As defined in 8.4.2.37	Specifies the parameters within the QoSCapability that are supported by the peer MAC entity. The parameter is optionally present only if dot11QosOption-Implemented is true.
RCPI	Integer	As defined in 16.4.8.6, or 18.3.10.7, or 17.4.8.6	The RCPI value represents the measured RCPI of the corresponding Association Request frame. The element is optionally present only if dot11RMRCPIMeasurementActivated is true.
RSNI	Integer	As defined in 8.4.2.43	The RSNI value represents the measured RSNI at the time the corresponding Association Request frame was received. The element is optionally present only if dot11RMRSNIMeasurementActivated is true.
RMEnabledCapabilities	RM Enabled Capabilities element	As defined in 8.4.2.47	Specifies the RM enabled capabilities advertised by the AP. The element is present only if dot11RadioMeasurementActivated is true.
Content of FT Authentication elements	Sequence of elements	As defined in 12.4	The set of elements included in the initial mobility domain association, as described in 12.4. Present only if dot11FastBSSTransitionActivated is true.
SupportedOperating Classes	As defined in the Supported Operating Classes element	As defined in 8.4.2.56	Indicates the supported operating classes capabilities of the AP. This parameter is present only if dot11ExtendedChannelSwitchActivated is true.
DSERegisteredLocation	As defined in the DSE Registered Location element	As defined in 8.4.2.54	Indicates the DSE registered location including the dependent enablement identifier assigned by the enabling STA. This parameter is optionally present only if dot11LCIDSERequired is true.

Name	Type	Valid range	Description
HT Capabilities	As defined in frame format	As defined in 8.4.2.58	Specifies the parameters within the HT Capabilities element that are supported by the MAC entity. The parameter is optionally present only if dot11HighThroughputOption-Implemented is true.
Extended Capabilities	As defined in frame format	As defined in 8.4.2.29	Specifies the parameters within the Extended Capabilities element that are supported by the MAC entity.
20/40 BSS Coexistence	As defined in frame format	As defined in 8.4.2.62	Specifies the parameters within the 20/40 BSS Coexistence element that are indicated by the MAC entity. The parameter is present if dot112040BSSCoexistenceManagementSupport is true.
QoS Traffic Capability	As defined in the QoS Traffic Capability element	As defined in 8.4.2.80	Specifies the QoS Traffic Capability flags of the non-AP STA. This parameter is optionally present if dot11MgmtOptionACStationCountActivated is true, and is not present otherwise.
TIMBroadcastRequest	As defined in TIM Broadcast Request element	As defined in 8.4.2.85	Specifies the proposed service parameters for TIM Broadcast. This parameter is optionally present if dot11MgmtOptionTIMBroadcastActivated is true, and is not present otherwise.
EmergencyServices	Boolean	True, false	Specifies the setting of the UESA field received from the non-AP STA, if an Interworking element was present in the Associate Request frame. The parameter is present only if dot11InterworkingServiceActivated is true.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.7.4.3 When generated

This primitive is generated by the MLME as a result of the receipt of an association request from a specific peer MAC entity.

6.3.7.4.4 Effect of receipt

The SME is notified of the receipt of the association request.

6.3.7.5 MLME-ASSOCIATE.response

6.3.7.5.1 Function

This primitive is used to send a response to a specific peer MAC entity that requested an association with the STA that issued this primitive, which is within an AP.

6.3.7.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
   MLME-ASSOCIATE.response(
                                        PeerSTAAddress,
                                        ResultCode,
                                        CapabilityInformation,
```

AssociationID,
EDCAParameterSet,
RCPI,
RSNI,
RMEnabledCapabilities,
Content of FT Authentication elements,
SupportedOperatingClasses,
DSERegisteredLocation,
HTCapabilities,
Extended Capabilities,
20/40 BSS Coexistence,
TimeoutInterval,
BSSMaxIdlePeriod,
TIMBroadcastResponse,
QoSMapSet,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerSTAAddress	MACAddress	Any valid individual MAC address	Specifies the address of the peer MAC entity from which the association request was received.
ResultCode	Enumeration	SUCCESS, REFUSED_REASON_UNSPECIFIED, REFUSED_CAPABILITIES_MISMATCH, REFUSED_EXTERNAL_REASON, REFUSED_AP_OUT_OF_MEMORY, REFUSED_BASIC_RATES_MISMATCH, REJECTED_EMERGENCY_SERVICES_NOT_SUPPORTED, REFUSED_TEMPORARILY	Indicates the result response to the association request from the peer MAC entity.
Capability-Information	Capability Information field	As defined in 8.4.1.4	Specifies the operational capabilities advertised by the AP.
AssociationID	Integer	1–2007 inclusive	If the association request result was SUCCESS, then AssociationID specifies the association ID value assigned to the peer MAC entity by the AP.
EDCAParameterSet	EDCA Parameter Set element	As defined in 8.4.2.31	Specifies the EDCA parameter set that the STA should use. The parameter is present only if dot11Qos-OptionImplemented is true.
RCPI	Integer	As defined in 16.4.8.6, or 18.3.10.7, or 17.4.8.6	The RCPI value represents the measured RCPI of the corresponding Association Request frame. The element is optionally present only if dot11RMRCPIMeasurementActivated is true.

Name	Type	Valid range	Description
RSNI	Integer	As defined in 8.4.2.43	The RSNI value represents the measured RSNI at the time the corresponding Association Request frame was received. The element is optionally present only if dot11RMRSNIMeasurementActivated is true.
RMEnabled-Capabilities	RM Enabled Capabilities element	As defined in 8.4.2.47	Specifies the RM enabled capabilities advertised by the AP. The element is present only if dot11RadioMeasurementActivated is true.
Content of FT Authentication elements	Sequence of elements	As defined in 12.4	The set of elements to be included in the initial mobility domain association response, as described in 12.4. Present only if dot11FastBSSTransitionActivated is true.
SupportedOperating Classes	As defined in the Supported Operating Classes element	As defined in 8.4.2.56	Indicates the supported operating classes capabilities of the AP. This parameter is present if dot11ExtendedChannelSwitch Activated is true.
DSERegisteredLocation	As defined in the DSE Registered Location element	As defined in 8.4.2.54	Indicates the DSE registered location including the dependent enablement identifier assigned by the enabling STA. This parameter is optionally present if dot11LCIDSERequired is true.
HT Capabilities	As defined in frame format	As defined in 8.4.2.58	Specifies the parameters within the HT Capabilities element that are supported by the MAC entity. The parameter is present if dot11HighThroughputOption-Implemented is true; otherwise it is not present.
Extended Capabilities	As defined in frame format	As defined in 8.4.2.29	Specifies the parameters within the Extended Capabilities element that are supported by the MAC entity.
20/40 BSS Coexistence	As defined in frame format	As defined in 8.4.2.62	Specifies the parameters within the 20/40 BSS Coexistence element that are indicated by the MAC entity. The parameter is present if dot112040BSSCoexistenceManagementSupport is true.
TimeoutInterval	Timeout Interval element, as defined in frame format	As defined in 8.4.2.51	This parameter is present when ResultCode is “Association request rejected temporarily; try again later.”

Name	Type	Valid range	Description
BSSMaxIdlePeriod	As defined in BSS Max Idle Period element	As defined in 8.4.2.81	Indicates the BSS Max idle period parameters of the AP. This parameter is present if dot11WirelessManagementImplemented is true, and is not present otherwise.
TIMBroadcastResponse	As defined in TIM Broadcast Response element	As defined in 8.4.2.86	Specifies the service parameters for TIM Broadcast. This parameter is optionally present if dot11MgmtOptionTIMBroadcastActivated is true and the TIM Broadcast Request element is present in corresponding Association Request frame, and is not present otherwise.
QoSMapSet	As defined in frame format	As defined in 8.4.2.97	Specifies the QoS Map Set the non-AP STA should use.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

Additional parameters needed to perform the association response procedure are not included in the primitive parameter list since the MLME already has that data (maintained as internal state).

6.3.7.5.3 When generated

This primitive is generated by the SME of a STA that is within an AP as a response to an MLME-ASSOCIATE.indication primitive.

6.3.7.5.4 Effect of receipt

This primitive initiates transmission of an AssociationResponse to the specific peer MAC entity that requested association.

6.3.8 Reassociate

6.3.8.1 Introduction

The following primitives describe how a STA becomes associated with another AP.

6.3.8.2 MLME-REASSOCIATE.request

6.3.8.2.1 Function

This primitive requests a change in association to a specified new peer MAC entity that is within an AP.

6.3.8.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
  MLME-REASSOCIATE.request(
                                    NewAPAddress,
                                    ReassociateFailureTimeout,
                                    CapabilityInformation,
                                    ListenInterval,
                                    Supported Channels
```

RSN,
QoSCapability,
Content of FT Authentication elements,
SupportedOperatingClasses,
HT Capabilities,
Extended Capabilities,
20/40 BSS Coexistence,
QoSTrafficCapability,
TIMBroadcastRequest,
FMSRequest,
DMSRequest,
EmergencyServices,
VendorSpecificInfo
)

Name	Type	Valid range	Description
NewAPAddress	MACAddress	Any valid individual MAC address	Specifies the address of the peer MAC entity with which to perform the reassociation process.
ReassociateFailure Timeout	Integer	≥ 1	Specifies a time limit (in TU) from dot11AssociationResposeTimeout, after which the reassociate procedure is terminated.
Capability-Information	Capability Information field	As defined in 8.4.1.4	Specifies the requested operational capabilities to the AP.
ListenInterval	Integer	≥ 0	Specifies how often the STA awakens and listens for the next Beacon frame, if it enters power save mode.
Supported Channels	As defined in the Supported Channels element	As defined in the Supported Channels element	The list of channels in which the STA is capable of operating. Present only if DFS functionality is required, as specified in 10.9.
RSN	RSNE	As defined in 8.4.2.27	A description of the cipher suites and AKM suites selected by the STA.
QoSCapability	QoS Capability element	As defined in 8.4.2.37	Specifies the parameters within the QoS Capability element that are supported by the MAC entity. The parameter is present only if dot11QosOptionImplemented is true.
Content of FT Authentication elements	Sequence of elements	As defined in 12.8	The set of elements to be included in the third message of the FT authentication sequence, as described in 12.8.4. Present only if dot11FastBSSTransitionActivated is true.
SupportedOperating Classes	As defined in the Supported Operating Classes element	As defined in 8.4.2.56	Specifies the supported operating classes of the STA. This parameter is present if dot11ExtendedChannelSwitchActivated is true.
HT Capabilities	As defined in frame format	As defined in 8.4.2.58	Specifies the parameters within the HT Capabilities element that are supported by the MAC entity. The parameter is present if dot11HighThroughputOption-Implemented is true; otherwise it is not present.
Extended Capabilities	As defined in frame format	As defined in 8.4.2.29	Specifies the parameters within the Extended Capabilities element that are supported by the MAC entity.

Name	Type	Valid range	Description
20/40 BSS Coexistence	As defined in frame format	As defined in 8.4.2.62	Specifies the parameters within the 20/40 BSS Coexistence element that are indicated by the MAC entity. The parameter is present if dot112040BSSCoexistenceManagementSupport is true.
QoS Traffic Capability	As defined in the QoS Traffic Capability element	As defined in 8.4.2.80	Specifies the QoS Traffic Capability flags of the non-AP STA. This parameter is optionally present if dot11MgmtOptionACStationCountActivated is true, and is not present otherwise.
TIMBroadcastRequest	As defined in TIM Broadcast Request element	As defined in 8.4.2.85	Specifies the proposed service parameters for TIM Broadcast. This parameter is optionally present if dot11MgmtOptionTIMBroadcastActivated is true, and is not present otherwise.
FMSRequest	As defined in FMS Request element	As defined in 8.4.2.78	Specifies the proposed multicast parameters for FMS Request. This parameter is optionally present if dot11MgmtOptionFMSActivated is true, and is not present otherwise.
DMSRequest	As defined in DMS Request element	As defined in 8.4.2.90	Specifies the proposed multicast parameters for DMS Request. This parameter is optionally present if dot11MgmtOptionDMSActivated is true, and is not present otherwise.
EmergencyServices	Boolean	True, False	Specifies that the non-AP STA intends to associate for the purpose of unauthenticated access to emergency services. The parameter shall only be present if dot11InterworkingServiceActivated is true.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

Additional parameters needed to perform the reassociation procedure are not included in the primitive parameter list since the MLME already has that data (maintained as internal state).

6.3.8.2.3 When generated

This primitive is generated by the SME for a STA to change association to a specified new peer MAC entity that is within an AP.

6.3.8.2.4 Effect of receipt

This primitive initiates a reassociation procedure. The MLME subsequently issues a MLME-REASSOCIATE.confirm primitive that reflects the results.

6.3.8.3 MLME-REASSOCIATE.confirm

6.3.8.3.1 Function

This primitive reports the results of a reassociation attempt with a specified peer MAC entity that is within an AP.

6.3.8.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-REASSOCIATE.confirm(
                              ResultCode,
                              CapabilityInformation,
                              AssociationID,
                              SupportedRates,
                              EDCAParameterSet,
                              RCPI.request,
                              RSNI.request,
                              RCPI.response,
                              RSNI.response,
                              RMEnabledCapabilities,
                              Content of FT Authentication elements,
                              SupportedOperatingClasses,
                              HT Capabilities,
                              Extended Capabilities,
                              20/40 BSS Coexistence,
                              TimeoutInterval,
                              BSSMaxIdlePeriod,
                              TIMBroadcastResponse,
                              FMSRespone,
                              DMSResponse,
                              QoSMapSet,
                              VendorSpecificInfo
                              )
```

Name	Type	Valid range	Description
ResultCode	Enumeration	SUCCESS, REFUSED_REASON_UNSPECIFIED, REFUSED_NOT_AUTHENTICATED, REFUSED_CAPABILITIES_MISMATCH, REFUSED_EXTERNAL_REASON, REFUSED_AP_OUT_OF_MEMORY, REFUSED_BASIC_RATES_MISMATCH, REJECTED_EMERGENCY_SERVICES_NOT_SUPPORTED, Association request rejected temporarily; try again later	Indicates the result of the MLME-REASSOCIATE.request primitive.
Capability-Information	Capability Information field	As defined in 8.4.1.4	Specifies the operational capabilities advertised by the AP.
AssociationID	Integer	1–2007 inclusive	If the association request result was SUCCESS, then AssociationID specifies the association ID value assigned by the AP.
Supported-Rates	Set of integers	2–127 inclusive (for each integer in the set), bit 7 is set to 1 to indicate that a rate is a member of the BBSBasicRateSet.	The set of data rates (in units of 500 kb/s) that are supported by AP, including indication of which rates are part of the BSSBasicRateSet (according to 8.4.2.3).

Name	Type	Valid range	Description
EDCAParameterSet	EDCA Parameter Set element	As defined in 8.4.2.31	Specifies the EDCA parameter set that the STA should use. The parameter is present only if dot11QosOptionImplemented is true.
RCPI.request	Integer	As defined in 16.4.8.6, or 18.3.10.7, or 17.4.8.6	The RCPI value represents the measured RCPI of the corresponding Association Request frame. The element is optionally present only if dot11RMRCPIMeasurementActivated is true.
RSNI.request	Integer	As defined in 8.4.2.43	RSNI at the time the corresponding Association Request frame was received. The element is optionally present only if dot11RMRSNIMeasurementActivated is true.
RCPI.response	Integer	As defined in 16.4.8.6, or 18.3.10.7, or 17.4.8.6	The RCPI value represents the measured RCPI of the corresponding Association Response frame. The element is optionally present only if dot11RMRCPIMeasurementActivated is true.
RSNI.response	Integer	As defined in 8.4.2.43	RSNI at the time the corresponding Association Response frame was received. The element is optionally present only if dot11RMRSNIMeasurementActivated is true.
RMEnabledCapabilities	RM Enabled Capabilities element	As defined in 8.4.2.47	Specifies the RM enabled capabilities advertised by the AP. The element is present only if dot11RadioMeasurementActivated is true.
Content of FT Authentication elements	Sequence of elements	As defined in 12.8	The set of elements included in the fourth message of the FT authentication sequence, as described in 12.8.5. This includes an optional response to a resource request (RIC). Present only if dot11FastBSSTransitionActivated is true.
SupportedOperatingClasses	As defined in the Supported Operating Classes element	As defined in 8.4.2.56	Specifies the supported operating classes of the STA. This parameter is present only if dot11ExtendedChannelSwitchActivated is true.
HT Capabilities	As defined in frame format	As defined in 8.4.2.58	Specifies the parameters within the HT Capabilities element that are supported by the MAC entity. The parameter is optionally present only if dot11HighThroughputOption-Implemented is true.
Extended Capabilities	As defined in frame format	As defined in 8.4.2.29	Specifies the parameters within the Extended Capabilities element that are supported by the MAC entity.
20/40 BSS Coexistence	As defined in frame format	As defined in 8.4.2.62	Specifies the parameters within the 20/40 BSS Coexistence element that are indicated by the MAC entity. The parameter is present if dot112040BSSCoexistenceManagement Support is true.

Name	Type	Valid range	Description
TimeoutInterval	Timeout Interval element, as defined in frame format	As defined in 8.4.2.51	This parameter is present when ResultCode is “Association request rejected temporarily; try again later.”
BSSMaxIdlePeriod	As defined in BSS Max Idle Period element	As defined in 8.4.2.81	Indicates the BSS Max idle period parameters of the AP. This parameter is present if dot11WirelessManagementImplemented is true, and is not present otherwise.
TIMBroadcastResponse	As defined in TIM Broadcast Response element	As defined in 8.4.2.86	Specifies the service parameters for TIM Broadcast. This parameter is optionally present if dot11MgmtOptionTIMBroadcastActivated is true and the TIM Broadcast Request element is present in corresponding Association Request frame, and is not present otherwise.
FMSResponse	As defined in FMS Response element	As defined in 8.4.2.79	Specifies the multicast parameters for FMS REsponse. This parameter is optionally present if dot11MgmtOptionFMSActivated is true and the FMS Request element is present in corresponding Association Request frame, and is not present otherwise.
DMSResponse	As defined in DMS Response element	As defined in 8.4.2.91	Specifies the multicast parameters for DMS Response. This parameter is optionally present if dot11MgmtOptionDMSActivated is true and the DMS Request element is present in corresponding Association Request frame, and is not present otherwise.
QoSMapSet	As defined in frame format	As defined in 8.4.2.97	Specifies the QoS Map Set the non-AP STA should use.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.8.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-REASSOCIATE.request primitive to reassociate with a specified peer MAC entity that is within an AP.

6.3.8.3.4 Effect of receipt

The SME is notified of the results of the reassociation procedure.

6.3.8.4 MLME-REASSOCIATE.indication

6.3.8.4.1 Function

This primitive indicates that a specific peer MAC entity is requesting reassociation with the local MAC entity, which is within an AP.

6.3.8.4.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-REASSOCIATE.indication(

PeerSTAAddress,
CurrentAPAddress,
CapabilityInformation,
ListenInterval,
SSID,
SupportedRates,
RSN,
QoSCapability,
RCPI,
RSNI,
RMEnabledCapabilities,
Content of FT Authentication elements,
SupportedOperatingClasses,
DSERegisteredLocation,
HT Capabilities,
Extended Capabilities,
20/40 BSS Coexistence,
QoSTrafficCapability,
TIMBroadcastRequest,
FMSRequest,
DMSRequest,
EmergencyServices,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerSTAAddress	MACAddress	Any valid individual MAC address	Specifies the address of the peer MAC entity from which the reassociation request was received.
CurrentAPAddress	MACAddress	Any valid individual MAC address	Specifies the address of the AP with which the peer STA is currently associated.
Capability-Information	Capability Information field	As defined in 8.4.1.4	Specifies the operational capability definitions provided by the peer MAC entity as part of the reassociation request.
ListenInterval	Integer	≥ 0	Specifies the listen interval value provided by the peer MAC entity as part of the reassociation request.
SSID	Octet string	0–32 octets	Specifies the desired SSID provided by the peer MAC entity as part of the reassociation request.
SupportedRates	Set of integers	2–127 inclusive (for each integer in the set)	The set of data rates (in units of 500 kb/s) that are supported by the STA that is requesting reassociation.
RSN	RSNE	As defined in 8.4.2.27	A description of the cipher suites and AKM suites selected by the STA.
QoSCapability	QoS Capability element	As defined in 8.4.2.37	Specifies the parameters within the QoS Capability that are supported by the peer MAC entity. The parameter is present only if dot11QosOption-Implemented is true.
RCPI	Integer	As defined in 16.4.8.6, or 18.3.10.7, or 17.4.8.6	The RCPI value represents the measured RCPI of the corresponding Reassociation Request frame. The element is optionally present only if dot11RMRCPIMeasurementActivated is true.

Name	Type	Valid range	Description
RSNI	Integer	As defined in 8.4.2.43	The RSNI value represents the measured RSNI at the time the corresponding Reassociation Request frame was received. The element is optionally present only if dot11RMRSNIMeasurementActivated is true.
RMEnabled-Capabilities	RM Enabled Capabilities element	As defined in 8.4.2.47	Specifies the RM enabled capabilities advertised by the AP. The element is present only if dot11RadioMeasurementActivated is true.
Content of FT Authentication elements	Sequence of elements	As defined in 12.8	The set of elements included in the third message of the FT authentication sequence, as described in 12.8.4. Present only if dot11FastBSSTransitionActivated is true.
SupportedOperatingClasses	As defined in the Supported Operating Classes element	As defined in 8.4.2.56	Specifies the supported operating classes of the STA. This parameter is present only if dot11ExtendedChannelSwitchActivated is true.
DSERegisteredLocation	As defined in the DSE Registered Location element	As defined in 8.4.2.54	Indicates the DSE registered location including the dependent enablement identifier assigned by the enabling STA. This parameter is optionally present only if dot11LCIDSERequired is true.
HT Capabilities	As defined in frame format	As defined in 8.4.2.58	Specifies the parameters within the HT Capabilities element that are supported by the MAC entity. The parameter is optionally present if dot11HighThroughputOptionImplemented is true.
Extended Capabilities	As defined in frame format	As defined in 8.4.2.29	Specifies the parameters within the Extended Capabilities element that are supported by the MAC entity.
20/40 BSS Coexistence	As defined in frame format	As defined in 8.4.2.62	Specifies the parameters within the 20/40 BSS Coexistence element that are indicated by the MAC entity. The parameter is present if dot112040BSSCoexistenceManagementSupport is true.
QoS Traffic Capability	As defined in the QoS Traffic Capability element	As defined in 8.4.2.80	Specifies the QoS Traffic Capability flags of the non-AP STA. This parameter is optionally present if dot11MgmtOptionACStationCountActivated is true, and is not present otherwise.
TIMBroadcastRequest	As defined in TIM Broadcast Request element	As defined in 8.4.2.85	Specifies the proposed service parameters for TIM Broadcast. This parameter is optionally present if dot11MgmtOptionTIMBroadcastActivated is true, and is not present otherwise.
FMSRequest	As defined in FMS Request element	As defined in 8.4.2.78	Specifies the proposed multicast parameters for FMS Request. This parameter is optionally present if dot11MgmtOptionFMSActivated is true, and is not present otherwise.
DMSRequest	As defined in DMS Request element	As defined in 8.4.2.90	Specifies the proposed multicast parameters for DMS Request. This parameter is optionally present if dot11MgmtOptionDMSActivated is true, and is not present otherwise.

Name	Type	Valid range	Description
EmergencyServices	Boolean	True, false	Specifies the setting of the UESA field received from the non-AP STA, if an Interworking element was present in the Reassociate Request frame. The parameter is present only if dot11InterworkingServiceActivated is true.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.8.4.3 When generated

This primitive is generated by the MLME as a result of the establishment of a reassociation with a specific peer MAC entity that resulted from a reassociation procedure that was initiated by that specific peer MAC entity.

6.3.8.4.4 Effect of receipt

The SME is notified of the establishment of the reassociation.

6.3.8.5 MLME-REASSOCIATE.response

6.3.8.5.1 Function

This primitive is used to send a response to a specific peer MAC entity that requested a reassociation with the STA that issued this primitive, which is within an AP.

6.3.8.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
  MLME-REASSOCIATE.response(
                                    PeerSTAAddress,
                                    ResultCode,
                                    CapabilityInformation,
                                    AssociationID,
                                    EDCAParameterSet,
                                    RCPI,
                                    RSNI,
                                    RMEnabledCapabilities,
                                    Content of FT Authentication elements,
                                    SupportedOperatingClasses,
                                    DSERegisteredLocation,
                                    HT Capabilities,
                                    Extended Capabilities,
                                    20/40 BSS Coexistence,
                                    TimeoutInterval,
                                    BSSMaxIdlePeriod,
                                    TIMBroadcastResponse,
                                    FMSResponse,
                                    DMSResponse,
                                    QoSMapSet,
```

VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerSTAAddress	MACAddress	Any valid individual MAC address	Specifies the address of the peer MAC entity from which the reassociation request was received.
ResultCode	Enumeration	SUCCESS, REFUSED_REASON_UNSPECIFIED, REFUSED_CAPABILITIES_MISMATCH, REFUSED_EXTERNAL_REASON, REFUSED_AP_OUT_OF_MEMORY, REFUSED_BASIC_RATES_MISMATCH REJECTED_EMERGENCY_SERVICES_NOT_SUPPORTED, Association request rejected temporarily; try again later	Indicates the result response to the reassociation request from the peer MAC entity.
Capability-Information	Capability Information field	As defined in 8.4.1.4	Specifies the operational capabilities advertised by the AP.
AssociationID	Integer	1–2007 inclusive	If the reassociation request result was SUCCESS, then AssociationID specifies the association ID value assigned to the peer MAC entity by the AP.
EDCAParameterSet	EDCA Parameter Set element	As defined in 8.4.2.31	Specifies the EDCA parameter set that the STA should use. The parameter is present only if dot11Qos-OptionImplemented is true.
RCPI	Integer	As defined in 16.4.8.6, or 18.3.10.7, or 17.4.8.6	The RCPI value represents the measured RCPI of the corresponding reassociation request frame. The element is optionally present only if dot11RMRCPIMeasurementActivated is true.
RSNI	Integer	As defined in 8.4.2.43	The RSNI value represents the measured RSNI at the time the corresponding reassociation request frame was received. The element is optionally present only if dot11RMRSNIMeasurementActivated is true.
RMEnabled-Capabilities	RM Enabled Capabilities element	As defined in 8.4.2.47	Specifies the RM enabled capabilities advertised by the AP. The element is present only if dot11RadioMeasurementActivated is true.

Name	Type	Valid range	Description
Content of FT Authentication elements	Sequence of elements	As defined in 12.8	The set of elements to be included in the fourth message of the FT authentication sequence, as described in 12.8.5. This includes an optional response to a resource request (RIC). Present only if dot11FastBSSTransitionActivated is true.
SupportedOperatingClasses	As defined in the Supported Operating Classes element	As defined in 8.4.2.56	Specifies the supported operating classes of the STA. This parameter is present if dot11ExtendedChannelSwitchActivated is true.
DSERegisteredLocation	As defined in the DSE Registered Location element	As defined in 8.4.2.54	Indicates the DSE registered location including the dependent enablement identifier assigned by the enabling STA. This parameter is optionally present if dot11LCIDSERequired is true.
HT Capabilities	As defined in frame format	As defined in 8.4.2.58	Specifies the parameters within the HT Capabilities element that are supported by the MAC entity. The parameter is present if dot11HighThroughputOption-Implemented is true; otherwise it is not present.
Extended Capabilities	As defined in frame format	As defined in 8.4.2.29	Specifies the parameters within the Extended Capabilities element that are supported by the MAC entity.
20/40 BSS Coexistence	As defined in frame format	As defined in 8.4.2.62	Specifies the parameters within the 20/40 BSS Coexistence element that are indicated by the MAC entity. The parameter is present if dot112040BSSCoexistenceManagementSupport is true.
TimeoutInterval	Timeout Interval element, as defined in frame format	As defined in 8.4.2.51	This parameter is present when ResultCode is “Association request rejected temporarily; try again later.”
BSSMaxIdlePeriod	As defined in BSS Max Idle Period element	As defined in 8.4.2.81	Indicates the BSS Max idle period parameters of the AP. This parameter is present if dot11WirelessManagementImplemented is true, and is not present otherwise.

Name	Type	Valid range	Description
TIMBroadcastResponse	As defined in TIM Broadcast Response element	As defined in 8.4.2.86	Specifies the service parameters for TIM Broadcast. This parameter is optionally present if dot11MgmtOptionTIMBroadcastActivated is true and the TIM Broadcast Request element is present in corresponding Association Request frame, and is not present otherwise.
FMSResponse	As defined in FMS Response element	As defined in 8.4.2.79	Specifies the multicast parameters for FMS Response. This parameter is optionally present if dot11MgmtOptionFMSActivated is true and the FMS Request element is present in corresponding Association Request frame, and is not present otherwise.
DMSResponse	As defined in DMS Response element	As defined in 8.4.2.91	Specifies the multicast parameters for DMS Response. This parameter is optionally present if dot11MgmtOptionDMSActivated is true and the DMS Request element is present in corresponding Association Request frame, and is not present otherwise.
QoSMapSet	As defined in frame format	As defined in 8.4.2.97	Specifies the QoS Map Set the non-AP STA should use.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

Additional parameters needed to perform the association response procedure are not included in the primitive parameter list since the MLME already has that data (maintained as internal state).

6.3.8.5.3 When generated

This primitive is generated by the SME of a STA that is within an AP as a response to an MLME-REASSOCIATE.indication primitive.

6.3.8.5.4 Effect of receipt

This primitive initiates transmission of a response to the specific peer MAC entity that requested reassociation.

6.3.9 Disassociate

6.3.9.1 MLME-DISASSOCIATE.request

6.3.9.1.1 Function

This primitive requests disassociation with a specified peer MAC entity.

6.3.9.1.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-DISASSOCIATE.request(
                              PeerSTAAddress,
                              ReasonCode,
                              VendorSpecificInfo
                              )
```

Name	Type	Valid range	Description
PeerSTAAddress	MACAddress	Any valid individual MAC address	Specifies the address of the peer MAC entity with which to perform the disassociation process.
ReasonCode	Reason Code field	As defined in 8.4.1.7	Specifies the reason for initiating the disassociation procedure.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.9.1.3 When generated

This primitive is generated by the SME for a STA to disassociate from a STA with which it has an association.

6.3.9.1.4 Effect of receipt

This primitive initiates a disassociation procedure. The MLME subsequently issues an MLME-DISASSOCIATE.confirm primitive that reflects the results.

6.3.9.2 MLME-DISASSOCIATE.confirm

6.3.9.2.1 Function

This primitive reports the results of a disassociation procedure with a specific peer MAC entity.

6.3.9.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-DISASSOCIATE.confirm(
                              ResultCode,
                              VendorSpecificInfo
                              )
```

Name	Type	Valid range	Description
ResultCode	Enumeration	SUCCESS, INVALID_PARAMETERS	Indicates the result of the MLME-DISASSOCIATE.request primitive.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.9.2.3 When generated

This primitive is generated by the MLME as a result of an MLME-DISASSOCIATE.request primitive to disassociate with a specified peer MAC entity.

6.3.9.2.4 Effect of receipt

The SME is notified of the results of the disassociation procedure.

6.3.9.3 MLME-DISASSOCIATE.indication

6.3.9.3.1 Function

This primitive reports disassociation with a specific peer MAC entity.

6.3.9.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-DISASSOCIATE.indication(
                                        PeerSTAAddress,
                                        ReasonCode,
                                        VendorSpecificInfo
                                        )
```

Name	Type	Valid range	Description
PeerSTAAddress	MACAddress	Any valid individual MAC address	Specifies the address of the peer MAC entity with which the association relationship was invalidated.
ReasonCode	Reason Code field	As defined in 8.4.1.7	Specifies the reason the disassociation procedure was initiated.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.9.3.3 When generated

This primitive is generated by the MLME as a result of the invalidation of an association relationship with a specific peer MAC entity.

6.3.9.3.4 Effect of receipt

The SME is notified of the invalidation of the specific association relationship.

6.3.10 Reset

6.3.10.1 Introduction

This mechanism supports the process of resetting the MAC.

6.3.10.2 MLME-RESET.request

6.3.10.2.1 Function

This primitive requests that the MAC entity be reset.

6.3.10.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-RESET.request(
                                        STAAddress,
```

SetDefaultMIB
)

Name	Type	Valid range	Description
STAAddress	MACAddress	Any valid individual MAC address	Specifies the MAC address that is to be used by the MAC entity that is being reset. This value can be used to provide a locally administered STA address.
SetDefaultMIB	Boolean	true, false	If true, all MIB attributes are set to their default values. The default values are implementation dependent. If false, the MAC is reset, but all MIB attributes retain the values that were in place prior to the generation of the MLME-RESET.request primitive.

6.3.10.2.3 When generated

This primitive is generated by the SME to reset the MAC to initial conditions. The MLME-RESET.request primitive shall be used prior to use of the MLME-START.request primitive.

6.3.10.2.4 Effect of receipt

This primitive sets the MAC to initial conditions, clearing all internal variables to the default values. MIB attributes can be reset to their implementation-dependent default values by setting the SetDefaultMIB flag to true.

If dot11OCBActivated is true and if the SetDefaultMIB parameter is false, MAC operation shall resume in less than 2 TU after the STAAddress parameter is changed.

6.3.11 Start

6.3.11.1 Introduction

This mechanism supports the process of creating a new BSS or becoming a member of an MBSS.

6.3.11.2 MLME-START.request

6.3.11.2.1 Function

This primitive requests that the MAC entity start a new BSS or become a member of an MBSS.

6.3.11.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-START.request(
                    SSID,
                    SSIDEncoding,
                    BSSType,
                    BeaconPeriod,
                    DTIMPeriod,
                    CF parameter set,
                    PHY parameter set,
                    IBSS parameter set,
                    ProbeDelay,
                    CapabilityInformation,
```

BSSBasicRateSet,
OperationalRateSet,
Country,
IBSS DFS Recovery Interval,
EDCAParameterSet,
DSERegisteredLocation,
HT Capabilities,
HT Operation,
BSSMembershipSelectorSet,
BSSBasicMCSSet,
HTOperationalMCSSet,
Extended Capabilities,
20/40 BSS Coexistence,
Overlapping BSS Scan Parameters,
MultipleBSSID,
InterworkingInfo,
AdvertismentProtocolInfo,
RoamingConsortiumInfo,
Mesh ID,
Mesh Configuration,
VendorSpecificInfo
)

Name	Type	Valid range	Description
SSID	Octet string	0–32 octets	The SSID of the BSS.
SSIDEncoding	Enumeration	UNSPECIFIED, UTF8	The encoding used for the SSID
BSSType	Enumeration	INFRASTRUCTURE, INDEPENDENT, MESH	The type of the BSS.
Beacon Period	Integer	≥ 1	The Beacon period (in TU) of the BSS if the BSSType is not MESH, or of the mesh STA if the BSSType is MESH.
DTIM Period	Integer	As defined in 8.4.2.7	The DTIM Period (in beacon periods) of the BSS if the BSSType is not MESH, or of the mesh STA if the BSSType is MESH.
CF parameter set	CF Parameter Set element	As defined in 8.4.2.6	The parameter set for CF periods, if the BSS supports CF mode.
PHY parameter sets	FH Parameter Set element or DSSS Parameter Set element	As defined in 8.4.2.4 or 8.4.2.5	The parameter sets relevant to the PHY.
IBSS parameter set	IBSS Parameter Set element	As defined in 8.4.2.8	The parameter set for the IBSS, if BSS is an IBSS.
ProbeDelay	Integer	N/A	Delay (in microseconds) to be used, while the STA is a member of this BSS, prior to transmitting when changing from Doze to Awake, if no frame sequence is detected by which the NAV can be set.
CapabilityInformation	Capability Information field	As defined in 8.4.1.4	The capabilities to be advertised for the BSS.

Name	Type	Valid range	Description
BSSBasicRateSet	Set of integers	1–127 inclusive (for each integer in the set)	The set of data rates that shall be supported by all STAs to join this BSS. The STA that is creating the BSS shall be able to receive and transmit at each of the data rates listed in the set.
OperationalRateSet	Set of integers	1–127 inclusive (for each integer in the set)	The set of data rates that the STA desires to use for communication within the BSS. The STA shall be able to receive at each of the data rates listed in the set. This set is a superset of the rates contained in the BSSBasicRateSet parameter.
Country	As defined in the Country element	As defined in the Country element	The information required to identify the regulatory domain in which the STA is located and to configure its PHY for operation in that regulatory domain. Present only if TPC functionality is required, as specified in 10.8 or dot11MultiDomainCapabilityActivated is true.
IBSS DFS Recovery Interval	Integer	1–255	Present only if BSSType = INDEPENDENT. The time interval that is used for DFS recovery. Present only if DFS functionality is required, as specified in 10.9.
EDCAParameterSet (QoS only)	EDCA Parameter Set element	As defined in 8.4.2.31	The initial EDCA parameter set values to be used in the BSS. The parameter is present only if dot11QosOptionImplemented is true.
DSERegisteredLocation	As defined in the DSE Registered Location element	As defined in 8.4.2.54	The information for the DSE Registered Location element. The parameter is present if dot11LCIDSERequired is true.
HT Capabilities	As defined in frame format HT Capabilities element	As defined in 8.4.2.58	The HT capabilities to be advertised for the BSS. The parameter is present if dot11HighThroughputOptionImplemented is true; otherwise, this parameter is not present.
HT Operation	As defined in frame format HT Operation element	As defined in 8.4.2.59	The additional HT capabilities to be advertised for the BSS. The parameter is present if BSSType = INFRASTRUCTURE and dot11HighThroughputOptionImplemented is true; otherwise, this parameter is not present.
BSSMembership-SelectorSet	Set of integers	A value from Table 8-55 for each member of the set	The BSS membership selectors that represent the set of features that shall be supported by all STAs to join this BSS. The STA that is creating the BSS shall be able to support each of the features represented by the set.
BSSBasicMCSSet	Set of integers	Each member of the set takes a value in the range 0 to 76, representing an MCS index value	The set of MCS values that shall be supported by all HT STAs to join this BSS. The STA that is creating the BSS shall be able to receive and transmit at each of the MCS values listed in the set. If the HT Operation parameter includes a value of 1 for either the Dual Beacon field or the Dual CTS Protection field, the BSSBasicMCSSet parameter shall include at least one integer value in the range 0 to 7.

Name	Type	Valid range	Description
HTOperationalMCSSet	Set of integers	Each member of the set takes a value in the range 0 to 76, representing an MCS index value	The set of MCS values that the STA desires to use for communication within the BSS. The STA shall be able to receive at each of the data rates listed in the set. This set is a superset of the MCS values contained in the BSSBasicMCSSet parameter.
Extended Capabilities	As defined in frame format	As defined in 8.4.2.29	Specifies the parameters within the Extended Capabilities element that are supported by the MAC entity.
20/40 BSS Coexistence	As defined in frame format	As defined in 8.4.2.62	Specifies the parameters within the 20/40 BSS Coexistence element that are indicated by the MAC entity. The parameter is present if dot112040BSSCoexistence-ManagementSupport is true.
Overlapping BSS Scan Parameters	As defined in frame format	As defined in 8.4.2.61	Specifies the parameters within the Overlapping BSS Scan Parameters element that are indicated by the MAC entity. This parameter is optionally present if dot11FortyMHzOptionImplemented is true; otherwise, it is not present.
MultipleBSSID	As defined in Multiple BSSID Element in 8.4.2.48	As defined in Multiple BSSID Element in 8.4.2.48	This element is optionally present when dot11RMMeasurementPilotCapability is a value between 2 and 7 and the AP is a member of a Multiple BSSID Set (see 10.11.14) with two or more members, or if dot11MgmtOptionMultiBSSIDActivated is true.
InterworkingInfo	As defined in frame format	As defined in Interworking element in 8.4.2.94	Specifies the Interworking capabilities of STA. This field is present when dot11InterworkingServiceActivated is true.
AdvertisementProtocolInfo	Integer or Sequence of Integers	As defined in Advertisement Protocol element in Table 8-175	Identifies zero or more Advertisement Protocols and advertisement control to be used in the BSSs. This field is present when dot11InterworkingServiceActivated is true.
RoamingConsortiumInfo	As defined in frame format	As defined in roaming consortium element in 8.4.2.98	Specifies identifying information for SSPs whose security credentials can be used to authenticate with the AP. This field may be present when dot11InterworkingServiceActivated is true.
Mesh ID	Octet string	0–32 octets	The value of MeshID. This element is present only if the BSSType = MESH.
Mesh Configuration	As defined in frame format	As defined in 8.4.2.100	Specifies the configuration of the mesh STA. This element is present only if the BSSType = MESH.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.11.2.3 When generated

This primitive is generated by the SME to start an infrastructure BSS (with the MAC entity within an AP), an IBSS (with the MAC entity acting as the first STA in the IBSS), or an MBSS (with the MAC entity acting as the first mesh STA in the MBSS) or to become a member of an existing MBSS. In an MBSS, this primitive starts the process of mesh beaconing.

An MLME-START.request primitive may be generated in an infrastructure BSS or IBSS only after an MLME-RESET.request primitive has been used to reset the MAC entity and before an MLME-JOIN.request primitive has been used to successfully join an existing infrastructure BSS or IBSS.

An MLME-START.request primitive may be generated in an MBSS only after an MLME-RESET.request primitive has been used to reset the MAC entity and before any synchronization and mesh peering have been established. When the mesh STA uses the default synchronization method and the default mesh peering protocol, the MLME-START.request primitive shall be generated before an MLME-MESHNEIGHBOROFFSETSYNCSTART.request primitive and MLME-MESHPEERINGMANAGEMENT.request primitive have been used.

The MLME-START.request primitive shall not be used after successful use of the MLME-START.request primitive or successful use of the MLME-JOIN.request primitive without generating an intervening MLME-RESET.request primitive.

6.3.11.2.4 Effect of receipt

This primitive initiates the BSS initialization procedure once the current frame exchange sequence is complete. The MLME subsequently issues an MLME-START.confirm primitive that reflects the results of the creation procedure.

If an MLME receives an MLME-START.request primitive with a BSSBasicRateSet parameter containing any unsupported rates, the MLME response in the resulting MLME-START.confirm primitive shall contain a ResultCode parameter that is not set to the value SUCCESS.

If the MLME of an HT STA receives an MLME-START.request primitive with a BSSBasicMCSSet parameter containing any unsupported MCSs, the MLME response in the resulting MLME-START.confirm primitive shall contain a ResultCode parameter that is not set to the value SUCCESS.

If an MLME receives an MLME-START.request primitive with the SSIDEncoding parameter value UTF8, the MLME shall set the UTF-8 SSID subfield of the Extended Capabilities element to one in Beacon and Probe Response frames.

6.3.11.3 MLME-START.confirm

6.3.11.3.1 Function

This primitive reports the results of a BSS creation procedure or a procedure to become a member of an MBSS.

6.3.11.3.2 Semantics of the service primitive

The primitive parameter is as follows:

```
  MLME-START.confirm(
                                    ResultCode
                                    )
```

Name	Type	Valid range	resetDescription
ResultCode	Enumeration	SUCCESS, BSS_ALREADY_STARTED_OR_JOINED, RESET_REQUIRED_BEFORE_ START, NOT_SUPPORTED	Indicates the result of the MLME-START.request primitive.

6.3.11.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-START.request primitive to create a new BSS or to become a member of an MBSS.

6.3.11.3.4 Effect of receipt

The SME is notified of the results of the BSS creation procedure or a procedure to become a member of an MBSS.

6.3.12 Stop

6.3.12.1 General

This mechanism supports the process of terminating an existing BSS.

6.3.12.2 MLME-STOP.request

6.3.12.2.1 Function

This primitive requests that the MAC entity stop a BSS previously started by using an MLME-START.request primitive

6.3.12.2.2 Semantics of the service primitive

The primitive parameter is as follows:

```
          MLME-STOP.request(
                              SSID
                              )
```

Name	Type	Valid range	Description
SSID	Octet string	0–32 octets	The SSID of the BSS to be stopped.

6.3.12.2.3 When generated

This primitive is generated by the SME to terminate an infrastructure BSS (with the MAC entity within an AP). The MLME-STOP.request primitive shall be generated only after successful use of an MLME-START.confirm primitive.

The MLME-STOP termination procedure does not reset the MAC to initial conditions. An MLME-RESET.request primitive shall be issued prior to use of the MLME-START.request primitive and subsequent to the use of an MLME-STOP.request primitive.

The SME should notify associated non-AP STAs of imminent infrastructure BSS termination before issuing the MLME-STOP.request. This can be done with the BSS Transition Management procedure, using the Termination information.

6.3.12.2.4 Effect of receipt

This primitive initiates the termination of the BSS. All services provided by the AP to an infrastructure BSS, including Beacons, Probe Responses and access to the DS, are stopped by the termination. All STAs in an infrastructure BSS are deauthenticated by the termination.

6.3.13 Protocol layer model for spectrum management and radio measurement

The layer management extensions for measurement, TPC, and channel switching assume a certain partition of functionality between the MLME and SME. This partitioning assumes that policy decisions (e.g., regarding measurement and channel switching) reside in the SME, while the protocol for measurement, switch timing, and the associated frame exchanges resides within the MLME (see Figure 6-2).

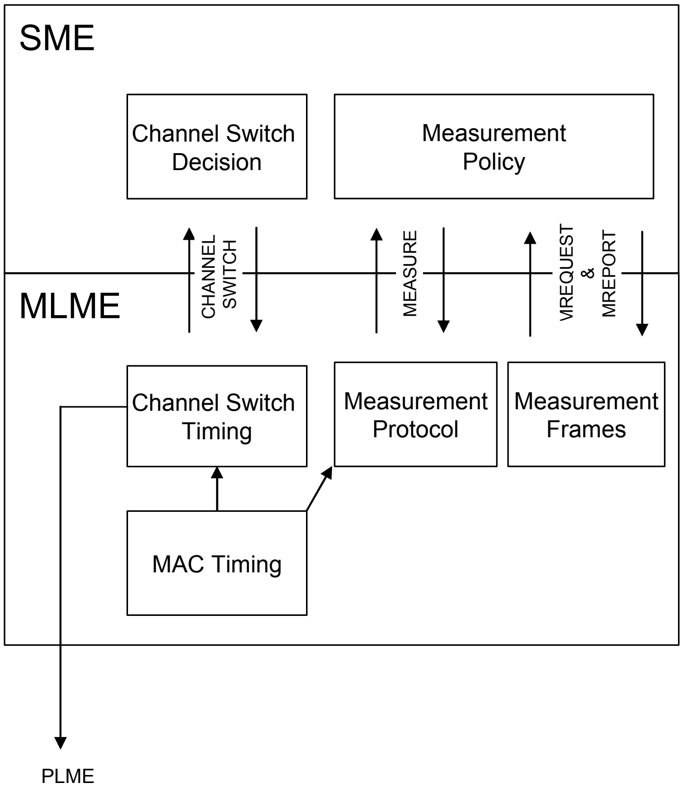

Figure 6-2—Layer management model

The informative diagrams within this subclause further illustrate the protocol layer model adopted. Figure 6-3 and Figure 6-4 depict the measurement process for a peer STA to accept and reject a measurement request, respectively. Figure 6-5 illustrates the TPC adaptation process. Lastly, Figure 6-6 depicts the management process for a channel switch using a Channel Switch Announcement frame.

It should be noted that these diagrams are intended as examples and do not depict all possible protocol scenarios, e.g., a measurement request may result in more than one measurement report frame as described in 10.9.7 and 10.11.

6.3.14 Measurement request

6.3.14.1 Introduction

This set of primitives supports the signaling of measurement requests between peer SMEs.

6.3.14.2 MLME-MREQUEST.request

6.3.14.2.1 Function

This primitive requests the transmission of a measurement request to a peer entity.

6.3.14.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MREQUEST.request(
                              Peer MAC Address,
                              Dialog Token,
                              Measurement Request Set,
                              Number of Repetitions,
                              Measurement Category,
                              VendorSpecificInfo
                              )
```

Name	Type	Valid range	Description
Peer MAC Address	MACAddress	Any valid individual or group MAC address	The address of the peer MAC entity to which the measurement request is transmitted.
Dialog Token	Integer	1–255	The dialog token to identify the measurement transaction.
Measurement Request Set	Set of measurement requests, each as defined in the Measurement Request element format	Set of measurement requests, each as defined in 8.4.2.23	A set of measurement requests, each containing a Measurement Token, Measurement Request Mode, Measurement Type, and Measurement Request.
Number of Repetitions	Integer	0 – 65 535	The number of times the Measurement Request Set is to be repeated. The parameter is present only if Measurement Category is Radio Measurement and dot11RadioMeasurementActivated is true.
Measurement Category	Enumeration	SPECTRUM MANAGEMENT, or RADIO MEASUREMENT	Indicates whether the Measurement Report Set is a set of Spectrum Management or Radio Measurement measurement requests. The parameter is present only if dot11RadioMeasurementActivated is true.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.14.2.3 When generated

This primitive is generated by the SME to request that a Measurement Request frame be sent to a peer entity to initiate one or more measurements.

6.3.14.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Measurement Request frame containing the set of Measurement Request elements specified. This frame is then scheduled for transmission.

6.3.14.3 MLME-MREQUEST.indication

6.3.14.3.1 Function

This primitive indicates that a Measurement Request frame has been received requesting the measurement of one or more channels.

6.3.14.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
        MLME-MREQUEST.indication(
                                    Peer MAC Address,
                                    Dialog Token,
                                    Measurement Request Set,
                                    Number of Repetitions,
                                    Measurement Category,
                                    VendorSpecificInfo
                                    )
```

Name	Type	Valid range	Description
Peer MAC Address	MACAddress	Any valid individual MAC address	The address of the peer MAC entity from which the measurement request was received.
Dialog Token	Integer	1–255	The dialog token to identify the measurement transaction.
Measurement Request Set	Set of measurement requests, each as defined in the Measurement Request element format	Set of measurement requests, each as defined in 8.4.2.23	A set of measurement requests, each containing a Measurement Token, Measurement Request Mode, Measurement Type, and Measurement Request.
Number of Repetitions	Integer	0 – 65 535	The number of times the Measurement Request Set is to be repeated. The parameter is present only if Measurement Category is Radio Measurement and dot11RadioMeasurementActivated is true.
Measurement Category	Enumeration	SPECTRUM MANAGEMENT, or RADIO MEASUREMENT	Indicates whether the Measurement Report Set is a set of Spectrum Management or Radio Measurement measurement requests. The parameter is present only if dot11RadioMeasurementActivated is true.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.14.3.3 When generated

This primitive is generated by the MLME when a valid Measurement Request frame is received.

6.3.14.3.4 Effect of receipt

On receipt of this primitive, the SME either rejects the request or commences the requested measurements.

6.3.15 Channel measurement

6.3.15.1 Introduction

This set of primitives supports the requesting and reporting of measurement data.

6.3.15.2 MLME-MEASURE.request

6.3.15.2.1 Function

This primitive is generated by the SME to request that the MLME initiate specified measurements.

6.3.15.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MEASURE.request(
                              Dialog Token,
                              Measurement Request Set,
                              VendorSpecificInfo
                              )
```

Name	Type	Valid range	Description
Dialog Token	Integer	0–255	The Dialog Token to identify the measurement transaction.
Measurement Request Set	Set of measurement requests, each as defined in the Measurement Request element	Set of measurement requests, each as defined in 8.4.2.23	A set of measurement requests, each containing a Measurement Token, Measurement Request Mode, Measurement Type, and Measurement Request.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.15.2.3 When generated

This primitive is generated by the SME to request that the MLME initiate the specified measurements.

6.3.15.2.4 Effect of receipt

On receipt of this primitive, the MLME commences the measurement process.

6.3.15.3 MLME-MEASURE.confirm

6.3.15.3.1 Function

This primitive reports the result of a measurement.

6.3.15.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MEASURE.confirm(
                              ResultCode,
                              Dialog Token,
                              Measurement Report Set,
                              VendorSpecificInfo
                              )
```

Name	Type	Valid range	Description
ResultCode	Enumeration	SUCCESS, UNSPECIFIED_FAILURE	The outcome of the measurement request.
Dialog Token	Integer	0–255	The dialog token to identify the measurement transaction.
Measurement Report Set	Set of measurement reports, each as defined in the Measurement Report element	Set of measurement reports, each as defined in 8.4.2.24	A set of measurement reports, each containing a Measurement Token, Measurement Report Mode, Measurement Type, and Measurement Report.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.15.3.3 When generated

This primitive is generated by the MLME to report the results when a measurement set completes.

6.3.15.3.4 Effect of receipt

On receipt of this primitive, the SME evaluates the result code and, if appropriate, stores the channel measurements pending communication to the requesting entity or for local use.

6.3.16 Measurement report

6.3.16.1 Introduction

This set of primitives supports the signaling of measurement reports.

6.3.16.2 MLME-MREPORT.request

6.3.16.2.1 Function

This primitive supports the signaling of measurement reports between peer SMEs.

6.3.16.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MREPORT.request(
                              Peer MAC Address,
                              Dialog Token,
                              Measurement Report Set,
                              Measurement Category,
                              VendorSpecificInfo
                              )
```

Name	Type	Valid range	Description
Peer MAC Address	MACAddress	Any valid individual MAC address	The address of the peer MAC entity to which the measurement report is sent.
Dialog Token	Integer	0–255	The dialog token to identify the measurement transaction. Set to 0 for an autonomous report.
Measurement Report Set	Set of measurement reports, each as defined in the Measurement Report element format	Set of measurement reports, each as defined in 8.4.2.24	A set of measurement reports, each containing a Measurement Token, Measurement Report Mode, Measurement Type, and Measurement Report.
Measurement Category	Enumeration	SPECTRUM MANAGEMENT, or RADIO MEASUREMENT	Indicates whether the Measurement Report Set is a set of Spectrum Management or Radio Measurement reports. The parameter is present only if dot11RadioMeasurementActivated is true.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.16.2.3 When generated

This primitive is generated by the SME to request that a frame be sent to a peer entity to report the results of measuring one or more channels.

6.3.16.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Measurement Report frame containing the set of measurement reports. This frame is then scheduled for transmission.

6.3.16.3 MLME-MREPORT.indication

6.3.16.3.1 Function

This primitive indicates that a Measurement Report frame has been received from a peer entity. This management report is either a response to an earlier measurement request (e.g., MLME-MREQUEST.request primitive) or an autonomous report.

6.3.16.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MREPORT.indication(
                              Peer MAC Address,
                              Dialog Token,
                              Measurement Report Set,
                              Measurement Category,
                              VendorSpecificInfo
                              )
```

Name	Type	Valid range	Description
Peer MAC Address	MACAddress	Any valid individual MAC address	The address of the peer MAC entity from which the Measurement Report frame was received.

Name	Type	Valid range	Description
Dialog Token	Integer	0–255	The dialog token to identify the measurement transaction. Set to 0 for an autonomous report.
Measurement Report Set	Set of measurement reports, each as defined in the Measurement Report element format	Set of measurement reports, each as defined in 8.4.2.24	A set of measurement reports, each containing a Measurement Token, Measurement Report Mode, Measurement Type, and Measurement Report.
Measurement Category	Enumeration	SPECTRUM MANAGEMENT, or RADIO MEASUREMENT	Indicates whether the Measurement Report Set is a set of Spectrum Management or Radio Measurement reports. The parameter is present only if dot11RadioMeasurementActivated is true.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.16.3.3 When generated

This primitive is generated by the MLME when a valid Measurement Report frame is received.

6.3.16.3.4 Effect of receipt

On receipt of this primitive, measurement data might be available for SME processes, such as channel selection.

6.3.17 Channel switch

6.3.17.1 MLME-CHANNELSWITCH.request

6.3.17.1.1 Function

This primitive requests a switch to a new operating channel.

6.3.17.1.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-CHANNELSWITCH.request(
                                Mode,
                                Channel Number,
                                Secondary Channel Offset,
                                Channel Switch Count,
                                Mesh Channel Switch Parameters,
                                VendorSpecificInfo
                                )
```

Name	Type	Valid range	Description
Mode	Integer	0, 1	Channel switch mode, as defined for the Channel Switch Announcement element.
Channel Number	Integer	As defined in 18.3.8.4.3	Specifies the new channel number.

Name	Type	Valid range	Description
Secondary Channel Offset	Integer	As in Table 8-57	Specifies the position of secondary channel in relation to the primary channel. The parameter is present if dot11FortyMHzOperationImplemented is true; otherwise, the parameter is not present.
Channel Switch Count	As defined in 8.4.2.21	As defined in 8.4.2.21	Specifies the time period until the channel switch event, as described in 8.4.2.21
Mesh Channel Switch Parameters	As defined in 8.4.2.105	As defined in 8.4.2.105	Specifies MBSS Channel Switch Parameters used by a mesh STA. This parameter is present if the dot11MeshActivated is true; otherwise, the parameter is not present.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

The Secondary Channel Offset parameter may be present for HT STAs.

6.3.17.1.3 When generated

This primitive is generated by the SME to schedule a channel switch and announce this switch to peer entities in the BSS.

6.3.17.1.4 Effect of receipt

On receipt of this primitive, the MLME schedules the channel switch event and announces this switch to other STAs in the BSS using the Channel Switch Announcement frame or element. The MLME sets the timing of the frame transmission taking into account the the activation delay.

6.3.17.2 MLME-CHANNELSWITCH.confirm

6.3.17.2.1 Function

This primitive reports the result of a request to switch channel.

6.3.17.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-CHANNELSWITCH.confirm(
                              ResultCode,
                              VendorSpecificInfo
                              )
```

Name	Type	Valid range	Description
ResultCode	Enumeration	SUCCESS, UNSPECIFIED FAILURE	Reports the result of a channel switch request.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.17.2.3 When generated

This primitive is generated by the MLME when a channel switch request completes. Possible unspecified failure causes include an inability to schedule a channel switch announcement.

6.3.17.2.4 Effect of receipt

The SME is notified of the results of the channel switch procedure.

6.3.17.3 MLME-CHANNELSWITCH.indication

6.3.17.3.1 Function

This primitive indicates that a channel switch announcement has been received from a peer entity.

6.3.17.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-CHANNELSWITCH.indication(
                                    Peer MAC Address,
                                    Mode,
                                    Channel Number,
                                    Secondary Channel Offset,
                                    Channel Switch Count,
                                    Mesh Channel Switch Parameters,
                                    VendorSpecificInfo
                                    )
```

Name	Type	Valid range	Description
Peer MAC Address	MACAddress	Any valid individual MAC address	The address of the peer MAC entity from which the Measurement Report frame was received.
Mode	Integer	0, 1	Channel switch mode, as defined for the Channel Switch Announcement element.
Channel Number	Integer	As defined in 18.3.8.4.3	Specifies the new channel number.
Secondary Channel Offset	Integer	As in Table 8-57	Specifies the position of secondary channel in relation to the primary channel. The parameter is optionally present only if dot11FortyMHzOperationImplemented is true.
Channel Switch Count	As defined in 8.4.2.21	As defined in 8.4.2.21	Specifies the time period until the channel switch event, as described in 8.4.2.21
Mesh Channel Switch Parameters	As defined in 8.4.2.105	As defined in 8.4.2.105	Specifies MBSS Channel Switch Parameters used by a mesh STA. This parameter is present if the dot11MeshActivated is true; otherwise, the parameter is not present.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.17.3.3 When generated

This primitive is generated by the MLME when a valid Channel Switch Announcement frame is received.

6.3.17.3.4 Effect of receipt

On receipt of this primitive, the SME decides whether to accept the switch.

6.3.17.4 MLME-CHANNELSWITCH.response

6.3.17.4.1 Function

This primitive is used to schedule an accepted channel switch.

6.3.17.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-CHANNELSWITCH.response(
                              Mode,
                              Channel Number,
                              Secondary Channel Offset,
                              Channel Switch Count,
                              Mesh Channel Switch Parameters,
                              VendorSpecificInfo
                              )
```

Name	Type	Valid range	Description
Mode	Integer	0, 1	Channel switch mode, as defined for the Channel Switch Announcement element.
Channel Number	Integer	As defined in 18.3.8.4.3	Specifies the new channel number.
Secondary Channel Offset	Integer	As in Table 8-57	Specifies the position of secondary channel in relation to the primary channel. The parameter is optionally present only if dot11FortyMHzOperationImplemented is true.
Channel Switch Count	As defined in 8.4.2.21	As defined in 8.4.2.21	Specifies the time period until the channel switch event, as described in 8.4.2.21
Mesh Channel Switch Parameters	As defined in 8.4.2.105	As defined in 8.4.2.105	Specifies MBSS Channel Switch Parameters used by a mesh STA. This parameter is present if the dot11MeshActivated is true; otherwise, the parameter is not present.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.17.4.3 When generated

This primitive is generated by the SME to schedule an accepted channel switch request.

6.3.17.4.4 Effect of receipt

On receipt of this primitive, the MLME schedules the channel switch.

6.3.18 TPC request

6.3.18.1 Introduction

This set of primitives supports the adaptation of transmit power between peer entities as described in 10.8.6.

6.3.18.2 MLME-TPCADAPT.request

6.3.18.2.1 Function

This primitive supports the adaptation of transmit power between peer entities as specified in 10.8.6.

6.3.18.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TPCADAPT.request(
                              Peer MAC Address,
                              Dialog Token,
                              VendorSpecificInfo
                              )
```

Name	Type	Valid range	Description
Peer MAC Address	MACAddress	Any valid individual or group MAC address	The address of the peer MAC entity to which the TPC request is sent.
Dialog Token	Integer	1–255	The dialog token to identify the TPC transaction.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.18.2.3 When generated

This primitive is generated by the SME to request that a TPC Request frame be sent to a peer entity to request that entity to report transmit power and link margin information.

6.3.18.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TPC Request frame. This frame is then scheduled for transmission.

6.3.18.3 MLME-TPCADAPT.confirm

6.3.18.3.1 Function

This primitive reports the result of the TPC adaptation procedure.

6.3.18.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TPCADAPT.confirm(
                              ResultCode
                              Transmit Power,
                              Link Margin,
                              Rate,
                              VendorSpecificInfo
                              )
```

Name	Type	Valid range	Description
ResultCode	Enumeration	SUCCESS, UNSPECIFIED FAILURE	Reports the outcome of a request to send a TPC Request frame.
Transmit Power	Integer	–127 to 127	Value of the Transmit Power field of the TPC Report element of the TPC Report frame.
Link Margin	Integer	–127 to 127	Value of the Link Margin field of the TPC Report element of the TPC Report frame.
Rate	Integer	As defined in 8.4.2.3	The rate at which the TPC Request frame was sent.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.18.3.3 When generated

This primitive is generated by the MLME when the TPC adaptation procedure completes.

6.3.18.3.4 Effect of receipt

The SME is notified of the results of the TPC adaptation procedure.

6.3.19 SetKeys

6.3.19.1 MLME-SETKEYS.request

6.3.19.1.1 Function

This primitive causes the keys identified in the parameters of the primitive to be set in the MAC and enabled for use.

6.3.19.1.2 Semantics of the service primitive

The primitive parameter is as follows:

```
   MLME-SETKEYS.request(
                                    Keylist
                                    )
```

Name	Type	Valid range	Description
Keylist	A set of SetKeyDescriptors	N/A	The list of keys to be used by the MAC.

Each SetKeyDescriptor consists of the following elements:

Name	Type	Valid range	Description
Key	Bit string	N/A	The temporal key value
Length	Integer	N/A	The number of bits in the Key to be used.
Key ID	Integer	0–3 shall be used with WEP, TKIP, and CCMP; 4–5 with BIP; and 6–4095 are reserved	Key identifier
Key Type	Integer	Group, Pairwise, PeerKey, IGTK	Defines whether this key is a group key, pairwise key, PeerKey, or Integrity Group key.

Name	Type	Valid range	Description
Address	MACAddress	Any valid individual MAC address	This parameter is valid only when the Key Type value is Pairwise, when the Key Type value is Group and the STA is in IBSS, or when the Key Type value is PeerKey.
Receive Sequence Count	8 octets	N/A	Value to which the RSC(s) is initialized
Is Authenticator	Boolean	true, false	Indicates whether the key is configured by the Authenticator or Supplicant. The value true indicates Authenticator.
Cipher Suite Selector	4 octets	As defined in 8.4.2.27	The cipher suite required for this association.
Direction	Integer	Receive, Transmit, Both	Indicates the direction for which the keys are to be installed. Receive indicates that the keys are being installed for the receive direction. Transmit indicates that the keys are being installed for the transmit direction. Both indicates that the keys are being installed for both the receive and transmit directions.

6.3.19.1.3 When generated

This primitive is generated by the SME at any time when one or more keys are to be set in the MAC.

6.3.19.1.4 Effect of receipt

Receipt of this primitive causes the MAC to apply the keys as follows provided the MLME-SETPROTECTION.request primitive has been issued:

- If the Direction element of the SetKeyDescriptor indicates Transmit or Both then the MAC uses the key information for the transmission of all subsequent frames to which the key applies.
- If the Direction element of the SetKeyDescriptor indicates Receive or Both then the MAC installs the key with the associated Key ID such that received frames of the appropriate type and containing the matching Key ID are processed using that key and its associated state information.

6.3.20 DeleteKeys

6.3.20.1 MLME-DELETEKEYS.request

6.3.20.1.1 Function

This primitive causes the keys identified in the parameters of the primitive to be deleted from the MAC and thus disabled for use.

6.3.20.1.2 Semantics of the service primitive

The primitive parameter is as follows:

```
MLME-DELETEKEYS.request(
                              Keylist
                              )
```

Name	Type	Valid range	Description
Keylist	A set of DeleteKeyDescriptors	N/A	The list of keys to be deleted from the MAC.

Each DeleteKeyDescriptor consists of the following elements:

Name	Type	Valid range	Description
Key ID	Integer	N/A	Key identifier.
Key Type	Integer	Group, Pairwise, PeerKey, IGTK	Defines whether this key is a group key, pairwise key, PeerKey, or Integrity Group key.
Address	MACAddress	Any valid individual MAC address	This parameter is valid only when the Key Type value is Pairwise, or when the Key Type value is Group and is from an IBSS STA, or when the Key Type value is PeerKey.

6.3.20.1.3 When generated

This primitive is generated by the SME at any time when keys for a security association are to be deleted in the MAC.

6.3.20.1.4 Effect of receipt

Receipt of this primitive causes the MAC to delete the temporal keys identified by the Keylist Address, including Group, Pairwise and PeerKey, and to cease using them.

6.3.21 MIC (Michael) failure event

6.3.21.1 MLME-MICHAELMICFAILURE.indication

6.3.21.1.1 Function

This primitive reports that a MIC failure event was detected.

6.3.21.1.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MICHAELMICFAILURE.indication (
                                   Count,
                                   Address,
                                   Key Type,
                                   Key ID,
                                   TSC
                                   )
```

Name	Type	Valid range	Description
Count	Integer	1 or 2	The current number of MIC failure events.
Address	MACAddress	Any valid individual MAC address	The source MAC address of the frame.
Key Type	Integer	Group, Pairwise, PeerKey	The key type that the received frame used.
Key ID	Integer	0–3	Key identifier.
TSC	6 octets	N/A	The TSC value of the frame that generated the MIC failure.

6.3.21.1.3 When generated

This primitive is generated by the MAC when it has detected a MIC failure.

6.3.21.1.4 Effect of receipt

The SME is notified that the MAC has detected a MIC failure; see 11.4.2.4.

6.3.22 EAPOL

6.3.22.1 MLME-EAPOL.request

6.3.22.1.1 Function

This primitive is generated by the SME when the SME has an IEEE 802.1X EAPOL-Key frame to send.

6.3.22.1.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-EAPOL.request (
                        Source Address,
                        Destination Address,
                        Data
                        )
```

Name	Type	Valid range	Description
Source Address	MACAddress	N/A	The MAC sublayer address from which the EAPOL-Key frame is being sent.
Destination Address	MACAddress	N/A	The MAC sublayer entity address to which the EAPOL-Key frame is being sent.
Data	IEEE 802.1X EAPOL-Key frame	N/A	The EAPOL-Key frame to be transmitted.

6.3.22.1.3 When generated

This primitive is generated by the SME when the SME has a 802.1X EAPOL-Key frame to send.

6.3.22.1.4 Effect of receipt

The MAC sends this EAPOL-Key frame.

6.3.22.2 MLME-EAPOL.confirm

6.3.22.2.1 Function

This primitive indicates that this EAPOL-Key frame has been transmitted by the IEEE 802.11 MAC.

6.3.22.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-EAPOL.confirm (
                        ResultCode
                        )
```

Name	Type	Valid range	Description
ResultCode	Enumeration	SUCCESS, TRANSMISSION_FAILURE	Indicates whether the EAPOL-Key frame has been transmitted to the target STA.

6.3.22.2.3 When generated

This primitive is generated by the MAC as a result of an MLME-EAPOL.request primitive being generated to send an EAPOL-Key frame.

6.3.22.2.4 Effect of receipt

The SME is always notified whether this EAPOL-Key frame has been transmitted to the IEEE 802.11 MAC.

This primitive communicates that the frame has been transmitted; see the procedures in 11.4.2.4.1.

6.3.23 MLME-PeerKeySTART

6.3.23.1 MLME- PeerKeySTART.request

6.3.23.1.1 Function

This primitive is generated by the SME to start a PeerKey Handshake with a peer.

6.3.23.1.2 Semantics of the service primitive

The primitive parameters are as follows:

```
    MLME-PeerKeySTART.request (
                                   PeerSTAAddress,
                                   RSN
                                   )
```

Name	Type	Valid range	Description
PeerSTAAddress	MACAddress	Any valid individual MAC address	Specifies the address of the peer MAC entity with which to perform the PeerKey Handshake process.
RSN	RSNE	As defined in 8.4.2.27	A description of the cipher suites supported by initiator STA.

6.3.23.1.3 When generated

This primitive is generated by the SME for a STA to initiate a PeerKey Handshake with a specified peer MAC entity in order to create a secure link between the two STAs.

6.3.23.1.4 Effect of receipt

This primitive initiates the SMK Handshake as part of PeerKey Handshake by sending an EAPOL-Key message.

6.3.24 SetProtection

6.3.24.1 MLME-SETPROTECTION.request

6.3.24.1.1 Function

This primitive indicates whether protection is required for frames sent to and received from the indicated MAC address.

6.3.24.1.2 Semantics of the service primitive

The primitive parameter is as follows:

```
MLME-SETPROTECTION.request(
                                    Protectlist
                                    )
```

Name	Type	Valid range	Description
Protectlist	A set of protection elements	N/A	The list of how each key is being used currently.

Each Protectlist consists of the following elements:

Name	Type	Valid range	Description
Address	MACAddress	Any valid individual MAC address	This parameter is valid only when the Key Type value is Pairwise or when the Key Type value is Group and is from an IBSS STA or PeerKey.
ProtectType	Enumeration	None, Rx, Tx, Rx_Tx	The protection value for this MAC.
Key Type	Integer	Group, Pairwise, PeerKey, IGTK	Defines whether this key is a group key, pairwise key, PeerKey, or Integrity Group key.

6.3.24.1.3 When generated

This primitive is generated by the SME when protection is required for frames sent to and received from the indicated MAC address.

6.3.24.1.4 Effect of receipt

Receipt of this primitive causes the MAC to set the protection and to protect data frames as indicated in the ProtectType element of the Protectlist parameter:

- None: Specifies that data frames neither from the MAC address nor to the MAC address are protected.
- Rx: Specifies that data frames from the MAC address are protected (i.e., any data frames without protection received from the MAC address are discarded).
- Tx: Specifies that data frames to the MAC address are protected.
- Rx_Tx: Specifies that data frames to and from the MAC address are protected.

Once data frames are protected to and/or from the specified MAC address, the MLME-SETPROTECTION.request primitive is used to reset the prior setting. Invocation of the MLME-SETPROTECTION.request primitive with a ProtectType of None deletes a protection state.

6.3.25 MLME-PROTECTEDFRAMEDROPPED

6.3.25.1 MLME- PROTECTEDFRAMEDROPPED.indication

6.3.25.1.1 Function

This primitive notifies the SME that a frame has been dropped because a temporal key was unavailable.

6.3.25.1.2 Semantics of the service primitive

This primitive has two parameters, the MAC addresses of the two STAs.

The primitive parameters are as follows:

```
   MLME-PROTECTEDFRAMEDROPPED.indication (
                                                    Address1,
                                                    Address2
                                                    )
```

Name	Type	Valid range	Description
Address1	MACAddress	Any valid individual MAC address	MAC address of TA.
Address2	MACAddress	Any valid individual MAC address	MAC address of RA.

6.3.25.1.3 When generated

This primitive is generated by the MAC when a frame is dropped because no temporal key is available for the frame.

6.3.25.1.4 Effect of receipt

The SME is notified that a frame was dropped. The SME can use this information in an IBSS to initiate a security association to the peer STA.

6.3.26 TS management interface

6.3.26.1 General

This mechanism supports the process of adding, modifying, or deleting a TS in a BSS using the procedures defined in 10.4.

The primitives used for this mechanism are called *TS Management primitives*, which include MLME-ADDTS.xxx and MLME-DELTS.xxx primitives, where xxx denotes request, confirm, indication, or response. Each primitive contains parameters that correspond to a QoS Action frame. Requests and responses may cause the transmission of the corresponding QoS Action frames. Confirms and indications are issued upon the receipt of the appropriate QoS Action frame.

Table 6-1 defines which primitives are supported by which type of STA.

Table 6-1—Supported TS management primitives

Primitive	Request	Confirm	Indication	Response
ADDTS	non-AP QoS STA	non-AP QoS STA	HC	HC
DELTS	non-AP QoS STA and HC	non-AP QoS STA and HC	non-AP QoS STA and HC	—

6.3.26.2 MLME-ADDTS.request

6.3.26.2.1 Function

This primitive requests addition (or modification) of a TS. It requests the HC to admit the new or changed TS.

6.3.26.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-ADDTS.request (
DialogToken,
TSPEC,
TCLAS,
TCLASProcessing,
ADDTSFailureTimeout,
U-APSD Coexistence,
EBR,
VendorSpecificInfo
)

Name	Type	Valid range	Description
DialogToken	Integer	0–127	Specifies a number unique to the QoS Action primitives and frames used in adding (or modifying) the TS of concern.
TSPEC	As defined in TSPEC element with the exception of the surplus bandwidth allowance, minimum PHY rate, and maximum and minimum SIs, which are optionally specified	As defined in 8.4.2.32 with the exception of the surplus bandwidth allowance, minimum PHY rate, and maximum and minimum SIs, which are optionally specified	Specifies the TSID, traffic characteristics, and QoS requirements of the TS of concern.
TCLAS	TCLAS element	As defined in 8.4.2.33	Zero or more TCLAS elements. Specifies the rules and parameters by which an MSDU may be classified to the specified TS.
TCLASProcessing	TCLAS Processing element	As defined in 8.4.2.35	Specifies how the TCLAS elements are to be processed when there are multiple TCLAS elements.

Name	Type	Valid range	Description
ADDTSFailure-Timeout	Integer	Greater than or equal to 1	Specifies a time limit (in TU) after which the TS setup procedure is terminated.
U-APSD Coexistence	U-APSD Coexistence element	As defined in 8.4.2.93.	Indicates the coexistence parameters for requested transmission during a U-APSD service period.
EBR	Expedited Bandwidth Request element	As defined in 8.4.2.96	Specifies the precedence level of the TS request. This element is optionally present when dot11EBRActivated is true.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.26.2.3 When generated

This primitive is generated by the SME to request the addition of a new (or modification of an existing) TS in order to support parameterized QoS transport of the MSDUs belonging to this TS when a higher layer protocol or mechanism signals the STA to initiate such an addition (or modification).

6.3.26.2.4 Effect of receipt

The STA operates according to the procedures defined in 10.4.

6.3.26.3 MLME-ADDTS.confirm

6.3.26.3.1 Function

This primitive reports the results of a TS addition (or modification) attempt.

6.3.26.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-ADDTS.confirm(
                        ResultCode,
                        DialogToken,
                        TSDelay,
                        TSPEC,
                        Schedule,
                        TCLAS,
                        TCLASProcessing,
                        EBR,
                        VendorSpecificInfo
                        )
```

Name	Type	Valid range	Description
ResultCode	Enumeration	SUCCESS, INVALID_PARAMETERS, REJECTED_WITH_SUGGESTED_ CHANGES, REJECTED_FOR_DELAY_PERIOD, REJECTED_WITH_SUGGESTED_BSS_ TRANSITION, REQUESTED_TCLAS_NOT_SUPPORTED, TCLAS_RESOURCES_EXHAUSTED, REJECTED_HOME_WITH_ SUGGESTED_CHANGES, REJECTED_FOR_SSP_PERMISSIONS	Indicates the results of the corresponding MLME-ADDTS.request primitive.
DialogToken	Integer	As defined in the corresponding MLME-ADDTS.request primitive	Specifies a number unique to the QoS Action primitives and frames used in adding (or modifying) the TS.
TSDelay	Integer	≥ 0	When the result code is REJECTED_FOR_DELAY_ PERIOD, provides the amount of time a STA should wait before attempting another ADDTS request frame.
TSPEC	TSPEC element	As defined in 8.4.2.32	Specifies the TS information, traffic characteristics, and QoS requirements of the TS.
Schedule	Schedule element	As defined in 8.4.2.36	Specifies the schedule information, service start time, SI, and the specification interval.
TCLAS	TCLAS element	As defined in 8.4.2.33	Zero or more TCLAS elements. Specifies the rules and parameters by which an MSDU may be classified to the specified TS.
TCLASProcessing	TCLAS Processing element	As defined in 8.4.2.35	Specifies how the TCLAS elements are to be processed when there are multiple TCLAS elements.
EBR	Expedited Bandwidth Request element	As defined in 8.4.2.96	Specifies the precedence level of the TS request. This element is optionally present when dot11EBRActivated is true.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

For the ResultCode value of SUCCESS, the TSPEC and the optional TCLAS parameters describe the characteristics of the TS that has been created (or modified); and the specified (nonzero) parameters [with the exception of Service Start Time, Medium Time, and any possibly unspecified minimum set of parameters (see 9.19.4.3) in the TSPEC in ADDTS Request frame] exactly match those of the matching MLME-ADDTS.request primitive.

For other values of ResultCode, no new TS has been created. In the case of REJECTED_WITH_ SUGGESTED_CHANGES, the TSPEC represents an alternative proposal by the HC based on information about the current status of the MAC entity. In the case of REJECTED_HOME_WITH_SUGGESTED_CHANGES, the TSPEC represents an alternative proposal by the HC based on information received from the SSPN interface. A TS is not created with this definition. If the suggested changes are acceptable to the STA, it is the responsibility of the STA to set up the TS with the suggested changes.

In the case of REJECTED_WITH_SUGGESTED_BSS_TRANSITION, non-AP STA should retry TS setup process with the newly associated AP once the transition is done.

If this is the result of a modification of an existing TS, the status of that TS remains unchanged.

6.3.26.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-ADDTS.request primitive indicating the results of that request.

This primitive is generated when that MLME-ADDTS.request primitive is found to contain invalid parameters, when a timeout occurs, or when the STA receives a response in the form of an ADDTS Response frame in the corresponding QoS Action frame from the HC.

6.3.26.3.4 Effect of receipt

The SME is notified of the results of the TS addition (or modification) procedure.

The SME should operate according to the procedures defined in 10.4.

6.3.26.4 MLME-ADDTS.indication

6.3.26.4.1 Function

This primitive reports to the HC’s SME the request for adding (or modifying) a TS.

6.3.26.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-ADDTS.indication (
                                    DialogToken,
                                    STAAddress,
                                    TSPEC,
                                    TCLAS,
                                    TCLASProcessing,
                                    U-APSD Coexistence,
                                    EBR,
                                    VendorSpecificInfo
                                    )
```

Name	Type	Valid range	Description
DialogToken	Integer	As defined in the received ADDTS request frame	Specifies a number unique to the QoS Action primitives and frames used in adding (or modifying) the TS.
STAAddress	MACAddress		Contains the MAC address of the STA that initiated the MLME-ADDTS.request primitive.

Name	Type	Valid range	Description
TSPEC	As defined in the TPEC element, with the exception of the surplus bandwidth allowance, minimum PHY rate, and maximum and minimum SIs, which are optionally specified	As defined in 8.4.2.32 with the exception of the surplus bandwidth allowance, minimum PHY rate, and maximum and minimum SIs, which are optionally specified	Specifies the TSID, traffic characteristics, and QoS requirements of the TS.
TCLAS	TCLAS element	As defined in 8.4.2.33	Zero or more TCLAS elements. Specifies the rules and parameters by which an MSDU may be classified to the specified TS.
TCLASProcessing	TCLAS Processing element	As defined in 8.4.2.35	Specifies how the TCLAS elements are to be processed when there are multiple TCLAS elements.
U-APSD Coexistence	U-APSD Coexistence element	As defined in 8.4.2.93	Indicates the coexistence parameters for requested transmission during a U-APSD service period.
EBR	Expedited Bandwidth Request element	As defined in 8.4.2.96	Specifies the precedence level of the TS request. This element is optionally present when dot11EBRActivated is true.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

The TCLAS is optional at the discretion of the STA that originated the request.

6.3.26.4.3 When generated

This primitive is generated by the MLME as a result of receipt of a request to add (or modify) a TS by a specified STA in the form of an ADDTS request frame.

6.3.26.4.4 Effect of receipt

The SME is notified of the request for a TS addition (or modification) by a specified STA.

This primitive solicits an MLME-ADDTS.response primitive from the SME that reflects the results of admission control at the HC on the TS requested to be added (or modified).

The SME should operate according to the procedures defined in 10.4.

The SME generates an MLME-ADDTS.response primitive within a dot11ADDTSResponseTimeout.

6.3.26.5 MLME-ADDTS.response

6.3.26.5.1 Function

This primitive responds to the request for a TS addition (or modification) by a specified STA's MAC entity.

6.3.26.5.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-ADDTS.response(
ResultCode,
DialogToken,
STAAddress,
TSDelay,
TSPEC,
Schedule,
TCLAS,
TCLASProcessing,
EBR,
VendorSpecificInfo
)

Name	Type	Valid range	Description
ResultCode	Enumeration	SUCCESS, INVALID_PARAMETERS, REJECTED_WITH_SUGGESTED_CHANGES, REJECTED_FOR_DELAY_PERIOD, REJECTED_WITH_SUGGESTED_BSS_TRANSITION, REQUESTED_TCLAS_NOT_SUPPORTED, TCLAS_RESOURCES_EXHAUSTED, REJECTED_HOME_WITH_SUGGESTED_CHANGES, REJECTED_FOR_SSP_PERMISSIONS	Indicates the results of the corresponding MLME-ADDTS.indication primitive.
DialogToken	Integer	As defined in the corresponding MLME-ADDTS.indication	DialogToken of the matching MLME-ADDTS.indication primitive.
STAAddress	MACAddress		Contains the STA address of the matching MLME-ADDTS.indication primitive.
TSDelay	Integer	≥ 0	When the result code is REJECTED_FOR_DELAY_PERIOD, provides the amount of time a STA should wait before attempting another ADDTS request.
TSPEC	TSPEC element	As defined in 8.4.2.32	Specifies the QoS parameters of the TS.
Schedule	Schedule element	As defined in 8.4.2.36	Specifies the schedule information, service start time, SI, and the specification interval.
TCLAS	TCLAS element	As defined in 8.4.2.33	Zero or more TCLAS elements. Specifies the rules and parameters by which an MSDU may be classified to the specified TS.

Name	Type	Valid range	Description
TCLASProcessing	TCLAS Processing element	As defined in 8.4.2.35	Specifies how the TCLAS elements are to be processed when there are multiple TCLAS elements.
EBR	Expedited Bandwidth Request element	As defined in 8.4.2.96	Specifies the precedence level of the TS request. This element is optionally present when dot11EBRActivated is true.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

The DialogToken and STAAddress parameters contain the values from the matching MLME-ADDTS.indication primitive.

If the result code is SUCCESS, the TSPEC and (optional) TCLAS parameters contain the values from the matching MLME-ADDTS-indication.

If the result code is REJECTED_WITH_SUGGESTED_CHANGES or REJECTED_HOME_WITH_SUGGESTED_CHANGES, the TSPEC and TCLAS parameters represent an alternative proposed TS either based on information local to the MAC entity or using additional information received across the SSPN interface. The TS, however, is not created. The TSID and direction values within the TSPEC are as in the matching MLME-ADDTS.indication primitive. The difference may lie in the QoS (e.g., minimum data rate, mean data rate, and delay bound) values, as a result of admission control performed at the SME of the HC on the TS requested to be added (or modified) by the STA. If sufficient bandwidth is not available, the QoS values may be reduced. In one extreme, the minimum data rate, mean data rate, and delay bound may be all set to 0, indicating that no QoS is to be provided to this TS.

If the result code is REJECTED_WITH_SUGGESTED_BSS_TRANSITION, the non-AP STA should initiate a transition query as defined in 10.23.6. Once the transition is completed, the STA should retry TS setup process, as defined in 10.4.4.

6.3.26.5.3 When generated

This primitive is generated by the SME at the HC as a result of an MLME-ADDTS.indication primitive to initiate addition (or modification) of a TS with a specified peer MAC entity or entities.

6.3.26.5.4 Effect of receipt

This primitive approves addition (or modification) of a TS requested by a specified STA's MAC entity, with or without altering the TSPEC.

This primitive causes the MAC entity at the HC to send an ADDTS Response frame in the corresponding QoS Action management frame to the requesting STA containing the specified parameters.

6.3.26.6 MLME-DELTS.request

6.3.26.6.1 Function

This primitive requests deletion of a TS with a specified peer MAC.

This primitive may be generated at either a non-AP STA or the HC.

6.3.26.6.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-DELTS.request(
                        STAAddress,
                        TSInfo,
                        ReasonCode,
                        VendorSpecificInfo
                        )
```

Name	Type	Valid range	Description
STAAddress	MACAddress		Specifies the MAC address of the STA that initiated this TS. Present only at the HC.
TSInfo	TS Info field	As defined in 8.4.2.32	Specifies the TS to be deleted.
ReasonCode	Enumeration	STA_LEAVING, END_TS, UNKNOWN_TS, TIMEOUT, SERVICE_CHANGE_PRECLUDES_TS	Indicates the reason why the TS is being deleted.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.26.6.3 When generated

This primitive is generated by the SME at a STA to initiate deletion of a TS when a higher layer protocol or mechanism signals the STA to initiate such a deletion.

6.3.26.6.4 Effect of receipt

This primitive initiates a TS deletion procedure.

This primitive causes the local MAC entity to send out a DELTS frame containing the specified parameters. If this primitive was generated at the HC, the frame is sent to the specified STA's MAC address. If this primitive was generated at the non-AP STA, the frame is sent to its HC. In either case, the DELTS frame does not solicit a response from the recipient frame other than an acknowledgment to receipt of the frame.

6.3.26.7 MLME-DELTS.indication

6.3.26.7.1 Function

This primitive reports the deletion of a TS by a specified peer MAC entity or deletion of the TS due to an inactivity timeout (HC only).

6.3.26.7.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-DELTS.indication(
                        STAAddress,
                        TSInfo,
                        ReasonCode,
                        VendorSpecificInfo
                        )
```

Name	Type	Valid range	Description
STAAddress	MACAddress		Specifies the MAC address of the STA for which the TS is being deleted. Present only at the HC.
TSInfo	TS Info field	As defined in 8.4.2.32	Specifies the TS information of the TS of concern.
ReasonCode	Enumeration	STA_LEAVING, END_TS, UNKNOWN_TS, TIMEOUT, SERVICE_CHANGE_PRECLUDES_TS	Indicates the reason why the TS is being deleted.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.26.7.3 When generated

This primitive is generated by the MLME when it receives a DELTS frame from the specified peer MAC entity.

This primitive may also be generated by the MLME at the HC as a result of inactivity of a particular TS. Inactivity results when a period equal to the inactivity interval in the TSPEC for the TS elapses

— Without arrival of an MSDU belonging to that TS at the MAC entity of the HC via an MA-UNITDATA.request primitive when the HC is the source STA of that TS or

— Without reception of an MSDU belonging to that TS by the MAC entity of the HC when the HC is not the source STA of that TS.

This primitive is generated after any other state concerning the TSID/direction within the MAC has been destroyed.

6.3.26.7.4 Effect of receipt

The SME is notified of the initiation of a TS deletion by a specified peer MAC entity.

6.3.27 Management of direct links

6.3.27.1 Introduction

This subclause describes the management procedures associated with direct links.

6.3.27.2 MLME-DLS.request

6.3.27.2.1 Function

This primitive requests the setup of a direct link with a specified peer MAC entity.

6.3.27.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-DLS.request(
                              PeerMACAddress,
                              DLSTimeoutValue,
                              DLSResponseTimeout,
                              VendorSpecificInfo
                              )
```

Name	Type	Valid range	Description
PeerMACAddress	MACAddress	Any valid individual MAC address	Specifies the MAC address of the STA that is the intended immediate recipient of the data flow.
DLSTimeoutValue	Integer	≥ 0	Specifies a time limit (in seconds) after which the direct link is terminated if there are no frame exchange sequences with the peer. A value of 0 implies that the direct link is never to be terminated based on a timeout.
DLSResponseTimeout	Integer	≥ 1	Specifies a time limit (in TU) after which the DLS procedure is terminated, from dot11DLSResponseTimeout.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.27.2.3 When generated

This primitive is generated by the SME at a STA to set up a direct link with another STA.

6.3.27.2.4 Effect of receipt

This primitive initiates a DLS procedure. The MLME subsequently issues an MLME-DLS.confirm primitive that reflects the results.

6.3.27.3 MLME-DLS.confirm

6.3.27.3.1 Function

This primitive reports the results of a DLS attempt with a specified peer MAC entity.

6.3.27.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-DLS.confirm(
                              PeerMACAddress,
                              ResultCode,
                              CapabilityInformation,
                              DLSTimeoutValue,
                              SupportedRates,
                              HT Capabilities,
                              VendorSpecificInfo
                              )
```

Name	Type	Valid range	Description
PeerMACAddress	MACAddress	Any valid individual MAC address	Specifies the MAC address of the STA that is the intended immediate recipient of the data flow.
ResultCode	Enumeration	SUCCESS, DLS_NOT_ALLOWED, NOT_PRESENT, NOT_QOS_STA, REFUSED	Indicates the results of the corresponding MLME-DLS.request primitive.
CapabilityInformation	Capability Information field	As defined in 8.4.1.4	Specifies the capabilities of the peer MAC entity.

Name	Type	Valid range	Description
DLSTimeoutValue	Integer	≥ 0	Specifies a time limit (in seconds) after which the direct link is terminated if there are no frame exchange sequences with the peer. A value of 0 implies that the direct link is never to be terminated based on a timeout.
SupportedRates	Set of integers	1–127 inclusive (for each integer in the set)	The set of data rates that are supported by the peer MAC entity.
HT Capabilities	As defined in frame format	As defined in 8.4.2.58	Specifies the parameters within the HT Capabilities element that are supported by the MAC entity. The parameter is optionally present only if dot11HighThroughputOptionImplemented is true.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.27.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-DLS.request primitive to establish a direct link with a specified peer MAC entity.

6.3.27.3.4 Effect of receipt

The SME is notified of the results of the DLS procedure.

6.3.27.4 MLME-DLS.indication

6.3.27.4.1 Function

This primitive reports the establishment of a direct link with a specified peer MAC entity.

6.3.27.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
  MLME-DLS.indication(
                                    PeerMACAddress,
                                    CapabilityInformation,
                                    DLSTimeoutValue,
                                    SupportedRates,
                                    HT Capabilities,
                                    VendorSpecificInfo
                                    )
```

Name	Type	Valid range	Description
PeerMACAddress	MACAddress	Any valid individual MAC address	Specifies the MAC address of the STA that is the sender of the data flow.
CapabilityInformation	Capability Information field	As defined in 8.4.1.4	Specifies the operational capability definitions to be used by the peer MAC entity.

Name	Type	Valid range	Description
DLSTimeoutValue	Integer	≥ 0	Specifies a time limit (in seconds) after which the direct link is terminated if there are no frame exchange sequences with the peer. A value of 0 implies that the direct link is never to be terminated based on a timeout.
SupportedRates	Set of integers	1–127 inclusive (for each integer in the set)	The set of data rates that are supported by the peer MAC entity.
HT Capabilities	As defined in frame format	As defined in 8.4.2.58	Specifies the parameters within the HT Capabilities element that are supported by the MAC entity. The parameter is optionally present only if dot11HighThroughputOptionImplemented is true.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.27.4.3 When generated

This primitive is generated by the MLME as result of the establishment of a direct link with a specific peer MAC entity that resulted from a DLS procedure that was initiated by that specific peer MAC entity.

6.3.27.4.4 Effect of receipt

The SME is notified of the establishment of the DLS.

6.3.27.5 MLME-DLSTeardown.request

6.3.27.5.1 Function

When initiated by a non-AP STA, this primitive requests the teardown of the direct link with a specified peer MAC entity. When initiated by an AP, this primitive requests the teardown of direct link between two specified MAC entities.

6.3.27.5.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-DLSTeardown.request(
PeerMACAddress1,
PeerMACAddress2,
ReasonCode,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerMACAddress1	MACAddress	Any valid individual MAC address	Specifies the MAC address of the STA that is the intended immediate recipient of the teardown.
PeerMACAddress2	MACAddress	Any valid individual MAC address	Specifies the MAC address of the STA with which the DLS is being torn down. This parameter is applicable only at the AP.

Name	Type	Valid range	Description
ReasonCode	Enumeration	STA_LEAVING, END_DLS, PEERKEY_MISMATCH, UNKNOWN_DLS, TIMEOUT, PEER_INITIATED, AP_INITIATED	Indicates the reason why the direct link is being torn down.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.27.5.3 When generated

This primitive is generated by the SME at a STA for tearing down a direct link with another STA.

6.3.27.5.4 Effect of receipt

This primitive initiates a direct-link teardown procedure. The MLME subsequently issues an MLME-DLSTeardown.confirm primitive that reflects the results.

6.3.27.6 MLME-DLSTeardown.indication

6.3.27.6.1 Function

This primitive indicates the teardown of an already established direct link with a specific peer MAC entity.

6.3.27.6.2 Semantics of the service primitive

The primitive parameters are as follows:

```
  MLME-DLSTeardown.indication(
                                        PeerMACAddress,
                                        ReasonCode,
                                        VendorSpecificInfo
                                        )
```

Name	Type	Valid range	Description
PeerMACAddress	MACAddress	Any valid individual MAC address	Specifies the MAC address of the STA that is the sender of the data flow.
ReasonCode	Enumeration	STA_LEAVING, END_DLS, PEERKEY_MISMATCH, UNKNOWN_DLS, TIMEOUT, PEER_INITIATED, AP_INITIATED	Indicates the reason why the direct link is being torn down.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.27.6.3 When generated

This primitive is generated by the MLME as result of the teardown of a direct link with a specific peer MAC entity that resulted from a direct link teardown procedure that was initiated either by that specific peer MAC entity or by the local MAC entity.

6.3.27.6.4 Effect of receipt

The SME is notified of the teardown of the DLS.

6.3.28 Higher layer synchronization support

6.3.28.1 Introduction

This mechanism supports the process of synchronization among higher layer protocol entities residing within different wireless STAs. The actual synchronization mechanism in the higher layer is out of the scope of this standard. In principle, the MLME indicates the transmission/reception of frames with a specific group address in the Address 1 field of a data MPDU.

6.3.28.2 MLME-HL-SYNC.request

6.3.28.2.1 Function

This primitive requests activation of the synchronization support mechanism.

6.3.28.2.2 Semantics of the service primitive

The primitive parameter is as follows:

```
MLME-HL-SYNC.request(
                              GroupAddress
                              )
```

Name	Type	Valid range	Description
GroupAddress	MACAddress	A group MAC address	Specifies the group MAC address to which the synchronization frames are addressed. A synchronization frame is a data frame with higher layer synchronization information.

6.3.28.2.3 When generated

This primitive is generated by the SME when a higher layer protocol initiates a synchronization process.

6.3.28.2.4 Effect of Receipt

This request activates the synchronization support mechanism at the STA. The MLME issues an MLME-HL-SYNC.indication primitive when a higher layer synchronization frame, which is a data frame with the specified group address in Address 1 field, is received or transmitted.

6.3.28.3 MLME-HL-SYNC.indication

6.3.28.3.1 Function

This primitive indicates the last symbol on air of a higher layer synchronization frame, whether transmitted or received by the MAC.

6.3.28.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-HL-SYNC.indication(
                              SourceAddress,
                              SequenceNumber
                              )
```

Name	Type	Valid range	Description
SourceAddress	MACAddress	Any valid individual MAC address	Specifies the SA of the STA that transmitted the higher layer synchronization frame.
SequenceNumber	Integer	As defined in 8.2.4.4.2	Specifies the sequence number of the higher layer synchronization frame received or transmitted.

6.3.28.3.3 When generated

This primitive is generated by the MLME when the successful reception or transmission of a higher layer synchronization frame is detected, as indicated by the PHY_RXEND.indication or PHY_TXEND.confirm primitives generated by the PHY. The higher layer synchronization frame is identified by the group MAC address registered by an earlier MLME-HL-SYNC.request primitive in the Address 1 field of a data frame.

6.3.28.3.4 Effect of Receipt

The SME is notified of the reception or transmission of a higher layer synchronization frame.

6.3.29 Block Ack

6.3.29.1 General

This mechanism supports the initiation (or modification) and termination of Block Ack.

The primitives used for this mechanism are called *Block Ack primitives*, which include MLME-ADDBA.xxx and MLME-DELBA.xxx primitives, where xxx denotes request, confirm, indication, or response. Each primitive contains parameters that correspond to a Block Ack Action frame body. Requests and responses may cause these frames to be sent. Confirms and indications are emitted when an appropriate Block Ack Action frame is received.

6.3.29.2 MLME-ADDBA.request

6.3.29.2.1 Function

This primitive requests the initiation (or modification) of Block Ack with a peer MAC entity.

6.3.29.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-ADDBA.request(
                                PeerSTAAddress,
                                DialogToken,
                                TID,
                                BlockAckPolicy,
                                BufferSize,
                                BlockAckTimeout,
                                ADDBAFailureTimeout,
                                BlockAckStartingSequenceControl,
                                VendorSpecificInfo
                                )
```

Name	Type	Valid range	Description
PeerSTAAddress	MACAddress	N/A	Specifies the address of the peer MAC entity with which to perform the Block Ack initiation (or modification).
DialogToken	Integer	0–255	Specifies a number unique to the Block Ack Action primitives and frames used in defining the Block Ack.
TID	Integer	0–15	Specifies the TID of the data.
BlockAckPolicy	Enumeration	Immediate, Delayed	Specifies the Block Ack policy.
BufferSize	Integer	0–127	Specifies the number of MPDUs that can be held in its buffer.
BlockAckTimeout	Integer	0 – 65 535	Specifies the number of TUs without a frame exchange between peers after which the Block Ack is considered to be torn down.
ADDBAFailureTimeout	Integer	Greater than or equal to 1	Specifies a time limit (in TU) after which the Block Ack setup procedure is terminated, from dot11ADDBAResponseTimeout.
BlockAckStartingSequenceControl	Block Ack Starting Sequence Control field	As defined in 8.3.1.8	Specifies the value of Block Ack starting sequence control.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.29.2.3 When generated

This primitive is generated by the SME at a STA to request initiation (or modification) of Block Ack with the specified peer MAC entity.

6.3.29.2.4 Effect of receipt

The STA sends the ADDBA Request frame to the specified peer MAC entity.

6.3.29.3 MLME-ADDBA.confirm

6.3.29.3.1 Function

The primitive reports the results of initiation (or modification) of the Block Ack attempt with the specified peer MAC entity.

6.3.29.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-ADDBA.confirm(
                              PeerSTAAddress,
                              DialogToken,
                              TID,
                              ResultCode,
                              BlockAckPolicy,
                              BufferSize,
                              BlockAckTimeout,
                              VendorSpecificInfo
                              )
```

Name	Type	Valid range	Description
PeerSTAAddress	MACAddress	N/A	Specifies the address of the peer MAC entity with which the Block Ack initiation (or modification) was attempted. This value matches the PeerSTAAddress parameter specified in MLME-ADDBA.request primitive.
DialogToken	Integer	0–255	Specifies a number unique to the Block Ack Action primitives and frames used in defining the Block Ack. This value matches the DialogToken parameter specified in MLME-ADDBA.request primitive.
TID	Integer	0–15	Specifies the TID of the data. This value matches the TID specified in MLME-ADDBA.request primitive.
ResultCode	Enumeration	SUCCESS, INVALID_ PARAMETERS, REFUSED	Indicates the result of the corresponding MLME-ADDBA.request primitive.
BlockAckPolicy	Enumeration	Immediate, Delayed	Specifies the Block Ack policy.
BufferSize	Integer	0–127	Specifies the maximum number of MPDUs in the block for the specified TID.
BlockAckTimeout	Integer	0 – 65 535	Specifies the number of TUs without a frame exchange between peers after which the Block Ack is considered to be torn down.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.29.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-ADDBA.request primitive to indicate the results of that request.

6.3.29.3.4 Effect of receipt

The SME is notified of the results of the Block Ack initiation (or modification).

6.3.29.4 MLME-ADDBA.indication

6.3.29.4.1 Function

This primitive reports the initiation (or modification) of Block Ack by a peer MAC entity.

6.3.29.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-ADDBA.indication(
                              PeerSTAAddress,
                              DialogToken,
                              TID,
                              BlockAckPolicy,
                              BufferSize,
                              BlockAckTimeout,
                              VendorSpecificInfo
                              )
```

Name	Type	Valid range	Description
PeerSTAAddress	MACAddress	N/A	Specifies the address of the peer MAC entity that requested the Block Ack initiation (or modification).
DialogToken	Integer	0–255	Specifies a number unique to the Block Ack Action primitives and frames used in defining the Block Ack.
TID	Integer	0–15	Specifies the TID of the data.
BlockAckPolicy	Enumeration	Immediate, Delayed	Specifies the Block Ack policy.
BufferSize	Integer	0–127	Specifies the number of MPDUs that can be held in peerSTAAddress buffer.
BlockAckTimeout	Integer	0 – 65 535	Specifies the number of TUs without a frame exchange between peers after which the Block Ack is considered to be torn down.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.29.4.3 When generated

This primitive is generated by the MLME as a result of receipt of a Block Ack initiation (or modification) by the specified peer MAC entity in the form of an ADDBA Request frame.

6.3.29.4.4 Effect of receipt

The SME is notified of the initiation (or modification) of the Block Ack by the specified peer MAC entity.

6.3.29.5 MLME-ADDBA.response

6.3.29.5.1 Function

The primitive responds to the initiation (or modification) by a specified peer MAC entity.

6.3.29.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-ADDBA.response(
                                PeerSTAAddress,
                                DialogToken,
                                TID,
                                ResultCode,
                                BlockAckPolicy,
                                BufferSize,
                                BlockAckTimeout,
                                VendorSpecificInfo
                                )
```

Name	Type	Valid range	Description
PeerSTAAddress	MACAddress	N/A	Specifies the address of the peer MAC entity that attempted the Block Ack initiation (or modification). This value matches the PeerSTAAddress parameter specified in MLME-ADDBA.indication primitive.

Name	Type	Valid range	Description
DialogToken	Integer	0–255	Specifies a number unique to the Block Ack Action primitives and frames used in defining the Block Ack. This value matches the DialogToken parameter specified in MLME-ADDBA.indication primitive.
TID	Integer	0–15	Specifies the TID of the data. This value matches the TID specified in MLME-ADDBA.indication primitive.
ResultCode	Enumeration	SUCCESS, REFUSED, INVALID_ PARAMETERS	Indicates the result of the corresponding MLME-ADDBA.indication primitive.
BlockAckPolicy	Enumeration	Immediate, Delayed	Specifies the Block Ack policy. Undefined when the result code is REFUSED.
BufferSize	Integer	0–127	Specifies the maximum number of MPDUs in the block for the specified TID. Undefined when the result code is REFUSED.
BlockAckTimeout	Integer	0 – 65 535	Specifies the number of TUs without a frame exchange between peers after which the Block Ack is considered to be torn down.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.29.5.3 When generated

This primitive is generated by the MLME as a result of an MLME-ADDBA.indication primitive to initiate Block Ack by the specified peer MAC entity.

6.3.29.5.4 Effect of receipt

The primitive causes the MAC entity to send an ADDBA Response frame to the specified peer MAC entity.

6.3.29.6 MLME-DELBA.request

6.3.29.6.1 Function

This primitive requests the deletion of Block Ack with a peer MAC entity.

6.3.29.6.2 Semantics of the service primitive

The primitive parameters are as follows:

```
  MLME-DELBA.request(
                              PeerSTAAddress,
                              Direction,
                              TID,
                              ReasonCode,
                              VendorSpecificInfo
                              )
```

Name	Type	Valid range	Description
PeerSTAAddress	MACAddress	N/A	Specifies the address of the peer MAC entity with which to perform the Block Ack deletion.

Name	Type	Valid range	Description
Direction	Enumeration	Originator, Recipient	Specifies if the MAC entity initiating the MLME-DELBA.request primitive is the originator or the recipient of the data stream that uses the Block Ack.
TID	Integer	0–15	Specifies the TID of the MSDUs for which this Block Ack has been set up.
ReasonCode	Enumeration	STA_LEAVING, END_BA, UNKNOWN_BA, TIMEOUT	Indicates the reason why the Block Ack is being deleted.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.29.6.3 When generated

This primitive is generated by the SME at a STA to request deletion of Block Ack with the specified peer MAC entity.

6.3.29.6.4 Effect of receipt

The STA sends the DELBA frame to the specified peer MAC entity.

6.3.29.7 MLME-DELBA.indication

6.3.29.7.1 Function

This primitive reports the deletion of Block Ack by a peer MAC entity.

6.3.29.7.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-DELBA.indication(
                                PeerSTAAddress,
                                Direction,
                                TID,
                                ReasonCode,
                                VendorSpecificInfo
                                )
```

Name	Type	Valid range	Description
PeerSTAAddress	MACAddress	N/A	Specifies the address of the peer MAC entity with which to perform the Block Ack deletion.
Direction	Enumeration	Originator, Recipient	Specifies if the MAC entity initiating the MLME-DELBA.request primitive is the originator or the recipient of the data stream that uses the Block Ack.
TID	Integer	0–15	Specifies the TID of the MSDUs for which this Block Ack has been set up.
ReasonCode	Enumeration	STA_LEAVING, END_BA, UNKNOWN_BA, TIMEOUT	Indicates the reason why the Block Ack is being deleted.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.29.7.3 When generated

This primitive is generated by the MLME as a result of receipt of a Block Ack deletion by the specified peer MAC entity in the form of a DELBA frame.

6.3.29.7.4 Effect of receipt

The SME is notified of the deletion of the Block Ack by the specified peer MAC entity.

6.3.30 Schedule element management

6.3.30.1 Introduction

This subclause describes the management procedures associated with the QoS Schedule element.

The primitives defined are MLME-SCHEDULE.request and MLME-SCHEDULE.indication.

6.3.30.2 MLME-SCHEDULE.request

6.3.30.2.1 Function

This primitive requests transmission of a Schedule frame. It is valid at the HC.

6.3.30.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
   MLME-SCHEDULE.request(
                                        STAAddress,
                                        Schedule
                                        )
```

Name	Type	Valid range	Description
STAAddress	MACAddress	Any valid individual address	MAC address of the STA to which the Schedule frame shall be sent.
Schedule	Schedule element	As defined in 8.4.2.36	Specifies the schedule for the STA, including the SI (minimum and maximum), TXOP duration (minimum and maximum), and specification interval.

6.3.30.2.3 When generated

This primitive is generated by the SME at the HC to send the schedule information, in the form of a Schedule frame, to a specified STA when the schedule information for the STA is changed.

6.3.30.2.4 Effect of receipt

This primitive causes the MAC entity at the HC to send a Schedule frame to the STA specified in the primitive containing the specified Schedule parameters.

6.3.30.3 MLME-SCHEDULE.indication

6.3.30.3.1 Function

This primitive reports the reception of a new schedule by the STA in the form of a Schedule frame.

6.3.30.3.2 Semantics of the service primitive

The primitive parameter is as follows:

```
MLME-SCHEDULE.indication(
                                        Schedule
                                        )
```

Name	Type	Valid range	Description
Schedule	Schedule element	As defined in 8.4.2.36	Specifies the schedule for the STA, including the SI (minimum and maximum), TXOP duration (minimum and maximum), and specification interval.

6.3.30.3.3 When generated

This primitive is generated by the MLME as a result of receipt of a new schedule in the form of a Schedule frame.

6.3.30.3.4 Effect of receipt

The SME is notified of the receipt of QoS schedule in the form of a Schedule frame. The new Schedule parameters overwrite the previously stored values.

6.3.31 Vendor-specific action

6.3.31.1 Introduction

This set of primitives supports the signaling of (Protected) Vendor Specific Action frames among peer SMEs.

6.3.31.2 MLME-VSPECIFIC.request

6.3.31.2.1 Function

This primitive requests transmission of a Vendor Specific Action frame.

6.3.31.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-VSPECIFIC.request(
                                        PeerMACAddress,
                                        Protected,
                                        Organization Identifier,
                                        VendorSpecificContent
                                        )
```

Name	Type	Valid range	Description
PeerMACAddress	MACAddress	Any valid individual MAC address or any valid group MAC address	The address of the peer MAC entity or group of entities to which the Vendor Specific Action frame is sent.

Name	Type	Valid range	Description
Protected	Boolean	true, false	Specifies whether the request is sent using a Robust Management frame. If true, the request is sent using a Protected Vendor Specific frame. If false, the request is sent using a Vendor Specific frame.
Organization Identifier	As defined in 8.4.1.31	As defined in 8.4.1.31	Contains a public value assigned by the IEEE to identify the organization that has defined the content of the particular vendor-specific action.
VendorSpecificContent	Determined by the entity to whom the Organization Identifier is registered	Determined by the entity to whom the Organization Identifier is registered	Vendor-specific content.

6.3.31.2.3 When generated

This primitive is generated by the SME to request that a Vendor Specific Action frame be sent.

6.3.31.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Vendor Specific Action frame containing the set of elements and vendor-specific fields. The STA then attempts to transmit the frame.

6.3.31.3 MLME-VSPECIFIC.indication

6.3.31.3.1 Function

This primitive indicates that a Vendor Specific Action frame has been received from a peer entity.

6.3.31.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-VSPECIFIC.indication(
                              PeerMACAddress,
                              Protected,
                              Organization Identifier,
                              RCPI,
                              VendorSpecificContent
                              )
```

Name	Type	Valid range	Description
PeerMACAddress	MACAddress	Any valid individual MAC address	The address of the peer MAC entity from which the Vendor Specific Action frame was received.

Name	Type	Valid range	Description
Protected	Boolean	true, false	Specifies whether the request was received using a Robust Management frame. If true, the request was received using a Protected Vendor Specific frame. If false, the request was received using a Vendor Specific frame.
Organization Identifier	As defined in 8.4.1.31	As defined in 8.4.1.31	Contains a public value assigned by the IEEE to identify the organization that has defined the content of the particular vendor-specific action.
RCPI	As defined in 8.4.2.40	As defined in 8.4.2.40	Present when dot11OCBActivated is true. RCPI is the measured value of received channel power on the received Vendor Specific Action frame.
VendorSpecificContent	Determined by the entity to whom the Organization Identifier is registered	Determined by the entity to whom the Organization Identifier is registered	Vendor-specific content.

6.3.31.3.3 When generated

This primitive is generated by the MLME when a valid Vendor Specific Action frame is received.

6.3.31.3.4 Effect of receipt

On receipt of this primitive, the Vendor Specific Content can be made available for SME processes.

6.3.32 Neighbor report request

6.3.32.1 General

The following MLME primitives support the signaling of neighbor report requests.

6.3.32.2 MLME-NEIGHBORREPREQ.request

6.3.32.2.1 Function

This primitive requests that a Neighbor Report Request frame be sent to the AP with which the STA is associated. It is valid only at a Radio Measurement capable STA.

6.3.32.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-NEIGHBORREPREQ.request(
                            DialogToken,
                            SSID,
                            VendorSpecificInfo
                            )
```

Name	Type	Valid range	Description
DialogToken	Integer	1–255	The Dialog Token to identify the neighbor report transaction.
SSID	As defined in the SSID element	As defined in the SSID element	Optional SSID element to request a neighbor list for a specific SSID.
Vendor-SpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.32.2.3 When generated

This primitive is generated by the SME to request that a Neighbor Report Request frame be sent to the AP with which the STA is associated to request a neighbor report.

6.3.32.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Neighbor Report Request frame. The STA then attempts to transmit this to the AP with which it is associated.

6.3.32.3 MLME-NEIGHBORREPREQ.indication

6.3.32.3.1 Function

This primitive indicates that a Neighbor Report Request frame was received. It is valid only at a Radio Measurement capable AP.

6.3.32.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-NEIGHBORREPREQ.indication(
                                   PeerSTAAddress,
                                   DialogToken,
                                   SSID,
                                   VendorSpecificInfo
                                   )
```

Name	Type	Valid range	Description
PeerSTA-Address	MACAddress	Any valid individual MAC address	The address of the STA's MAC entity from which a Neighbor Report Request frame was received.
DialogToken	Integer	1–255	The Dialog Token in the Neighbor Report Request frame that was received.
SSID	As defined in the SSID element	As defined in the SSID element	Optional SSID element to request a neighbor list for a specific SSID.
Vendor-SpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.32.3.3 When generated

This primitive is generated by the MLME when a valid Neighbor Report Request frame is received.

6.3.32.3.4 Effect of receipt

On receipt of this primitive, the SME operates according to the procedure in 10.11.10.3.

6.3.33 Neighbor report response

6.3.33.1 General

The following MLME primitives support the signaling of neighbor report responses.

6.3.33.2 MLME-NEIGHBORREPRESP.request

6.3.33.2.1 Function

This primitive requests that a neighbor report response be sent. This may be in response to an MLME-NEIGHBORREPREQ.indication primitive or an autonomous request. It is valid only at a Radio Measurement capable AP.

6.3.33.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-NEIGHBORREPRESP.request(
                              PeerSTAAddress,
                              DialogToken,
                              NeighborListSet,
                              VendorSpecificInfo
                              )
```

Name	Type	Valid range	Description
PeerSTAAddress	MACAddress	Any valid individual MAC address	The address of the STA's MAC entity to which a Neighbor Report Response frame is to be sent.
DialogToken	Integer	0–255	The Dialog Token to identify the neighbor report transaction. Set to the value received in the corresponding MLME-NEIGHBORREPREQ.indication primitive or to 0 for an autonomous report.
NeighborListSet	Set of Neighbor List elements each as defined in the Neighbor Report element format	As defined in 8.4.2.39	A set of Neighbor List elements, each representing a neighboring AP being reported as defined in the Neighbor Report element format.
Vendor-SpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.33.2.3 When generated

This primitive is generated by the SME to request a neighbor report be sent. This may be in response to an earlier MLME-NEIGHBORREPREQ.indication primitive or a request to transmit an autonomous report.

6.3.33.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Neighbor Report Response frame. The STA then attempts to transmit this to the STA indicated by the PeerSTAAddress parameter.

6.3.33.3 MLME-NEIGHBORREPRESP.indication

6.3.33.3.1 Function

This primitive indicates that a neighbor report response has been received. This may be in response to an earlier neighbor report request (MLME-NEIGHBORREPREQ.request) or an autonomous report. It is valid only at a Radio Measurement capable STA.

6.3.33.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
   MLME-NEIGHBORREPRESP.indication(
                                   PeerSTAAddress,
                                   DialogToken,
                                   NeighborListSet,
                                   VendorSpecificInfo
                                   )
```

Name	Type	Valid range	Description
PeerSTAAddress	MACAddress	Any valid individual MAC address	The address of the AP from which the Neighbor Report Response frame was received.
DialogToken	Integer	0–255	The Dialog Token received in the Neighbor Report Response frame to identify the neighbor report transaction.
NeighborListSet	Set of Neighbor List elements, each as defined in the Neighbor Report element format	As defined in 8.4.2.39	A set of Neighbor List elements derived from the MIB table dot11RMNeighborReportTable, each representing a neighboring AP being reported as defined in the Neighbor Report element format.
Vendor-SpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.33.3.3 When generated

This primitive is generated by the MLME when a valid Neighbor Report Response frame is received.

6.3.33.3.4 Effect of receipt

On receipt of this primitive, neighbor report data may be available to the SME.

6.3.34 Link Measure Request

6.3.34.1 General

The following primitives support the measurement of link path loss and the estimation of link margin between peer entities.

6.3.34.2 MLME-LINKMEASURE.request

6.3.34.2.1 Function

This primitive supports the measurement of link path loss and the estimation of link margin between peer entities.

NOTE—The layer management model used assumes that the handling of a received Link Measurement Request frame is entirely within the MLME. Correspondingly there are no MLME-SME primitives specified for the peer side of a link measurement request transaction.

6.3.34.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-LINKMEASURE.request(
                              PeerMACAddress,
                              DialogToken,
                              Transmit Power,
                              Max Transmit Power,
                              VendorSpecificInfo
                              )
```

Name	Type	Valid range	Description
PeerMAC Address	MACAddress	Any valid individual MAC address	The address of the peer MAC entity to which the Link Measure Request shall be sent.
DialogToken	Integer	1–255	The dialog token to identify the Link Measure transaction.
Transmit Power	Integer	As defined in 8.5.7.4	The transmit power to be used when transmitting the Link Measurement Request frame and included in the frame body. See 8.5.7.4.
Max Transmit Power	Integer	As defined in 8.5.7.4	The maximum transmit power to be used by the transmitting STA on its operating channel. See 8.5.7.5.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.34.2.3 When generated

This primitive is generated by the SME to request that a Link Measurement Request frame be sent to the peer entity to request that entity to report transmit power and link margin information.

6.3.34.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Link Measurement Request frame. The STA then attempts to transmit this to the STA indicated in the PeerMACAddress parameter.

6.3.34.3 MLME-LINKMEASURE.confirm

6.3.34.3.1 Function

This primitive reports the result of a Link Measurement request.

6.3.34.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-LINKMEASURE.confirm(
                              ResultCode,
                              DialogToken,
                              TransmitPower,
                              LinkMargin,
                              RCPI.request,
                              RSNI.request,
                              RCPI.report,
                              RSNI.report,
                              ReceiveAntennaID,
                              TransmitAntennaID,
                              VendorSpecificInfo
                              )
```

Name	Type	Valid range	Description
ResultCode	Enumeration	SUCCESS, UNSPECIFIED FAILURE	Indicates the result of the corresponding MLME-LINKMEASURE.request primitive.
DialogToken	Integer	As defined in the corresponding MLME-LINK-MEASURE.request primitive	The Dialog Token to identify the link measurement transaction.
TransmitPower	As defined in the TPC Report element	As defined in the TPC Report element	The contents of the Transmit Power field of the received Link Measurement Report frame. Present only if ResultCode = SUCCESS.
LinkMargin	As defined in the TPC Report element	As defined in the TPC Report element	The contents of the Link Margin field of the received Link Measurement Report frame. Present only if ResultCode = SUCCESS.
RCPI.request	Integer	As defined in 16.4.8.6, or 18.3.10.7, or 17.4.8.6	The RCPI level of the corresponding Link Measurement Request frame received at the reporting STA. Present only if ResultCode = SUCCESS.
RSNI.request	Integer	As defined in 8.4.2.43	The RSNI of the corresponding Link Measurement Request frame received at the reporting STA. Present only if ResultCode = SUCCESS
RCPI.report	Integer	As defined in 16.4.8.6, or 18.3.10.7, or 17.4.8.6	The RCPI level of the corresponding Link Measurement Report frame received at the requesting STA. Present only if ResultCode = SUCCESS.
RSNI.report	Integer	As defined in 8.4.2.43	The RSNI of the corresponding Link Measurement Report frame received at the requesting STA. Present only if ResultCode = SUCCESS
Receive Antenna ID	Integer	0–255	The Antenna ID corresponding to the antenna on which the Link Measurement Request frame was received at the reporting STA. Antenna ID is defined in 8.4.2.31.
Transmit Antenna ID	Integer	0–255	The Antenna ID corresponding to the antenna used to transmit the Link Measurement Report frame. Antenna ID is defined in 8.4.2.31.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.34.3.3 When generated

This primitive is generated by the MLME when a valid Link Measurement Report frame is received from the requested STA.

6.3.34.3.4 Effect of receipt

On receipt of this primitive, the SME evaluates the ResultCode and may use the reported data.

6.3.35 MLME SAP interface for resource request

6.3.35.1 MLME-RESOURCE-REQUEST.request

6.3.35.1.1 Function

This primitive is used to perform the over-the-air resource request of an FT Resource Request Protocol. The over-the-air resource request is performed using Authentication frames, with an authentication algorithm of FT authentication and transaction sequence number of 3 or 4.

6.3.35.1.2 Semantics of the service primitive

The primitive parameters are as follows:

```
        MLME-RESOURCE-REQUEST.request(
                                        PeerMACAddress,
                                        Contents of FT Authentication elements
                                        )
```

Name	Type	Valid range	Description
PeerMACAddress	MACAddress	Any valid individual MAC address	Specifies the MAC address of the AP that is the intended immediate recipient of the resource request.
Content of FT Authentication elements	Sequence of elements	As defined in 12.8	The set of elements to be included in the FT Confirm frame, as described in 12.8.4.

6.3.35.1.3 When generated

This primitive is generated by the SME to send the third frame of the over-the-air FT Resource Request Protocol. The third frame is an Authentication frame, with an authentication algorithm of FT authentication and transaction sequence value of 3.

6.3.35.1.4 Effect of receipt

Upon receipt of this primitive, the MLME constructs the appropriate Authentication frame and causes it to be transmitted to the peer MAC address.

6.3.35.2 MLME-RESOURCE-REQUEST.indication

6.3.35.2.1 Function

This primitive is used to enact the security and QoS resource request with a specified peer MAC entity.

6.3.35.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-RESOURCE-REQUEST.indication(
                                  PeerMACAddress,
                                  Content of FT Authentication elements
                                  )
```

Name	Type	Valid range	Description
PeerMACAddress	MACAddress	Any valid individual MAC address	Specifies the MAC address of the STA that was the sender of the resource request.
Content of FT Authentication elements	Sequence of elements	As defined in 12.8	The set of elements included in the FT Confirm frame, as described in 12.8.4.

6.3.35.2.3 When generated

This primitive is generated by the MLME at an AP to indicate that the third frame of the over-the-air FT Resource Request Protocol has been received. The third frame is an Authentication frame, with an authentication algorithm of FT authentication and transaction sequence value of 3.

6.3.35.2.4 Effect of receipt

Upon receipt of this primitive, the SME examines the Transition element and RSNE contents and responds to the peer MAC address using the MLME-RESOURCE-REQUEST.response primitive.

6.3.35.3 MLME-RESOURCE-REQUEST.response

6.3.35.3.1 Function

This primitive is used to enact the security and QoS resource request protocol with a specified peer MAC entity.

6.3.35.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-RESOURCE-REQUEST.response(
                                PeerMACAddress,
                                Content of FT Authentication elements
                                )
```

Name	Type	Valid range	Description
PeerMACAddress	MACAddress	Any valid individual MAC address	Specifies the MAC address of the STA that is the intended immediate recipient of the resource response.
Content of FT Authentication elements	Sequence of elements	As defined in 12.8	The set of elements to be included in the FT Ack frame, as described in 12.8.5. This includes an optional response to a resource request (RIC).

6.3.35.3.3 When generated

This primitive is generated by the SME at an AP to cause the transmission of the fourth frame in the over-the-air FT Resource Request Protocol. The fourth frame is an Authentication frame, with an authentication algorithm of FT authentication and transaction sequence value of 4.

6.3.35.3.4 Effect of receipt

Upon receipt of this primitive, the MLME constructs the appropriate Authentication frame and causes it to be transmitted to the peer MAC address.

6.3.35.4 MLME-RESOURCE-REQUEST.confirm

6.3.35.4.1 Function

This primitive is used to enact the security and QoS resource request protocol with a specified peer MAC entity.

6.3.35.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-RESOURCE-REQUEST.confirm(
                                        PeerMACAddress,
                                        Content of FT Authentication elements
                                        )
```

Name	Type	Valid range	Description
PeerMACAddress	MACAddress	Any valid individual MAC address	Specifies the MAC address of the AP that was the sender of the resource response.
Content of FT Authentication elements	Sequence of elements	As defined in 12.8	The set of elements included in the FT Ack frame, as described in 12.8.5. This includes an optional response to a resource request (RIC).

6.3.35.4.3 When generated

This primitive is generated by the MLME on receipt of the fourth frame in the FT Resource Request Protocol.

6.3.35.4.4 Effect of receipt

Upon receipt of this primitive, the SME examines the content of the message and completes its processing of the resource request.

6.3.35.5 MLME-RESOURCE-REQUEST-LOCAL.request

6.3.35.5.1 Function

This primitive is used to enact the over-the-DS FT Resource Request Protocol for a specified peer MAC entity. The over-the-DS FT Resource Request Protocol is performed by communication between the STA and the SME of the target AP, bypassing the MAC of the target AP. This MLME function is used to allow the MAC of the target AP to process the resource requests.

6.3.35.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-RESOURCE-REQUEST-LOCAL.request(
                                        MACAddress,
                                        Content of Resource Descriptor(s)
                                        )
```

Name	Type	Valid range	Description
MACAddress	MACAddress	Any valid individual MAC address	Specifies the MAC address of the STA that is making the resource request.
Content of Resource Descriptor(s)	Sequence of elements	As defined in 12.11.2	Specifies the resource(s) that are being requested.

6.3.35.5.3 When generated

This primitive is generated by the SME at a target AP upon receiving an over-the-DS resource request to request resources within the local MAC.

6.3.35.5.4 Effect of receipt

Upon receipt of this primitive, the MAC checks for resource availability and allocates resources as requested.

6.3.35.6 MLME-RESOURCE-REQUEST-LOCAL.confirm

6.3.35.6.1 Function

This primitive is used to respond to a local resource request for resources from the SME.

6.3.35.6.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-RESOURCE-REQUEST-LOCAL.confirm(
                                                  MACAddress,
                                                  Content of Resource Descriptor(s),
                                                  ResultCode
                                                  )
```

Name	Type	Valid range	Description
MACAddress	MACAddress	Any valid individual MAC address	Specifies the MAC address of the STA that is making the resource request.
Content of Resource Descriptor(s)	Sequence of elements	As defined in 12.11.2	Specifies the resource(s) that were allocated or could have been allocated.
ResultCode	Enumeration	SUCCESS, REFUSED, UNSPECIFIED FAILURE	Indicates the result of the outcome of a resource request.

6.3.35.6.3 When generated

This primitive is generated by the MAC in response to a local resource request for resources via MLME-RESOURCE-REQUEST-LOCAL.request primitive.

6.3.35.6.4 Effect of receipt

Upon receipt of this primitive, the SME prepares a success or failure response to be sent to the STA via the current AP.

6.3.36 MLME SAP interface for remote requests

6.3.36.1 MLME-REMOTE-REQUEST.request

6.3.36.1.1 Function

This primitive is used by the SME of a non-AP STA (to send over-the-DS requests) and the SME of an AP (to send over-the-DS responses) to request the MAC to send an FT Action frame.

6.3.36.1.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-REMOTE-REQUEST.request(
PeerMACAddress,
Content of FT Action Frame
)

Name	Type	Valid range	Description
PeerMACAddress	MACAddress	Any valid individual MAC address	Specifies the MAC address of the STA that is the destination of the Action frame
Content of FT Action Frame	Sequence of octets	As defined in 8.5.9	The Action frame to send to the STA.

6.3.36.1.3 When generated

This primitive is generated by the SME to send an FT Action frame to a specific peer MAC entity.

6.3.36.1.4 Effect of receipt

Upon receipt of this primitive, the MAC forwards the Action frame to the STA identified in the Action frame.

6.3.36.2 MLME-REMOTE-REQUEST.indication

6.3.36.2.1 Function

This primitive is used by the MAC to indicate to the SME the reception of an FT Action frame.

6.3.36.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-REMOTE-REQUEST.indication(
PeerMACAddress,
Contents of FT Action Frame
)

Name	Type	Valid range	Description
PeerMACAddress	MACAddress	Any valid individual MAC address	Specifies the MAC address of the STA that issued the Action frame.
Content of FT Action Frame	Sequence of octets	As defined in 8.5.9	The Action frame received from the STA.

6.3.36.2.3 When generated

This primitive is generated by the MAC as a result of the receipt of an FT Action frame from a specific peer MAC entity.

6.3.36.2.4 Effect of receipt

Upon receipt of this primitive, the remote request broker (RRB) in the SME of the current AP forwards the Action frame to the target AP identified in the Action frame.

6.3.37 Extended channel switch announcement

6.3.37.1 General

The following MLME primitives support the signaling of extended channel switch announcement.

6.3.37.2 MLME-EXTCHANNELSWITCH.request

6.3.37.2.1 Function

This primitive requests that a (Protected) Extended Channel Switch Announcement frame be sent by an AP or mesh STA in an MBSS.

6.3.37.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-EXTCHANNELSWITCH.request(
                                    Mode,
                                    OperatingClass,
                                    ChannelNumber,
                                    ChannelSwitchCount,
                                    Protected,
                                    Mesh Channel Switch Parameters,
                                    VendorSpecificInfo
                                    )
```

Name	Type	Valid range	Description
Mode	Integer	0,1	Channel switch mode, as defined for the Extended Channel Switch Announcement element.
OperatingClass	Integer	As defined in Annex E	Specifies the new operating class.
ChannelNumber	Integer	As defined in Annex E	Specifies the new channel number.
ChannelSwitchCount	As defined in 8.4.2.55	As defined in 8.4.2.55	Specifies the time period until the channel switch event, as described in 8.4.2.55
Protected	Boolean	true, false	Specifies whether the request is sent using a Robust Management frame. If true, the request is sent using the Protected Extended Channel Switch Announcement frame. If false, the request is sent using the Extended Channel Switch Announcement frame.

Name	Type	Valid range	Description
Mesh Channel Switch Parameters	As defined in 8.4.2.105	As defined in 8.4.2.105	Specifies MBSS Channel Switch Parameters used by a mesh STA. This parameter is present if the dot11MeshActivated is true; otherwise, the parameter is not present.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.37.2.3 When generated

This primitive is generated by the STA management entity (SME) to request that a (Protected) Extended Channel Switch Announcement frame be sent to a STA that is associated to the AP or to peer mesh STAs in the MBSS.

6.3.37.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs and transmits a (Protected) Extended Channel Switch Announcement frame.

6.3.37.3 MLME-EXTCHANNELSWITCH.confirm

6.3.37.3.1 Function

This primitive reports the result of a request to switch channel.

6.3.37.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-EXTCHANNELSWITCH.confirm(
                                ResultCode,
                                VendorSpecificInfo
                                )
```

Name	Type	Valid range	Description
ResultCode	Enumeration	SUCCESS, UNSPECIFIED_FAILURE	Reports the result of an extended channel switch request.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.37.3.3 When generated

This primitive is generated by the MLME when an extended channel switch request completes. Possible unspecified failure causes include an inability to schedule an extended channel switch announcement.

6.3.37.3.4 Effect of receipt

The SME is notified of the results of the extended channel switch procedure.

6.3.37.4 MLME-EXTCHANNELSWITCH.indication

6.3.37.4.1 Function

This primitive indicates that a (Protected) Extended Channel Switch Announcement frame was received from an AP or from a peer mesh STA.

6.3.37.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-EXTCHANNELSWITCH.indication(
                                        Peer MAC Address,
                                        Mode,
                                        OperatingClass,
                                        ChannelNumber,
                                        ChannelSwitchCount,
                                        Protected,
                                        Mesh Channel Switch Parameters,
                                        VendorSpecificInfo
                                        )
```

Name	Type	Valid range	Description
Peer MAC Address	MACAddress	Any valid individual MAC address	The address of the peer MAC entity from which the Extended Channel Switch Announcement frame was received.
Mode	Integer	0, 1	Channel switch mode, as defined for the Channel Switch Announcement element.
OperatingClass	Integer	As defined in Annex E	Specifies the new operating class.
ChannelNumber	Integer	As defined in Annex E	Specifies the new channel number.
ChannelSwitchCount	As defined in 8.4.2.55	As defined in 8.4.2.55	Specifies the time period until the channel switch event, as described in 8.4.2.55
Protected	Boolean	true, false	Specifies whether the request was received using a Robust Management frame. If true, the request was received using the Protected Extended Channel Switch Announcement frame. If false, the request was received using the Extended Channel Switch Announcement frame.
Mesh Channel Switch Parameters	As defined in 8.4.2.105	As defined in 8.4.2.105	Specifies MBSS Channel Switch Parameters used by a mesh STA. This parameter is present if the dot11MeshActivated is true; otherwise, the parameter is not present.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.37.4.3 When generated

This primitive is generated by the MLME when a valid (Protected) Extended Channel Switch Announcement frame is received.

6.3.37.4.4 Effect of receipt

On receipt of this primitive, the SME decides whether to accept the switch request.

6.3.37.5 MLME-EXTCHANNELSWITCH.response

6.3.37.5.1 Function

This primitive is used to schedule an accepted extended channel switch.

6.3.37.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
   MLME-EXTCHANNELSWITCH.response(
                                                    Mode,
                                                    OperatingClass,
                                                    ChannelNumber,
                                                    ChannelSwitchCount,
                                                    Mesh Channel Switch Parameters,
                                                    VendorSpecificInfo
                                                    )
```

Name	Type	Valid range	Description
Mode	Integer	0, 1	Channel switch mode, as defined for the Channel Switch Announcement element.
OperatingClass	Integer	As defined in Annex E	Specifies the new operating class.
ChannelNumber	Integer	As defined in Annex E	Specifies the new channel number.
ChannelSwitchCount	As defined in 8.4.2.55	As defined in 8.4.2.55	Specifies the time period until the channel switch event, as described in 8.4.2.55
Mesh Channel Switch Parameters	As defined in 8.4.2.105	As defined in 8.4.2.105	Specifies MBSS Channel Switch Parameters used by a mesh STA. This parameter is present if the dot11MeshActivated is true; otherwise, the parameter is not present.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.37.5.3 When generated

This primitive is generated by the SME to schedule an accepted extended channel switch request.

6.3.37.5.4 Effect of receipt

On receipt of this primitive, the MLME schedules the extended channel switch.

6.3.38 DSE power constraint announcement

6.3.38.1 General

The following MLME primitives support the signaling of DSE power constraint to dependent STAs.

6.3.38.2 MLME-DSETPC.request

6.3.38.2.1 Function

This primitive requests that a (Protected) DSE Power Constraint frame be sent by an enabling STA.

6.3.38.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-DSETPC.request(
                        RequesterSTAAddress,
                        ResponderSTAAddress,
                        DSELocalPowerConstraint,
                        Protected,
                        VendorSpecificInfo
                        )
```

Name	Type	Valid range	Description
RequesterSTAAddress	MACAddress	Any valid individual MAC address	Specifies the address of the MAC entity of the enabling STA.
ResponderSTAAddress	MACAddress	Any valid individual MAC address	Specifies the address of the MAC entity that initiates the enablement process.
DSELocalPowerConstraint	Integer	0–255	Specifies the local power constraint, as described in the DSE Power Constraint frame (see 8.5.8.10).
Protected	Boolean	true, false	Specifies whether the request is sent using a Robust Management frame. If true, the request is sent using the Protected DSE Power Constraint frame. If false, the request is sent using the DSE Power Constraint frame.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.38.2.3 When generated

This primitive is generated by the SME to request that a (Protected) DSE Power Constraint Announcement frame be sent to a dependent STA.

6.3.38.2.4 Effect of receipt

Upon receipt of this primitive, the MLME constructs a (Protected) DSE Power Constraint Announcement frame. The enabling STA then schedules this frame for transmission.

6.3.38.3 MLME-DSETPC.confirm

6.3.38.3.1 Function

This primitive reports the results of a request to send a (Protected) DSE Power Constraint Announcement frame.

6.3.38.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-DSETPC.confirm(
                        ResultCode,
                        VendorSpecificInfo
                        )
```

Name	Type	Valid range	Description
ResultCode	Enumeration	SUCCESS, REFUSED	Indicates the result of MLME-DSETPC.request primitive.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.38.3.3 When generated

This primitive is generated by the MLME when a DSE power constraint announcement completes.

6.3.38.3.4 Effect of receipt

The SME is notified of the results of the DSE power constraint procedure.

6.3.38.4 MLME-DSETPC.indication

6.3.38.4.1 Function

This primitive indicates that a DSE Power Constraint Announcement frame was received from an enabling STA.

6.3.38.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-DSETPC.indication(
                        RequesterSTAAddress,
                        ResponderSTAAddress,
                        DSELocalPowerConstraint,
                        Protected,
                        VendorSpecificInfo
                        )
```

Name	Type	Valid range	Description
RequesterSTAAddress	MACAddress	Any valid individual MAC address	Specifies the address of the peer MAC entity that initiated the enablement process.
ResponderSTAAddress	MACAddress	Any valid individual MAC address	Specifies the address of the peer MAC entity that is the enabling STA.
DSELocalPowerConstraint	Integer	0–255	Specifies the local power constraint, as described in the DSE Power Constraint frame (see 8.5.8.10).

Name	Type	Valid range	Description
Protected	Boolean	true, false	Specifies whether the request was received using a Robust Management frame. If true, the request was received using the Protected DSE Power Constraint frame. If false, the request was received using the DSE Power Constraint frame.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.38.4.3 When generated

This primitive is generated by the MLME when a valid (Protected) DSE Power Constraint Announcement frame is received.

6.3.38.4.4 Effect of receipt

On receipt of this primitive, the SME performs the DSE power constraint procedure (see 10.12.5).

6.3.38.5 MLME-DSETPC.response

6.3.38.5.1 Function

This primitive is used to report the result of the DSE power constraint procedure.

6.3.38.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-DSETPC.response(
                        RequesterSTAAddress,
                        ResponderSTAAddress,
                        ResultCode,
                        Protected,
                        VendorSpecificInfo
                        )
```

Name	Type	Valid range	Description
RequesterSTAAddress	MACAddress	Any valid individual MAC address	Specifies the address of the MAC entity of the enabling STA.
ResponderSTAAddress	MACAddress	Any valid individual MAC address	Specifies the address of the peer MAC entity that initiates the enabling process.
ResultCode	Enumeration	SUCCESS, REFUSED	Reports the result of a DSE power constraint procedure.
Protected	Boolean	true, false	Specifies whether the response is sent using a Robust Management frame. If true, the response is sent using the Protected DSE Power Constraint frame. If false, the response is sent using the DSE Power Constraint frame.

Name	Type	Valid range	Description
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.38.5.3 When generated

This primitive is generated by the SME to schedule a response to DSE power constraint announcement.

6.3.38.5.4 Effect of receipt

On receipt of this primitive, the MLME schedules the transmission of a (Protected) DSE power constraint result to the enabling STA that sent the DSE power constraint announcement.

6.3.39 Enablement

6.3.39.1 General

This mechanism supports the process of establishing an enablement relationship with a peer MAC entity.

6.3.39.2 MLME-ENABLEMENT.request

6.3.39.2.1 Function

This primitive requests enablement with a specified peer MAC entity.

6.3.39.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-ENABLEMENT.request(
                              RequesterSTAAddress,
                              ResponderSTAAddress,
                              EnablementTimeLimit,
                              Protected,
                              VendorSpecificInfo
                              )
```

Name	Type	Valid range	Description
RequesterSTAAddress	MACAddress	Any valid individual MAC address	Specifies the address of the MAC entity that initiates the enablement process.
ResponderSTAAddress	MACAddress	Any valid individual MAC address	Specifies the address of the MAC entity of the enabling STA.
EnablementTimeLimit	Integer	> 0	Specifies a time limit (in TU) after which the enablement process is terminated.
Protected	Boolean	true, false	Specifies whether the request is sent using a Robust Management frame. If true, the request is sent using the Protected DSE Enablement frame. If false, the request is sent using the DSE Enablement frame.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.39.2.3 When generated

This primitive is generated by the SME for a STA to establish enablement with a specified peer MAC entity. During the enablement procedure, the SME can generate additional MLME-ENABLEMENT.request primitives.

6.3.39.2.4 Effect of receipt

This primitive initiates an enablement procedure. The MLME subsequently issues a MLME-ENABLEMENT.confirm primitive that reflects the results.

6.3.39.3 MLME-ENABLEMENT.confirm

6.3.39.3.1 Function

This primitive reports the results of an enablement attempt with a specified peer MAC entity.

6.3.39.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-ENABLEMENT.confirm(
                              RequesterSTAAddress,
                              ResponderSTAAddress,
                              ResultCode,
                              Protected,
                              EnablementIdentifier,
                              VendorSpecificInfo
                              )
```

Name	Type	Valid range	Description
RequesterSTAAddress	MACAddress	Any valid individual MAC address	Specifies the address of the MAC entity that initiated the enablement process. This value matches the RequesterSTAAddress parameter specified in the corresponding MLME-ENABLEMENT.request primitive.
ResponderSTAAddress	MACAddress	Any valid individual MAC address	Specifies the address of the peerMAC entity with which the enablement process was attempted.This value matches the ResponderSTAAddress parameter specified in the corresponding MLME-ENABLEMENT.request primitive.
ResultCode	Enumeration	SUCCESS, REFUSED, INVALID_PARAMETERS, TOO_MANY_SIMULTANEOUS_REQUESTS	Indicates the result of MLME-ENABLEMENT.request primitive.
EnablementIdentifier	Integer	0 – 65 535	Specifies the dependent enablement identifier.

Name	Type	Valid range	Description
Protected	Boolean	true, false	Specifies whether the response was received using a Robust Management frame. If true, the response was received using the Protected DSE Enablement frame. If false, the response was received using the DSE Enablement frame.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.39.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-ENABLEMENT.request primitive for enablement with a specified peer MAC entity.

6.3.39.3.4 Effect of receipt

The SME is notified of the results of the enablement procedure.

6.3.39.4 MLME-ENABLEMENT.indication

6.3.39.4.1 Function

This primitive indicates receipt of a request from a specific peer MAC entity to establish an enablement relationship with the STA processing this primitive.

6.3.39.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-ENABLEMENT.indication(
                                   RequesterSTAAddress,
                                   ResponderSTAAddress,
                                   Protected,
                                   VendorSpecificInfo
                                   )
```

Name	Type	Valid range	Description
RequesterSTAAddress	MACAddress	Any valid individual MAC address	Specifies the address of the peer MAC entity that initiated the enablement process.
ResponderSTAAddress	MACAddress	Any valid individual MAC address	Specifies the address of the peer MAC entity that is the enabling STA.
Protected	Boolean	true, false	Specifies whether the request was sent using a Robust Management frame. If true, the request was sent using the Protected DSE Enablement frame. If false, the request was sent using the DSE Enablement frame.

Name	Type	Valid range	Description
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.39.4.3 When generated

This primitive is generated by the MLME as a result of the receipt of an enablement request from a specific peer MAC entity.

6.3.39.4.4 Effect of receipt

The SME is notified of the receipt of this enablement request.

6.3.39.5 MLME-ENABLEMENT.response

6.3.39.5.1 Function

This primitive is used to send a response to a specified peer MAC entity that requested enablement with the STA that issued this primitive.

6.3.39.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-ENABLEMENT.response(
                              RequesterSTAAddress,
                              ResponderSTAAddress,
                              ResultCode,
                              EnablementIdentifier,
                              Protected,
                              VendorSpecificInfo
                              )
```

Name	Type	Valid range	Description
RequesterSTAAddress	MACAddress	Any valid individual MAC address	Specifies the address of the MAC entity that initiated the enablement process.
ResponderSTAAddress	MACAddress	Any valid individual MAC address	Specifies the address of the peerMAC entity that is the enabling STA.
ResultCode	Enumeration	SUCCESS, REFUSED, INVALID_PARAMETERS, TOO_MANY_SIMULTANEOUS_REQUESTS	Indicates the result response to the enablement request from the peer MAC entity.
EnablementIdentifier	Integer	0-65535	Specifies the dependent enablement identifier.
Protected	Boolean	true, false	Specifies whether the response is sent using a Robust Management frame. If true, the response is sent using the Protected DSE Enablement frame. If false, the response is sent using the DSE Enablement frame.

Name	Type	Valid range	Description
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.39.5.3 When generated

This primitive is generated by the SME of a STA as a response to an MLME-ENABLEMENT.indication primitive.

6.3.39.5.4 Effect of receipt

This primitive initiates transmission of a response to the specific peer MAC entity that requested enablement.

6.3.40 Deenablement

6.3.40.1 MLME-DEENABLEMENT.request

6.3.40.1.1 Function

This primitive requests that the enablement relationship with a specified peer MAC entity be invalidated.

6.3.40.1.2 Semantics of the service primitive

The primitive parameters are as follows:

```
   MLME-DEENABLEMENT.request(
                                        RequesterSTAAddress,
                                        ResponderSTAAddress,
                                        ReasonCode,
                                        Protected,
                                        VendorSpecificInfo
                                        )
```

Name	Type	Valid range	Description
RequesterSTAAddress	MACAddress	Any valid individual MAC address	Specifies the address of the peer MAC entity that requests the deenablement process.
ResponderSTAAddress	MACAddress	Any valid individual MAC address	Specifies the address of the MAC entity that becomes deenabled in the process.
ReasonCode	Reason Result Code field	As defined in 8.5.8.5	Specifies the reason code for initiating the deenablement process.
Protected	Boolean	true, false	Specifies whether the request is sent using a Robust Management frame. If true, the request is sent using the Protected DSE Deenablement frame. If false, the request is sent using the DSE Deenablement frame.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.40.1.3 When generated

This primitive is generated by the SME for a STA to invalidate enablement with a specified peer MAC entity in order to prevent the exchange of (Protected dual of) Public Action frames between the two STAs. During the deenablement procedure, the SME can generate additional MLME-DEENABLEMENT.request primitives.

6.3.40.1.4 Effect of receipt

This primitive initiates a deenablement procedure.

6.3.40.2 MLME-DEENABLEMENT.indication

6.3.40.2.1 Function

This primitive reports the invalidation of an enablement relationship with a specified peer MAC entity.

6.3.40.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-DEENABLEMENT.indication(
                                        RequesterSTAAddress,
                                        ResponderSTAAddress,
                                        ReasonCode,
                                        Protected,
                                        VendorSpecificInfo
                                        )
```

Name	Type	Valid range	Description
RequesterSTAAddress	MACAddress	Any valid individual MAC address	Specifies the address of the peer MAC entity with which the enablement relationship was invalidated.
ResponderSTAAddress	MACAddress	Any valid individual MAC address	Specifies the address of the MAC entity with which the enablement relationship was invalidated.
ReasonCode	Reason Result Code field	As defined in 8.5.8.5	Specifies the reason the deenablement procedure was initiated.
Protected	Boolean	true, false	Specifies whether the request was received using a Robust Management frame. If true, the request was received using the Protected DSE Deenablement frame. If false, the request was received using the DSE Deenablement frame.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.40.2.3 When generated

This primitive is generated by the MLME as a result of the invalidation of an enablement relationship with a specific peer MAC entity.

6.3.40.2.4 Effect of receipt

The SME is notified of the invalidation of the specific enablement relationship.

6.3.41 SA Query support

6.3.41.1 MLME-SAQuery.request

6.3.41.1.1 Function

This primitive requests that a SA Query Request frame be sent to a specified peer STA to which the STA is associated.

6.3.41.1.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-SAQuery.request(
                    PeerSTAAddress,
                    TransactionIdentifier
                    )
```

Name	Type	Valid range	Description
PeerSTA Address	MAC Address	Any valid individual MAC Address	Specifies the address of the peer MAC entity for the SA Query
TransactionIdentifier	2 octets	As defined in 8.5.10.2	The Transaction Identifier to identify the SA Query Request and Response transaction

6.3.41.1.3 When generated

This primitive is generated by the SME to request that a SA Query Request frame be sent to a specified peer STA with which the STA is associated.

6.3.41.1.4 Effect of receipt

On receipt of this primitive, the MLME constructs a SA Query Request frame. The STA then attempts to transmit this to the peer STA with which it is associated.

6.3.41.2 MLME-SAQuery.confirm

6.3.41.2.1 Function

This primitive reports the result of a SA Query procedure.

6.3.41.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-SAQuery.confirm(
                    PeerSTAAddress,
                    TransactionIdentifier
                    )
```

Name	Type	Valid Range	Description
PeerSTA Address	MAC Address	Any valid individual MAC Address	Specifies the address of the peer MAC entity for the SA Query
TransactionIdentifier	2 octets	As defined in 8.5.10.2	The Transaction Identifier to identify the SA Query Request and Response transaction

6.3.41.2.3 When generated

This primitive is generated by the MLME as a result of the receipt of a valid SA Query Response frame.

6.3.41.2.4 Effect of receipt

On receipt of this primitive, the SME may use the response as a sign of liveness of the peer STA.

6.3.41.3 MLME-SAQuery.indication

6.3.41.3.1 Function

This primitive indicates that a SA Query Request frame was received from a STA.

6.3.41.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-SAQuery.indication(
                         PeerSTAAddress,
                         TransactionIdentifier
                         )
```

Name	Type	Valid range	Description
PeerSTA Address	MAC Address	Any valid individual MAC Address	Specifies the address of the peer MAC entity for the SA Query
TransactionIdentifier	2 octets	As defined in 8.5.10.2	The Transaction Identifier to identify the SA Query Request and Response transaction

6.3.41.3.3 When generated

This primitive is generated by the MLME when a valid SA Query Request frame is received.

6.3.41.3.4 Effect of receipt

On receipt of this primitive, the SME operates according to the procedure in 10.3.

6.3.41.4 MLME-SAQuery.response

6.3.41.4.1 Function

This primitive is generated in response to an MLME-SAQuery.indication requesting a SA Query Response frame be sent to a STA.

6.3.41.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-SAQuery.response(
                        PeerSTAAddress,
                        TransactionIdentifier
                        )
```

Name	Type	Valid range	Description
PeerSTA Address	MAC Address	Any valid individual MAC Address	Specifies the address of the peer MAC entity for the SA Query
TransactionIdentifier	2 octets	As defined in 8.5.10.2	The Transaction Identifier to identify the SA Query Request and Response transaction

6.3.41.4.3 When generated

This primitive is generated by the SME, in response to an MLME-SAQuery.indication primitive, requesting a SA Query Response frame be sent to a STA.

6.3.41.4.4 Effect of receipt

On receipt of this primitive, the MLME constructs a SA Query Response frame. The STA then attempts to transmit this to the STA indicated by the PeerSTAAddress parameter.

6.3.42 Get TSF timer

6.3.42.1 General

This mechanism is used to request the current value of the TSF timer that the STA maintains.

6.3.42.2 MLME-GETTSFTIME.request

6.3.42.2.1 Function

This primitive is generated by the SME to request that the MLME returns the value of its TSF timer. The value returned in TSFtime (as specified in 6.3.42.2.2) is the value of the TSF timer at the instant the MLME-GETTSFTIME.request primitive is received.

6.3.42.2.2 Semantics of the service primitive

This primitive has no parameters.

6.3.42.2.3 When generated

This primitive is generated by the SME to request the value of the TSF timer from the MLME.

6.3.42.2.4 Effect of receipt

The MLME issues an MLME-GETTSFTIME.confirm.

6.3.42.2 MLME-GETTSFTIME.confirm

6.3.42.2.1 Function

This primitive is generated by the MLME to report to the SME the result of a request to get the value of the TSF timer.

6.3.42.2.2 Semantics of the service primitive

This primitive uses the following parameters:

```
   MLME-GETTSFTIME.confirm(
                              ResultCode,
                              TSFtime
                              )
```

Name	Type	Valid range	Description
ResultCode	Enumeration	SUCCESS, FAILURE	Reports the outcome of an MLME-GETTSFTIME.request primitive
TSFtime	Integer	0 – (2^{64} –1)	The value of the TSF timer. Present only if ResultCode is SUCCESS.

6.3.42.2.3 When generated

This primitive is generated by the MLME to report to the SME the result of an MLME-GETTSFTIME.request.

6.3.42.2.4 Effect of receipt

The SME is notified of the result of an MLME-GETTSFTIME.request primitive and, if successful, has the value of the TSF timer at the instant the MLME-GETTSFTIME.request was received by the MLME. If the result of an MLME-GETTSFTIME.request is failure, the TSFtime parameter is not included in the MLME-GETTSFTIME.confirm primitive.

NOTE—The TSF timer value can be used, along with other information, by the SME to compute an offset between an external time standard such as a version of Universal Coordinated Time (UTC) from a Global Positioning System (GPS) unit and the TSF timer.

6.3.43 Timing Advertisement

6.3.43.1 General

The Timing Advertisement primitives are used to communicate timing and other information from the higher layers or the SME of one STA to the higher layers or SME of other STAs.

6.3.43.2 MLME-TIMING_ADVERTISEMENT.request

6.3.43.2.1 Function

This primitive is generated by the SME to request that the MLME generate a Timing Advertisement frame to transmit timing and, optionally, higher layer information.

6.3.43.2.2 Semantics of the service primitive

This primitive provides the following parameters:

```
MLME-TIMING_ADVERTISEMENT.request(
                                   PeerMACAddress,
                                   Capability Information,
                                   Country,
                                   Power Constraint,
                                   Time Advertisement,
                                   Extended Capabilities,
                                   VendorSpecificInfo
                                   )
```

Name	Type	Valid range	Description
PeerMACAddress	MACAddress	Any valid individual or group MAC address	The address of the peer MAC entity or group of entities to which the Timing Advertisement frame is sent.
Capability Information	As defined in 8.4.1.4	As defined in 8.4.1.4	The announced capabilities of the STA.
Country	As defined in 8.4.2.10	As defined in 8.4.2.10	The information required to identify the regulatory domain in which the STA is located and to configure its PHY for operation in that regulatory domain. Present only when TPC functionality is required, as specified in 10.8 or when dot11MultiDomainCapabilityActivated is true.
Power Constraint	As defined in 8.4.2.16	As defined in 8.4.2.16	Optional. The Power Constraint element contains the information necessary to allow a STA to determine the local maximum transmit power in the current channel.
Time Advertisement	As defined in 8.4.2.63	As defined in 8.4.2.63	Timing announced by the STA.
Extended Capabilities	As defined in 8.4.2.29	As defined in 8.4.2.29	Optional. The Extended Capabilities element may be present if any of the fields in this element are nonzero.
Vendor-SpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.43.2.3 When generated

This primitive is generated by the SME to request that the MLME generates a Timing Advertisement frame for transmission.

6.3.43.2.4 Effect of receipt

Upon the receipt of this primitive, the MLME attempts to transmit a Timing Advertisement frame to the specified MAC address, using the procedures defined in 10.21.

6.3.43.3 MLME-TIMING_ADVERTISEMENT.indication

6.3.43.3.1 Function

This primitive is generated by the MLME to indicate to the SME the reception of a Timing Advertisement frame.

6.3.43.3.2 Semantics of the service primitive

This primitive provides the following parameters:

```
MLME-TIMING_ADVERTISEMENT.indication(
                                      Timestamp,
                                      Capability Information,
                                      Local Time,
                                      Country,
                                      Power Constraint,
                                      Time Advertisement,
                                      Extended Capabilities,
                                      RCPI,
                                      Source MAC address,
                                      VendorSpecificInfo
                                      )
```

Name	Type	Valid range	Description
Timestamp	Integer	N/A	The timestamp of the received frame.
Capability Information	As defined in 8.4.1.4	As defined in 8.4.1.4	The announced capabilities of the STA.
Local Time	Integer	N/A	Local Time is the value of a station's TSF timer at the start of reception of the first octet of the timestamp field of the received Timing Advertisement frame.
Country	As defined in 8.4.2.10	As defined in 8.4.2.10	The information required to identify the regulatory domain in which the STA is located and to configure its PHY for operation in that regulatory domain. Present only when TPC functionality is required, as specified in 10.8 or when dot11MultiDomainCapabilityActivated is true.
Power Constraint	As defined in 8.4.2.16	As defined in 8.4.2.16	The Power Constraint element contains the information necessary to allow a STA to determine the local maximum transmit power in the current channel.
Time Advertisement	As defined in 8.4.2.63	As defined in 8.4.2.63	Timing announced by the STA.
Extended Capabilities	As defined in 8.4.2.29	As defined in 8.4.2.29	The Extended Capabilities element may be present if any of the fields in this element are nonzero.
RCPI	Integer as defined in 8.4.2.40	As defined in 8.4.2.40	RCPI is the measured value of received channel power on the received Timing Advertisement frame.
Source MAC Address	As defined in 8.2.4.3.6	As defined in 8.2.4.3.6	The SA field of the MAC header from the received Timing Advertisement frame.
Vendor-SpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.43.3.3 When generated

This primitive is generated by the MLME when a Timing Advertisement frame is received.

6.3.43.3.4 Effect of receipt

Upon the receipt of this primitive, the SME is notified that a Timing Advertisement frame has been received.

6.3.44 TDLS Discovery

6.3.44.1 General

The following MLME primitives support the signaling of TDLS Discovery.

6.3.44.2 MLME-TDLSDISCOVERY.request

6.3.44.2.1 Function

This primitive requests that a TDLS Discovery Request frame be sent through the AP path.

6.3.44.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TDLSDISCOVERY.request(
                              DestinationAddress,
                              TDLSDiscoveryRequest
                              )
```

Name	Type	Valid range	Description
DestinationAddress	MAC Address	Any valid individual MAC Address	Specifies the DA to which a TDLS Discovery Request frame is transmitted.
TDLSDiscoveryRequest	Sequence of octets	As defined in TDLS Discovery Request frame	Specifies the proposed service parameters for the TDLS Discovery Request frame.

6.3.44.2.3 When generated

This primitive is generated by the SME to request that a TDLS Discovery Request frame be sent through the AP.

6.3.44.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TDLS Discovery Request frame. The STA then attempts to transmit this frame.

6.3.44.3 MLME-TDLSDISCOVERY.confirm

6.3.44.3.1 Function

This primitive is generated when a valid TDLS Discovery Response frame is received.

6.3.44.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TDLSDISCOVERY.confirm(
                              TDLSPeerSTAAddress,
                              TDLSDiscoveryResponse
                              )
```

Name	Type	Valid range	Description
TDLSPeerSTAAddress	MAC Address	Any valid individual MAC Address	Specifies the MAC address of the TDLS peer STA from which a TDLS Discovery Response frame was received.
TDLSDiscoveryResponse	Sequence of octets	As defined in TDLS Discovery Response frame	Specifies the service parameters contained in the received TDLS Discovery Response frame.

6.3.44.3.3 When generated

This primitive is generated when a valid TDLS Discovery Response frame is received.

6.3.44.3.4 Effect of receipt

On receipt of this primitive, the SME evaluates the MLME-TDLSDISCOVERY.confirm primitive and may use the reported data.

6.3.44.4 MLME-TDLSDISCOVERY.indication

6.3.44.4.1 Function

This primitive indicates that a TDLS Discovery Request frame was received from a TDLS peer STA.

6.3.44.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
        MLME-TDLSDISCOVERY.indication(
                                        TDLSPeerSTAAddress,
                                        TDLSDiscoveryRequest
                                        )
```

Name	Type	Valid range	Description
TDLSPeerSTAAddress	MACAddress	Any valid individual MAC Address	Specifies the MAC address of the TDLS peer STA from which a TDLS Discovery Request frame was received.
TDLSDiscoveryRequest	Sequence of octets	As defined in TDLS Discovery Request frame	Specifies the proposed service parameters of the TDLS Discovery Request frame.

6.3.44.4.3 When generated

This primitive is generated by the MLME when a valid TDLS Discovery Request frame is received.

6.3.44.4.4 Effect of receipt

On receipt of this primitive, the SME operates according to the procedure in 10.22.

6.3.44.5 MLME-TDLSDISCOVERY.response

6.3.44.5.1 Function

This primitive requests that a TDLS Discovery Response frame be sent directly to the TDLS peer STA from which a TDLS Discovery Request frame was received.

6.3.44.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
        MLME-TDLSDISCOVERY.response(
                                    TDLSPeerSTAAddress,
                                    TDLSDiscoveryResponse
                                    )
```

Name	Type	Valid range	Description
TDLSPeerSTAAddress	MAC Address	Any valid individual MAC Address	Specifies the MAC address of the TDLS peer STA to which a TDLS Discovery Response frame is transmitted.
TDLSDiscoveryResponse	Sequence of octets	As defined in TDLS Discovery Response frame	Specifies the proposed service parameters for the TDLS Discovery Response frame.

6.3.44.5.3 When generated

This primitive is generated by the SME to request that a TDLS Discovery Response frame be sent to the TDLS peer STA from which a TDLS Discovery Request frame was received.

6.3.44.5.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TDLS Discovery Response frame. The STA then attempts to transmit this frame to the TDLS peer STA.

6.3.45 TDLS direct-link establishment

6.3.45.1 General

The following MLME primitives support the signaling of tunneled direct-link setup. Figure 6-7 depicts the TDLS direct-link establishment process. The figure is only an example of the basic procedure and is not meant to be exhaustive of all possible uses of the protocol.

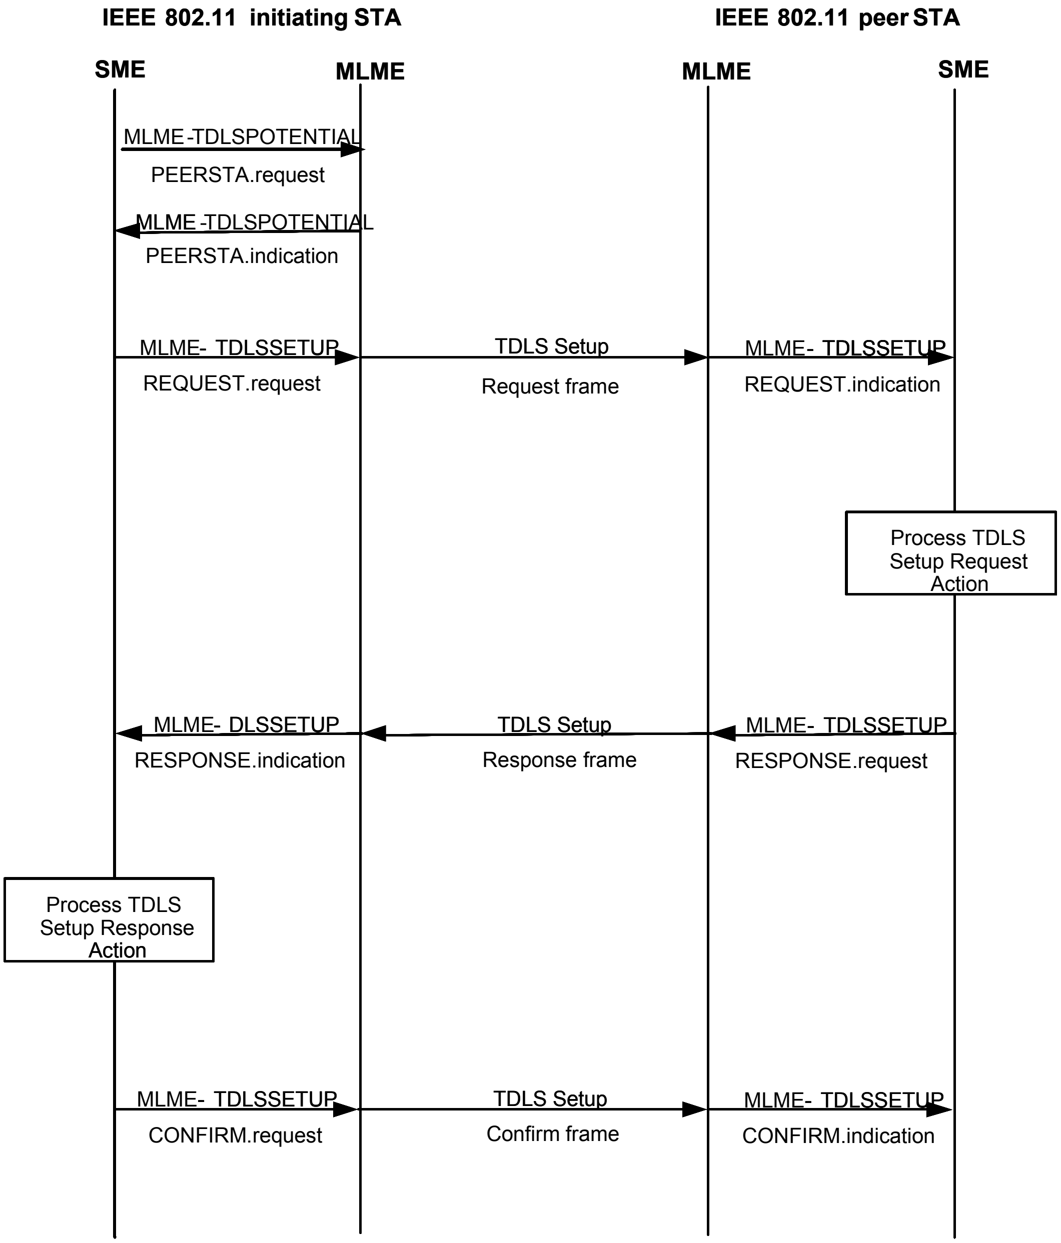

Figure 6-7—TDLS direct-link establishment

6.3.45.2 MLME-TDLSSETUPREQUEST.request

6.3.45.2.1 Function

This primitive requests that a TDLS Setup Request frame be sent to a candidate TDLS responder STA.

6.3.45.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TDLSSETUPREQUEST.request(
                                          TDLSResponderAddress,
                                          TDLSSetupRequest
                                          )
```

Name	Type	Valid range	Description
TDLSResponderAddress	MAC Address	Any valid individual MAC Address	Specifies the MAC address of the STA to which the TDLS Setup Request frame is transmitted.
TDLSSetupRequest	Sequence of octets	As defined in TDLS Setup Request frame	Specifies the proposed service parameters for the TDLS Setup.

6.3.45.2.3 When generated

This primitive is generated by the SME to request that a TDLS Setup Request frame be sent to a candidate TDLS responder STA.

6.3.45.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TDLS Setup Request frame. The STA then attempts to transmit this frame to the candidate TDLS responder STA.

6.3.45.3 MLME-TDLSSETUPREQUEST.indication

6.3.45.3.1 Function

This primitive indicates that a TDLS Setup Request frame was received.

6.3.45.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TDLSSETUPREQUEST.indication(
                                          TDLSInitiatorAddress,
                                          TDLSSetupRequest
                                          )
```

Name	Type	Valid range	Description
TDLSInitiatorAddress	MACAddress	Any valid individual MAC Address	Specifies the MAC address of the TDLS initiator STA from which a TDLS Setup Request frame was received.
TDLSSetupRequest	Sequence of octets	As defined in TDLS Setup Request frame	Specifies the proposed service parameters for the TDLS Setup.

6.3.45.3.3 When generated

This primitive is generated by the MLME when a valid TDLS Setup Request frame is received.

6.3.45.3.4 Effect of receipt

On receipt of this primitive, the SME operates according to the procedure in 10.22.

6.3.45.4 MLME-TDLSSETUPRESPONSE.request

6.3.45.4.1 Function

This primitive requests that a TDLS Setup Response frame be sent to the TDLS initiator STA.

6.3.45.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TDLSSETUPRESPONSE.request(
                               TDLSInitiatorAddress,
                               TDLSSetupResponse
                               )
```

Name	Type	Valid range	Description
TDLSInitiatorAddress	MAC Address	Any valid individual MAC Address	Specifies the MAC address of the TDLS initiator STA to which a TDLS Setup Response frame is transmitted.
TDLSSetupResponse	Sequence of octets	As defined in TDLS Setup Response frame	Specifies the proposed service parameters for the TDLS Setup.

6.3.45.4.3 When generated

This primitive is generated by the SME to request that a TDLS Setup Response frame be sent to the TDLS initiator STA.

6.3.45.4.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TDLS Setup Response frame. The STA then attempts to transmit this to the TDLS initiator STA.

6.3.45.5 MLME-TDLSSETUPRESPONSE.indication

6.3.45.5.1 Function

This primitive indicates that a TDLS Setup Response frame was received from the TDLS responder STA.

6.3.45.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TDLSSETUPRESPONSE.indication(
                               TDLSResponderAddress,
                               TDLSSetupResponse
                               )
```

Name	Type	Valid range	Description
TDLSResponderAddress	MACAddress	Any valid individual MAC Address	Specifies the MAC address of the TDLS responder STA from which a TDLS Setup Response frame was received.
TDLSSetupResponse	Sequence of octets	As defined in TDLS Setup Response frame	Specifies the proposed service parameters for the TDLS Setup.

6.3.45.5.3 When generated

This primitive is generated by the MLME when a valid TDLS Setup Response frame is received.

6.3.45.5.4 Effect of receipt

On receipt of this primitive, the SME operates according to the procedure in 10.22.

6.3.45.6 MLME-TDLSSETUPCONFIRM.request

6.3.45.6.1 Function

This primitive requests that a TDLS Setup Confirm frame be sent to the TDLS responder STA.

6.3.45.6.2 Semantics of the service primitive

The primitive parameters are as follows:

```
        MLME-TDLSSETUPCONFIRM.request(
                                        TDLSResponderAddress,
                                        TDLSSetupConfirm
                                        )
```

Name	Type	Valid range	Description
TDLSResponderAddress	MAC Address	Any valid individual MAC Address	Specifies the MAC address of the TDLS responder STA to which a TDLS Setup Confirm frame is transmitted.
TDLSSetupConfirm	Sequence of octets	As defined in TDLS Setup Confirm frame	Specifies the proposed service parameters for the TDLS Setup.

6.3.45.6.3 When generated

This primitive is generated by the SME to request that a TDLS Setup Confirm frame be sent to the TDLS responder STA.

6.3.45.6.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TDLS Setup Confirm frame. The STA then attempts to transmit this to the TDLS responder STA.

6.3.45.7 MLME-TDLSSETUPCONFIRM.indication

6.3.45.7.1 Function

This primitive indicates that a TDLS Setup Confirm frame was received from the TDLS initiator STA.

6.3.45.7.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TDLSSETUPCONFIRM.indication(
                                 TDLSInitiatorAddress,
                                 TDLSSetupConfirm
                                 )
```

Name	Type	Valid range	Description
TDLSInitiatorAddress	MACAddress	Any valid individual MAC Address	Specifies the MAC address of the TDLS initiator STA from which a TDLS Setup Confirm frame was received.
TDLSSetupConfirm	Sequence of octets	As defined in TDLS Setup Confirm frame	Specifies the proposed service parameters for the TDLS setup.

6.3.45.7.3 When generated

This primitive is generated by the MLME when a valid TDLS Setup Confirm frame is received.

6.3.45.7.4 Effect of receipt

On receipt of this primitive, the SME operates according to the procedure in 10.22.

6.3.45.8 MLME-TDLSPOTENTIALPEERSTA.request

6.3.45.8.1 Function

This primitive requests information about a potential TDLS peer STA.

6.3.45.8.2 Semantics of the service primitive

The primitive parameter is as follows:

```
MLME-TDLSPOTENTIALPEERSTA.request(
                                 MACAddress
                                 )
```

Name	Type	Valid Range	Description
MACAddress	MAC Address	Any valid individual MAC Address	Specifies the MAC address of the potential TDLS peer STA.

6.3.45.8.3 When generated

This primitive is generated by the SME to request the MLME to provide information about a potential TDLS peer STA.

6.3.45.8.4 Effect of receipt

On receipt of this primitive, the MLME responds with the requested information about the identified STA.

6.3.45.9 MLME-TDLSPOTENTIALPEERSTA.confirm

6.3.45.9.1 Function

This primitive informs the SME about a potential TDLS peer STA.

6.3.45.9.2 Semantics of the service primitive

The primitive parameters are as follows:

```
        MLME-TDLSPOTENTIALPEERSTA.confirm(
                                            MACAddress,
                                            RSSI,
                                            VendorSpecificInfo
                                            )
```

Name	Type	Valid range	Description
MACAddress	MAC Address	Any valid individual MAC Address	Specifies the MAC address of the STA for which information is requested.
RSSI	Integer	–1-RSSI Max	Specifies the RSSI from the STA. –1 indicates that the STA is not present.
VendorSpecificInfo	Vendor Specific	Vendor Specific	Specifies vendor-specific information about the STA identified in the MACAddress field.

6.3.45.9.3 When generated

This primitive is generated by the MLME to indicate to the SME that a potential TDLS peer STA has been detected.

6.3.45.9.4 Effect of receipt

On receipt of this primitive, the SME may attempt to set up a TDLS direct link by issuing an MLME-TDLSSETUPREQUEST.request primitive to the MLME.

6.3.46 TDLS direct-link teardown

6.3.46.1 General

The following MLME primitives support the signaling of tunneled direct-link setup. Figure 6-8 depicts the TDLS direct-link teardown process. The figure is only an example of the basic procedure and is not meant to be exhaustive of all possible uses of the protocol.

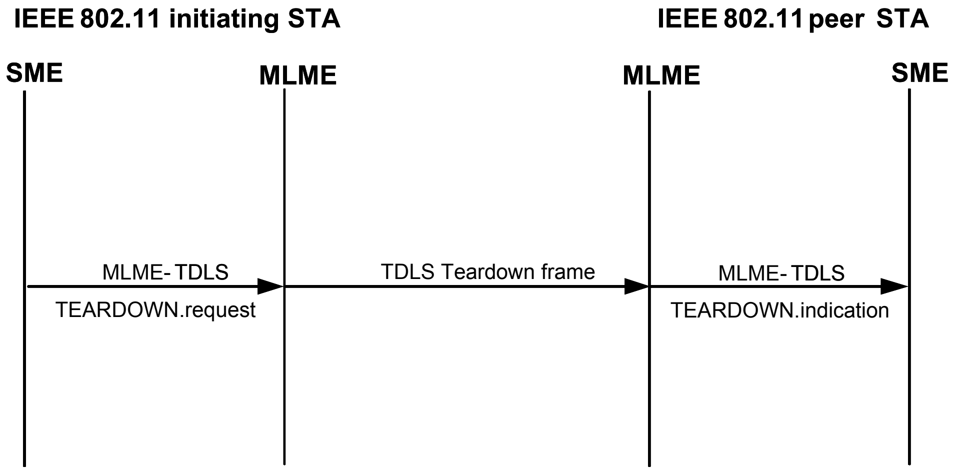

Figure 6-8—TDLS direct-link teardown

6.3.46.2 MLME-TDLSTEARDOWN.request

6.3.46.2.1 Function

This primitive requests that a TDLS Teardown frame be sent to the TDLS peer STA.

6.3.46.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
          MLME-TDLSTEARDOWN.request(
                                        TDLSPeerSTAAddress,
                                        TDLSTeardown
                                        )
```

Name	Type	Valid range	Description
TDLSPeerSTAAddress	MAC Address	Any valid individual MAC Address	Specifies the MAC address of the TDLS peer STA to which a TDLS Teardown frame is transmitted.
TDLSTeardown	Sequence of octets	As defined in TDLS Teardown frame	Specifies the proposed service parameters for the TDLS teardown.

6.3.46.2.3 When generated

This primitive is generated by the SME to request that a TDLS Teardown frame be sent to the TDLS peer STA.

6.3.46.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TDLS Teardown frame. The STA then attempts to transmit this frame to the TDLS peer STA.

6.3.46.3 MLME-TDLSTEARDOWN.indication

6.3.46.3.1 Function

This primitive indicates that a TDLS Teardown frame was received from a TDLS peer STA.

6.3.46.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
        MLME-TDLSTEARDOWN.indication(
                                TDLSPeerSTAAddress,
                                TDLSTeardown
                                )
```

Name	Type	Valid range	Description
TDLSPeerSTAAddress	MACAddress	Any valid individual MAC Address	The MAC address of the TDLS peer STA from which a TDLS Teardown frame was received.
TDLSTeardown	Sequence of octets	As defined in TDLS Teardown frame	Specifies the proposed service parameters for the TDLS teardown.

6.3.46.3.3 When generated

This primitive is generated by the MLME when a valid TDLS Teardown frame is received.

6.3.46.3.4 Effect of receipt

On receipt of this primitive, the SME should operate according to the procedure in 10.22.

6.3.47 TDLS Peer U-APSD

6.3.47.1 General

The following MLME primitives support the signaling of TDLS Peer U-APSD. Figure 6-9 depicts the TDLS peer U-APSD process. The figure is only an example of the basic procedure and is not meant to be exhaustive of all possible uses of the protocol.

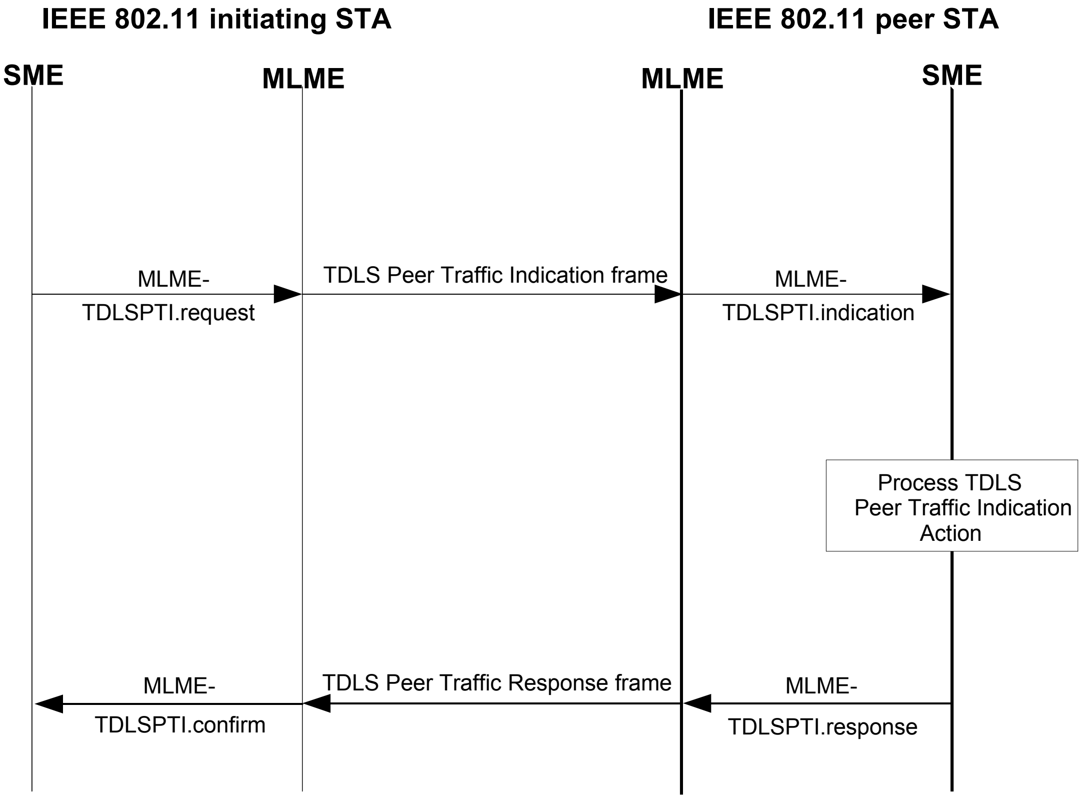

Figure 6-9—TDLS Peer U-APSD

6.3.47.2 MLME-TDLSPTI.request

6.3.47.2.1 Function

This primitive requests that a TDLS Peer Traffic Indication frame be sent to a TDLS peer STA.

6.3.47.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TDLSPTI.request(
                     TDLSPeerSTAAddress,
                     TDLSPTI
                     )
```

Name	Type	Valid range	Description
TDLSPeerSTAAddress	MAC Address	Any valid individual MAC Address	Specifies the address of the MAC entity with which to perform the TDLS peer U-APSD process.
TDLSPTI	Sequence of octets	As defined in TDLS Peer Traffic Indication frame	Specifies the proposed service parameters for the TDLS Peer U-APSD.

6.3.47.2.3 When generated

This primitive is generated by the SME to request that a TDLS Peer Traffic Indication frame be sent to the TDLS peer STA.

6.3.47.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TDLS Peer Traffic Indication frame. The STA then attempts to transmit this to the TDLS peer STA.

6.3.47.3 MLME-TDLSPTI.confirm

6.3.47.3.1 Function

This primitive reports the result of an MLME-TDLSPTI.request primitive to trigger an unscheduled SP from a candidate TDLS peer STA. This primitive is generated after transmitting a Peer Traffic Indication frame when this frame contains a PTI Control field, and after receiving a Peer Traffic Response frame otherwise.

6.3.47.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
        MLME-TDLSPTI.confirm(
                              TDLSPeerSTAAddress,
                              TDLSPTR
                              )
```

Name	Type	Valid range	Description
TDLSPeerSTAAddress	MAC Address	Any valid individual MAC Address	Specifies the MAC address of the peer MAC entity with which to perform the TDLS Peer U-APSD process.
TDLSPTR	Sequence of octets	As defined in TDLS Peer Traffic Response frame	Specifies the proposed service parameters for the TDLS Peer U-APSD.

6.3.47.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-TDLSPTI.request and indicates the results of the request.

This primitive is generated when the STA successfully receives a TDLS Peer Traffic Response frame from the TDLS peer STA or when an unspecified failure occurs.

6.3.47.3.4 Effect of receipt

On receipt of this primitive, the SME evaluates the results of the MLME-TDLSPTI.request primitive and may use the reported data.

6.3.47.4 MLME-TDLSPTI.indication

6.3.47.4.1 Function

This primitive indicates that a TDLS Peer Traffic Indication frame was received from a TDLS peer STA.

6.3.47.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
          MLME-TDLSPTI.indication(
                                          TDLSPeerSTAAddress,
                                          TDLSPTI
                                          )
```

Name	Type	Valid range	Description
TDLSPeerSTAAddress	MACAddress	Any valid individual MAC Address	The MAC address of the non-AP STA MAC entity from which a TDLS Peer Traffic Indication frame was received.
TDLSPTI	Sequence of octets	As defined in TDLS Peer Traffic Indication frame	Specifies the proposed service parameters for the TDLS Peer U-APSD.

6.3.47.4.3 When generated

This primitive is generated by the MLME when a valid TDLS Peer Traffic Indication frame is received.

6.3.47.4.4 Effect of receipt

On receipt of this primitive, the SME should operate according to the procedure as specified in 10.2.1.15.

6.3.47.5 MLME-TDLSPTI.response

6.3.47.5.1 Function

This primitive requests that a TDLS Peer Traffic Response frame be sent to the TDLS peer STA.

6.3.47.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
          MLME-TDLSPTI.response(
                                          PeerSTAAddress,
                                          TDLSPTR
                                          )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC Address	Any valid individual MAC Address	Specifies the address of the peer MAC entity with which to perform the TDLS Peer U-APSD.
TDLSPTR	Sequence of octets	As defined in TDLS Peer Traffic Response frame	Specifies the proposed service parameters for the TDLS Peer U-APSD.

6.3.47.5.3 When generated

This primitive is generated by the SME to request that a TDLS Peer Traffic Response frame be sent to the TDLS peer STA.

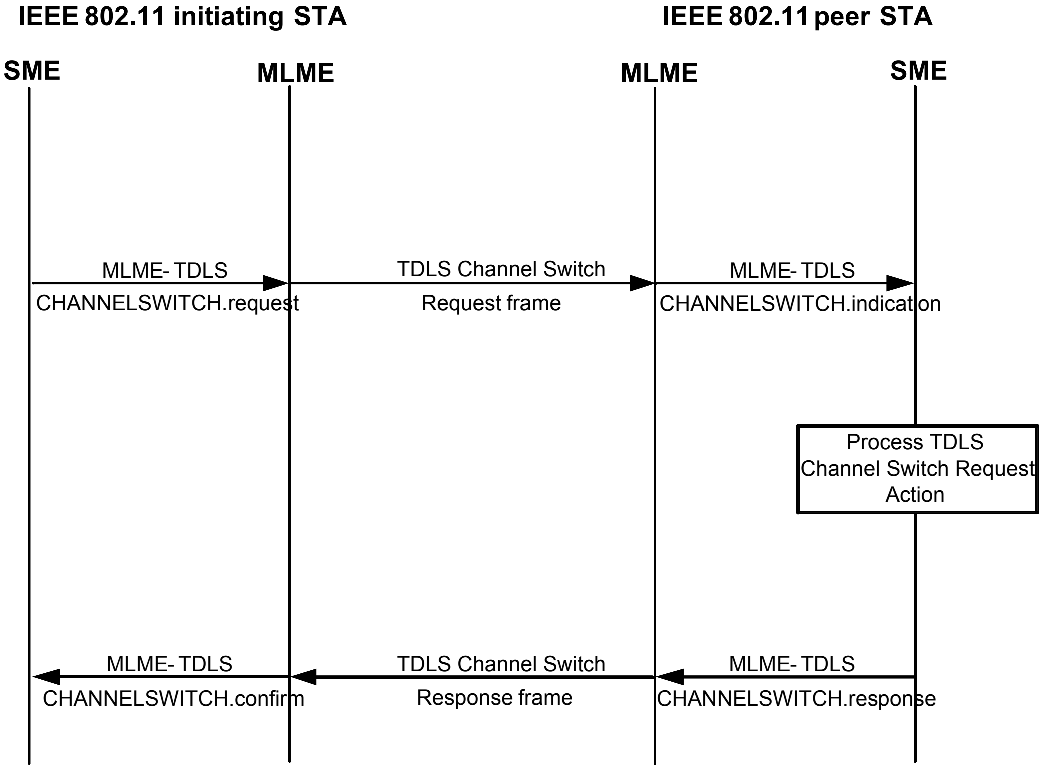
6.3.47.5.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TDLS Peer Traffic Response frame. The STA then attempts to transmit this to the TDLS peer STA.

6.3.48 TDLS channel switching

6.3.48.1 General

The following MLME primitives support the signaling of a TDLS channel switch. Figure 6-10 depicts the TDLS channel switching process. The figure is only an example of the basic procedure and is not meant to be exhaustive of all possible uses of the protocol.



IEEE 802.11 initiating STA
IEEE 802.11 peer STA
SME
MLME

MLME- TDLS CHANNELSWITCH.confirm
TDLS Channel Switch Response frame
MLME- TDLS CHANNELSWITCH.response

Figure 6-10—TDLS channel switching

6.3.48.2 MLME-TDLSCHANNELSWITCH.request

6.3.48.2.1 Function

This primitive requests that a TDLS Channel Switch Request frame be sent to the TDLS peer STA.

6.3.48.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
          MLME-TDLSCHANNELSWITCH.request(
                                          TDLSPeerSTAAddress,
                                          TDLSChannelSwitchRequest
                                          )
```

Name	Type	Valid range	Description
TDLSPeerSTAAddress	MAC Address	Any valid individual MAC Address	Specifies the address of the TDLS peer MAC entity to which a TDLS Channel Switch Request frame is transmitted.
TDLSChannelSwitchRequest	Sequence of octets	As defined in TDLS Channel Switch Request frame	Specifies the proposed service parameters for the TDLS Channel Switch.

6.3.48.2.3 When generated

This primitive is generated by the SME to request that a TDLS Channel Switch Request frame be sent to the TDLS peer STA.

6.3.48.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TDLS Channel Switch Request frame. The STA then attempts to transmit this to the TDLS peer STA.

6.3.48.3 MLME-TDLSCHANNELSWITCH.confirm

6.3.48.3.1 Function

This primitive reports the result of an MLME-TDLSCHANNELSWITCH.request primitive to switch a channel with a TDLS peer STA.

6.3.48.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
          MLME-TDLSCHANNELSWITCH.confirm(
                                          TDLSPeerSTAAddress,
                                          TDLSChannelSwitchResponse
                                          )
```

Name	Type	Valid range	Description
TDLSPeerSTAAddress	MAC Address	Any valid individual MAC Address	Specifies the MAC address of the TDLS peer STA from which a TDLS Channel Switch Response frame was received.
TDLSChannelSwitchResponse	Sequence of octets	As defined in TDLS Channel Switch Response frame	Specifies the proposed service parameters for the TDLS Channel Switch.

6.3.48.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-TDLSCHANNELSWITCH.request and indicates the results of the request.

This primitive is generated when the STA successfully receives a TDLS Channel Switch Response frame from the TDLS peer STA.

6.3.48.3.4 Effect of receipt

On receipt of this primitive, the SME evaluates the results of the MLME-TDLSCHANNEL-SWITCH.request primitive and may use the reported data.

6.3.48.4 MLME-TDLSCHANNELSWITCH.indication

6.3.48.4.1 Function

This primitive indicates that a TDLS Channel Switch request frame was received from a TDLS peer STA.

6.3.48.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
        MLME-TDLSCHANNELSWITCH.indication(
                                            TDLSPeerSTAAddress,
                                            TDLSChannelSwitchRequest
                                            )
```

Name	Type	Valid range	Description
TDLSPeerSTAAddress	MACAddress	Any valid individual MAC Address	Specifies the MAC address of the TDLS peer STA from which a TDLS Channel Switch Request frame was received.
TDLSChannelSwitch Request	Sequence of octets	As defined in TDLS Channel Switch Request frame	Specifies the proposed service parameters for the TDLS Channel Switch.

6.3.48.4.3 When generated

This primitive is generated by the MLME when a valid TDLS Channel Switch Request frame is received.

6.3.48.4.4 Effect of receipt

On receipt of this primitive, the SME should operate according to the procedure in 10.22.

6.3.48.5 MLME-TDLSCHANNELSWITCH.response

6.3.48.5.1 Function

This primitive requests that a TDLS Channel Switch Response frame be sent to the TDLS peer STA.

6.3.48.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
        MLME-TDLSCHANNELSWITCH.response(
                                        TDLSPeerSTAAddress,
                                        TDLSChannelSwitchResponse
                                        )
```

Name	Type	Valid range	Description
TDLSPeerSTAAddress	MAC Address	Any valid individual MAC Address	Specifies the MAC address of the TDLS peer STA to which a TDLS Channel Switch Response frame is transmitted.
TDLSChannelSwitchResponse	Sequence of octets	As defined in TDLS Channel Switch Response frame	Specifies the proposed service parameters for the TDLS Channel Switch.

6.3.48.5.3 When generated

This primitive is generated by the SME to request that a TDLS Channel Switch Response frame be sent to the TDLS peer STA.

6.3.48.5.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TDLS Channel Switch Response frame. The STA then attempts to transmit this frame to the TDLS peer STA.

6.3.49 TDLS Peer PSM

6.3.49.1 General

The following MLME primitives support the management of TDLS Peer PSM. Figure 6-11 depicts the TDLS Peer PSM process. The figure is only an example of the basic procedure and is not meant to be exhaustive of all possible uses of the protocol.

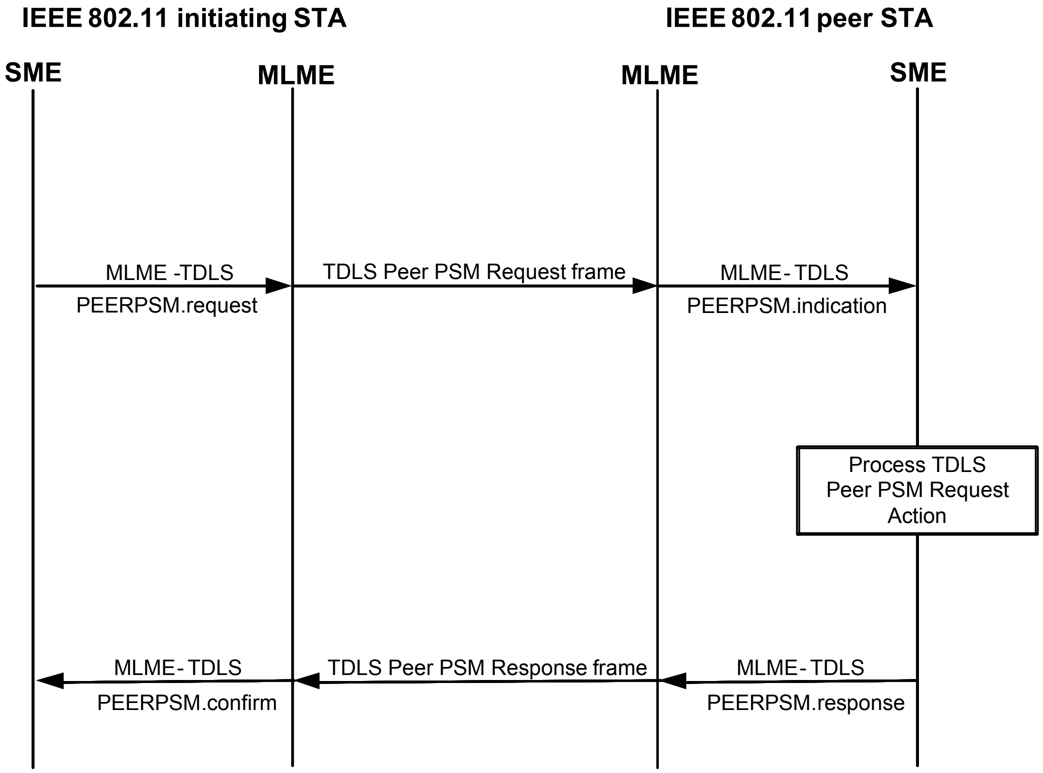

Figure 6-11—TDLS Peer PSM

6.3.49.2 MLME-TDLSPEERPSM.request

6.3.49.2.1 Function

This primitive requests that a TDLS Peer PSM Request frame be sent to the TDLS peer STA.

6.3.49.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TDLSPEERPSM.request(
                        TDLSPeerSTAAddress,
                        TDLSPeerPSMRequest
                        )
```

Name	Type	Valid range	Description
TDLSPeerSTAAddress	MAC Address	Any valid individual MAC Address	Specifies the MAC address of the TDLS peer STA to which a TDLS Peer PSM Request frame is transmitted.
TDLSPeerPSMRequest	Sequence of octets	As defined in TDLS Peer PSM Request frame	Specifies the proposed service parameters for the TDLS Peer PSM.

6.3.49.2.3 When generated

This primitive is generated by the SME to request that a TDLS Peer PSM Request frame be sent to the TDLS peer STA.

6.3.49.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TDLS Peer PSM Request frame. The STA then attempts to transmit this to the TDLS peer STA.

6.3.49.3 MLME-TDLSPEERPSM.confirm

6.3.49.3.1 Function

This primitive reports the result of an MLME-TDLSPEERPSM.request primitive to initiate power save mode based on scheduled service periods with a TDLS peer STA.

6.3.49.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
        MLME-TDLSPEERPSM.confirm(
                                 TDLSPeerSTAAddress,
                                 TDLSPeerPSMResponse
                                 )
```

Name	Type	Valid range	Description
TDLSPeerSTAAddress	MAC Address	Any valid individual MAC Address	Specifies the MAC address of the TDLS peer STA from which a TDLS Peer PSM Response frame was received.
TDLSPeerPSMResponse	Sequence of octets	As defined in TDLS Peer PSM Response frame	Specifies the proposed service parameters for the TDLS Peer PSM.

6.3.49.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-TDLSPEERPSM.request and indicates the results of the request.

This primitive is generated when the STA successfully receives a TDLS Peer PSM Response frame from the TDLS peer STA or when an unspecified failure occurs.

6.3.49.3.4 Effect of receipt

On receipt of this primitive, the SME evaluates the results of the MLME-TDLSPEERPSM.request primitive and may use the reported data.

6.3.49.4 MLME-TDLSPEERPSM.indication

6.3.49.4.1 Function

This primitive indicates that a TDLS Peer PSM Request frame was received from a TDLS peer STA.

6.3.49.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
        MLME-TDLSPEERPSM.indication(
                                        TDLSPeerSTAAddress,
                                        TDLSPeerPSMRequest
                                        )
```

Name	Type	Valid range	Description
TDLSPeerSTAAddress	MAC Address	Any valid individual MAC Address	Specifies the MAC address of the TDLS peer STA MAC entity from which a TDLS Peer PSM Request frame was received.
TDLSPeerPSMRequest	Sequence of octets	As defined in TDLS Peer PSM Request frame	Specifies the proposed service parameters for the TDLS Peer PSM.

6.3.49.4.3 When generated

This primitive is generated by the MLME when a valid TDLS Peer PSM Request frame is received.

6.3.49.4.4 Effect of receipt

On receipt of this primitive, the SME should operate according to the procedure in 10.2.1.14.

6.3.49.5 MLME-TDLSPEERPSM.response

6.3.49.5.1 Function

This primitive requests that a TDLS Peer PSM Response frame be sent to the TDLS peer STA.

6.3.49.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
        MLME-TDLSPEERPSM.response(
                                      TDLSPeerSTAAddress,
                                      TDLSPeerPSMResponse
                                      )
```

Name	Type	Valid range	Description
TDLSPeerSTAAddress	MAC Address	Any valid individual MAC Address	Specifies the MAC address of the TDLS peer STA to which a TDLS Peer PSM Response frame is transmitted.
TDLSPeerPSMResponse	Sequence of octets	As defined in TDLS Peer PSM Response frame	Specifies the proposed service parameters for the TDLS Peer PSM.

6.3.49.5.3 When generated

This primitive is generated by the SME to request that a TDLS Peer PSM Response frame be sent to the TDLS peer STA.

6.3.49.5.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TDLS Peer PSM Response frame. The STA then attempts to transmit this to the TDLS peer STA.

6.3.50 Event request

6.3.50.1 General

This set of primitives supports the exchange of Event Request and Event Report frames. The informative diagram shown in Figure 6-12 illustrates the Event Request and Event Report process, and is not meant to be exhaustive of all possible protocol uses.

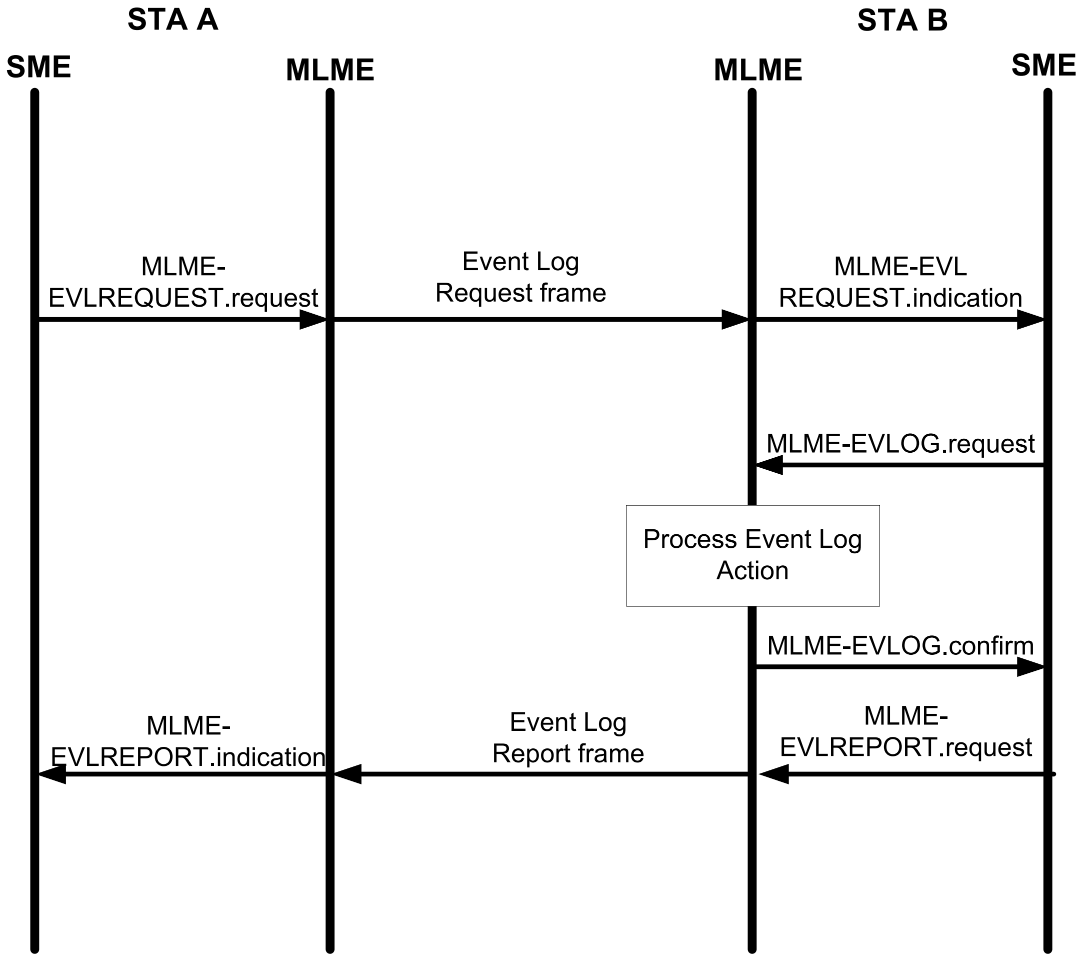

Figure 6-12—Event protocol exchange

6.3.50.2 MLME-EVLREQUEST.request

6.3.50.2.1 Function

This primitive requests the transmission of an event request to a peer entity.

6.3.50.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
        MLME-EVLREQUEST.request(
                                Peer MAC Address,
                                Dialog Token,
                                Event Request Set,
                                Destination URI
                                )
```

Name	Type	Valid range	Description
Peer MAC Address	MACAddress	Any valid individual MAC Address	The address of the peer MAC entity to which the event request is sent.
Dialog Token	Integer	1–255	The dialog token to identify the event transaction.
Event Request Set	Set of event elements	Set of event elements	A set of event elements describing the requested event.
Destination URI	Destination URI element	Destination URI element	The Destination URI element as defined in 8.4.2.92.

6.3.50.2.3 When generated

This primitive is generated by the SME to request that an Event Request frame be sent to a peer entity to initiate one or more transactions.

6.3.50.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs an Event Request frame containing the set of event elements specified. This frame is then scheduled for transmission.

6.3.50.3 MLME-EVLREQUEST.indication

6.3.50.3.1 Function

This primitive indicates that an Event Request frame requesting an event transaction has been received.

6.3.50.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
        MLME-EVLREQUEST.indication(
                                Peer MAC Address,
                                Dialog Token,
                                Event Request Set,
                                Destination URI
                                )
```

Name	Type	Valid range	Description
Peer MAC Address	MACAddress	Any valid individual MAC Address	The address of the peer MAC entity from which the event request was received.
Dialog Token	Integer	1–255	The dialog token to identify the event transaction.
Event Request Set	Set of event elements	Set of event elements	A set of event elements describing the requested event.
Destination URI	Destination URI element	Destination URI element	The Destination URI element as defined in 8.4.2.92.

6.3.50.3.3 When generated

This primitive is generated by the MLME when a valid Event Request frame is received.

6.3.50.3.4 Effect of receipt

On receipt of this primitive, the SME either rejects the request or commences the event transaction.

6.3.51 Event report

6.3.51.1 General

This set of primitives supports the signaling of event reports.

6.3.51.2 MLME-EVLREPORT.request

6.3.51.2.1 Function

This primitive supports the signaling of event reports between peer SMEs.

6.3.51.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
        MLME-EVLREPORT.request(
                                  Peer MAC Address,
                                  Dialog Token,
                                  Event Report Set
                                  )
```

Name	Type	Valid range	Description
Peer MAC Address	MACAddress	Any valid individual MAC Address	The address of the peer MAC entity to which the event report is sent.
Dialog Token	Integer	1–255	The Dialog Token to identify the event transaction.
Event Report Set	Set of event elements	Set of event elements	A set of event elements describing the response to the event request.

6.3.51.2.3 When generated

This primitive is generated by the SME to request that an Event Report frame be sent to a peer entity to report the results of one or more transactions.

6.3.51.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs an Event Report frame containing the set of event elements. This frame is then scheduled for transmission.

6.3.51.3 MLME-EVLREPORT.indication

6.3.51.3.1 Function

This primitive indicates that an Event Report frame has been received from a peer entity.

6.3.51.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
        MLME-EVLREPORT.indication(
                                    Peer MAC Address,
                                    Dialog Token,
                                    Event Report Set
                                    )
```

Name	Type	Valid range	Description
Peer MAC Address	MACAddress	Any valid individual MAC Address	The address of the peer MAC entity from which the event report was received.
Dialog Token	Integer	1–255	The Dialog Token to identify the event transaction.
Event Report Set	Set of event elements	Set of event elements	A set of event elements describing the response to the event request.

6.3.51.3.3 When generated

This primitive is generated by the MLME when a valid Event Report frame is received.

6.3.51.3.4 Effect of receipt

On receipt of this primitive, the event data can be made available for SME processes.

6.3.52 Event

6.3.52.1 General

This set of primitives supports the requesting and reporting of event data.

6.3.52.2 MLME-EVLOG.request

6.3.52.2.1 Function

This primitive is generated by the SME to request that the MLME identify specific events.

6.3.52.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
        MLME-EVLOG.request(
```

Dialog Token,
Event Request Set
)

Name	Type	Valid range	Description
Dialog Token	Integer	1–255	The Dialog Token to identify the event transaction.
Event Request Set	Set of event elements	Set of event elements	A set of event elements describing the response to the event request.

6.3.52.2.3 When generated

This primitive is generated by the SME to request that the MLME initiate the specified event.

6.3.52.2.4 Effect of receipt

On receipt of this primitive, the MLME commences the identification of events.

6.3.52.3 MLME-EVLOG.confirm

6.3.52.3.1 Function

This primitive reports the result of an event.

6.3.52.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-EVLOG.confirm(
Dialog Token,
Event Report Set
)

Name	Type	Valid range	Description
Dialog Token	Integer	1–255	The dialog token to identify the event transaction.
Event Report Set	Set of event report elements	Set of event report elements	A set of event report elements describing the reported event.

6.3.52.3.3 When generated

This primitive is generated by the MLME to report the results when event identification completes.

6.3.52.3.4 Effect of receipt

On receipt of this primitive, the SME evaluates the result and, if appropriate, stores the events pending communication to the requesting entity or for local use.

6.3.53 Diagnostic request

6.3.53.1 General

This set of primitives supports the initiation of diagnostics between peer SMEs. The informative diagram shown in Figure 6-13 depicts the diagnostic reporting process and is not meant to be exhaustive of all possible protocol uses.

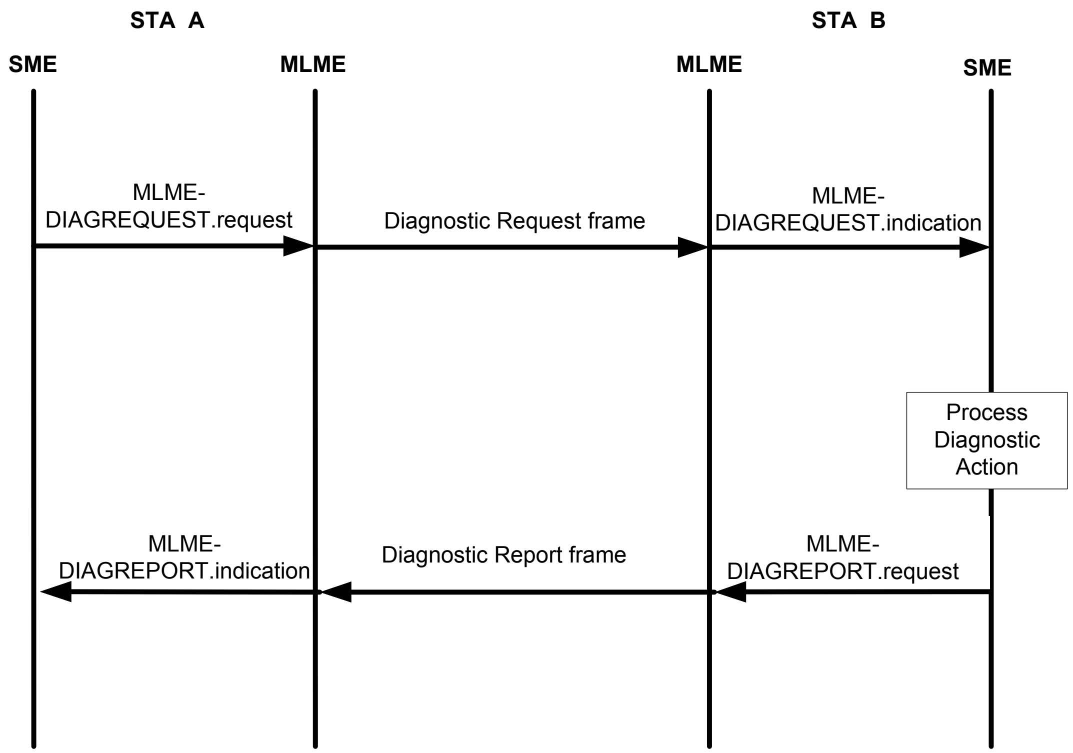

Figure 6-13—Diagnostic protocol exchange

6.3.53.2 MLME-DIAGREQUEST.request

6.3.53.2.1 Function

This primitive requests the transmission of a Diagnostic Request frame to a peer entity.

6.3.53.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-DIAGREQUEST.request(
                         Peer MAC Address,
                         Dialog Token,
                         Diagnostic Request Set,
                         Destination URI
                         )
```

Name	Type	Valid range	Description
Peer MAC Address	MACAddress	Any valid individual MAC Address	The address of the peer MAC entity to which the diagnostic request is sent.
Dialog Token	Integer	1–255	The dialog token to identify the diagnostic transaction.
Diagnostic Request Set	Set of diagnostic elements	Set of diagnostic elements	A set of diagnostic elements describing the requested diagnostics.
Destination URI	Destination URI element	Destination URI element	The Destination URI element as defined in 8.4.2.92.

6.3.53.2.3 When generated

This primitive is generated by the SME to request that a Diagnostic Request frame be sent to a peer entity to initiate one or more diagnostic transactions.

6.3.53.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Diagnostic Request frame containing the set of diagnostic elements specified. This frame is then scheduled for transmission.

6.3.53.3 MLME-DIAGREQUEST.indication

6.3.53.3.1 Function

This primitive indicates that a Diagnostic Request frame requesting a Diagnostic transaction has been received.

6.3.53.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
        MLME-DIAGREQUEST.indication(
                                    Peer MAC Address,
                                    Dialog Token,
                                    Diagnostic Request Set,
                                    Destination URI
                                    )
```

Name	Type	Valid range	Description
Peer MAC Address	MACAddress	Any valid individual MAC Address	The address of the peer MAC entity from which the diagnostic request was received.
Dialog Token	Integer	1–255	The dialog token to identify the diagnostic transaction.
Diagnostic Request Set	Set of diagnostic elements	Set of diagnostic elements	A set of diagnostic elements describing the requested diagnostics.
Destination URI	Destination URI element	Destination URI element	The Destination URI element as defined in 8.4.2.92.

6.3.53.3.3 When generated

This primitive is generated by the MLME when a valid Diagnostic Request frame is received.

6.3.53.3.4 Effect of receipt

On receipt of this primitive, the SME either rejects the request or commences the diagnostic transaction.

6.3.54 Diagnostic report

6.3.54.1 MLME-DIAGREPORT.request

6.3.54.1.1 Function

This primitive supports the signaling of diagnostic reports between peer SMEs.

6.3.54.1.2 Semantics of the service primitive

The primitive parameters are as follows:

```
        MLME-DIAGREPORT.request(
                                  Peer MAC Address,
                                  Dialog Token,
                                  Diagnostic Report Set
                                  )
```

Name	Type	Valid range	Description
Peer MAC Address	MACAddress	Any valid individual MAC Address	The address of the peer MAC entity from which the diagnostic report was received.
Dialog Token	Integer	1–255	The Dialog Token to identify the diagnostic transaction.
Diagnostic Report Set	Set of diagnostic elements	Set of diagnostic elements	A set of diagnostic elements describing the results of the requested diagnostics.

6.3.54.1.3 When generated

This primitive is generated by the SME to request that a Diagnostic Report frame be sent to a peer entity to report the results of one or more diagnostic transactions.

6.3.54.1.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Diagnostic Report frame containing the set of diagnostic elements. This frame is then scheduled for transmission.

6.3.54.2 MLME-DIAGREPORT.indication

6.3.54.2.1 Function

This primitive indicates that a Diagnostic Report frame has been received from a peer entity.

6.3.54.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
        MLME-DIAGREPORT.indication(
                                  Peer MAC Address,
                                  Dialog Token,
                                  Diagnostic Report Set
                                  )
```

Name	Type	Valid range	Description
Peer MAC Address	MACAddress	Any valid individual MAC Address	The address of the peer MAC entity to which the diagnostic report is sent.
Dialog Token	Integer	1–255	The Dialog Token to identify the diagnostic transaction.
Diagnostic Report Set	Set of diagnostic elements	Set of diagnostic elements	A set of diagnostic elements describing the results of the requested diagnostics.

6.3.54.2.3 When generated

This primitive is generated by the MLME when a valid Diagnostic Report frame is received.

6.3.54.2.4 Effect of receipt

On receipt of this primitive, the diagnostic data can be made available for SME processes.

6.3.55 Location Configuration request

6.3.55.1 General

This set of primitives supports the exchange of location configuration parameter information between peer SMEs. The informative diagram shown in Figure 6-14 depicts the location configuration request and response process, and is not meant to be exhaustive of all possible protocol uses.

MLME-LOCATIONCFG.response

Figure 6-14—Location configuration request and response protocol exchange

6.3.55.2 MLME-LOCATIONCFG.request

6.3.55.2.1 Function

This primitive requests the transmission of a Location Configuration Request frame to a peer entity.

6.3.55.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
        MLME-LOCATIONCFG.request(
                                  Peer MAC Address,
                                  Dialog Token,
                                  Location Parameters
                                  )
```

Name	Type	Valid range	Description
Peer MAC Address	MACAddress	Any valid individual MAC Address	The address of the peer MAC entity to which the location configuration request is sent.
Dialog Token	Integer	1–255	The dialog token to identify the location transaction.
Location Parameters	Location Parameters element	Location Parameters element	A Location Parameters element containing one or more subelements describing the STA location information. See 8.4.2.73.

6.3.55.2.3 When generated

This primitive is generated by the SME to request that a Location Configuration Request frame be sent to a peer entity to convey location configuration information.

6.3.55.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Location Configuration Request frame containing the set of Location Parameters elements specified. This frame is then scheduled for transmission.

6.3.55.3 MLME-LOCATIONCFG.confirm

6.3.55.3.1 Function

This primitive reports the result of a location configuration request.

6.3.55.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
        MLME-LOCATIONCFG.confirm(
                                  Dialog Token,
                                  Peer MAC Address,
                                  Location Parameters
                                  )
```

Name	Type	Valid range	Description
Dialog Token	Integer	1–255	The dialog token to identify the location transaction.
Peer MAC Address	MACAddress	Any valid individual MAC Address	The address of the peer MAC entity to which the location configuration response is sent.
Location Parameters	Location Parameters element	Location Parameters element	A Location Parameters element containing one or more subelements describing the STA location information. See 8.4.2.73.

6.3.55.3.3 When generated

This primitive is generated by the MLME when transmission of the Location Configuration Request frame is acknowledged, when (re)transmission of the Location Configuration Request frame fails, or when a failure reason is unspecified.

6.3.55.3.4 Effect of receipt

No effect of receipt is specified.

6.3.55.4 MLME-LOCATIONCFG.indication

6.3.55.4.1 Function

This primitive indicates that a Location Configuration Request frame has been received requesting a location transaction.

6.3.55.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
        MLME-LOCATIONCFG.indication(
                                    Peer MAC Address,
                                    Dialog Token,
                                    Location Parameters
                                    )
```

Name	Type	Valid range	Description
Peer MAC Address	MACAddress	Any valid individual MAC Address	The address of the peer MAC entity from which the location configuration request was received.
Dialog Token	Integer	1–255	The dialog token to identify the location transaction.
Location Parameters	Location Parameters element	Location Parameters element	A Location Parameters element containing one or more subelements describing the STA location information. See 8.4.2.73.

6.3.55.4.3 When generated

This primitive is generated by the MLME when a valid Location Configuration Request frame is received.

6.3.55.4.4 Effect of receipt

On receipt of this primitive, the SME either rejects the request or commences the location transaction.

6.3.55.5 MLME-LOCATIONCFG.response

6.3.55.5.1 Function

This primitive requests the transmission of location information to a peer entity, in response to a received Location Configuration Request frame.

6.3.55.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
        MLME-LOCATIONCFG.response(
                                    Peer MAC Address,
                                    Dialog Token,
                                    Location Parameters
                                    )
```

Name	Type	Valid range	Description
Peer MAC Address	MACAddress	Any valid individual MAC Address	The address of the peer MAC entity to which the location request is sent.
Dialog Token	Integer	1–255	The dialog token to identify the location transaction.
Location Parameters	Location Parameters element	Location Parameters element	A location parameters element containing one or more subelements describing the STA location information. See 8.4.2.73.

6.3.55.5.3 When generated

This primitive is generated by the SME to request that a Location Configuration Response frame be sent to a peer entity to convey location configuration information.

6.3.55.5.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Location Configuration Response frame containing the set of location parameters elements specified. This frame is then scheduled for transmission.

6.3.56 Location track notification

6.3.56.1 General

This set of primitives supports the location track notification from one SME to one or more receiving SMEs. The informative diagram in Figure 6-15 depicts the location track notification process, is not meant to be exhaustive of all possible protocol uses.

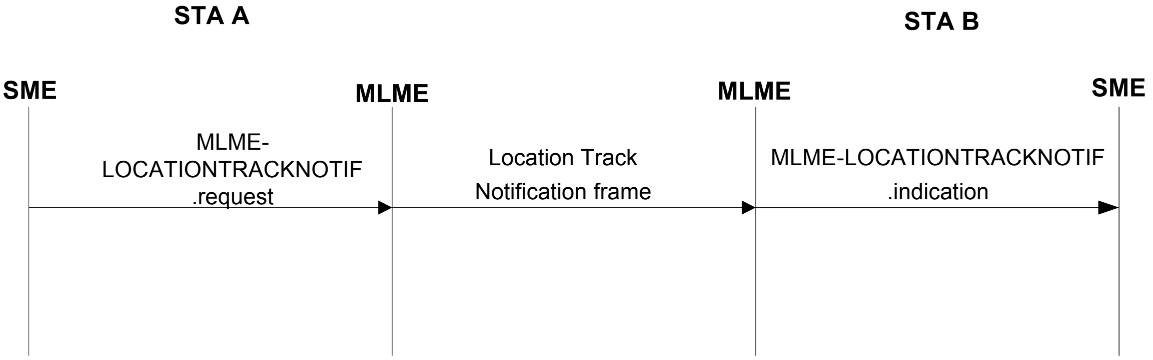

Figure 6-15—Location track notification protocol exchange

6.3.56.2 MLME-LOCATIONTRACKNOTIF.request

6.3.56.2.1 Function

This primitive requests the transmission of Location Configuration Request frame to a peer entity.

6.3.56.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
          MLME-LOCATIONTRACKNOTIF.request(
                                        Peer MAC Address,
                                        Location Parameters,
                                        Measurement Report
                                        )
```

Name	Type	Valid range	Description
Peer MAC Address	MACAddress	Any valid individual or group addressed MAC Address	The address of the peer MAC entity to which the location track notification is sent.
Location Parameters	Location Parameters element	Location Parameters element	A location parameters element containing one or more subelements describing the STA location information. See 8.4.2.73.
Measurement Report	Measurement Report element	Measurement Report element	A Measurement Report element contains the beacon measurement information. See 8.4.2.24.

6.3.56.2.3 When generated

This primitive is generated by the SME to request that a Location Track Notification frame be sent to a peer entity to help convey location information.

6.3.56.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Location Track Notification frame containing the set of location parameters elements specified. This frame is then scheduled for transmission.

6.3.56.3 MLME-LOCATIONTRACKNOTIF.indication

6.3.56.3.1 Function

This primitive indicates that a Location Track Notification frame has been received.

6.3.56.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
   MLME-LOCATIONTRACKNOTIF.indication(
                                         Peer MAC Address,
                                         Location Parameters,
                                         Measurement Report
                                         )
```

Name	Type	Valid range	Description
Peer MAC Address	MACAddress	Any valid individual or group addressed MAC Address	The address of the peer MAC entity from which the location track notification was received.
Location Parameters	Location Parameters element	Location Parameters element	A location parameters element containing one or more subelements describing the STA location information. See 8.4.2.73.
Measurement Report	Measurement Report element	Measurement Report element	A Measurement Report element contains the beacon measurement information. See 8.4.2.24.

6.3.56.3.3 When generated

This primitive is generated by the MLME when a valid Location Track Notification frame is received.

6.3.56.3.4 Effect of receipt

On receipt of this primitive, the SME uses the information contained within the notification.

6.3.57 Timing measurement

6.3.57.1 General

The following set of primitives supports exchange of timing measurement information from one SME to another. The informative diagram in Figure 6-16 depicts various points in time that are of interest to the timing measurement procedure.

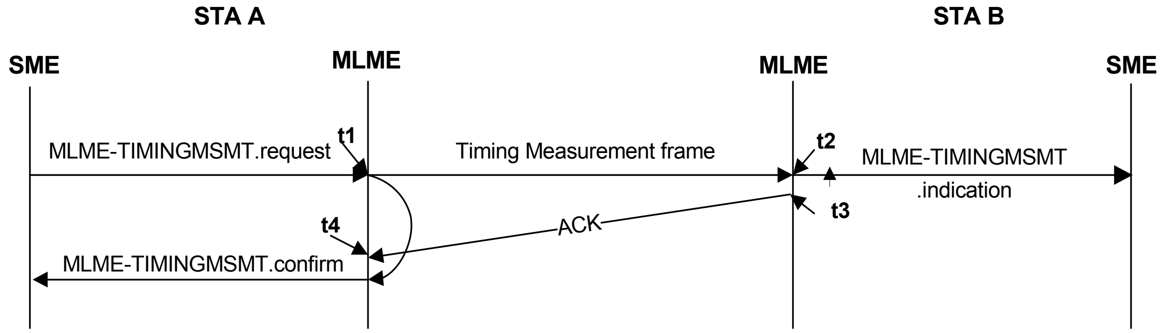

Figure 6-16—Timing measurement primitives and timestamps capture

NOTE 1—In Figure 6-16, t1 and t3 correspond to the point in time at which the start of the preamble for the transmitted frame appears at the transmit antenna port. An implementation may capture a timestamp during the transmit processing earlier or later than the point at which it actually occurs and offset the value to compensate for the time difference.

NOTE 2—In Figure 6-16, t2 and t4 correspond to the point in time at which the start of the preamble for the incoming frame arrives at the receive antenna port. Because time is needed to detect the frame and synchronize with its logical structure, an implementation determines when the start of the preamble for the incoming frame arrived at the receive antenna port by capturing a timestamp some time after it occurred and compensating for the delay by subtracting an offset from the captured value.

6.3.57.2 MLME-TIMINGMSMT.request

6.3.57.2.1 Function

This primitive requests the transmission of Timing Measurement frame to a peer entity.

6.3.57.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
        MLME-TIMINGMSMT.request(
                                  Peer MAC Address,
                                  Dialog Token,
                                  Follow Up Dialog Token,
                                  t1,
                                  Max t1 Error,
                                  t4,
                                  Max t4 Error,
                                  VendorSpecific
                                  )
```

Name	Type	Valid range	Description
Peer MAC Address	MACAddress	Any valid individual addressed MAC Address	The address of the peer MAC entity to which the Timing Measurement frame is sent.
Dialog Token	Integer	1–255	The dialog token to identify the Timing Measurement transaction.
Follow Up Dialog Token	Integer	0–255	The dialog token of a Timing Measurement frame which the current frame follows. See 10.23.5.
t1	Integer		Set to the value of t1 (see Figure 6-16) expressed in 10 ns units.
Max t1 Error	Integer	0–255	Maximum error in the t1 value expressed in 10 ns units; see 8.5.15.3.
t4	Integer		Set to the value of t4 (see Figure 6-16) expressed in 10 ns units.
Max t4 Error	Integer	0–255	Maximum error in t4 value expressed in 10 ns units.
VendorSpecific	A set of information elements	As defined in 8.4.2.28	Zero or more elements.

6.3.57.2.3 When generated

This primitive is generated by the SME to request that a Timing Measurement frame be sent to a peer entity.

6.3.57.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Timing Measurement frame with the specified parameters. This frame is then scheduled for transmission.

6.3.57.3 MLME-TIMINGMSMT.confirm

6.3.57.3.1 Function

This primitive indicates that a Timing Measurement frame has been successfully received by the peer STA to which it was sent.

6.3.57.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
        MLME-TIMINGMSMT.confirm(
                                Peer MAC Address,
                                Dialog Token,
                                t1,
                                Max t1 Error,
                                t4,
                                Max t4 Error
                                )
```

Name	Type	Valid range	Description
Peer MAC Address	MACAddress	Any valid individual addressed MAC Address	The address of the peer MAC entity to which acknowledges the receipt of the Timing Measurement frame.
Dialog Token	Integer	1–255	The dialog token to identify the Timing Measurement transaction.
t1	32-bit unsigned Integer	0 – (2^{32}–1)	Set to the value of t1 (see Figure 6-16) expressed in 10 ns units.
Max t1 Error	Integer	0–255	Maximum error in the t1 value expressed in 10 ns units.
t4	32-bit unsigned Integer	0 – (2^{32}–1)	Set to the value of t4 (see Figure 6-16) expressed in 10 ns units.
Max t4 Error	Integer	0–255	Maximum error in t4 value expressed in 10 ns units.

6.3.57.3.3 When generated

This primitive is generated by the MLME when an ACK corresponding to the Timing Measurement frame is received from the peer STA.

6.3.57.3.4 Effect of receipt

On receipt of this primitive, the SME uses the information contained within the notification.

6.3.57.4 MLME-TIMINGMSMT.indication

6.3.57.4.1 Function

This primitive indicates that a Timing Measurement frame has been received and the corresponding ACK has been transmitted.

6.3.57.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
        MLME-TIMINGMSMT.indication(
                                      Peer MAC Address,
                                      Dialog Token,
                                      Follow Up Dialog Token,
                                      t1,
                                      Max t1 Error,
                                      t4,
                                      Max t4 Error,
                                      t2,
                                      Max t2 Error,
                                      t3,
                                      Max t3 Error,
```

VendorSpecific
)

Name	Type	Valid range	Description
Peer MAC Address	MACAddress	Any valid individual addressed MAC Address	The address of the peer MAC entity from which the Timing Measurement frame was sent.
Dialog Token	Integer	1–255	The dialog token to identify the Timing Measurement transaction.
Follow Up Dialog Token	Integer	1–255	The dialog token of a Timing Measurement frame which the current frame follows. See 10.23.5.
t1	32-bit unsigned integer	0 – (2^{32}–1)	Set to the value of t1 (see Figure 6-16) expressed in 10 ns units.
Max t1 Error	Integer	0–255	Maximum error in the t1 value expressed in 10 ns units.
t4	32-bit unsigned integer	0 – (2^{32}–1)	Set to the value of t4 (see Figure 6-16) expressed in 10 ns units.
Max t4 Error	Integer	0–255	Maximum error in t4 value expressed in 10 ns units.
t2	32-bit unsigned Integer	0 – (2^{32}–1)	Set to the value of t2 (see Figure 6-16) expressed in 10 ns units.
Max t2 Error	Integer	0–255	Maximum error in t2 value expressed in 10 ns units.
t3	32-bit unsigned integer	0 – (2^{32}–1)	Set to the value of t3 (see Figure 6-16) expressed in 10 ns units.
Max t3 Error	Integer	0–255	Maximum error in t3 value expressed in 10 ns units.
VendorSpecific	A set of information elements	As defined in 8.4.2.28	Zero or more elements.

6.3.57.4.3 When generated

This primitive is generated by the MLME when a valid Timing Measurement frame is received.

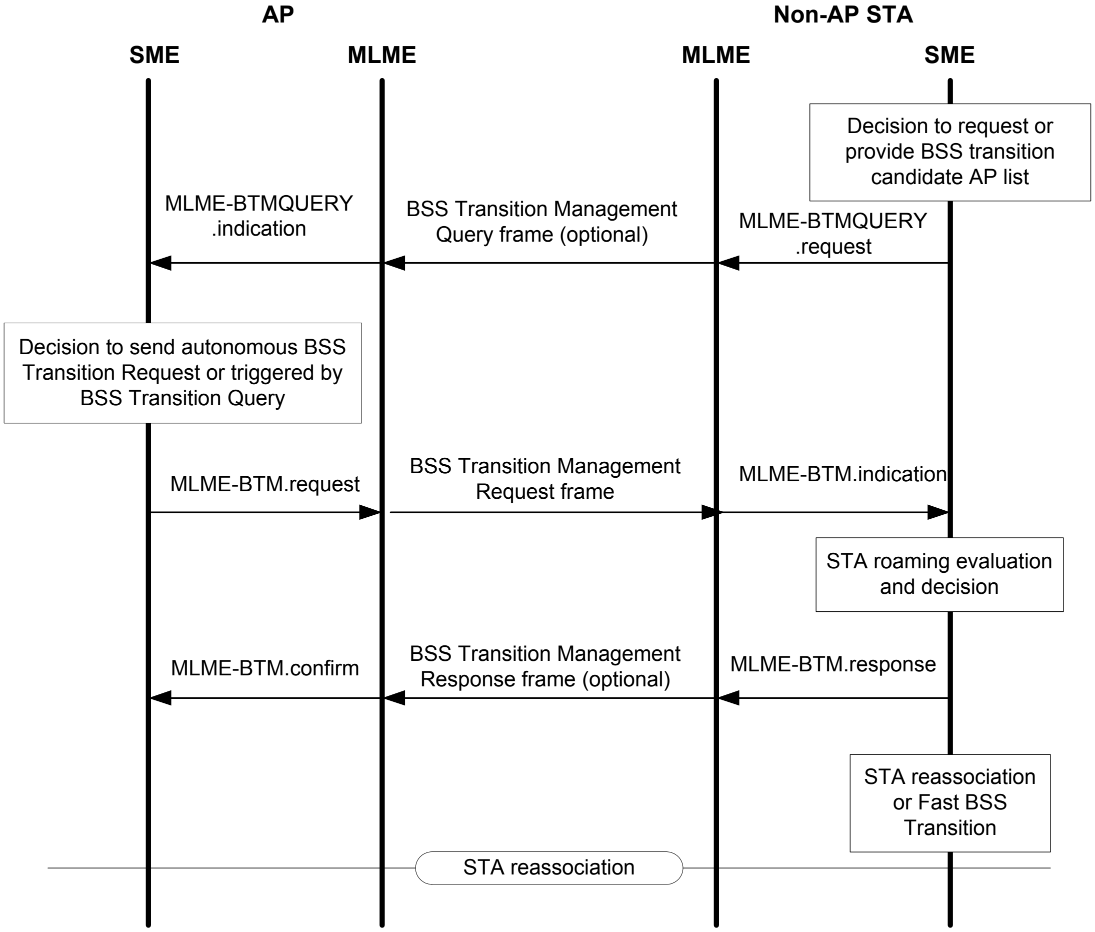
6.3.57.4.4 Effect of receipt

On receipt of this primitive, the SME uses the information contained within the notification.

6.3.58 BSS Transition Management

6.3.58.1 BSS Transition Management procedure

The informative diagram shown in Figure 6-17 depicts the BSS Transition Management procedure and is not meant to be exhaustive of all possible protocol uses.



AP
Non-AP STA
SME
MLME
MLME
SME
Decision to request or provide BSS transition candidate AP list
MLME-BTMQUERY .indication
BSS Transition Management Query frame (optional)
MLME-BTMQUERY .request
Decision to send autonomous BSS Transition Request or triggered by BSS Transition Query
MLME-BTM.request
BSS Transition Management Request frame
MLME-BTM.indication
STA roaming evaluation and decision
MLME-BTM.confirm
BSS Transition Management Response frame (optional)
MLME-BTM.response
STA reassociation or Fast BSS Transition
STA reassociation

Figure 6-17—BSS Transition Management request—accepted

6.3.58.2 MLME-BTMQUERY.request

This set of primitives supports the signaling of BSS Transition Management Query frames between non-AP STAs and an AP.

6.3.58.2.1 Function

This primitive requests transmission of a BSS Transition Management Query frame to the AP with which the STA is associated.

6.3.58.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-BTMQUERY.request(
                              Peer MAC Address,
                              DialogToken,
                              BSSTransitionQueryReason,
                              BSSTransitionCandidateListEntries
                              )
```

Name	Type	Valid range	Description
Peer MAC Address	MACAddress	Any valid individual MAC Address	The address of the peer MAC entity to which the BSS Transition Management Query frame is sent.
DialogToken	Integer	1–255	The Dialog Token to identify this BSS Transition Management transaction.
BSSTransitionQuery Reason	Integer	0–255	As defined in 8.5.14.8.
BSSTransition CandidateListEntries	Set of Neighbor Report Elements	Set of Neighbor Report Elements as defined in the Neighbor Report Element in 8.4.2.39	Contains the description of candidate BSS transition APs and their capabilities as described in 8.4.2.39.

6.3.58.2.3 When generated

This primitive is generated by the SME to request that a BSS Transition Management Query frame be sent to the AP with which the STA is associated to initiate a BSS Transition Management procedure.

6.3.58.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a BSS Transition Management Query management frame of action type. The STA then attempts to transmit the frame to the AP with which it is associated.

6.3.58.3 MLME-BTMQUERY.indication

6.3.58.3.1 Function

This primitive indicates that a BSS Transition Management Query frame was received from a non-AP STA.

6.3.58.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-BTMQUERY.indication(
                              Peer MAC Address,
                              DialogToken,
                              BSSTransitionQueryReason,
                              BSSTransitionCandidateListEntries
                              )
```

Name	Type	Valid range	Description
Peer MAC Address	MACAddress	Any valid individual MAC Address	The address of the non-AP STA MAC entity from which a BSS Transition Management Query frame was received.
DialogToken	Integer	1–255	The Dialog Token to identify the BSS Transition Management transaction received in the BSS Transition Management Query frame.
BSSTransitionQuery Reason	Integer	0–255	The BSS Transition Query Reason Code in the BSS Transition Management Query frame that was received.
BSSTransition CandidateListEntries	Set of Neighbor Report Elements	Set of Neighbor Report Elements as defined in the Neighbor Report Element in 8.4.2.39	Contains the description of candidate BSS transition APs and their capabilities as described in 8.4.2.39.

6.3.58.3.3 When generated

This primitive is generated by the MLME when a valid BSS Transition Management Query frame is received.

6.3.58.3.4 Effect of receipt

On receipt of this primitive, the SME shall operate according to the procedure in 10.23.6.

6.3.58.4 MLME-BTM.request

6.3.58.4.1 Function

This primitive requests transmission of a BSS Transition Management Request frame to a non-AP STA.

6.3.58.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
        MLME-BTM.request(
                        Peer MAC Address
                        DialogToken,
                        RequestMode,
                        DisassociationTimer,
                        ValidityInterval,
                        BSSTerminationDuration,
                        SessionInformationURL,
                        BSSTransitionCandidateListEntries
                        )
```

Name	Type	Valid range	Description
Peer MAC Address	MACAddress	Any valid individual MAC Address	The address of the peer MAC entity to which the BSS Transition Management Request frame is sent.
DialogToken	Integer	1–255	The Dialog Token to identify the BSS Transition Management transaction. Set to 0 for an autonomous BSS Transition Management Request frame.

Name	Type	Valid range	Description
RequestMode	Integer	As specified in 8.5.14.10	Contains RequestMode for the BSS Transition Management Request frame.
DisassociationTimer	Integer	0 – 65 535	Specifies the number of TBTTs until the AP disassociates the non-AP STA. A value of 0 indicates time of disassociation has not yet been determined and a value of 1 indicates disassociation shall occur before the next TBTT.
ValidityInterval	Integer	1–255	Specifies the number of beacon transmission times (TBTTs) until this recommendation of this BSS transition candidate list is no longer valid.
BSSTerminationDuration	BSS Termination Duration subelement	BSS Termination Duration subelement	Contains the BSS Termination Duration subelement (see 8.4.2.39) for the current BSS and is present only when the BSS Termination Included field is 1 in the Request mode field.
SessionInformationURL	URL	n/a	Optionally contains a URL formatted per IETF RFC 3986 where additional information pertaining to the user's accounting session may be found.
BSSTransition CandidateListEntries	Set of Neighbor Report Elements	Set of Neighbor Report Elements as defined in the Neighbor Report Element in 8.4.2.39	Contains the description of candidate BSS transition APs and their capabilities as described in 8.4.2.39.

6.3.58.4.3 When generated

This primitive is generated by the SME to request that a BSS Transition Management Request frame be sent to an associated non-AP STA. This request is sent either following the reception of a MLME-BTMQUERY.indication or may be sent autonomously.

6.3.58.4.4 Effect of receipt

On receipt of this primitive, the MLME constructs a BSS Transition Management Request management frame of action type. The STA then attempts to transmit this frame to the indicated non-AP STA.

6.3.58.5 MLME-BTM.indication

6.3.58.5.1 Function

This primitive indicates that a BSS Transition Management Request frame was received from the AP with which the STA is associated.

6.3.58.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
    MLME-BTM.indication(
                        PeerMACAddress,
                        DialogToken,
                        RequestMode,
                        DisassociationTimer,
                        ValidityInterval,
                        BSSTerminationDuration,
                        SessionInformationURL,
```

BSSTransitionCandidateListEntries
)

Name	Type	Valid range	Description
PeerMACAddress	MACAddress	Any valid individual MAC Address	The address of the MAC entity from which a BSS Transition Management Request frame was received.
DialogToken	Integer	1–255	The Dialog Token to identity the BSS Transition Management transaction as received in the BSS Transition Management Request frame.
RequestMode	Integer	As specified in 8.5.14.10	Contains the RequestMode for the BSS Transition Management Request frame.
Disassociation Timer	Integer	0 – 65 535	Specifies the number of TBTTs until the AP disassociates the non-AP STA. A value of 0 indicates time of disassociation has not been determined yet and a value of 1 indicates disassociation shall occur before the next TBTT.
ValidityInterval	Integer	1–255	Specifies the number of beacon transmission times (TBTTs) until this recommendation of this BSS transition candidate list is no longer valid.
BSSTerminationDuration	BSS Termination Duration subelement	BSS Termination Duration subelement	Contains the BSS Termination Duration subelement (see 8.4.2.39) for the current BSS and is present only when the BSS Termination Included field is 1 in the Request mode field.
SessionInformationURL	URL	n/a	Optionally contains a URL formatted per IETF RFC 3986 where additional information pertaining to the user’s accounting session may be found.
BSSTransition CandidateListEntries	Set of Neighbor Report Elements	Set of Neighbor Report Elements as defined in the Neighbor Report Element in 8.4.2.39	Contains the description of candidate BSS transition APs and their capabilities as described in 8.4.2.39.

6.3.58.5.3 When generated

This primitive is generated by the MLME when a valid BSS Transition Management Request frame is received. This primitive is also generated when a timeout or failure occurs.

6.3.58.5.4 Effect of receipt

On receipt of this primitive the SME shall operate according to the procedure in 10.23.6.

6.3.58.6 MLME-BTM.response

6.3.58.6.1 Function

This primitive requests transmission of a BSS Transition Management Response frame to the AP with which the STA is associated.

6.3.58.6.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-BTM.response(
Peer MAC Address

DialogToken,
StatusCode,
BSSTerminationDelay,
TargetBSSID,
BSSTransitionCandidateListEntries
)

Name	Type	Valid range	Description
Peer MAC Address	MACAddress	Any valid individual MAC Address	The address of the peer MAC entity to which the BSS Transition Management Query frame is sent.
DialogToken	Integer	1–255	The Dialog Token to identify the BSS Transition Management transaction.
StatusCode	Integer	0–255	As defined in 8.5.14.10.
BSSTerminationDelay	Integer	0–255	As defined in 8.5.14.10.
TargetBSSID	MACAddress	Any valid individual MAC Address	The BSSID of the BSS that the STA decided to transition to. Field shall be null if STA decided not to transition.
BSSTransition CandidateListEntries	Set of Neighbor Report Elements	Set of Neighbor Report Elements as defined in the Neighbor Report Element in 8.4.2.39	Contains the description of candidate BSS transition APs and their capabilities as described in 8.4.2.39.

6.3.58.6.3 When generated

This primitive is generated by the SME to request that a BSS Transition Management Response frame be sent to the AP with which the STA is associated.

6.3.58.6.4 Effect of receipt

On receipt of this primitive, the MLME constructs a BSS Transition Management Response management frame of action type. The non-AP STA then attempts to transmit this to the AP with which it is associated.

6.3.58.7 MLME-BTM.confirm

6.3.58.7.1 Function

This primitive reports the results of a BSS Transition Management attempt with a specified peer MAC entity that is within an AP.

6.3.58.7.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-BTM.confirm(
Peer MAC Address,
DialogToken,
BSSTransitionQueryReason,
StatusCode,
BSSTerminationDelay,
TargetBSSID,
BSSTransitionCandidateListEntries
)

Name	Type	Valid range	Description
Peer MAC Address	MAC Address	Any valid individual MAC Address	The address of the non-AP STA MAC entity from which a BSS Transition Management Response frame was received.
DialogToken	Integer	1–255	The Dialog Token to identify the BSS transition management transaction as received in the BSS Transition Management Response frame.
StatusCode	Integer	0–255	As defined in 8.5.14.10.
BSSTerminationDelay	Integer	0–255	As defined in 8.5.14.10.
TargetBSSID	MACAddress	Any valid individual MAC Address	The BSSID of the BSS that the STA indicated to transition to as received in the BSS Transition Management Response frame.
BSSTransition CandidateListEntries	Set of Neighbor Report Elements	Set of Neighbor Report Elements as defined in the Neighbor Report Element in 8.4.2.39	Contains the BSS Transition Candidate List Entries in the received BSS Transition Management Response frame.

6.3.58.7.3 When generated

This primitive is generated by the MLME when transmission of the BSS Transition Management Request frame is acknowledged, when (re)transmission of the BSS Transition Management Request frame fails, or when a failure reason is unspecified.

6.3.58.7.4 Effect of receipt

On receipt of this primitive, the SME shall operate according to the procedure in 10.23.6.

6.3.59 FMS setup

6.3.59.1 General

The following MLME primitives support the signaling of FMS Setup. The informative diagram shown in Figure 6-18 depicts the FMS setup process and is not meant to be exhaustive of all possible protocol uses.

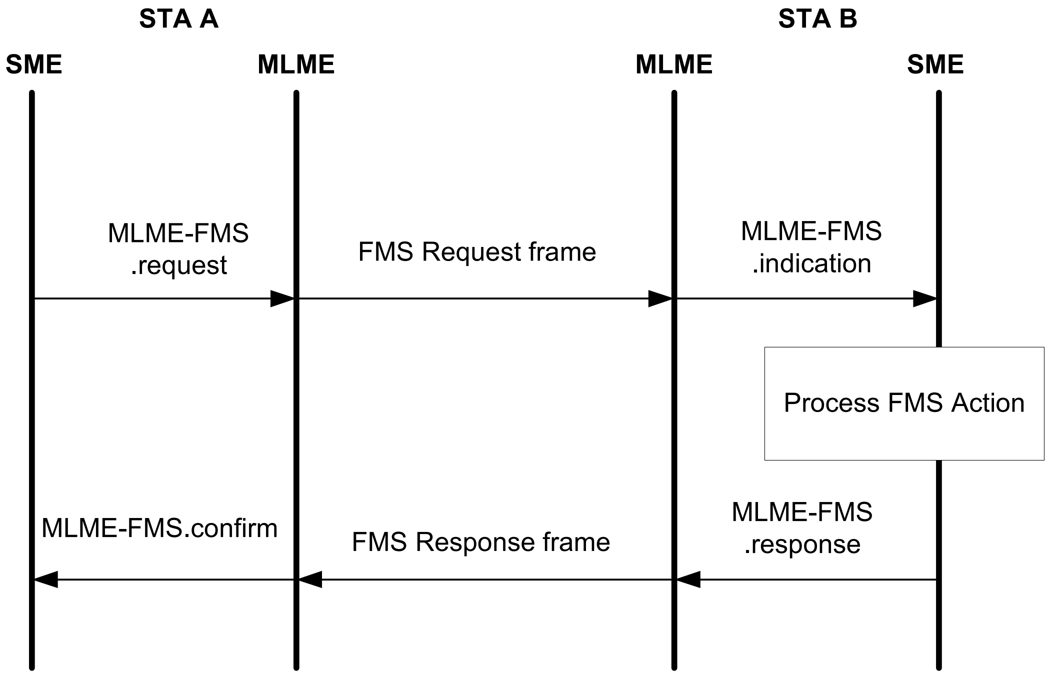


Figure 6-18—FMS setup protocol exchange

6.3.59.2 MLME-FMS.request

6.3.59.2.1 Function

This primitive requests that an FMS Request frame be sent to the AP with which the non-AP STA is associated.

6.3.59.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
    MLME-FMS.request(
                        PeerSTAAddress,
                        DialogToken,
                        FMSRequest
                        )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC Address	Any valid individual MAC Address	Specifies the address of the peer MAC entity with which to perform the FMS process.
Dialog Token	Integer	1–255	The dialog token to identify the FMS transaction.

Name	Type	Valid range	Description
FMSRequest	FMS Request element	As defined in 8.4.2.78	Specifies the proposed service parameters for the FMS.

6.3.59.2.3 When generated

This primitive is generated by the SME to request that an FMS Request frame be sent to the AP with which the STA is associated.

6.3.59.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs an FMS Request action management frame. The STA then attempts to transmit this to the AP with which it is associated.

6.3.59.3 MLME-FMS.confirm

6.3.59.3.1 Function

This primitive reports the result of an FMS procedure.

6.3.59.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
        MLME- FMS.confirm(
                              Peer MAC Address,
                              Dialog Token,
                              FMSResponse
                              )
```

Name	Type	Valid range	Description
Peer MAC Address	MACAddress	Any valid individual MAC Address	The address of the peer MAC entity to which the location response is sent.
Dialog Token	Integer	0–255	The dialog token to identify the FMS transaction.
FMSResponse	FMS Response element	As defined in 8.4.2.79	Specifies service parameters for the FMS.

6.3.59.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-FMS.request and indicates the results of the request. This primitive is generated when a timeout or failure occurs or when the STA receives an FMS Response frame from the AP.

6.3.59.3.4 Effect of receipt

On receipt of this primitive, the SME should operate according to the procedure in 10.2.1.16.

6.3.59.4 MLME-FMS.indication

6.3.59.4.1 Function

This primitive indicates that an FMS Request frame was received from a non-AP STA.

6.3.59.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
          MLME- FMS.indication(
                                  PeerSTAAddress,
                                  DialogToken,
                                  FMSRequest
                                  )
```

Name	Type	Valid range	Description
PeerSTAAddress	MACAddress	Any valid individual MAC Address	The address of the non-AP STA MAC entity from which an FMS Request frame was received.
Dialog Token	Integer	1–255	The dialog token to identify the FMS transaction.
FMSRequest	FMS Request element	As defined in 8.4.2.78	Specifies the proposed service parameters for the FMS.

6.3.59.4.3 When generated

This primitive is generated by the MLME when a valid FMS Request frame is received.

6.3.59.4.4 Effect of receipt

On receipt of this primitive, the SME should operate according to the procedure in 10.2.1.16.

6.3.59.5 MLME-FMS.response

6.3.59.5.1 Function

This primitive is either generated in response to a received FMS Request frame or autonomously by the AP and requests the transmission of an FMS Response frame.

6.3.59.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
          MLME-FMS.response(

                                  PeerSTAAddress,
                                  FMSResponse
                                  )
```

Name	Type	Valid range	Description
PeerSTAAddress	MACAddress	Any valid individual MAC Address	The address of the non-AP STA MAC entity from which an FMS Request frame was received.
Dialog Token	Integer	0–255	The dialog token to identify the FMS transaction.
FMSResponse	FMS Response element	As defined in 8.4.2.79	Specifies service parameters for the FMS.

6.3.59.5.3 When generated

This primitive is generated by the SME to request that an FMS Response frame be sent to a peer entity to convey FMS information.

6.3.59.5.4 Effect of receipt

On receipt of this primitive, the MLME constructs an FMS Response frame. The STA then attempts to transmit this to the non-AP STA indicated by the PeerSTAAddress parameter.

6.3.60 Collocated Interference request

6.3.60.1 General

This set of primitives supports the exchange of collocated interference information between peer SMEs. The informative diagram shown in Figure 6-19 depicts the Collocated Interference request and response process, and is not meant to be exhaustive of all possible protocol uses.

6.3.60.2 MLME-CLINTERFERENCEREQUEST.request

6.3.60.2.1 Function

This primitive requests the transmission of Collocated Interference Request frame to a peer entity.

6.3.60.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-CLINTERFERENCEREQUEST.request(
                                    Peer MAC Address,
                                    Dialog Token,
                                    Request Info
                                    )
```

Name	Type	Valid range	Description
Peer MAC Address	MACAddress	Any valid individual MAC Address, or the group MAC address	The address of the peer MAC entity to which the collocated interference request is sent.
Dialog Token	Integer	1–255	The dialog token to identify the collocated interference transaction.
Request Info	Integer	As defined in the Collocated Interference Request frame, see 8.5.14.13	Specifies the requested information.

6.3.60.2.3 When generated

This primitive is generated by the SME to request that a Collocated Interference Request frame be sent to a peer entity.

6.3.60.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Collocated Interference Request frame. This frame is then scheduled for transmission.

6.3.60.3 MLME-CLINTERFERENCEREQUEST.indication

6.3.60.3.1 Function

This primitive indicates that a Collocated Interference Request frame has been received requesting a Collocated Interference report.

6.3.60.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-CLINTERFERENCEREQUEST.indication(
                                    Peer MAC Address,
                                    Dialog Token,
                                    Request Info
                                    )
```

Name	Type	Valid range	Description
Peer MAC Address	MACAddress	Any valid individual MAC Address or the group MAC address	The address of the peer MAC entity from which the Collocated Interference request was received.
Dialog Token	Integer	1–255	The dialog token to identify the collocated interference transaction.
Request Info	Integer	As defined in the Collocated Interference Request frame, see 8.5.14.13	Specifies the requested information.

6.3.60.3.3 When generated

This primitive is generated by the MLME when a valid Collocated Interference Request frame is received.

6.3.60.3.4 Effect of receipt

On receipt of this primitive, the SME either rejects the request or commences the Collocated Interference reporting procedure as described in 10.23.8.

6.3.61 Collocated Interference report

6.3.61.1 General

This set of primitives supports the exchange of collocated interference information between peer SMEs.

6.3.61.2 MLME-CLINTERFERENCEREPORT.request

6.3.61.2.1 Function

This primitive requests the transmission of Collocated Interference Report to a peer entity, in response to a received Collocated Interference Request frame.

6.3.61.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-CLINTERFERENCEREPORT.request(
                                        Peer MAC Address,
                                        Dialog Token,
                                        Collocated Interference Report
                                        )
```

Name	Type	Valid range	Description
Peer MAC Address	MACAddress	Any valid individual MAC Address	The address of the peer MAC entity to which the Collocated Interference Report is sent.
Dialog Token	Integer	1–255	The dialog token to identify the collocated interference transaction.
Collocated Interference Report	Collocated Interference Report elements	As defined in 8.4.2.87	Specifies the collocated interference characteristics.

6.3.61.2.3 When generated

This primitive is generated by the SME to request that a Collocated Interference Report frame be sent to a peer entity to convey collocated interference information.

6.3.61.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Collocated Interference Report frame. This frame is then scheduled for transmission.

6.3.61.3 MLME-CLINTERFERENCEREPORT.indication

6.3.61.3.1 Function

This primitive indicates that a Collocated Interference Report frame has been received.

6.3.61.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-CLINTERFERENCEREPORT.indication(
                                         Peer MAC Address,
                                         Dialog Token,
                                         Collocated Interference Report
                                         )
```

Name	Type	Valid range	Description
Peer MAC Address	MACAddress	Any valid individual MAC Address	The address of the peer MAC entity from which the location response was received.
Dialog Token	Integer	1–255	The dialog token to identify the location transaction.
Collocated Interference Report	Collocated Interference Report elements	As defined in 8.4.2.87	Specifies the collocated interference characteristics.

6.3.61.3.3 When generated

This primitive is generated by the MLME when a valid Collocated Interference Report frame is received.

6.3.62 TFS Setup

6.3.62.1 General

This set of primitives supports the exchange of the signaling of TFS Setup between peer SMEs. The informative diagram shown in Figure 6-20 depicts the TFS request and response process, and is not meant to be exhaustive of all possible protocol uses.

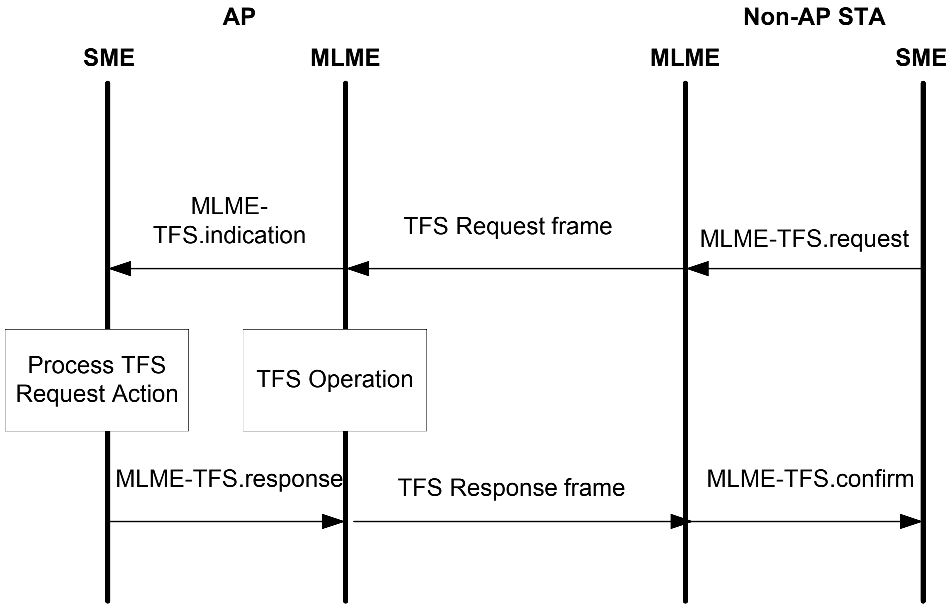

Figure 6-20—TFS request and response exchange

6.3.62.2 MLME-TFS.request

6.3.62.2.1 Function

This primitive requests that a TFS Request frame be sent to the AP with which the STA is associated.

6.3.62.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-TFS.request(
PeerSTAAddress,
DialogToken,
TFSRequest,
VendorSpecific
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC Address	Any valid individual MAC Address	Specifies the address of the peer MAC entity for TFS.
DialogToken	Integer	0–255	The Dialog Token to identify the TFS Request and Response transaction.

Name	Type	Valid range	Description
TFSRequest	A set of TFS Request elements	As defined in the TFS Request element	Specifies the proposed service parameters for the TFS. One or more TFS Request elements.
VendorSpecific	A set of information elements	As defined in 8.4.2.28	Zero or more elements.

6.3.62.2.3 When generated

This primitive is generated by the SME to request that a TFS Request frame be sent to the AP with which the STA is associated.

6.3.62.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TFS Request action management frame. The STA then attempts to transmit this to the AP with which it is associated.

6.3.62.3 MLME-TFS.confirm

6.3.62.3.1 Function

This primitive reports the result of a TFS procedure.

6.3.62.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
        MLME-TFS.confirm(
                        PeerSTAAddress,
                        DialogToken,
                        TFSResponse,
                        VendorSpecific
                        )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC Address	Any valid individual MAC Address	The address of the peer MAC entity from which the TFS Response frame is received.
DialogToken	Integer	0–255	The Dialog Token to identify the TFS Request and Response transaction.
TFSResponse	A set of TFS Response elements	As defined in the TFS Response element	Specifies service parameters for the TFS. One or more TFS Response elements.
VendorSpecific	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.62.3.3 When generated

This primitive is generated by the MLME when transmission of the TFS Request frame is acknowledged, when (re)transmission of the TFS Request frame fails, when a failure reason is unspecified, or when the STA receives a TFS Response frame from the AP.

This primitive is also generated when the MLME-TFS.request contains invalid parameters and when a timeout or failure occurs.

6.3.62.3.4 Effect of receipt

On receipt of this primitive, the SME evaluates the result and may use the reported data. The SME should operate according to the procedure in 10.23.11.

6.3.62.4 MLME-TFS.indication

6.3.62.4.1 Function

This primitive indicates that a TFS Request frame was received from a non-AP STA.

6.3.62.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
        MLME-TFS.indication(
                                PeerSTAAddress,
                                DialogToken,
                                TFSRequest,
                                VendorSpecific
                                )
```

Name	Type	Valid range	Description
PeerSTAAddress	MACAddress	Any valid individual MAC Address	The address of the non-AP STA MAC entity from which a TFS Request frame was received.
DialogToken	Integer	0–255	The Dialog Token to identify the TFS Request and Response transaction.
TFSRequest	A set of TFS Request elements	As defined in the TFS Request element	Specifies the proposed service parameters for the TFS. One or more TFS Request elements.
VendorSpecific	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.62.4.3 When generated

This primitive is generated by the MLME when a valid TFS Request action management frame is received.

6.3.62.4.4 Effect of receipt

On receipt of this primitive the SME should operate according to the procedure in 10.23.11.

6.3.62.5 MLME-TFS.response

6.3.62.5.1 Function

This primitive is generated in response to an MLME-TFS.indication requesting a TFS Response frame be sent to a non-AP STA.

6.3.62.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
        MLME-TFS.response(
                                PeerSTAAddress,
                                DialogToken,
                                TFSResponse,
                                VendorSpecific
                                )
```

Name	Type	Valid range	Description
PeerSTAAddress	MACAddress	Any valid individual MAC Address	The address of the non-AP STA MAC entity from which a TFS Request frame was received.
DialogToken	Integer	0–255	The Dialog Token to identify the TFS Request and Response transaction.
TFSResponse	A set of TFS Response elements	As defined in 8.4.2.83	Specifies service parameters for the TFS. One or more TFS Response elements.
VendorSpecific	A set of elements.	As defined in 8.4.2.28	Zero or more elements.

6.3.62.5.3 When generated

This primitive is generated by the SME in response to an MLME-TFS.indication requesting a TFS Response be sent to a non-AP STA.

6.3.62.5.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TFS Response action management frame. The STA then attempts to transmit this to the non-AP STA indicated by the PeerSTAAddress parameter.

6.3.63 Sleep Mode request

6.3.63.1 General

This set of primitives supports the exchange of sleep mode parameter information between peer SMEs. The informative diagram shown in Figure 6-21 depicts the sleep mode request and response process, and is not meant to be exhaustive of all possible protocol uses.

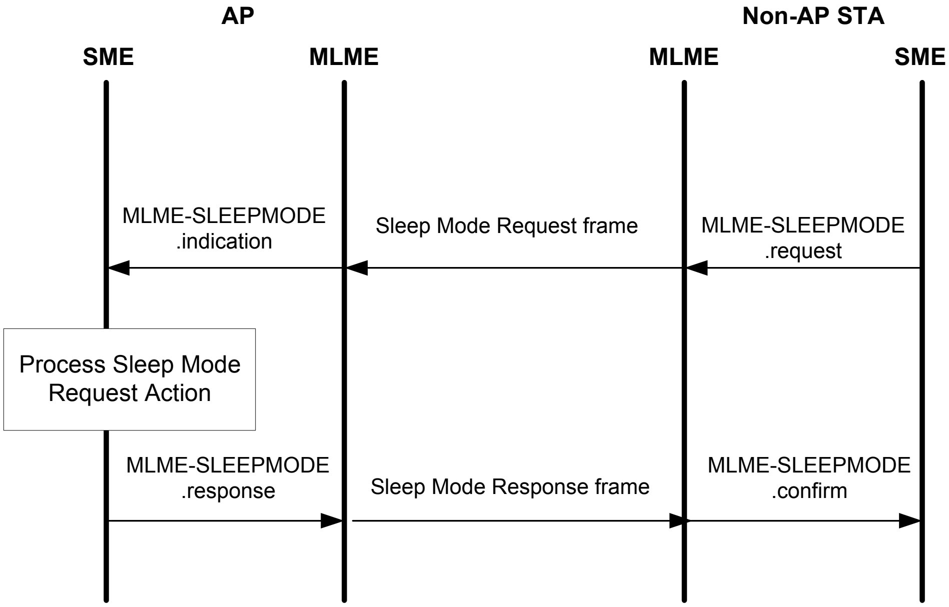

Figure 6-21—Sleep mode request and response exchange

6.3.63.2 MLME-SLEEPMODE.request

6.3.63.2.1 Function

This primitive requests that a Sleep Mode Request frame be sent to the AP with which the STA is associated.

6.3.63.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
        MLME-SLEEPMODE.request(
                                          PeerSTAAddress,
                                          DialogToken,
                                          SleepMode,
                                          TFSRequest,
                                          VendorSpecificInfo
                                          )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC Address	Any valid individual MAC Address	The address of the peer MAC entity to which the Sleep Mode Request frame is to be sent.
DialogToken	Integer	0–255	The Dialog Token to identify the Sleep Mode Request and Response transaction.
SleepMode	As defined in the Sleep Mode element	As defined in the Sleep Mode element	Specifies the proposed sleep mode service parameters for the Sleep Mode Request frame.
TFSRequest	A set of TFS Request elements	As defined in 8.4.2.82	Specifies the proposed TFS service parameters for the Sleep Mode Request frame.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.63.2.3 When generated

This primitive is generated by the SME to request that a Sleep Mode Request frame be sent to the AP with which the STA is associated.

6.3.63.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Sleep Mode Request frame. The STA then attempts to transmit this to the AP with which it is associated.

6.3.63.3 MLME-SLEEPMODE.indication

6.3.63.3.1 Function

This primitive indicates that a Sleep Mode Request frame was received from a non-AP STA.

6.3.63.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-SLEEPMODE.indication(
                          PeerSTAAddress,
                          DialogToken,
                          SleepMode,
                          TFSRequest,
                          VendorSpecificInfo
                          )
```

Name	Type	Valid range	Description
PeerSTAAddress	MACAddress	Any valid individual MAC Address	The address of the peer MAC entity from which the Sleep Mode request frame is received.
DialogToken	Integer	0–255	The Dialog Token to identify the Sleep Mode Request and Response transaction.
SleepMode	As defined in the Sleep Mode element	As defined in the Sleep Mode element	Specifies the proposed sleep mode service parameters for the Sleep Mode Request frame.

Name	Type	Valid range	Description
TFSRequest	A set of TFS Request elements	As defined in 8.4.2.82	Specifies the proposed TFS service parameters for the Sleep Mode Request frame.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.63.3.3 When generated

This primitive is generated by the MLME when a valid Sleep Mode Request frame is received.

6.3.63.3.4 Effect of receipt

On receipt of this primitive, the SME should operate according to the procedure in 10.2.1.18.

6.3.63.4 MLME-SLEEPMODE.response

6.3.63.4.1 Function

This primitive requests the transmission of Sleep Mode information to a peer entity, in response to a received Sleep Mode Request frame.

6.3.63.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
        MLME-SLEEPMODE.response(
                                  PeerSTAAddress,
                                  DialogToken,
                                  SleepMode,
                                  TFSResponse,
                                  VendorSpecificInfo
                                  )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC Address	Any valid individual MAC Address	The address of the peer MAC entity to which the Sleep Mode Response frame is to be sent.
DialogToken	Integer	0–255	The Dialog Token to identify the Sleep Mode Request and Response transaction.
SleepMode	As defined in the Sleep Mode element	As defined in the Sleep Mode element	Specifies the proposed sleep mode service parameters for the Sleep Mode Response frame.
TFSResponse	A set of TFS Request elements	As defined in 8.4.2.83	Specifies the proposed TFS service parameters for the Sleep Mode Response frame.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.63.4.3 When generated

This primitive is generated by the SME to request that a Sleep Mode Response frame be sent to a peer entity to convey Sleep Mode information.

6.3.63.4.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Sleep Mode Response frame containing the Sleep Mode elements specified. This frame is then scheduled for transmission.

6.3.63.5 MLME-SLEEPMODE.confirm

6.3.63.5.1 Function

This primitive reports the result of a request to send a Sleep Mode Response frame.

6.3.63.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
        MLME-SLEEPMODE.confirm(
                                PeerSTAAddress,
                                DialogToken,
                                SleepMode,
                                TFSResponse,
                                VendorSpecificInfo
                                )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC Address	Any valid individual MAC Address	The address of the peer MAC entity from which the Sleep Mode Response frame is received.
DialogToken	Integer	0–255	The Dialog Token to identify the Sleep Mode Request and Response transaction.
SleepMode	As defined in the Sleep Mode element	As defined in the Sleep Mode element	Specifies the proposed sleep mode service parameters for the Sleep Mode Response frame.
TFSResponse	A set of TFS Request elements	As defined in the TFS Response element	Specifies the proposed TFS service parameters for the Sleep Mode Response frame.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.63.5.3 When generated

This primitive is generated by the MLME when transmission of the Sleep Mode Request frame is acknowledged, when (re)transmission of the Sleep Mode Request frame fails, when the Sleep Mode Request frame contains invalid parameters, or when a failure reason is unspecified.

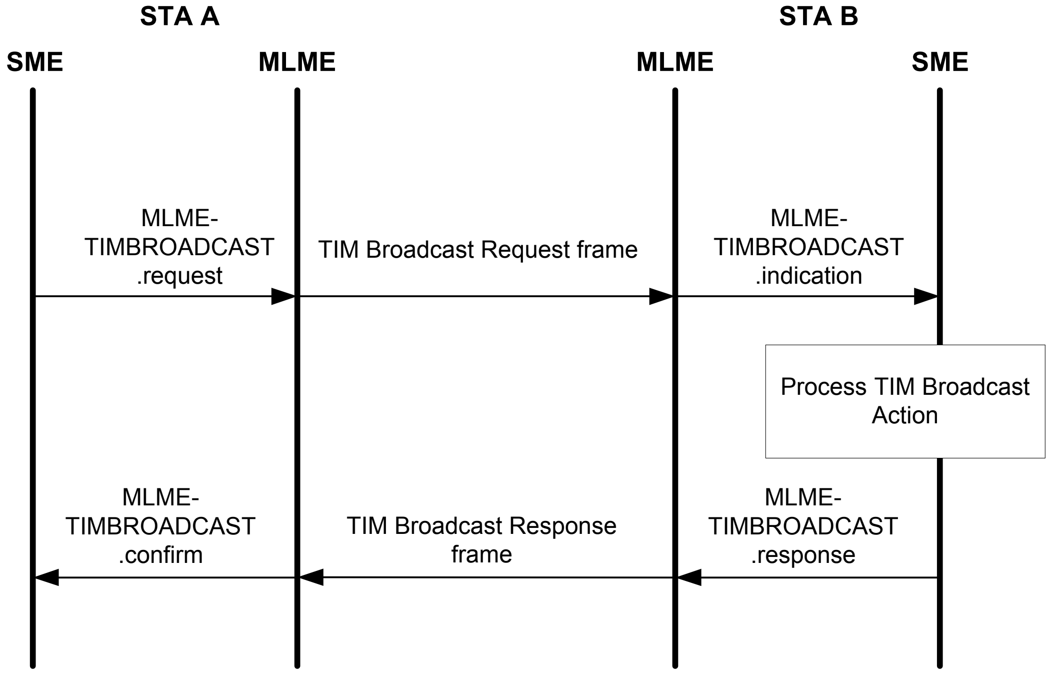
6.3.63.5.4 Effect of receipt

No effect of receipt is specified.

6.3.64 TIM broadcast setup

6.3.64.1 General

The following MLME primitives support the signaling of TIM Broadcast Setup. The informative diagram shown in Figure 6-22 depicts the TIM Broadcast setup process and is not meant to be exhaustive of all possible protocol uses.



STA A
STA B
SME
MLME
MLME
SME
MLME-TIMBROADCAST.request
TIM Broadcast Request frame
MLME-TIMBROADCAST.indication
Process TIM Broadcast Action
MLME-TIMBROADCAST.confirm
TIM Broadcast Response frame
MLME-TIMBROADCAST.response

Figure 6-22—TIM broadcast setup protocol exchange

6.3.64.2 MLME-TIMBROADCAST.request

6.3.64.2.1 Function

This primitive requests that a TIM Broadcast Request frame be sent to the AP with which the non-AP STA is associated.

6.3.64.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
        MLME-TIMBROADCAST.request(
                                    PeerSTAAddress,
                                    Dialog Token,
                                    TIMBroadcastRequest
                                    )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC Address	Any valid individual MAC Address	Specifies the address of the peer MAC entity with which to perform the TIM Broadcast process.
Dialog Token	Integer	1–255	The Dialog Token to identify the TIM Broadcast request and response transaction.
TIMBroadcastRequest	As defined in TIM Broadcast Request element	As defined in 8.4.2.85	Specifies the proposed service parameters for the TIM Broadcast.

6.3.64.2.3 When generated

This primitive is generated by the SME to request that a TIM Broadcast Request frame be sent to the AP with which the STA is associated.

6.3.64.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TIM Broadcast Request action management frame. The STA then attempts to transmit this to the AP with which it is associated.

6.3.64.3 MLME-TIMBROADCAST.confirm

6.3.64.3.1 Function

This primitive reports the result of a TIM Broadcast procedure.

6.3.64.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
        MLME-TIMBROADCAST.confirm(
                                    PeerSTAAddress,
                                    Dialog Token,
                                    TIMBroadcastResponse
                                    )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC Address	Any valid individual MAC Address	Specifies the address of the peer MAC entity with which to perform the TIM Broadcast process.
Dialog Token	Integer	0–255	The Dialog Token to identify the TIM Broadcast request and response transaction.
TIMBroadcast-Response	As defined in TIM Broadcast Response element	As defined in 8.4.2.86	Specifies service parameters for the TIM Broadcast.

6.3.64.3.3 When generated

This primitive is generated by the MLME when transmission of the TIM Broadcast Request frame is acknowledged, when (re)transmission of the TIM Broadcast Request frame fails, when the TIM Broadcast Request frame contains invalid parameters, or when a failure reason is unspecified.

6.3.64.3.4 Effect of receipt

On receipt of this primitive, the SME evaluates the results in the TIMBroadcastResponse element and may use the reported data.

6.3.64.4 MLME-TIMBROADCAST.indication

6.3.64.4.1 Function

This primitive indicates that a TIM Broadcast Request frame was received from a non-AP STA.

6.3.64.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TIMBROADCAST.indication(
                                    PeerSTAAddress,
                                    Dialog Token,
                                    TIMBroadcastRequest
                                    )
```

Name	Type	Valid range	Description
PeerSTAAddress	MACAddress	Any valid individual MAC Address	The address of the non-AP STA MAC entity from which a TIM Broadcast Request frame was received.
Dialog Token	Integer	1–255	The Dialog Token to identify the TIM Broadcast request and response transaction.
TIMBroadcast-Request	As defined in TIM Broadcast Request element	As defined in 8.4.2.85	Specifies the proposed service parameters for the TIM Broadcast.

6.3.64.4.3 When generated

This primitive is generated by the MLME when a valid TIM Broadcast Request frame is received.

6.3.64.4.4 Effect of receipt

On receipt of this primitive, the SME should operate according to the procedure in 10.2.1.17.

6.3.64.5 MLME-TIMBROADCAST.response

6.3.64.5.1 Function

This primitive is generated in response to an MLME-TIMBROADCAST.indication requesting a TIM Broadcast Response frame be sent to a non-AP STA.

6.3.64.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TIMBROADCAST.response(
                                PeerSTAAddress,
                                Dialog Token,
                                TIMBroadcastResponse
                                )
```

Name	Type	Valid range	Description
PeerSTAAddress	MACAddress	Any valid individual MAC Address	The address of the non-AP STA MAC entity from which a TIM Broadcast Request frame was received.
Dialog Token	Integer	0–255	The Dialog Token to identify the TIM Broadcast request and response transaction.
TIM Broadcast Response	As defined in TIM Broadcast Response element	As defined in 8.4.2.86	Specifies service parameters for the TIM Broadcast.

6.3.64.5.3 When generated

This primitive is generated by the SME in response to an MLME-TIMBROADCAST.indication requesting a TIM Broadcast Response be sent to a non-AP STA.

6.3.64.5.4 Effect of receipt

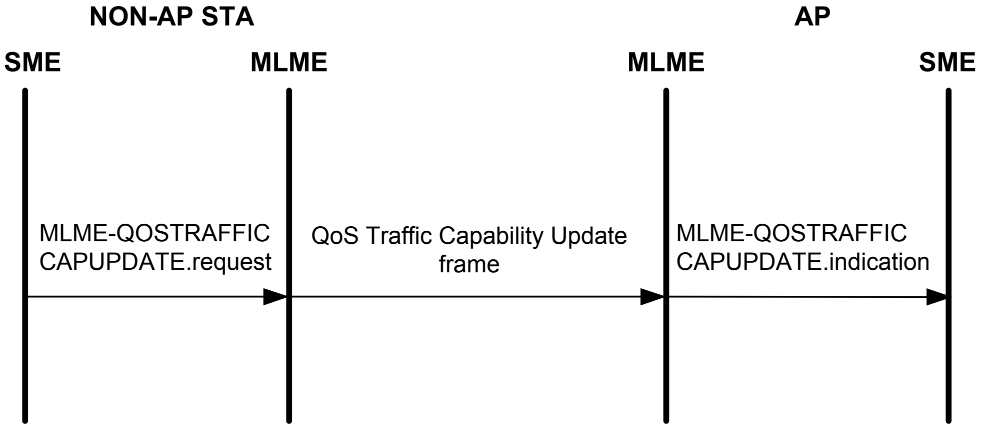
On receipt of this primitive, the MLME constructs a TIM Broadcast Response frame. The STA then attempts to transmit this to the non-AP STA indicated by the PeerSTAAddress parameter.

6.3.65 QoS Traffic Capability Update

6.3.65.1 MLME-QOSTRAFFICCAPUPDATE.request

6.3.65.1.1 Function

This primitive requests that a QoS Traffic Capability Update frame be sent to the AP with which the STA is associated. The informative diagram shown in Figure 6-23 depicts the QoS Traffic Capability Update process and is not meant to be exhaustive of all possible protocol uses.



NON-AP STA
AP
SME
MLME

QoS Traffic Capability Update frame
MLME-QOSTRAFFIC CAPUPDATE.indication

Figure 6-23—QoS traffic capability update protocol exchange

6.3.65.1.2 Semantics of the service primitive

The primitive parameter is as follows:

```
MLME-QOSTRAFFICCAPUPDATE.request(
                                        QoSTrafficCapability
                                        )
```

Name	Type	Valid range	Description
QoS Traffic Capability	Bit field as defined in 8.5.14.22	As defined in 8.5.14.22	Specifies the QoS Traffic Capability flags of the non-AP STA. This parameter is present if dot11WirelessManagementImplemented is true and dot11MgmtOptionQoSTrafficCapabilityActivated is true, and is not present otherwise.

6.3.65.1.3 When generated

This primitive is generated by the SME to request that a QoS Traffic Capability Update frame be sent to the AP with which the STA is associated.

6.3.65.1.4 Effect of receipt

On receipt of this primitive, the MLME constructs a QoS Traffic Capability Update action management frame. The STA then attempts to transmit this to the AP with which it is associated.

6.3.65.2 MLME-QOSTRAFFICCAPUPDATE.indication

6.3.65.2.1 Function

This primitive indicates that a QoS Traffic Capability Update frame was received from a non-AP STA.

6.3.65.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-QOSTRAFFICCAPUPDATE.indication(
                                        PeerSTAAddress,
                                        QoS Traffic Capability
                                        )
```

Name	Type	Valid range	Description
PeerSTAAddress	MACAddress	Any valid individual MAC Address	The address of the non-AP STA MAC entity from which a QoS Traffic Capability Update frame was received.
QoS Traffic Capability	Bit field as defined in 8.5.14.22	As defined in 8.5.14.22	Specifies the QoS Traffic Capability flags of the non-AP STA. This parameter is present if dot11WirelessManagementImplemented is true and dot11MgmtOptionQoSTrafficCapabilityActivated is true, and is not present otherwise.

6.3.65.2.3 When generated

This primitive is generated by the MLME when a valid QoS Traffic Capability Update action management frame is received.

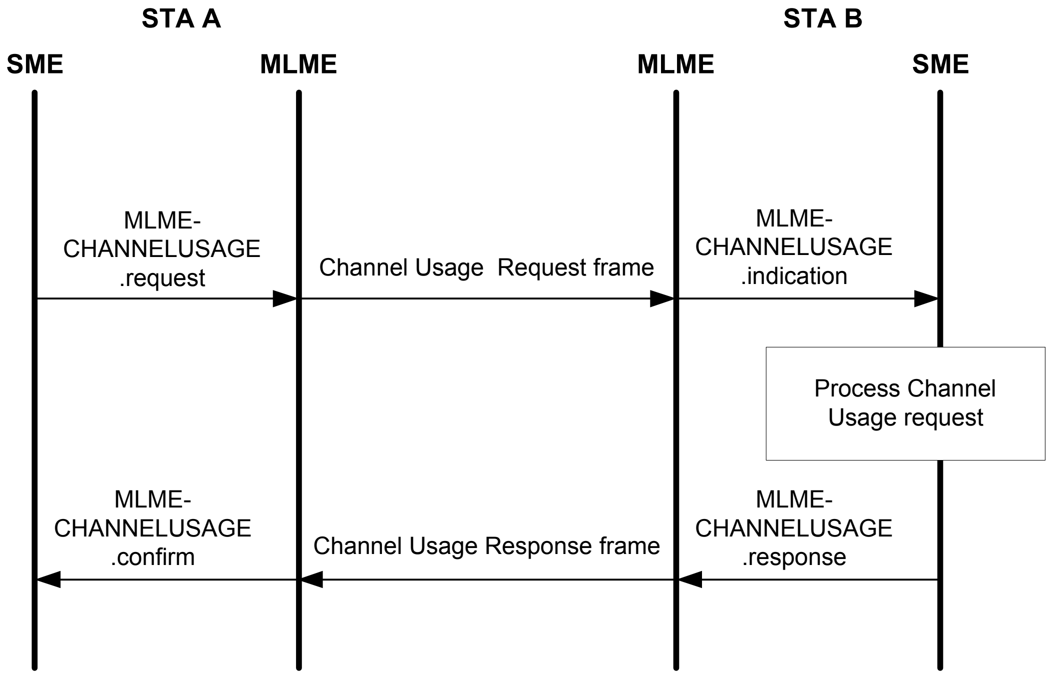
6.3.65.2.4 Effect of receipt

On receipt of this primitive the SME should operate according to the procedure in 10.23.9.

6.3.66 Channel Usage request

6.3.66.1 General

The following MLME primitives support the signaling of Channel Usage request. Figure 6-24 depicts the Channel Usage request process. The figure illustrates the basic protocol and is only an example and therefore is not meant to be exhaustive of all possible protocol uses.



STA A
STA B
SME

Process Channel Usage request
MLME-CHANNELUSAGE.confirm
Channel Usage Response frame
MLME-CHANNELUSAGE.response

Figure 6-24—Channel usage request protocol exchange

6.3.66.2 MLME-CHANNELUSAGE.request

6.3.66.2.1 Function

This primitive requests the transmission of a Channel Usage Request frame be sent to an AP.

6.3.66.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
        MLME-CHANNELUSAGE.request(
                                        PeerSTAAddress,
                                        Dialog Token,
                                        ChannelUsage,
                                        SSID,
                                        SupportedOperatingClasses,
                                        VendorSpecificInfo
                                        )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC Address	Any valid individual MAC Address	Specifies the address of the peer MAC entity with which to perform the Channel Usage process.
Dialog Token	Integer	1–255	The Dialog Token to identify the Channel Usage request and response transaction.
ChannelUsage	A set of Channel Usage element	As defined in 8.4.2.88	Specifies request types for the Channel Usage request.
SSID	Octet string	0–32 octets	Specifies the desired SSID or the wildcard SSID.
SupportedOperating Classes	As defined in Supported Operating Classes element	As defined in 8.4.2.56	Specifies the Supported Operating Classes information for the Channel Usage Request.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.66.2.3 When generated

This primitive is generated by the SME to request that a Channel Usage Request frame be sent to the BSS which is advertising the SSID passed down in this primitive.

6.3.66.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Channel Usage Request action management frame. The STA then attempts to transmit this to the BSS which is advertising the SSID included in this primitive request. When wild card SSID is passed down, the MLME-CHANNELREQUEST.request shall be transmitted to all BSSs in the current scan list as determined by the most recent MLME-SCAN.request.

6.3.66.3 MLME-CHANNELUSAGE.confirm

6.3.66.3.1 Function

This primitive reports the result of a Channel Usage procedure.

6.3.66.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
        MLME-CHANNELUSAGE.confirm(
                                        PeerSTAAddress,
                                        Dialog Token,
                                        ChannelUsage,
                                        SSID,
                                        Country String,
                                        Power Constraint,
                                        VendorSpecificInfo
                                        )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC Address	Any valid individual MAC Address	Specifies the address of the peer MAC entity with which to perform the Channel Usage process.
Dialog Token	Integer	1–255	The Dialog Token to identify the Channel Usage request and response transaction.
ChannelUsage	A set of Channel Usage element	As defined in 8.4.2.88	Specifies parameters for the Channel Usage.
SSID	Octet string	0–32 octets	Specifies the SSID or the wildcard SSID used in the request.
Country String	Octet string	3 octets	Specifies Country strings.
Power Constraint	An element	As defined in 8.4.2.16	Zero or one Power Constraint element.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.66.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-CHANNELUSAGE.request and indicates the results of the request.

This primitive is generated when the MLME-CHANNELUSAGE.request contains invalid parameters, when a timeout or failure occurs, or when the STA receives a Channel Usage Response frame from the AP.

6.3.66.3.4 Effect of receipt

On receipt of this primitive the SME should operate according to the procedure in 10.23.14.

6.3.66.4 MLME-CHANNELUSAGE.indication

6.3.66.4.1 Function

This primitive indicates that a Channel Usage Request frame was received from a non-AP STA.

6.3.66.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
        MLME-CHANNELUSAGE.indication(
                                        PeerSTAAddress,
                                        Dialog Token,
                                        ChannelUsage,
                                        SSID,
                                        SupportedOperatingClasses,
                                        VendorSpecificInfo
                                        )
```

Name	Type	Valid range	Description
PeerSTAAddress	MACAddress	Any valid individual MAC Address	The address of the non-AP STA MAC entity from which a Channel Usage Request frame was received.
Dialog Token	Integer	0–255	The Dialog Token to identify the Channel Usage request and response transaction.

Name	Type	Valid range	Description
ChannelUsage	A set of Channel Usage element	As defined in 8.4.2.88	Specifies request types for the Channel Usage request.
SSID	Octet string	0–32 octets	Specifies the desired SSID or the wildcard SSID.
SupportedOperating Classes	As defined in Supported Operating Classes element	As defined in 8.4.2.56	Specifies the Supported Operating Classes information for the Channel Usage Request.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.66.4.3 When generated

This primitive is generated by the MLME when a valid Channel Usage Request frame is received.

6.3.66.4.4 Effect of receipt

On receipt of this primitive the SME should operate according to the procedure in 10.23.14.

6.3.66.5 MLME-CHANNELUSAGE.response

6.3.66.5.1 Function

This primitive is generated in response to an MLME-CHANNELUSAGE.indication requesting a Channel Usage Response frame be sent to a non-AP STA.

6.3.66.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
        MLME-CHANNELUSAGE.response(
                                        PeerSTAAddress,
                                        Dialog Token,
                                        ChannelUsage,
                                        SSID,
                                        Country String,
                                        Power Constraint,
                                        VendorSpecificInfo
                                        )
```

Name	Type	Valid range	Description
PeerSTAAddress	MACAddress	Any valid individual MAC Address	The address of the non-AP STA MAC entity from which a Channel Usage Request frame was received.
Dialog Token	Integer	0–255	The Dialog Token to identify the Channel Usage request and response transaction.
ChannelUsage	A set of Channel Usage elements	As defined in 8.4.2.88	Specifies parameters for the Channel Usage.
SSID	Octet string	0–32 octets	Specifies the desired SSID or the wildcard SSID.
Country String	Octet string	3 octets	Specifies Country strings.
Power Constraint	An element	As defined in 8.4.2.16	Zero or one Power Constraint element.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.66.5.3 When generated

This primitive is generated by the SME in response to an MLME-CHANNELUSAGE.indication requesting a Channel Usage Response be sent to a non-AP STA.

6.3.66.5.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Channel Usage Response frame. The STA then attempts to transmit this to the non-AP STA indicated by the PeerSTAAddress parameter.

6.3.67 DMS request and response procedure

6.3.67.1 General

The following MLME primitives support the signaling of DMS request and response procedure. The informative diagram shown in Figure 6-25 depicts the DMS request and response process and is not meant to be exhaustive of all possible protocol uses.

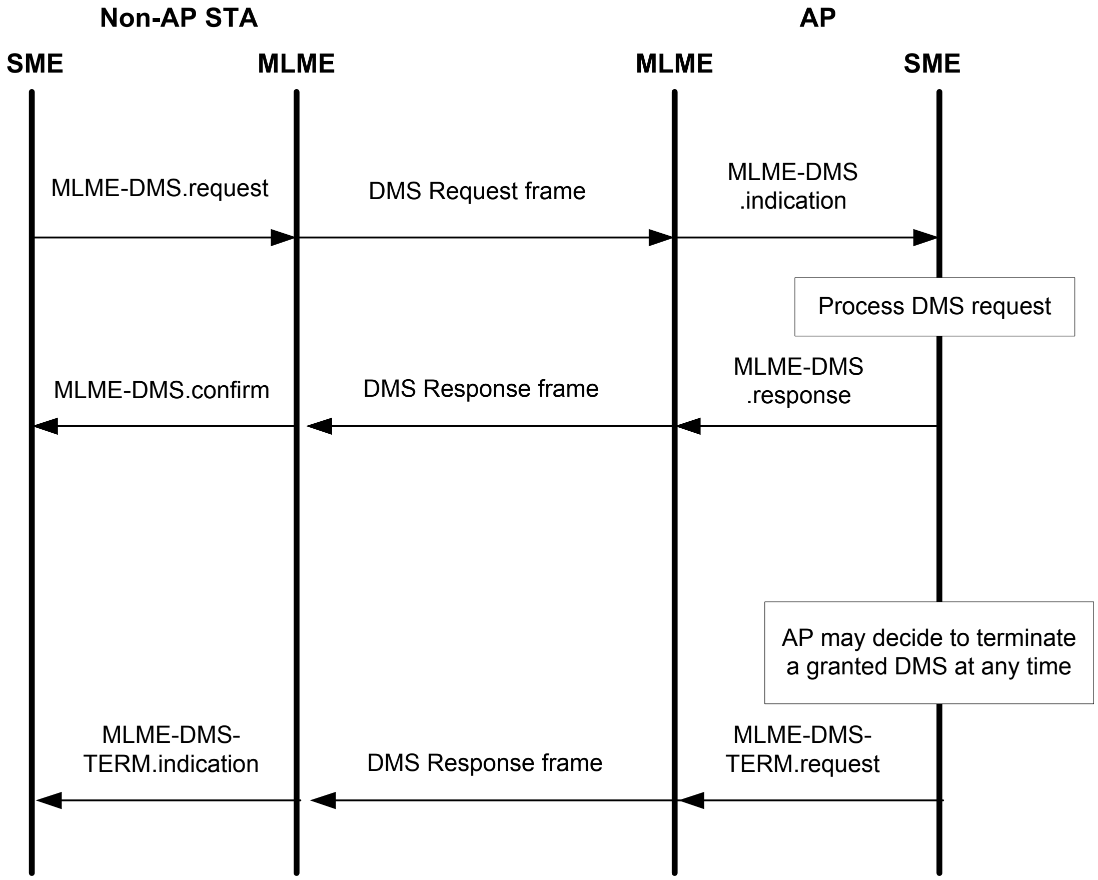

Figure 6-25—DMS setup protocol exchange

6.3.67.2 MLME-DMS.request

6.3.67.2.1 Function

This primitive requests the transmission of a DMS Request frame be sent to an AP.

6.3.67.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
        MLME-DMS.request(
                          PeerSTAAddress,
                          Dialog Token,
                          DMSRequest
                          )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC Address	Any valid individual MAC Address	Specifies the address of the peer MAC entity with which to perform the DMS process.
Dialog Token	Integer	1–255	The Dialog Token to identify the DMS request and response transaction.
DMSRequest	DMS Request element	As defined in 8.4.2.90	Specifies group addressed frames for the requested DMS stream.

6.3.67.2.3 When generated

This primitive is generated by the SME to request that a DMS Request frame be sent to the AP with which the STA is associated.

6.3.67.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a DMS Request action management frame. The STA then attempts to transmit this to the AP with which the STA is associated.

6.3.67.3 MLME-DMS.confirm

6.3.67.3.1 Function

This primitive reports the result of a DMS procedure.

6.3.67.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-DMS.confirm(
                                PeerSTAAddress,
                                Dialog Token,
                                DMSResponse
                                )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC Address	Any valid individual MAC Address	Specifies the address of the peer MAC entity with which to perform the DMS process.
Dialog Token	Integer	1–255	The Dialog Token to identify the DMS request and response transaction.
DMSResponse	DMS Response element	As defined in 8.4.2.91	Specifies the status returned by the AP responding to the STA's requested DMS stream.

6.3.67.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-DMS.request and indicates the results of the request.

This primitive is generated when the MLME-DMS.request contains invalid parameters, when a timeout or failure occurs, or when the STA receives a DMS Response frame from the AP.

6.3.67.3.4 Effect of receipt

On receipt of this primitive the SME should operate according to the procedure in 10.23.15.

6.3.67.4 MLME-DMS.indication

6.3.67.4.1 Function

This primitive indicates that a DMS Request frame was received from a non-AP STA.

6.3.67.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-DMS.indication(
                                PeerSTAAddress,
                                Dialog Token,
                                DMSRequest
                                )
```

Name	Type	Valid range	Description
PeerSTAAddress	MACAddress	Any valid individual MAC Address	The address of the non-AP STA MAC entity from which a DMS Request frame was received.
Dialog Token	Integer	1–255	The Dialog Token to identify the DMS request and response transaction.
DMSRequest	DMS Request element	As defined in 8.4.2.90	Specifies group addressed frames for the requested DMS stream.

6.3.67.4.3 When generated

This primitive is generated by the MLME when a valid DMS Request frame is received.

6.3.67.4.4 Effect of receipt

On receipt of this primitive the SME should operate according to the procedure in 10.23.15.

6.3.67.5 MLME-DMS.response

6.3.67.5.1 Function

This primitive is generated in response to an MLME-DMS.indication requesting a DMS Response frame be sent to a non-AP STA.

6.3.67.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
          MLME-DMS.response(
                              PeerSTAAddress,
                              Dialog Token,
                              DMSResponse
                              )
```

Name	Type	Valid range	Description
PeerSTAAddress	MACAddress	Any valid individual MAC Address	The address of the non-AP STA MAC entity from which a DMS Request frame was received.
Dialog Token	Integer	1–255	The Dialog Token to identify the DMS request and response transaction.
DMSResponse	DMS Response element	As defined in 8.4.2.91	Specifies the status returned by the AP responding to the STA’s requested DMS stream.

6.3.67.5.3 When generated

This primitive is generated by the SME in response to an MLME-DMS.indication requesting a DMS Response be sent to a non-AP STA.

6.3.67.5.4 Effect of receipt

On receipt of this primitive, the MLME constructs a DMS Response frame. The STA then attempts to transmit this to the non-AP STA indicated by the PeerSTAAddress parameter.

6.3.67.6 MLME-DMS-TERM.request

6.3.67.6.1 Function

This primitive requests the transmission of a DMS Response frame to non-AP STAs to terminate a granted DMS.

6.3.67.6.2 Semantics of the service primitive

The primitive parameters are as follows:

```
          MLME-DMS-TERM.request(
```

PeerSTAAddress,
Dialog Token,
DMSResponse
)

Name	Type	Valid range	Description
PeerSTAAddress	MACAddress	Any valid individual MAC Address	The address of the non-AP STA MAC entity from which a DMS Request frame was received.
Dialog Token	Integer	0	Set to 0 for an autonomous DMS Response frame.
DMSResponse	DMS Response element	As defined in 8.4.2.91	Specifies the requested DMS stream that is cancelled by the AP.

6.3.67.6.3 When generated

This primitive is generated by the SME to terminate DMS.

6.3.67.6.4 Effect of receipt

On receipt of this primitive, the MLME constructs a DMS Response frame. The STA then attempts to transmit this to the non-AP STA indicated by the PeerSTAAddress parameter.

6.3.67.7 MLME-DMS-TERM.indication

6.3.67.7.1 Function

This primitive is generated by the MLME when a valid unsolicited DMS Response frame is received.

6.3.67.7.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-DMS-TERM.indication(
PeerSTAAddress,
Dialog Token,
DMSResponse
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC Address	Any valid individual MAC Address	Specifies the address of the peer MAC entity with which to perform the DMS process.
Dialog Token	Integer	0	Set to 0 for an autonomous DMS Response frame.
DMSResponse	DMS Response element	As defined in 8.4.2.91	Specifies the requested DMS stream that is cancelled by the AP.

6.3.67.7.3 When generated

This primitive is generated when the STA receives an unsolicited DMS Response frame from the AP.

6.3.67.7.4 Effect of receipt

On receipt of this primitive the SME should operate according to the procedure in 10.23.15.

6.3.68 Timing Measurement Request

6.3.68.1 General

The following set of primitives supports triggering a Timing Measurement procedure or stopping an ongoing Timing Measurement procedure.

6.3.68.2 MLME-TIMINGMSMTRQ.request

6.3.68.2.1 Function

This primitive requests the transmission of a Timing Measurement Request frame to a peer entity.

6.3.68.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
        MLME-TIMINGMSMTRQ.request(
                                      Peer MAC Address,
                                      Trigger
                                      )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC Address	Any valid individual MAC Address	The address of the peer MAC entity to which the Timing Measurement Request frame is sent.
Trigger	Integer	0–1	The trigger to identify the action.

6.3.68.2.3 When generated

This primitive is generated by the SME to request that a Timing Measurement Request frame be sent to a peer entity.

6.3.68.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Timing Measurement Request frame with the specified parameters. This frame is then scheduled for transmission.

6.3.68.3 MLME-TIMINGMSMTRQ.indication

6.3.68.3.1 Function

This primitive indicates that a Timing Measurement Request frame has been received and the corresponding ACK has been transmitted.

6.3.68.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
        MLME-TIMINGMSMTRQ.indication(
                                 Peer MAC Address,
                                 Trigger
                                 )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC Address	Any valid individual MAC Address	The address of the peer MAC entity to which the Timing Measurement Request frame is sent.
Trigger	Integer	0–1	The trigger to identify the action.

6.3.68.3.3 When generated

This primitive is generated by the MLME when a valid Timing Measurement Request frame is received.

6.3.68.3.4 1 Effect of receipt

On receipt of this primitive, the SME uses the information contained within the notification.

6.3.69 WNM-Notification request

6.3.69.1 General

This set of primitives supports the exchange of WNM-Notification Request and Response frames between peer SMEs.

6.3.69.2 MLME-WNMNOTIFICATIONREQUEST.request

6.3.69.2.1 Function

This primitive requests the transmission of a WNM-Notification Request frame to a peer entity.

6.3.69.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-WNMNOTIFICATIONREQUEST.request(
                                              Peer MAC Address,
                                              Dialog Token,
                                              Type,
                                              Optional Subelements
                                              )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC Address	Any valid individual MAC Address	The address of the peer MAC entity to which the WNM-Notification Request frame is sent.
Dialog Token	Integer	1–255	The dialog token to identify the WNM-Notification transaction.
Type	Integer	1–255	The type of WNM-Notification.
Optional Subelements	Set subelements	As defined in 8.5.14.28	A set of subelements describing the notification.

6.3.69.2.3 When generated

This primitive is generated by the SME to request that a WNM-Notification Request frame be sent to a peer entity to initiate a WNM-Notification.

6.3.69.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a WNM-Notification Request frame containing the elements specified. This frame is then scheduled for transmission.

6.3.69.3 MLME-WNMNOTIFICATIONREQUEST indication

6.3.69.3.1 Function

This primitive indicates that a WNM-Notification Request frame has been received.

6.3.69.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
   MLME-WNMNOTIFICATIONREQUEST.indication(
                                          Peer MAC Address,
                                          Dialog Token,
                                          Type,
                                          Optional Subelements
                                          )
```

Name	Type	Valid range	Description
PeerSTAAddress	MAC Address	Any valid individual MAC Address	The address of the peer MAC entity from which the WNM-Notification request was received.
Dialog Token	Integer	1–255	The dialog token to identify the WNM-Notification transaction.
Type	Integer	1–255	The type of WNM-Notification Request.
Optional Subelements	Set subelements	As defined in 8.5.14.28	A set of subelements describing the notification.

6.3.69.3.3 When generated

This primitive is generated by the MLME when a valid WNM-Notification Request frame is received.

6.3.69.3.4 Effect of receipt

On receipt of this primitive, the SME replies to the request.

6.3.70 WNM-Notification response

6.3.70.1 MLME-WNMNOTIFICATIONRESPONSE.request

6.3.70.1.1 Function

This primitive supports the signaling of the WNM-Notification Response frame between peer SMEs.

6.3.70.1.2 Semantics of the service primitive

The primitive parameters are as follows:

```
   MLME-WNMNOTIFICATIONRESPONSE.request(
```

Peer MAC Address,
Dialog Token,
Response Status,
Optional Subelements
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC Address	Any valid individual MAC Address	The address of the peer MAC entity to which the WNM-Notification Response frame is sent.
Dialog Token	Integer	1–255	The dialog token to identify the WNM-Notification transaction.
Response Status	Integer	1–255	The response status of the WNM-Notification.
Optional Subelements	Set subelements	As defined in 8.5.14.29	A set of subelements describing the results of the WNM-Notification.

6.3.70.1.3 When generated

This primitive is generated by the SME to request that a WNM-Notification Response frame be sent to a peer entity to report the results of the WNM-Notification.

6.3.70.1.4 Effect of receipt

On receipt of this primitive, the MLME constructs a WNM-Notification Response frame containing the indicated fields. This frame is then scheduled for transmission.

6.3.70.2 MLME-WNMNOTIFICATIONRESPONSE.indication

6.3.70.2.1 Function

This primitive indicates that a WNM-Notification Response frame has been received from a peer entity.

6.3.70.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-WNMNOTIFICATIONRESPONSE.indication(
Peer MAC Address,
Dialog Token,
Response Status,
Optional Subelements
)

Name	Type	Valid range	Description
PeerSTAAddress	MAC Address	Any valid individual MAC Address	The address of the peer MAC entity from which the WNM-Notification Response frame was received.
Dialog Token	Integer	1–255	The dialog token to identify the WNM-Notification transaction.
Response Status	Integer	1–255	The response status of the WNM-Notification.
Optional Subelements	Set subelements	As defined in 8.5.14.29	A set of subelements describing the results of the WNM-Notification.

6.3.70.2.3 When generated

This primitive is generated by the MLME when a valid WNM-Notification Response frame is received.

6.3.70.2.4 Effect of receipt

On receipt of this primitive, the WNM-Notification can be made available for SME processes.

6.3.71 Network discovery and selection support

6.3.71.1 General

This set of primitives supports the process of GAS.

6.3.71.2 MLME-GAS.request

6.3.71.2.1 Function

This primitive requests the information of a specific advertisement service from another STA and requests the STA to provide GAS.

6.3.71.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
        MLME-GAS.request(
                        PeerSTAAddress,
                        DialogToken,
                        AdvertisementProtocolID,
                        Query,
                        QueryFailureTimeout,
                        Protected
                        )
```

Name	Type	Valid range	Description
PeerSTAAddress	MacAddress	Any valid individual MacAddress	Specifies the address of the peer MAC entity to which query is transmitted.
DialogToken	Integer	0–255	The dialog token to identify the GAS transaction.
AdvertisementProtocolID	Integer or Sequence of Integers	As defined in Table 8-175	This contains an Advertisement Protocol ID (see 8.4.2.95), which may be IEEE 802.11 assigned or vendor specified.
Query	String	N/A	Query string formatted using protocol identified in AdvertisementProtocolID. E.g., if the AdvertisementProtocolID value is 1, then Query is formatted as defined in IEEE Std 802.21-2008.
QueryFailureTimeout	Integer	> 1	The time limit, in units of Beacon intervals, after which the GAS Query procedure is terminated.
Protected	Boolean	true, false	Specifies whether the request is sent using a Robust Management frame. If true, the request is sent using a Protected Dual of Public Action frame. Otherwise, the request is sent using a Public Action frame.

6.3.71.2.3 When generated

This primitive is generated by the SME at a STA to request a specific Advertisement Service from another STA.

6.3.71.2.4 Effect of receipt

The STA operates according to the procedures defined in 10.24.3.

6.3.71.3 MLME-GAS.confirm

6.3.71.3.1 Function

This primitive reports the status code and Query Response from an Advertisement Server to the requesting STA.

6.3.71.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
        MLME-GAS.confirm(
                          PeerSTAAddress,
                          DialogToken,
                          ResultCode,
                          ResponseInfo,
                          Protected
                          )
```

Name	Type	Valid range	Description
PeerSTAAddress	MacAddress	Any valid individual MacAddress	Specifies the address of the peer MAC entity to which query is transmitted.
DialogToken	Integer	0–255	The dialog token to identify the GAS transaction.
ResultCode	Enumeration	SUCCESS, NO_OUTSTANDING_GAS_REQUEST, GAS_ADVERTISEMENT_PROTOCOL_NOT_SUPPORTED, GAS_QUERY_RESPONSE_OUTSTANDING, GAS_QUERY_RESPONSE_TOO_LARGE, SERVER_UNREACHABLE, GAS_QUERY_TIMEOUT, GAS_RESPONSE_NOT_RECEIVED_FROM_SERVER	Indicates the result response to the GAS request from the peer MAC entity.

Name	Type	Valid range	Description
ResponseInfo	String	N/A	Query Response string formatted using protocol identified in AdvertisementProtocolID. E.g., if the AdvertisementProtocolID value is 1, then Query is formatted as defined in IEEE Std 802.21-2008.
Protected	Boolean	true, false	Specifies whether the response was received in a Robust Management frame. If true, the response was received using a Protected Dual of Public Action frame. Otherwise, the response was received using a Public Action frame.

The mapping of Status Code received in the GAS Response frame is mapped to the corresponding Result Code in Table 8-37.

6.3.71.3.3 When generated

This primitive is generated by the MLME as a response to the MLME-GAS.request primitive indicating the result of that request.

The primitive is generated when the requesting STA receives a query response in a (Protected) GAS Initial Response frame or one or more (Protected) GAS Comeback Response frames.

6.3.71.3.4 Effect of receipt

The STA operates according to the procedures defined in 10.24.3.

6.3.71.4 MLME-GAS.indication

6.3.71.4.1 Function

This primitive reports to the STA’s SME about the GAS Request.

6.3.71.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
        MLME-GAS.indication(
                                PeerSTAAddress,
                                DialogToken,
                                AdvertisementProtocolID,
                                Query,
                                Protected
                                )
```

Name	Type	Valid range	Description
PeerSTAAddress	MacAddress	Any valid individual MAC address	Specifies the address of the peer MAC entity from which the query message was received.
DialogToken	Integer	0–255	The dialog token to identify the GAS transaction.
AdvertisementProtocolID	Integer or Sequence of Integers	As defined in Table 8-175	This contains an Advertisement Protocol ID (see 8.4.2.95), which may be IEEE 802.11 assigned or vendor specified.
Query	String	N/A	Query string formatted using protocol identified in AdvertisementProtocolID. E.g., if the AdvertisementProtocolID value is 1, then Query is formatted as defined in IEEE Std 802.21-2008.
Protected	Boolean	true, false	Specifies whether the request was received in a Robust Management frame. If true, the request was received in a Protected Dual of Public Action frame. Otherwise, the request was received in a Public Action frame.

6.3.71.4.3 When generated

This primitive is generated by the MLME as a result of receipt of a GAS request from STA.

6.3.71.4.4 Effect of receipt

The SME is notified of the request from the STA.

The SME operates according to the procedures defined in 10.24.3.

The SME generates an MLME-GAS.response primitive within a dot11GASResponseTimeout.

6.3.71.5 MLME-GAS.response

6.3.71.5.1 Function

This primitive responds to the request for an advertisement service by a specified STA MAC entity.

6.3.71.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
        MLME-GAS.response(
                                 PeerSTAAddress,
                                 DialogToken,
                                 ResultCode,
                                 ResponseInfo,
                                 Protected
                                 )
```

Name	Type	Valid range	Description
PeerSTAAddress	MacAddress	Any valid individual MAC address	Specifies the address of the peer MAC entity to which query response information is transmitted.

Name	Type	Valid range	Description
DialogToken	Integer	0–255	The dialog token to identify the GAS transaction.
ResultCode	Enumeration	SUCCESS, NO_OUTSTANDING_GAS_REQUEST, GAS_ADVERTISEMENT_PROTOCOL_NOT_SUPPORTED, GAS_QUERY_RESPONSE_OUTSTANDING, GAS_QUERY_RESPONSE_TOO_LARGE, SERVER_UNREACHABLE, GAS_QUERY_TIMEOUT, GAS_RESPONSE_NOT_RECEIVED_FROM_SERVER	Indicates the result response to the GAS-request from the peer MAC entity. See Table 8-37.
ResponseInfo	String	N/A	Query Response string formatted using protocol identified in AdvertisementProtocolID. E.g., if the AdvertisementProtocolID value is 1, then Query is formatted as defined in IEEE Std 802.21-2008.
Protected	Boolean	true, false	Specifies whether the response is sent using a Robust Management frame. If true, the response is sent using a Protected Dual of Public Action frame. Otherwise, the response is sent using a Public Action frame.

6.3.71.5.3 When generated

This primitive is generated by the MLME at a STA as a result of an MLME-GAS.indication primitive.

6.3.71.5.4 Effect of receipt

This primitive causes the MAC entity at the STA to send a (Protected) GAS Initial Response frame to the requesting STA and optionally one or more (Protected) GAS Comeback Response frames.

6.3.72 QoS Map Set element management

6.3.72.1 General

The QoS Map Set element is provided to non-AP STAs in (Re)Association Response frames. However, if the SME of an AP detects a change of the QoS Map information while one or more non-AP STAs are associated to the BSS, then the AP may transmit an unsolicited QoS Map Set element to associated STAs. The AP's SME invokes the MLME-QoSMap.request primitive to cause individually addressed frames containing a QoS Map Set element to be transmitted to associated STAs. The AP's SME invokes the MLME-QoSMap.request primitive to transmit individually addressed frames containing a QoS Map Set element to associated STAs. When a non-AP STA receives such unsolicited QoS Map information, its MLME generates a MLME-QoSMap.indication primitive to the STA's SME. In turn, the SME should take appropriate action, e.g., initiate an ADDTS or DELTS if admission control changes are necessary.

6.3.72.2 MLME-QoSMap.request

6.3.72.2.1 Function

This primitive is used by an AP to transmit an unsolicited QoS Map Set to a specified non-AP STA MAC entity. The specified non-AP STA MAC address is an individual MAC address.

6.3.72.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
        MLME-QoSMap.request(
                              Non-APSTAAddress,
                              QoSMapSet
                              )
```

Name	Type	Valid range	Description
Non-APSTAAddress	MacAddress	Any valid individual MAC address	Specifies the address of the peer MAC entity from which query message is received.
QoSMapSet	As defined in frame format	As defined in 8.4.2.97	Specifies the QoS Map Set the non-AP STA should use.

6.3.72.2.3 When generated

This primitive is generated by the MLME at the AP as a result of any change in the AP QoS Map configurations.

6.3.72.2.4 Effect of receipt

This primitive causes the MAC entity at the AP to send a QoS MAP Set element in a QoS MAP Configure frame to the non-AP STA.

6.3.72.3 MLME-QoSMap.indication

6.3.72.3.1 Function

This primitive reports the QoS mapping information sent from the AP to the non-AP STA.

6.3.72.3.2 Semantics of the service primitive

The primitive parameter is as follows:

```
        MLME-QoSMap.indication(
                                  QoSMapSet
                                  )
```

Name	Type	Valid range	Description
QoSMapSet	As defined in frame format	As defined in 8.4.2.97	Specifies the QoS Map Set to be used by the non-AP STA.

6.3.72.3.3 When generated

This primitive is generated when the non-AP STA receives a QoS Map Set element in an unsolicited QoS Map Configure frame from the AP.

The SME of the non-AP STA should use the information to decide proper actions. For example, an ADDTS or DELTS procedure should be activated if the QoS Map information indicates a change in the admission control.

6.3.72.3.4 Effect of receipt

The non-AP STA operates according to the procedures defined in 10.24.9.

6.3.73 Mesh peering management

6.3.73.1 Introduction

The following primitives facilitate the mesh peering management protocol and authenticated mesh peering exchange protocol.

6.3.73.2 MLME-MESHPEERINGMANAGEMENT.request

6.3.73.2.1 Function

This primitive requests that the MAC entity establish, confirm, or close a mesh peering with the specified peer MAC entity by sending a Mesh Peering Management frame to the peer MAC entity. The mesh peering management procedures are specified in 13.3.

6.3.73.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MESHPEERINGMANAGEMENT.request(
                                        PeerMACAddress,
                                        MeshPeeringMgmtFrameContent
                                        )
```

Name	Type	Valid range	Description
PeerMACAddress	MAC Address	Valid individual MAC address	Specifies the address of the peer MAC entity to which the Mesh Peering Management frame is to be sent.
MeshPeeringMgmtFrameContent	Sequence of octets	As defined in 8.5.16.2, 8.5.16.3, or 8.5.16.4	The contents of the Action field of the Mesh Peering Open, Mesh Peering Confirm, or Mesh Peering Close frame to send to the peer MAC entity.

6.3.73.2.3 When generated

This primitive is generated by the SME to request that a Mesh Peering Management frame be sent to the specified mesh STA.

6.3.73.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Mesh Peering Management frame containing the information specified. The frame is scheduled for transmission.

6.3.73.3 MLME-MESHPEERINGMANAGEMENT.confirm

6.3.73.3.1 Function

This primitive reports the results of a request to send a Mesh Peering Management frame.

6.3.73.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MESHPEERINGMANAGEMENT.confirm(
                                              PeerMACAddress,
                                              MeshPeeringMgmtFrameContent
                                              )
```

Name	Type	Valid range	Description
PeerMACAddress	MAC Address	Valid individual MAC address	Specifies the address of the peer MAC entity to which the Mesh Peering Management frame was sent.
MeshPeeringMgmtFrameContent	Sequence of octets	As defined in 8.5.16.2, 8.5.16.3, or 8.5.16.4	The contents of the Action field of the Mesh Peering Open, Mesh Peering Confirm, or Mesh Peering Close frame received from the peer MAC entity.

6.3.73.3.3 When generated

This primitive is generated as a result of an MLME-MESHPEERINGMANAGEMENT.request with a specified MAC peer.

6.3.73.3.4 Effect of receipt

The SME is notified of the results of the mesh peering management protocol request.

6.3.73.4 MLME-MESHPEERINGMANAGEMENT.indication

6.3.73.4.1 Function

This primitive indicates to the SME that the MLME has received a Mesh Peering Management frame from a peer MAC entity.

6.3.73.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MESHPEERINGMANAGEMENT.indication(
                                              PeerMACAddress,
                                              MeshPeeringMgmtFrameContent
                                              )
```

Name	Type	Valid range	Description
PeerMACAddress	MAC Address	Valid individual MAC address	Specifies the address of the peer MAC entity from which the Mesh Peering Management frame was received.
MeshPeeringMgmtFrameContent	Sequence of octets	As defined in 8.5.16.2, 8.5.16.3, or 8.5.16.4	The contents of the Action field of the Mesh Peering Open, Mesh Peering Confirm, or Mesh Peering Close frame received from the peer MAC entity.

6.3.73.4.3 When generated

This primitive is generated by the MLME as a result of the receipt of a Mesh Peering Management frame from a peer MAC entity.

6.3.73.4.4 Effect of receipt

The SME is notified of the reception of a Mesh Peering Management frame and is provided the contents of the frame.

6.3.73.5 MLME-MESHPEERINGMANAGEMENT.response

6.3.73.5.1 Function

This primitive is used to send a response to a Mesh Peering Management frame to the specified peer MAC entity.

6.3.73.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MESHPEERINGMANAGEMENT.response(
                                        PeerMACAddress,
                                        ResultCode,
                                        MeshPeeringMgmtFrameContent
                                        )
```

Name	Type	Valid range	Description
PeerMACAddress	MAC Address	Valid individual MAC address	Specifies the address of the peer MAC entity to which the Mesh Peering Management frame is to be sent.
ResultCode	Enumeration	SUCCESS, INVALID_PARAMETERS, UNSPECIFIED_FAILURE	Reports the result response to the Mesh Peering Management frame from the peer MAC entity.
MeshPeeringMgmtFrameContent	Sequence of octets	As defined in 8.5.16.2, 8.5.16.3, or 8.5.16.4	The contents of the Action field of the Mesh Peering Open, Mesh Peering Confirm, or Mesh Peering Close frame to send to the peer MAC entity.

6.3.73.5.3 When generated

This primitive is generated by the SME as a response to an MLME-MESHPEERINGMANAGEMENT.indication primitive.

6.3.73.5.4 Effect of receipt

This primitive indicates scheduling for transmission of a Mesh Peering management frame containing the indicated response.

6.3.74 Mesh power management

6.3.74.1 Introduction

The following primitives describe how a mesh entity changes its mesh power mode for a mesh peering.

6.3.74.2 MLME-MESHPOWERMGT.request

6.3.74.2.1 Function

This primitive requests a change in the mesh STAs mesh power mode for the mesh peering.

6.3.74.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
   MLME-MESHPOWERMGT.request(
                                        PeerMACAddress,
                                        Mesh Power Mode
                                        )
```

Name	Type	Valid Range	Description
PeerMACAddress	MAC Address	Valid individual MAC address	Specifies the address of the peer MAC entity to which the mesh power mode is changed.
Mesh Power Mode	Enumeration	ACTIVE_MODE, LIGHT_SLEEP_MODE, DEEP_SLEEP_MODE	Specifies the mesh power mode that the local mesh STA is using for the mesh peering.

6.3.74.2.3 When generated

The primitive is generated when the mesh entity wishes to change its mesh power mode for a mesh peering.

6.3.74.2.4 Effect of receipt

This primitive initiates the local mesh STA’s mesh power mode change for the mesh peering. The MLME subsequently issues an MLME-MESHPOWERMGT.confirm that reflects the results.

6.3.74.3 MLME-MESHPOWERMGT.confirm

6.3.74.3.1 Function

This primitive reports the result of a mesh power mode change attempt.

6.3.74.3.2 Semantics of the service primitive

The primitive parameter is as follows:

```
   MLME-MESHPOWERMGT.confirm(
                                        PeerMACAddress
                                        )
```

Name	Type	Valid Range	Description
PeerMAC Address	MAC Address	Valid individual MAC address	Specifies the address of the peer MAC entity to which the mesh power mode is changed.

6.3.74.3.3 When generated

This primitive is generated as a result of an MLME-MESHPOWERMGT.request.

6.3.74.3.4 Effect of receipt

The SME is notified of the results of the mesh power mode change for a mesh peering procedure.

6.3.75 Mesh neighbor offset synchronization

6.3.75.1 Introduction

This mechanism manages the neighbor offset synchronization method with the specified neighbor STA.

6.3.75.2 MLME-MESHNEIGHBOROFFSETSYNCSTART.request

6.3.75.2.1 Function

This primitive requests to start the neighbor offset synchronization method with the specified neighbor STA.

6.3.75.2.2 Semantics of the service primitive

The primitive parameter is as follows:

```
MLME-MESHNEIGHBOROFFSETSYNCSTART.request(
                                         PeerMACAddress
                                         )
```

Name	Type	Valid range	Description
PeerMACAddress	MAC Address	Any valid individual MAC address	Specifies the address of the peer MAC entity with which to start the neighbor offset synchronization method.

6.3.75.2.3 When generated

This primitive is generated by the SME to start the neighbor offset synchronization method with the specified neighbor STA.

6.3.75.2.4 Effect of receipt

On receipt of this primitive, the MLME commences the neighbor offset synchronization method and the calculation of the TSF timer offset value. The MLME subsequently issues an MLME-MESHNEIGHBOROFFSETSYNCSTART.confirm that reflects the results of this request.

6.3.75.3 MLME-MESHNEIGHBOROFFSETSYNCSTART.confirm

6.3.75.3.1 Function

This primitive reports the results of a mesh neighbor offset synchronization request.

6.3.75.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MESHNEIGHBOROFFSETSYNCSTART.confirm(
                                          PeerMACAddress,
                                          TSFOffsetValue
                                          )
```

Name	Type	Valid range	Description
PeerMACAddress	MAC Address	Valid individual MAC address	Specifies the address of the peer MAC entity to which the neighbor offset synchronization is requested.
TSFOffsetValue	Integer	-2^{63} to $(2^{63}-1)$	Indicates the TSF offset value with the specified neighbor STA, expressed in twos complement in µs.

6.3.75.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-MESHNEIGHBOROFFSETSYNCSTART.request and report the TSF offset value.

6.3.75.3.4 Effect of receipt

The SME is notified of the results of the mesh neighbor offset synchronization request.

6.3.75.4 MLME-MESHNEIGHBOROFFSETCALCULATE.request

6.3.75.4.1 Function

This primitive requests a calculation result of the TSF timer offset value for the specified neighbor STA.

6.3.75.4.2 Semantics of the service primitive

The primitive parameter is as follows:

```
MLME-MESHNEIGHBOROFFSETCALCULATE.request(
                                          PeerMACAddress
                                          )
```

Name	Type	Valid range	Description
PeerMACAddress	MAC Address	Any valid individual MAC address	Specifies the address of the peer MAC entity with which to report the TSF offset value.

6.3.75.4.3 When generated

This primitive is generated by the SME to order a calculation of the TSF timer offset value with the specified neighbor STA.

6.3.75.4.4 Effect of receipt

On receipt of this primitive, the MLME receives a Beacon or Probe Response frame and calculates the TSF timer offset value from the received frame. The MLME tries to receive a Beacon frame immediately after the issue of MLME-MESHNEIGHBOROFFSETCALCULATE.request even if the mesh STA does not listen to the Beacon frame from the specified neighbor STA regularly (i.e., in deep sleep mode toward the specified neighbor STA). The MLME subsequently issues an MLME-MESHNEIGHBOROFFSETCALCULATE.confirm that reflects the results of this request.

6.3.75.5 MLME-MESHNEIGHBOROFFSETCALCULATE.confirm

6.3.75.5.1 Function

This primitive reports the results of a mesh neighbor offset calculation request.

6.3.75.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MESHNEIGHBOROFFSETCALCULATE.confirm(
                                          PeerMACAddress,
                                          TSFOffsetValue
                                          )
```

Name	Type	Valid range	Description
PeerMACAddress	MAC Address	Valid individual MAC address	Specifies the address of the peer MAC entity to which the Neighbor Offset Measure is requested.
TSFOffsetValue	Integer	-2^{63} to $(2^{63}-1)$	Indicates the TSF offset value with the specified neighbor STA, expressed in twos complement in µs.

6.3.75.5.3 When generated

This primitive is generated by the MLME as a result of an MLME-MESHNEIGHBOROFFSETCALCULATE.request to report a TSF offset value.

6.3.75.5.4 Effect of receipt

The SME is notified of the results of the mesh neighbor offset calculation request.

6.3.75.6 MLME-MESHNEIGHBOROFFSETSYNCSTOP.request

6.3.75.6.1 Function

This primitive requests to stop the neighbor offset synchronization method with the specified neighbor STA.

6.3.75.6.2 Semantics of the service primitive

The primitive parameter is as follows:

```
MLME-MESHNEIGHBOROFFSETSYNCSTOP.request(
                                          PeerMACAddress
                                          )
```

Name	Type	Valid range	Description
PeerMACAddress	MAC Address	Any valid individual MAC address	Specifies the address of the peer MAC entity with which to stop the neighbor offset synchronization method.

6.3.75.6.3 When generated

This primitive is generated by the SME to stop the maintenance of the neighbor offset synchronization method with the specified neighbor STA.

6.3.75.6.4 Effect of receipt

On receipt of this primitive, the MLME stops the neighbor offset synchronization method with the specified peer. The MLME subsequently issues an MLME-MESHNEIGHBOROFFSETSYNCSTOP.confirm that reflects the results of this request.

6.3.75.7 MLME-MESHNEIGHBOROFFSETSYNCSTOP.confirm

6.3.75.7.1 Function

This primitive reports the results of a neighbor offset synchronization method stop request.

6.3.75.7.2 Semantics of the service primitive

The primitive parameter is as follows:

```
   MLME-MESHNEIGHBOROFFSETSYNCSTOP.confirm(
                                       PeerMACAddress
                                       )
```

Name	Type	Valid range	Description
PeerMACAddress	MAC Address	Valid individual MAC address	Specifies the address of the peer MAC entity to which the Neighbor Offset Stop is requested.

6.3.75.7.3 When generated

This primitive is generated by the MLME as a result of an MLME-MESHNEIGHBOROFFSETSYNCSTOP.request.

6.3.75.7.4 Effect of receipt

The SME is notified of the results of the mesh neighbor offset synchronization stop request.

6.3.76 Mesh TBTT adjustment

6.3.76.1 Introduction

The following primitives describe how a mesh STA requests a TBTT adjustment from a neighboring peer mesh STA.

6.3.76.2 MLME-MESHTBTTADJUSTMENT.request

6.3.76.2.1 Function

This primitive requests transmission of a TBTT Adjustment Request frame.

6.3.76.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MESHTBTTADJUSTMENT.request(
                                PeerMACAddress,
                                BeaconTiming,
                                VendorSpecificInfo
                                )
```

Name	Type	Valid range	Description
PeerMACAddress	MAC Address	Any valid individual MAC address	Specifies the address of the peer MAC entity to which the TBTT Adjustment Request is sent.
BeaconTiming	A set of Beacon Timing elements	As defined in 8.4.2.107	A set of Beacon Timing elements of the mesh STA.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.76.2.3 When generated

This primitive is generated by the SME to request that a TBTT Adjustment Request frame be sent to a peer entity to request the adjustment of the peer entity’s TBTT.

6.3.76.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TBTT Adjustment Request frame containing the Beacon Timing elements. This frame is then scheduled for transmission. The MLME subsequently issues an MLME-MESHTBTTADJUSTMENT.confirm that reflects the result of this request.

6.3.76.3 MLME-MESHTBTTADJUSTMENT.confirm

6.3.76.3.1 Function

This primitive reports the result of a mesh TBTT adjustment request.

6.3.76.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MESHTBTTADJUSTMENT.confirm(
                                PeerMACAddress,
                                ResultCode,
                                BeaconTiming,
                                VendorSpecificInfo
                                )
```

Name	Type	Valid range	Description
PeerMACAddress	MAC Address	Any valid individual MAC address	Specifies the address of the peer MAC entity from which the TBTT Adjustment Response is received.

Name	Type	Valid range	Description
ResultCode	Enumeration	SUCCESS, REFUSED_REASON_UNSPECIFIED, CANNOT_FIND_ALTERNATIVE_TBTT	Indicates the result of the TBTT adjustment request.
BeaconTiming	A set of Beacon Timing elements	As defined in 8.4.2.107	A set of Beacon Timing elements of the responding mesh STA. Present only when such an element was present in the TBTT Adjustment Response frame.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.76.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-MESHTBTTADJUSTMENT.request primitive to indicate the result of that request.

6.3.76.3.4 Effect of receipt

The SME is notified of the result of the mesh TBTT adjustment request.

6.3.76.4 MLME-MESHTBTTADJUSTMENT.indication

6.3.76.4.1 Function

This primitive indicates that a specific peer MAC entity is requesting adjustment of the TBTT.

6.3.76.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MESHTBTTADJUSTMENT.indication(
                                   PeerMACAddress,
                                   BeaconTiming,
                                   VendorSpecificInfo
                                   )
```

Name	Type	Valid range	Description
PeerMACAddress	MAC Address	Any valid individual MAC address	Specifies the address of the peer MAC entity from which the TBTT Adjustment request was received.
BeaconTiming	A set of Beacon Timing elements	As defined in 8.4.2.107	A set of Beacon Timing elements of the requesting mesh STA.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.76.4.3 When generated

This primitive is generated by the MLME as a result of the receipt of a TBTT Adjustment Request frame from the specified peer MAC entity.

6.3.76.4.4 Effect of receipt

The SME is notified of the receipt of the TBTT adjustment request by the specified peer MAC entity. The mesh STA that received this primitive subsequently processes the TBTT scanning and adjustment procedure described in 13.13.4.4.3, and responds with the MLME-MESHTBTTADJUSTMENT.response.

6.3.76.5 MLME-MESHTBTTADJUSTMENT.response

6.3.76.5.1 Function

This primitive is used to send a response to the specified peer MAC entity that requested a TBTT adjustment from the mesh STA that issued this primitive.

6.3.76.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
  MLME-MESHTBTTADJUSTMENT.response(
                                              PeerMACAddress,
                                              Status Code,
                                              BeaconTiming,
                                              VendorSpecificInfo
                                              )
```

Name	Type	Valid range	Description
PeerMACAddress	MAC Address	Any valid individual MAC address	Specifies the address of the peer MAC entity to which the TBTT Adjustment Response is sent.
Status Code	As defined in frame format	SUCCESS, REFUSED_REASON_UNSPECIFIED, CANNOT_FIND_ALTERNATIVE_TBTT	Indicates the result response to the TBTT adjustment request from the peer mesh STA.
BeaconTiming	A set of Beacon Timing elements	As defined in 8.4.2.107	A set of Beacon Timing elements of the mesh STA. Present only when the STA could not find an alternative TBTT.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.76.5.3 When generated

This primitive is generated by the SME of a mesh STA as response to an MLME-MESHTBTTADJUSTMENT.indication primitive.

6.3.76.5.4 Effect of receipt

This primitive initiates the transmission of a TBTT Adjustment Response frame to the peer MAC entity that requested the TBTT adjustment.

On receipt of this primitive, the MLME constructs a TBTT Adjustment Response frame. This frame is then scheduled for transmission.

6.3.77 MCCA management interface

6.3.77.1 Introduction

The following primitives describe how a mesh entity manages its MCCA operation.

6.3.77.2 MLME-ACTIVATEMCCA.request

6.3.77.2.1 Function

This primitive requests that the MAC entity activate MCCA.

6.3.77.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-ACTIVATEMCCA.request(
                                    MCCAScanDuration,
                                    MAFLimit,
                                    MCCAAdvertPeriodMax,
                                    MCCAMaxTrackStates,
                                    MCCACWmin,
                                    MCCACWmax,
                                    MCCAAIFSN
                                    )
```

Name	Type	Valid range	Description
MCCAScanDuration	Integer	0 – 65 535	Specifies the duration in TUs that the mesh STA shall not initiate or accept MCCA Setup Request frames.
MAFLimit	Integer	0–255	Specifies the maximum MCCA access fraction allowed at the mesh STA. This number is always a multiple of (1/255) of the DTIM Interval.
MCCAAdvertPeriodMax	Integer	0–255	Specifies the maximum interval that a mesh STA with dot11MCCAActivated equal to true waits for an MCCAOP advertisement. It is expressed in number of DTIM intervals.
MCCAMaxTrackStates	Integer	dot11MCCAMinTrackStates – 65 535	Specifies the total number of MCCAOP reservations that the MAC entity is able to track.
MCCACWmin	Integer	0–15	Specifies the value of the minimum size of the contention window that the MAC entity uses for channel access during an MCCAOP.
MCCACWmax	Integer	0–63	Specifies the value of the maximum size of the contention that the MAC entity uses for channel access during an MCCAOP.
MCCAAIFSN	Integer	0–15	Specifies the value of the AIFSN that the MAC entity uses for channel access during an MCCAOP.

6.3.77.2.3 When generated

This primitive is generated by the SME to start the use of MCCA.

6.3.77.2.4 Effect of receipt

This primitive sets dot11MCCAActivated to true and initializes the MCCA parameters.

6.3.77.3 MLME-MCCASETUP.request

6.3.77.3.1 Function

This primitive requests that the MAC entity set up an MCCAOP reservation.

6.3.77.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
   MLME-MCCASETUP.request(
                                    MCCAOPDuration,
                                    MCCAOPPeriodicity,
                                    MCCAOPOffset,
                                    MCCAOPResponder,
                                    VendorSpecificInfo
                                    )
```

Name	Type	Valid range	Description
MCCAOPDuration	Integer	0 – 65 535	Specifies the MCCAOP Duration of the needed MCCAOPs as described in 8.4.2.108.2.
MCCAOPPeriodicity	Integer	0–255	Specifies the MCCAOP Periodicity of the needed MCCAOPs as described in 8.4.2.108.2.
MCCAOPOffset	Integer	0 – 16 777 215	Specifies the MCCAOP offset of the needed MCCAOPs as described in 8.4.2.108.2.
MCCAOPResponder	MAC address	Any valid individual or group MAC address	Specifies the MAC address of the intended MCCAOP responder.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.77.3.3 When generated

This primitive is generated by the SME to start an MCCAOP setup procedure.

6.3.77.3.4 Effect of receipt

This primitive causes the transmission of an MCCA Setup Request frame to the MCCAOP responder provided that the conditions for the transmission are met. The MLME subsequently issues an MLME-MCCASETUP.confirm primitive that reflects the results.

6.3.77.4 MLME-MCCASETUP.confirm

6.3.77.4.1 Function

This primitive is generated by the MLME to report the result of an MLME-MCCASETUP.request primitive, which was issued in order to establish an MCCAOP reservation with the peer MAC entity specified in MCCAOPResponder.

6.3.77.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MCCASETUP.confirm(
                                   MCCAOPParameters,
                                   MCCAOPID,
                                   MCCAOPResponder,
                                   ResultCode,
                                   VendorSpecificInfo
                                   )
```

Name	Type	Valid range	Description
MCCAOPParameters	MCCAOP Reservation	See 8.4.2.108.2	The MCCAOP reservation parameters.
MCCAOPID	Integer	0–254	MCCAOP reservation ID of the MCCAOP reservation.
MCCAOPResponder	MAC address	Any valid individual or group MAC address	Specifies the MAC address of the intended MCCAOP responder.
ResultCode	Enumeration	SUCCESS, INVALID_PARAMETERS, MCCAOP_RESERVATION_CONFLICT, MAF_LIMIT_EXCEEDED, MCCA_TRACK_LIMIT_EXCEEDED, MCCA_SETUP_TIMEOUT	Indicates the result of the MLME-MCCASETUP.request.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.77.4.3 When generated

This primitive is generated by the MLME as a result of an MLME-MCCASETUP.request to establish an MCCAOP reservation with the peer mesh STA identified in MCCAOPResponder or upon receipt of an MCCA Setup Reply frame from the peer mesh STA identified in MCCAOPResponder.

6.3.77.4.4 Effect of receipt

The SME is notified of the results of the MCCAOP setup procedure.

6.3.77.5 MLME-MCCASETUP.indication

6.3.77.5.1 Function

This primitive indicates the receipt of an MCCA Setup Request frame from the peer MAC entity specified in MCCAOPOwner.

6.3.77.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MCCASETUP.indication(
                                   MCCAOPParameters,
                                   MCCAOPID,
                                   MCCAOPOwner,
                                   VendorSpecificInfo
                                   )
```

Name	Type	Valid range	Description
MCCAOPParameters	MCCAOP Reservation	See 8.4.2.108.2	The MCCAOP reservation parameters.
MCCAOPID	Integer	0–254	MCCAOP reservation ID of the MCCAOP reservation.
MCCAOPOwner	MAC address	Any valid individual MAC address	Specifies the MAC address of the MCCAOP owner.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.77.5.3 When generated

This primitive is generated by the MLME as result of the receipt of an MCCA Setup Request frame from the peer MAC entity specified in MCCAOPOwner.

6.3.77.5.4 Effect of receipt

The SME is notified of the request to establish an MCCAOP reservation with the peer MAC entity specified in MCCAOPOwner.

6.3.77.6 MLME-MCCASETUP.response

6.3.77.6.1 Function

This primitive is used to send a response to the peer MAC entity specified in MCCAOPOwner that requested the set up of the MCCAOP reservation.

6.3.77.6.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MCCASETUP.response(
                                    MCCAOPParameters,
                                    MCCAOPID,
                                    MCCAOPOwner,
                                    ResultCode,
                                    VendorSpecificInfo
                                    )
```

Name	Type	Valid range	Description
MCCAOPParameters	MCCAOP Reservation	See 8.4.2.108.2	The MCCAOP reservation parameters.
MCCAOPID	Integer	0–254	MCCAOP reservation ID of the MCCAOP reservation.
MCCAOPOwner	MAC address	Any valid individual MAC address	Specifies the MAC address of the MCCAOP owner.
ResultCode	Enumeration	SUCCESS, INVALID_PARAMETERS, MCCAOP_RESERVATION_CONFLICT, MAF_LIMIT_EXCEEDED, MCCA_TRACK_LIMIT_EXCEEDED	Indicates the result of the MLME-MCCASETUP.request.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.77.6.3 When generated

This primitive is generated by the SME of a STA as a response to an MLME-MCCASETUP.indication procedure.

6.3.77.6.4 Effect of receipt

This primitive initiates transmission of a response to the peer MAC entity specified in the MCCAOPOwner that requested the set up of an MCCAOP reservation.

6.3.77.7 MLME-MCCAADVERTISEMENT.request

6.3.77.7.1 Function

This primitive requests that the MAC entity request an MCCAOP advertisement from the specified peer MAC entity by sending an MCCA Advertisement Request frame to the peer MAC entity.

6.3.77.7.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MCCAADVERTISEMENT.request(
                                    PeerMACAddress,
                                    VendorSpecificInfo
                                    )
```

Name	Type	Valid range	Description
PeerMACAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the peer MAC that will send the Advertisement.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.77.7.3 When generated

This primitive is generated by the SME to request an MCCAOP advertisement from the specified peer MAC entity.

6.3.77.7.4 Effect of receipt

This primitive causes the transmission of an MCCA Advertisement Request frame to the specified peer MAC entity. The MLME subsequently issues an MLME-MCCAADVERTISEMENT.confirm primitive that reflects the results.

6.3.77.8 MLME-MCCAADVERTISEMENT.confirm

6.3.77.8.1 Function

This primitive reports the result of an MLME-MCCAADVERTISEMENT.request.

6.3.77.8.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MCCAADVERTISEMENT.confirm(
```

MCCAOPAdvertisement,
PeerMACAddress,
ResultCode,
VendorSpecificInfo
)

Name	Type	Valid range	Description
MCCAOPAdvertisement	MCCAOP Advertisement	See 8.4.2.111	One or more MCCAOP Advertisement elements.
PeerMACAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the transmitter of the MCCAOP advertisement.
ResultCode	Enumeration	SUCCESS, REFUSED	Indicates the result of the MLME-MCCAADVERTISEMENT.request.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.77.8.3 When generated

This primitive is generated by the MLME as a result of an MLME-MCCAADVERTISEMENT.request.

6.3.77.8.4 Effect of receipt

The SME is notified of the results of the MCCA Advertisement Request frame.

6.3.77.9 MLME-MCCAADVERTISEMENT.indication

6.3.77.9.1 Function

This primitive reports that an MCCA Advertisement Request frame has been received from the specified peer MAC entity.

6.3.77.9.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-MCCAADVERTISEMENT.indication(
PeerMACAddress,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerMACAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the transmitter of the MCCA Advertisement Request frame.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.77.9.3 When generated

This primitive is generated by the MLME upon receipt of an MCCA Advertisement Request frame from the specified peer MAC entity.

6.3.77.9.4 Effect of receipt

The SME is notified of the request to advertise its MCCAOP reservations.

6.3.77.10 MLME-MCCAADVERTISEMENT.response

6.3.77.10.1 Function

This primitive requests that the MAC entity respond to the MCCAOP advertisement request from the specified peer MAC entity by sending an MCCA Advertisement frame to the peer MAC entity.

6.3.77.10.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MCCAADVERTISEMENT.response(
                                        MCCAOPAdvertisement,
                                        PeerMACAddress,
                                        ResultCode,
                                        VendorSpecificInfo
                                        )
```

Name	Type	Valid range	Description
MCCAOPAdvertisement	MCCAOP Advertisement	See 8.4.2.111	One or more MCCAOP Advertisement elements.
PeerMACAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the transmitter of the MCCA Advertisement frame.
ResultCode	Enumeration	SUCCESS, REFUSED	Indicates the result of the MLME-MCCAADVERTISEMENT.response.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.77.10.3 When generated

This primitive is generated by the SME of a STA as a response to an MLME-MCCAADVERTISEMENT.indication procedure.

6.3.77.10.4 Effect of receipt

This primitive initiates transmission of a response to the specified peer MAC entity that requested advertisement of the MCCAOP reservations.

6.3.77.11 MLME-MCCATEARDOWN.request

6.3.77.11.1 Function

This primitive requests that the MAC entity tear down an MCCAOP reservation.

6.3.77.11.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MCCATEARDOWN.request(
```

MCCAOPID,
PeerMACAddress
)

Name	Type	Valid range	Description
MCCAOPID	Integer	0–255	Specifies the MCCAOP reservation ID of the MCCAOP reservation to be torn down.
PeerMACAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the peer MAC for the MCCAOP reservation.

6.3.77.11.3 When generated

This primitive is generated by the SME to start an MCCAOP teardown procedure.

6.3.77.11.4 Effect of receipt

This primitive causes the teardown MCCAOP reservation identified by means of the MCCAOP reservation ID in MCCAOPID, and the transmission of an MCCA Teardown frame to the peer MAC entity in PeerMACAddress.

6.3.77.12 MLME-MCCATEARDOWN.indication

6.3.77.12.1 Function

This primitive reports that an MCCA Teardown frame has been received from the specified peer MAC entity.

6.3.77.12.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-MCCATEARDOWN.indication(
MCCAOPID,
PeerMACAddress
)

Name	Type	Valid range	Description
MCCAOPID	Integer	0–255	MCCAOP reservation ID of the MCCAOP reservation to be torn down.
PeerMACAddress	MAC address	Any valid individual MAC address	Specifies the MAC address of the peer MAC for the MCCAOP reservation.

6.3.77.12.3 When generated

This primitive is generated by the MLME as result of receipt of a MCCA Teardown frame.

6.3.77.12.4 Effect of receipt

The SME is notified of the request to start an MCCAOP teardown procedure.

6.3.78 MBSS congestion control

6.3.78.1 Introduction

The following primitives describe how a mesh STA manages its congestion control operation.

6.3.78.2 MLME-MBSSCONGESTIONCONTROL.request

6.3.78.2.1 Function

This primitive requests that the MAC entity notify the peer MAC entity on the congestion level or requests to traffic generation by transmitting a Congestion Control Notification frame to the specified peer MAC entity.

6.3.78.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME- MBSSCONGESTIONCONTROL.request(
                    PeerMACAddress,
                    CongestionNotification,
                    VendorSpecificInfo
                    )
```

Name	Type	Valid range	Description
PeerMACAddress	MAC Address	Any valid individual MAC address	Specifies the address of the peer MAC entity to which the Congestion Control Notification frame is sent.
CongestionNotification	A set of Congestion Notification elements	As defined in 8.4.2.103	Congestion notification information generated by the mesh STA.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.78.2.3 When generated

The SME generates this primitive to request that the MAC notify its peer MAC about the current congestion level.

6.3.78.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Congestion Control Notification frame. This frame is then scheduled for transmission.

6.3.78.3 MLME-MBSSCONGESTIONCONTROL.indication

6.3.78.3.1 Function

This primitive indicates that a congestion notification has been received.

6.3.78.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME- MBSSCONGESTIONCONTROL.indication(
                                        PeerMACAddress,
                                        CongestionNotification,
                                        VendorSpecificInfo
                                        )
```

Name	Type	Valid range	Description
PeerMACAddress	MAC Address	Any valid individual MAC address	Specifies the address of the peer MAC entity from which the Congestion Control Notification frame was received.
CongestionNotification	A set of Congestion Notification elements	As defined in 8.4.2.103	Congestion notification information contained in the received Congestion Control Notification frame.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.78.3.3 When generated

This primitive is generated by the MLME as a result of the receipt of a Congestion Control Notification frame from a specific peer MAC entity.

6.3.78.3.4 Effect of receipt

The SME is notified of the results of the receipt of the congestion control notification from the specified peer MAC entity. The mesh STA that received this primitive subsequently activates the local rate control as described in 13.12.

6.3.79 MBSS proxy update

6.3.79.1 Introduction

The following primitives describe how a mesh STA reports the proxy update information to another mesh STA in the MBSS.

6.3.79.2 MLME-MBSSPROXYUPDATE.request

6.3.79.2.1 Function

This primitive requests that the MAC entity inform a destination mesh STA about its proxy information by transmitting a Proxy Update frame to the specified peer MAC entity.

6.3.79.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME- MBSSPROXYUPDATE.request(
                                PeerMACAddress,
                                ProxyUpdate,
                                VendorSpecificInfo
                                )
```

Name	Type	Valid range	Description
PeerMACAddress	MAC Address	Any valid individual MAC address	Specifies the address of the peer MAC entity to which the Proxy Update frame is sent.
ProxyUpdate	A set of PXU elements	As defined in 8.4.2.118	A set of proxy information available at the mesh STA.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.79.2.3 When generated

This primitive is generated by the SME to request that a Proxy Update frame be sent to the specified peer MAC entity.

6.3.79.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Proxy Update frame containing the PXU element. This frame is then scheduled for transmission. The MLME subsequently issues an MLME-MBSSPROXYUPDATE.confirm that reflects the results of this request.

6.3.79.3 MLME-MBSSPROXYUPDATE.confirm

6.3.79.3.1 Function

This primitive reports the results of a proxy update request.

6.3.79.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME- MBSSPROXYUPDATE.confirm(
                              PeerMACAddress,
                              ProxyUpdateConfirmation,
                              VendorSpecificInfo
                              )
```

Name	Type	Valid range	Description
PeerMACAddress	MAC Address	Any valid individual MAC address	Specifies the address of the peer MAC entity from which the Proxy Update Confirmation frame is received.
ProxyUpdateConfirmation	A set of PXUC elements	As defined in 8.4.2.119	A set of proxy update confirmation information from the peer MAC entity to which the Proxy Update frame was sent.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.79.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-MBSSPROXYUPDATE.request primitive.

6.3.79.3.4 Effect of receipt

The SME is notified of the results of the MBSS proxy update request.

6.3.79.4 MLME-MBSSPROXYUPDATE.indication

6.3.79.4.1 Function

This primitive indicates that an update of the proxy information has been received from a specific peer MAC entity.

6.3.79.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME- MBSSPROXYUPDATE.indication(
                              PeerMACAddress,
                              ProxyUpdate,
                              VendorSpecificInfo
                              )
```

Name	Type	Valid range	Description
PeerMACAddress	MAC Address	Any valid individual MAC address	Specifies the address of the peer MAC entity from which the update of the proxy information was received.
ProxyUpdate	A set of PXU elements	As defined in 8.4.2.118	A set of proxy information received from the peer mesh STA.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.79.4.3 When generated

This primitive is generated by the MLME as a result of the receipt of a Proxy Update frame from a specific peer MAC entity.

6.3.79.4.4 Effect of receipt

The SME is notified of the results of the receipt of the proxy update request by the specified peer MAC entity. The mesh STA that received this primitive subsequently updates the proxy information as described in 13.11.4.3.

6.3.79.5 MLME-MBSSPROXYUPDATE.response

6.3.79.5.1 Function

This primitive is used to send a response to a specific peer MAC entity that sent an update of the proxy information to the mesh STA that issued this primitive.

6.3.79.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME- MBSSPROXYUPDATE.response(
                              PeerMACAddress,
                              ProxyUpdateConfirmation,
```

VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerMACAddress	MAC Address	Any valid individual MAC address	Specifies the address of the peer MAC entity to which the Proxy Update Confirmation frame is sent.
ProxyUpdateConfirmation	A set of PXUC elements	As defined in 8.4.2.119	A set of proxy update confirmation information to be sent to the peer MAC entity.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.79.5.3 When generated

This primitive is generated by the SME of a STA as a response to an MLME-MBSSPROXYUPDATE.indication primitive.

6.3.79.5.4 Effect of receipt

This primitive initiates transmission of a response to the specific peer MAC entity that sent an update of the proxy information.

On receipt of this primitive, the MLME constructs a Proxy Update Confirmation frame. The frame contains one or more PXUC elements. This frame is then scheduled for transmission.

6.3.80 MBSS mesh gate announcement

6.3.80.1 Introduction

The following primitives describe how a mesh STA announces mesh gate reachability.

6.3.80.2 MLME-MBSSGATEANNOUNCEMENT.request

6.3.80.2.1 Function

This primitive requests that the MAC entity update the mesh gate information by transmitting a Gate Announcement frame to the specified MAC entity.

6.3.80.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME- MBSSGATEANNOUNCEMENT.request(
PeerMACAddress,
GateAnnouncement,
VendorSpecificInfo
)

Name	Type	Valid range	Description
PeerMACAddress	MAC Address	Any valid group MAC address	Specifies the address of the MAC entity to which the Gate announcement frame is sent.
GateAnnouncement	GANN element	As defined in 8.4.2.113	A set of gate announcement information to be sent through a Gate Announcement frame.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.80.2.3 When generated

This primitive is generated by the SME to request that a Gate Announcement frame be sent to the specified MAC entity.

6.3.80.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Gate Announcement frame containing the GANN element. This frame is then scheduled for transmission following the interval specified by dot11MeshGateAnnouncementInterval.

6.3.80.3 MLME-MBSSGATEANNOUNCEMENT.indication

6.3.80.3.1 Function

This primitive indicates that a mesh gate announcement has been received from the specific peer MAC entity.

6.3.80.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME- MBSSGATEANNOUNCEMENT.indication(
                                    PeerMACAddress,
                                    GateAnnouncement,
                                    VendorSpecificInfo
                                    )
```

Name	Type	Valid range	Description
PeerMACAddress	MAC Address	Any valid individual MAC address	Specifies the address of the peer MAC entity from which the gate announcement was received.
GateAnnouncement	GANN element	As defined in 8.4.2.113	A set of gate announcement information contained in the received Gate Announcement frame.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.80.3.3 When generated

This primitive is generated by the MLME as a result of the receipt of a Gate Announcement frame from a specific peer MAC entity.

6.3.80.3.4 Effect of receipt

The SME is notified of the reachability to a mesh gate in the mesh BSS. The mesh STA received this primitive subsequently triggers MBSSGATEANNOUNCEMENT.request as described in 13.11.2.

6.3.81 Mesh link metric

6.3.81.1 Introduction

Subclause 6.3.81 describes the management procedures associated with mesh link metric reporting.

6.3.81.2 MLME-MESHLINKMETRICREAD.request

6.3.81.2.1 Function

This primitive requests to read a link metric value between the local MAC entity and a specific peer MAC entity.

6.3.81.2.2 Semantics of the service primitive

The primitive parameter is as follows:

```
MLME-MESHLINKMETRICREAD.request(
                              PeerMACAddress
                              )
```

Name	Type	Valid range	Description
PeerMACAddress	MAC Address	Any valid individual MAC address	Specifies the address of the peer MAC entity for which the link metric value is read

6.3.81.2.3 When generated

This primitive is generated by the SME to read the link metric value for the mesh link to the specified peer MAC entity.

6.3.81.2.4 Effect of receipt

On receipt of this primitive, the MLME reports the link metric value. The MLME subsequently issues an MLME-MESHLINKMETRICREAD.confirm that reflects the results of this request.

6.3.81.3 MLME-MESHLINKMETRICREAD.confirm

6.3.81.3.1 Function

This primitive reports the results of a link metric read request.

6.3.81.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME- MESHLINKMETRICREAD.confirm(
                              LinkMetricValue,
                              VendorSpecificInfo
                              )
```

Name	Type	Valid range	Description
LinkMetricValue	Mesh Link Metric Report element	As defined in 8.4.2.102	The link metric value for the mesh link to the specified peer MAC entity.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.81.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-MESHLINKMETRICREAD.request primitive to request a link metric value.

6.3.81.3.4 Effect of receipt

The SME is notified of the results of the link metric read request.

6.3.81.4 MLME-MESHLINKMETRICREPORT.request

6.3.81.4.1 Function

This primitive requests that the MAC entity either transmit a link metric to or request a link metric from the specified peer MAC entity.

6.3.81.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MESHLINKMETRICREPORT.request(
                                  PeerMACAddress,
                                  LinkMetricRequestFlag,
                                  MeshLinkMetricReport,
                                  VendorSpecificInfo
                                  )
```

Name	Type	Valid range	Description
PeerMACAddress	MAC Address	Any valid individual MAC address	Specifies the address of the peer MAC entity to which the Mesh Link Metric Report is sent.
LinkMetricRequestFlag	Enumeration	REPORT_ONLY, REPORT_AND_REQUEST	Indicates whether the mesh STA requests a link metric report from the peer MAC entity.
MeshLinkMetricReport	Mesh Link Metric Report element	As defined in 8.4.2.102	A metric value computed for the corresponding link.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.81.4.3 When generated

This primitive is generated by the SME to request that a Mesh Link Metric Report frame be sent to a peer MAC entity in order to report a link metric value and to request a mesh link metric report from the peer MAC entity if LinkMetricRequestFlag is equal to REPORT_AND_REQUEST.

6.3.81.4.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Mesh Link Metric Report frame.The Request subfield in the Flags field of the Mesh Link Metric Report element is set depending on the parameter given by the LinkMetricRequestFlag. If LinkMetricRequestFlag is equal to REPORT_ONLY, the Request subfield is set to 0. If LinkMetricRequestFlag is equal to REPORT_AND_REQUEST, the Request subfield is set to 1. This frame is then scheduled for transmission.

6.3.81.5 MLME-MESHLINKMETRICREPORT.indication

6.3.81.5.1 Function

This primitive indicates that a Mesh Link Metric Report frame has been received from a peer MAC entity. This Mesh Link Metric Request Report can be in response to an earlier MLME-MESHLINKMETRICREPORT.request primitive with LinkMetricRequestFlag equal to REPORT_AND_REQUEST.

6.3.81.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME- MESHLINKMETRICREPORT.indication(
                                      PeerMACAddress,
                                      LinkMetricRequestFlag,
                                      MeshLinkMetricReport,
                                      VendorSpecificInfo
                                      )
```

Name	Type	Valid range	Description
PeerMACAddress	MAC Address	Any valid individual MAC address	Specifies the address of the peer MAC entity from which the Mesh Link Metric Report frame was received.
LinkMetricRequestFlag	Enumeration	REPORT_ONLY, REPORT_AND_ REQUEST	Indicates whether the peer MAC entity requests a link metric report.
MeshLinkMetricReport	Mesh Link Metric Report element	As defined in 8.4.2.102	A metric value reported from the specified peer MAC entity.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.81.5.3 When generated

This primitive is generated by the MLME as a result of the receipt of a Mesh Link Metric Report frame from a specific peer MAC entity.

6.3.81.5.4 Effect of receipt

The SME is notified of the receipt of the link metric report from the specified peer MAC entity. When LinkMetricRequestFlag is equal to REPORT_AND_REQUEST, the mesh STA responds with a Mesh Link Metric Report frame.

6.3.82 HWMP mesh path selection

6.3.82.1 Introduction

The following primitives describe how a mesh STA establishes and maintains a mesh path to a specified peer MAC entity.

6.3.82.2 MLME-HWMPMESHPATHSELECTION.request

6.3.82.2.1 Function

This primitive requests that the MAC entity establish or maintain a mesh path to the specified peer MAC entity by transmitting an HWMP Mesh Path Selection frame to the specified peer MAC entity.

6.3.82.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-HWMPMESHPATHSELECTION.request(
                                PeerMACAddress,
                                RootAnnouncement,
                                PathRequest,
                                PathReply,
                                PathError,
                                VendorSpecificInfo
                                )
```

Name	Type	Valid range	Description
PeerMACAddress	MAC Address	Any valid individual or group MAC address	Specifies the address of the peer MAC entity to which the HWMP Mesh Path Selection frame is sent.
RootAnnouncement	RANN element	As defined in 8.4.2.114	A set of RANN elements generated by the mesh STA. Present only if the mesh STA is configured as a root mesh STA using the proactive RANN mechanism [dot11MeshHWMProotMode = rann (4)], and as described in 13.10.12.
PathRequest	PREQ element	As defined in 8.4.2.115	A set of PREQ elements generated by the mesh STA. Present as described in 13.10.9.
PathReply	PREP element	As defined in 8.4.2.116	A set of PREP elements generated by the mesh STA. Present as described in 13.10.10.
PathError	PERR element	As defined in 8.4.2.117	A set of PERR elements generated by the mesh STA. Present as described in 13.10.11.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.82.2.3 When generated

This primitive is generated by the SME to request that an HWMP Mesh Path Selection frame be sent to a specified peer entity.

6.3.82.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs an HWMP Mesh Path Selection frame. This frame is then scheduled for transmission.

6.3.82.3 MLME-HWMPMESHPATHSELECTION.indication

6.3.82.3.1 Function

This primitive indicates that an HWMP Mesh Path Selection frame has been received from the specified peer MAC entity.

6.3.82.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-HWMPMESHPATHSELECTION.indication(
                                    PeerMACAddress,
                                    RootAnnouncement,
                                    PathRequest,
                                    PathReply,
                                    PathError,
                                    VendorSpecificInfo
                                    )
```

Name	Type	Valid range	Description
PeerMACAddress	MAC Address	Any valid individual MAC address	Specifies the address of the peer MAC entity from which the HWMP Mesh Path Selection frame was received.
RootAnnouncement	RANN element	As defined in 8.4.2.114	A set of RANN elements contained in the received frame. Present only when such an element was present in the received frame.
PathRequest	PREQ element	As defined in 8.4.2.115	A set of PREQ elements contained in the received frame. Present only when such an element was present in the received frame.
PathReply	PREP element	As defined in 8.4.2.116	A set of PREP elements contained in the received frame. Present only when such an element was present in the received frame.
PathError	PERR element	As defined in 8.4.2.117	A set of PERR elements contained in the received frame. Present only when such an element was present in the received frame.
VendorSpecificInfo	A set of elements	As defined in 8.4.2.28	Zero or more elements.

6.3.82.3.3 When generated

This primitive is generated by the MLME as a result of the receipt of an HWMP Mesh Path Selection frame from a specific peer MAC entity.

6.3.82.3.4 Effect of receipt

The SME is notified of the results of the receipt of the HWMP Mesh Path Selection from the specified peer MAC entity. The mesh STA received this primitive subsequently activates path selection procedures described in 13.10.

6.4 MAC state generic convergence function (MSGCF)

6.4.1 Overview of the convergence function

The MSGCF and its interaction with other management entities is defined in 6.4. The MSGCF correlates information exchanged between the MAC management entities regarding the state of an IEEE 802.11 interface and converges this information into events and status for consumption by higher layer protocols. Non-AP STAs when dot11MSGCFActivated is set to true shall support the MSGCF procedures in this clause; APs do not support the MSGCF.

This clause defines interactions between the MSGCF and MLME and PLME through the MLME_SAP and PLME_SAP respectively, as well as with the SME via the MSGCF-SME_SAP. The detailed manner in which the SAPs are implemented is not specified within this standard.

The MSGCF operates at the level of an IEEE 802.11 ESS, and generates events based on the state of the link between a non-AP STA and an ESS. A non-AP STA that transitions between two APs in the same ESS can operate transparently to the LLC sublayer, and does not change state in the state machine defined within this clause.

6.4.2 Overview of convergence function state machine

The convergence function maintains information on the state of the ESS, using the state machine shown in Figure 6-26. Because Figure 6-26 is defined in terms of ESS connectivity, it is not affected by changes in association provided that the transition was an intra-ESS transition.

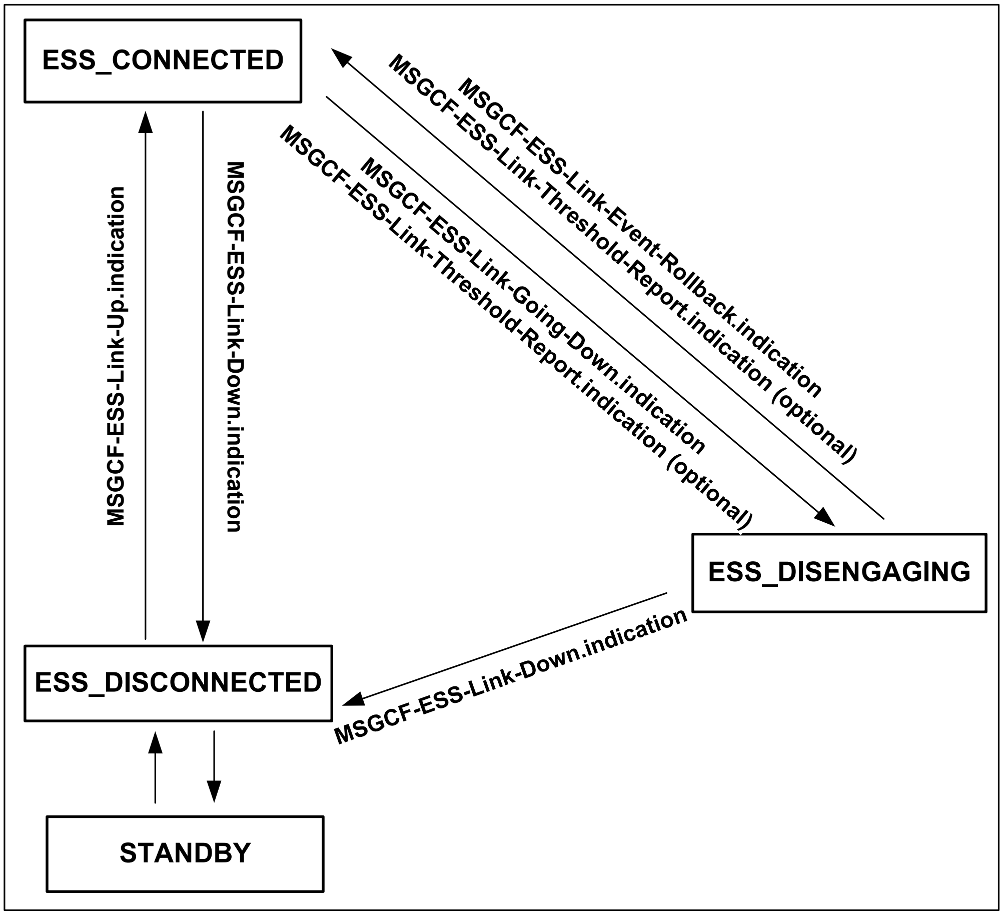
6.4.3 Convergence function state list

6.4.3.1 ESS_CONNECTED

In the ESS_CONNECTED state, a non-AP STA has completed all layer 2 setup activities and is able to send Class 3 frames to peer LLC entities. A non-AP STA remains in this state as long as it is possible to send Class 3 frames through any AP within an ESS. A non-AP STA does not leave this state upon successful intra-ESS transitions.

6.4.3.2 ESS_DISCONNECTED

In the ESS_DISCONNECTED state, a non-AP STA is unable to send Class 3 frames to peer LLC entities. Higher layer network protocols are unavailable. In this state, a non-AP STA may use GAS to perform network discovery and selection.



ESS_CONNECTED
MSGCF-ESS-Link-Up.indication
MSGCF-ESS-Link-Down.indication
MSGCF-ESS-Link-Going-Down.indication
MSGCF-ESS-Link-Threshold-Report.indication (optional)
MSGCF-ESS-Link-Event-Rollback.indication
MSGCF-ESS-Link-Threshold-Report.indication (optional)
ESS_DISENGAGING
MSGCF-ESS-Link-Down.indication
ESS_DISCONNECTED
STANDBY

Figure 6-26—MSGCF state machine

6.4.3.3 ESS_DISENGAGING

In the ESS_DISENGAGING state, the non-AP STA's SME anticipates that links to all APs within the ESS will be lost in a defined time interval, but the non-AP STA is still able to send Class 3 frames to peer LLC entities. The predictive failure of the link may be due to explicit disassociation by the peer, the imminent invalidation of cryptographic keys because of usage limits (such as sequence counter exhaustion), or predictive signal strength algorithms. In this state, it is recommended that a non-AP STA also initiate a search to find a new ESS.

6.4.3.4 STANDBY

In the STANDBY state, the non-AP STA is powered down and unable to communicate with any other IEEE 802.11 STAs.

6.4.4 Convergence function state transitions

6.4.4.1 Transitions to ESS_CONNECTED

6.4.4.1.1 From ESS_DISCONNECTED

To make this transition, a non-AP STA will have completed the network selection process and the relevant procedures to attach to the ESS, including IEEE 802.11 authentication, IEEE 802.11 association, and, if required, IEEE 802.11 RSN procedures. When this transition is completed, the MSGCF sends an MSGCF-ESS-Link-Up.indication primitive to higher layers.

6.4.4.1.2 From ESS_DISENGAGING

To make this transition, the SME cancels a previous event that predicted an ESS link failure. This may be due to network parameters indicating renewed link strength or a successful renewal of an expiring RSN SA. When this transition is complete, the MSGCF sends an MSGCF-ESS-Link-Event-Rollback.indication event to indicate that a prior link failure predictive event is no longer valid. If the transition was due to network parameters crossing a threshold, the MSGCF also issues an MSGCF-ESS-Link-Threshold-Report.indication to higher layers.

6.4.4.2 Transitions to ESS_ DISCONNECTED

6.4.4.2.1 From ESS_CONNECTED

This transition indicates that administrative action was taken to shut down the link, a sudden loss of signal strength or that RSN keys expired and could not be renewed. At the conclusion of this transition, the MSGCF issues an MSGCF-ESS-Link-Down.indication event to higher layer protocols.

6.4.4.2.2 From ESS_DISENGAGING

This transition indicates that the predictive link failure event has occurred. At the conclusion of this transition, the MSGCF issues an MSGCF-ESS-Link-Down.indication event to higher layer protocols.

6.4.4.2.3 From STANDBY

This transition occurs when the non-AP STA is powered on and initialized. No event is issued by the MSGCF.

6.4.4.3 Transitions to ESS_DISENGAGING

6.4.4.3.1 From ESS_CONNECTED

When the parameters as defined in Table 6-7 change or imminent action is taken to bring down the link, the SME may predict an imminent link failure and initiate a transition. Upon completion of this transition, the MSGCF issues an MSGCF-ESS-Link-Going-Down event. If the cause of the transition was the degradation of network parameters beyond the thresholds stored in the MIB, an MSGCF-ESS-Link-Threshold-Report.indication is also issued to higher layers.

6.4.4.4 Transitions to STANDBY

6.4.4.4.1 From ESS_DISCONNECTED

When the non-AP STA has disconnected from an ESS, it may be administratively powered off to extend battery life. No events are issued by the MSGCF upon completion of this transition.

6.4.5 Convergence function informational events

Informational events may occur in any state. When they occur, the SME updates the convergence function MIB with new parameters. Informational events do not cause state changes in Figure 6-26. Informational events are generated when new potential ESS links are discovered, when the network parameter thresholds are set or read, and when higher layer protocols issue commands to the non-AP STA through the MSGCF-ESS-Link-Command.request primitive.

6.4.6 MAC state generic convergence SAP

The MAC state generic convergence SAP is the interface between the convergence function and higher layer protocols. It presents a standardized interface for higher layer protocols to access the state of the MAC, whether that state information is available in the MLME, PLME, or SME.

Some events on the MAC state generic convergence SAP require event identifiers for use as a dialog token in event sequencing and rollback. The EventID is an unsigned integer that is initialized to one when the non-AP STA leaves the STANDBY state.

6.4.7 ESS status reporting

6.4.7.1 MSGCF-ESS-Link-Up

6.4.7.1.1 Function

This event is triggered when a new ESS has been made available for sending frames.

6.4.7.1.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MSGCF-ESS-Link-Up.indication(
                              NonAPSTAMacAddress,
                              ESSIdentifier
                              )
```

Name	Type	Valid range	Description
NonAPSTAMacAddress	MAC Address	Any valid individual MAC Address	The MAC address of the non-AP STA that is reporting that an IEEE 802.11 ESS has become available.
ESSIdentifier	String	N/A	An identifier for the network, composed of the string value of the SSID element used to identify the network, concatenated with the value of the HESSID if it is in use. The HESSID is encoded in upper-case ASCII characters with the octet values separated by dash characters, as described in IETF RFC 3580 [B35].

6.4.7.1.3 When generated

This primitive is generated when the ESS link to a network of APs is available to exchange data frames. The generation of this primitive may vary depending on the contents of dot11WEPDefaultKeysTable and dot11WEPKeyMappingsTable and the setting of dot11RSNAOptionImplemented.

If there are no entries in the dot11WEPDefaultKeysTable, no entry for the current AP in dot11WEPKeyMappingsTable, and dot11RSNAOptionImplemented is false, then the network does not use encryption. This event is generated upon receipt of an MLME-ASSOCIATE.confirm message with a result code of success.

If there are entries in the dot11WEPDefaultKeysTable, or an entry for the current AP in dot11WEPKeyMappingsTable, or dot11RSNAOptionImplemented is true, then the network requires the use of encryption on the link. Before declaring that the link is ready to exchange data frames, the convergence function receives an MLME-ASSOCIATE.confirm primitive with a result code of success and the SME emits an MLME-SETKEYS.request primitive. The latter primitive is used to determine that a WEP key is available, or that the RSN 4-Way Handshake has completed.

This event is not triggered by MLME-REASSOCIATE.confirm messages because MLME-REASSOCIATE.confirm messages are defined as transitions within the same ESS.

The MLME-ASSOCIATE.confirm primitive may be issued upon AP transitions. It is the objective of the MSGCF to generate this event only upon the initial connection to an IEEE 802.11 network, when the MSGCF state machine moves into the ESS_CONNECTED state.

6.4.7.1.4 Effect of receipt

This event is made available to higher layer protocols by the convergence function. Actions taken by higher layers are outside of scope of this standard, but may include router discovery, IP configuration, and other higher layer protocol operations.

6.4.7.2 MSGCF-ESS-Link-Down.indication

6.4.7.2.1 Function

This event is triggered to indicate that an IEEE 802.11 ESS is no longer available for sending frames.

6.4.7.2.2 Semantics of the service primitive

The event’s parameters are as follows:

```
   MSGCF-ESS-Link-Down.indication (
                                    NonAPSTAMacAddress,
                                    ESSIdentifier,
                                    ReasonCode
                                    )
```

Name	Type	Valid range	Description
NonAPSTAMac Address	MAC Address	Any valid individual MAC Address	The MAC address of the non-AP STA that is reporting that an IEEE 802.11 ESS is no longer available.
ESSIdentifier	String	N/A	An identifier for the network, composed of the string value of the SSID used to identify the network, concatenated with the value of the HESSID if it is in use.
ReasonCode	Enumerated	EXPLICT_DISCONNECT, KEY_EXPIRATION, LOW_POWER, VENDOR_SPECIFIC	Reason code, drawn from Table 6-2.

Table 6-2—Reason codes for network down

Name	Description
EXPLICIT_DISCONNECT	An explicit disconnection operation (Disassociation or Deauthentication) was initiated by the non-AP STA or the non-AP STA's current serving AP and the non-AP STA was unable to Reassociate with an alternate AP in the same ESS.
KEY_EXPIRATION	Keys used by an RSN SA have expired due to time or traffic limitations, or TKIP countermeasures have invalidated the key hierarchy.
LOW_POWER	If the SME reports that the IEEE 802.11 interface was shut down to conserve power, that event may be reported to higher level protocols.
VENDOR_SPECIFIC	Vendor-specific usage.

6.4.7.2.3 When generated

This event is generated when the SME declares that connectivity to an ESS is lost. It may be generated in the case of an explicit disconnection from the link peer, received as an MLME-DEAUTHENTICATE.indication or an MLME-DISASSOCIATE.indication primitive message. The SME should wait for a period of dot11ESSDisconnectFilterInterval before declaring connectivity lost to confirm that a non-AP STA is unable to reassociate with any alternate AP within the ESS.

6.4.7.2.4 Effect of receipt

This event is made available to higher layer protocols by the convergence function. Actions taken by those higher layers are outside the scope of this standard, but may include removing entries from routing and forwarding tables, and attempting to initiate handover of open application connections to network interfaces that are still active.

6.4.7.3 MSGCF-ESS-Link-Going-Down

6.4.7.3.1 Function

This event is triggered to indicate the expectation that IEEE 802.11 ESS will no longer be available for sending frames in the near future.

6.4.7.3.2 Semantics of the service primitive

The event parameters are as follows:

```
MSGCF-ESS-Link-Going-Down.indication(
                                        NonAPSTAMacAddress,
                                        ESSIdentifier,
                                        EventID,
                                        TimeInterval,
                                        ReasonCode
                                        )
```

Name	Type	Valid range	Description
NonAPSTAMac Address	MacAddress	Any valid individual MAC Address	The MAC address of the non-AP STA that is reporting that an IEEE 802.11 ESS is expected to go down.
ESSIdentifier	String	N/A	An identifier for the network, composed of the string value of the SSID element used to identify the network, concatenated with the value of the HESSID if it is in use.
EventID	Integer	N/A	An integer used to identify the event that is used in the case of event rollback.
TimeInterval	Integer	N/A	Time Interval, in time units, in which the link is expected to go down. Connectivity is expected to be available at least for time specified by TimeInterval.
Reason Code	Enumerated	EXPLICT_DISCONNECT, KEY_EXPIRATION, LOW_POWER, VENDOR_ SPECIFIC	Indicates the reason the link is expected to go down, drawn from Table 6-3.

Table 6-3—Reason codes for ESS link down

Name	Description
EXPLICIT_DISCONNECT	An explicit disconnection operation (Disassociation or Deauthentication) was initiated by the non-AP STA or the non-AP STA's current serving AP.
KEY_EXPIRATION	Keys used by an RSN SA have expired due to time or traffic limitations, or TKIP countermeasures have invalidated the key hierarchy.
LOW_POWER	If the SME reports that the IEEE 802.11 interface is going to be shut down to conserve power, that event may be reported to higher level protocols.
VENDOR_SPECIFIC	Vendor-specific usage.

6.4.7.3.3 When generated

This notification is generated by the MSGCF when the IEEE 802.11 ESS link is currently established and is expected to go down within the specified time interval. The network may be expected to go down because of an event whose timing is well understood, such as an explicit disconnection event observed on the MLME_SAP. It may also be expected as the result of a predictive algorithm that monitors link quality. The details of such a predictive algorithm used are beyond the scope of this standard.

The convergence function should attempt to deliver this event at least dot11ESSLinkDownTimeInterval time units before the link is predicted to go down. Different higher layer network protocols may require different levels of advance notice, and may configure the dot11ESSLinkDownTimeInterval attribute accordingly.

Not all thresholds in the dot11MACStateParameterTable are supported by every PHY. In the case when a threshold parameter is not supported (e.g., RSSI in Clause 15), it is not applied.

6.4.7.3.4 Effect of receipt

This event is made available to higher layer protocols by the convergence function. Actions taken by those higher layers are outside the scope of this standard, but may include beginning preparations for handover.

6.4.7.4 MSGCF-ESS-Link-Event-Rollback.indication

6.4.7.4.1 Function

This event is used to indicate that specific previous reports or events are no longer valid and should be disregarded.

6.4.7.4.2 Semantics of the service primitive

The event parameters are as follows:

```
MSGCF-ESS-Link-Event-Rollback.indication(
                                         NonAPSTAMacAddress,
                                         ESSIdentifier,
                                         EventID
                                         )
```

Name	Type	Valid range	Description
NonAPSTAMac Address	MacAddress	Any valid individual MAC Address	The MAC address of the non-AP STA that is reporting that a previous event relating to an IEEE 802.11 ESS is no longer valid.
ESSIdentifier	String	N/A	An identifier for the network, composed of the string value of the SSID element used to identify the network, concatenated with the value of the HESSID if it is in use.
EventID	Integer	N/A	An integer used to identify the event that is used in the case of event rollback.

6.4.7.4.3 When generated

This event is generated when a previous predictive event is no longer valid within its expiration time.

MSGCF-ESS-Link-Event-Rollback.indication is used in conjunction with MSGCF-ESS-Link-Going-Down. MSGCF-ESS-Link-Event-Rollback.indication events are issued when the prediction of link failure is no longer valid. Algorithms used to determine that link failure predictions are beyond the scope of this standard.

6.4.7.4.4 Effect of receipt

This event is made available to higher layer protocols by the convergence function to cancel any actions begun by the previous event. Actions taken by those higher layers are outside the scope of this standard, but may include cancelling any handover procedures started by the MSGCF-ESS-Link-Going-Down event.

6.4.7.5 MSGCF-ESS-Link-Detected.indication

6.4.7.5.1 Function

This event reports on the presence of a new IEEE 802.11 ESS.

6.4.7.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MSGCF-ESS-Link-Detected.indication(
                                   NonAPSTAMacAddress,
                                   ESSIdentifier,
                                   ESSDescription
                                   )
```

Name	Type	Valid range	Description
NonAPSTAMacAddress	MacAddress	Any valid individual MAC Address	The MAC address of the non-AP STA that is reporting the new network.
ESSIdentifier	String	N/A	An identifier for the network, composed of the string value of the SSID used to identify the network, concatenated with the value of the HESSID if it is in use.
ESSDescription	As defined in Table 6-4	N/A	A set of information about the ESS.

Table 6-4—ESS description

Name	Syntax	Description
SSID	String	The SSID used by the ESS.
InformationServiceSupport	As described in Table 6-5	A set of values indicating the type of information services supported on this network.
TriggerSupport	As described in Table 6-5	A set of values indicating the support for the types of triggers that can be used to propose that the station take action.
RSN	As defined in 8.4.2.27	The RSN configuration of the ESS.
Interworking	As defined in 8.4.2.94	Interworking configuration of the ESS.

Table 6-5—Trigger support values

Name	Description
MIH_CS_ES_Support	This network supports the IEEE 802.21 MIH Command Service and Event Service.
Vendor_Specific_Trigger_Support	This network supports a vendor-specific trigger service.

6.4.7.5.3 When generated

Support for MIH is indicated by the presence or absence of the relevant Advertisement Protocol IDs in the Advertisement Protocol element.To maintain the list of detected networks, the SME issues recurring MLME-SCAN.request primitives to the MLME. The SME may schedule these requests to avoid interruption of user traffic. Responses to these requests, received in the MLME-SCAN.confirm primitives, contain a list of detected networks. Each network is stored in the MIB in the dot11MACStateESSLinkDetectedTable. This table holds a list of networks, organized by Network Identifier. Each entry in the table contains a list of

BSSIDs within the network, as well as indications of support for MIH. Support for MIH is indicated by the presence or absence of the relevant Advertisement Protocol IDs in the Advertisement Protocol element. Each entry in the table is held for at least dot11ESSLinkDetectionHoldInterval time units. When a non-AP STA has not observed an ESS for longer than dot11ESSLinkDetectionHoldInterval, it may be removed from the table.

This event is generated when a new entry is made into the dot11MACStateESSLinkDetectedTable. Modifications to existing entries in the list, such as an update to the BSSID list, do not trigger this event.

6.4.7.5.4 Effect of receipt

This event is made available to higher layer protocols by the convergence function. Actions taken by those higher layers are outside the scope of this standard.

6.4.7.6 MSGCF-ESS-Link-Scan.request

6.4.7.6.1 Function

This function is used by higher layer protocols to request that the SME perform a scan operation for available ESSs.

6.4.7.6.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MSGCF-ESS-Link-Scan.request(
                                    SSID,
                                    HESSID,
                                    AccessNetworkType
                                    )
```

Name	Type	Valid range	Description
SSID	Octet string	0–32 octets	Specific or wildcard.
HESSID	As defined in 8.4.2.94	As defined in 8.4.2.94	The HESSID to search for. It can be set to all 1s for use as a wildcard to match all available HESSID values.
AccessNetworkType	As defined in 8.4.2.94	As defined in 8.4.2.94	This may be a specific value to match one type of networks, or all 1s to match all access network types.

6.4.7.6.3 When generated

This request is generated when higher protocol layers request a list of available ESSs.

6.4.7.6.4 Effect of receipt

The SME generates a corresponding MLME-SCAN.request primitive to find available networks.

6.4.7.7 MSGCF-ESS-Link-Scan.confirm

6.4.7.7.1 Function

This function reports information on available ESSs to higher protocol layers.

6.4.7.7.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MSGCF-ESS-Link-Scan.confirm(
                              NonAPSTAMacAddress,
                              ESSIdentifiers,
                              ESSDescriptions
                              )
```

Name	Type	Valid range	Description
NonAPSTAMacAddress	MacAddress	Any valid individual MAC Address	The MAC address of the non-AP STA that is reporting the new network.
ESSIdentifiers	Set of Strings	N/A	An identifier for the network composed of the string value of the SSID used to identify the network, concatenated with the value of the HESSID if it is in use.
ESSDescriptions	Set of ESSDescriptions, as defined in Table 6-4	N/A	A set of information about each discovered ESS.

6.4.7.7.3 When generated

This primitive is generated when scan results are available for reporting to higher protocol layers, in response to an MSGCF-ESS-Link-Scan.request primitive.

6.4.7.7.4 Effect of receipt

This event is made available to higher layer protocols by the convergence function. Actions taken by those higher layers are outside the scope of this standard.

6.4.8 Network configuration

6.4.8.1 MSGCF-ESS-Link-Capability.request

6.4.8.1.1 Function

This primitive requests a list of the capabilities supported by a network.

6.4.8.1.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MSGCF-ESS-Link-Capability.request(
                              NonAPSTAMacAddress,
                              ESSIdentifier
                              )
```

Name	Type	Valid range	Description
NonAPSTAMac Address	MacAddress	Any valid individual MAC Address	The MAC address of the non-AP STA that is reporting the new network.
ESSIdentifier	String	N/A	An identifier for the network, composed of the string value of the SSID element used to identify the network, concatenated with the value of the HESSID if it is in use.

6.4.8.1.3 When generated

This primitive is issued to service higher layer protocols by reporting on the capabilities of a particular network.

6.4.8.1.4 Effect of receipt

The convergence function retrieves the capabilities and reports them via the MSGCF-ESS-Link-Capability.confirm primitive.

6.4.8.2 MSGCF-ESS-Link-Capability.confirm

6.4.8.2.1 Function

This primitive reports the convergence function capabilities of the network to higher layer protocols.

6.4.8.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MSGCF-ESS-Link-Capability.confirm(
                                  NonAPSTAMacAddress,
                                  ESSIdentifier,
                                  EssLinkParameterSet,
                                  ReasonCode
                                  )
```

Name	Type	Valid range	Description
NonAPSTAMac Address	MacAddress	Any valid individual MAC Address	The MAC address of the non-AP STA that is reporting the new network.
ESSIdentifier	String	N/A	An identifier for the network, composed of the string value of the SSID element used to identify the network, concatenated with the value of the HESSID if it is in use.
EventCapability Set	As defined in Table 6-6	N/A	list of supported events.
ReasonCode	Enumerated	SUCCESS, UNKNOWN_NETWORK, UNKNOWN_CAPABILITIES	An error code, if applicable.

Table 6-6—Event Capability Set

Name	Type	Valid range	Description
NonAPSTAMacAddress	MacAddress	Any valid individual MAC Address	The MAC address of the non-AP STA that is reporting the new network.
ESS-Link-Up	Boolean	true, false	Indicates whether the MSGCF-ESS-Link-Up.indication event as defined in 6.4.7.1 is supported.
ESS-Link-Down	Boolean	true, false	Indicates whether the MSGCF-ESS-Link-Down.indication event as defined in 6.4.7.2 is supported.
ESS-Link-Going-Down	Boolean	true, false	Indicates whether the MSGCF-ESS-Link-Going-Down event as defined in 6.4.7.3 is supported.
ESS-Link-Event-Rollback	Boolean	true, false	Indicates whether the MSGCF-ESS-Link-Event-Rollback.indication event as defined in 6.4.7.4 is supported.
ESS-Link-Detected	Boolean	true, false	Indicates whether the MSGCF-ESS-Link-Detected.indication event as defined in 6.4.7.5 is supported.
ESS-Link-Threshold-Report	Boolean	true, false	Indicates whether the MSGCF-ESS-Link-Threshold-Report.indication event as defined in 6.4.9.1 is supported.
ESS-Link-Command	Boolean	true, false	Indicates whether the MSGCF-ESS-Link-Command.request primitive as defined in 6.4.10.1 is supported.

6.4.8.2.3 When generated

This primitive is generated in response to the MSGCF-ESS-Link-Capability.request primitive to report whether specific events are supported.

6.4.8.2.4 Effect of receipt

This event is made available to higher layer protocols by the convergence function.

6.4.8.3 MSGCF-Set-ESS-Link-Parameters.request

6.4.8.3.1 Function

This primitive sets thresholds for reporting of network events.

6.4.8.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MSGCF-Set-ESS-Link-Parameters.request(
                                    NonAPSTAMacAddress,
                                    ESSIdentifier,
                                    EssLinkParameterSet
                                    )
```

Name	Type	Valid range	Description
NonAPSTAMacAddress	MacAddress	Any valid individual MAC Address	The MAC address of the non-AP STA that is reporting the new network.
ESSIdentifier	String	N/A	An identifier for the network, composed of the string value of the SSID element used to identify the network, concatenated with the value of the HESSID if it is in use.
ESSLinkParameterSet	As defined in Table 6-7	N/A	The EssLinkParameterSet is used to configure when event reports are sent to higher protocol layers.

The ESSLinkParameterSet parameter is defined in Table 6-7. It may include any or all of the elements in Table 6-7.

Table 6-7—ESS Link Parameter Set

Name	Type	Valid range	Description
PeakOperationalRate	Integer	As defined in 8.4.2.3	The integer representing the desired peak modulation data rate used for data frame transmission.
MinimumOperationalRate	Integer	As defined in 8.4.2.3	The integer encoding of the desired minimum modulation data rate used in data frame transmission.
NetworkDowntimeInterval	Integer	0 – 65 535	Desired advance warning time interval, in TUs, for MSGCF-ESS-Link-Going-Down events.
DataFrameRSSI	Integer	–100 to 40	The received signal strength in dBm of received Data frames from the network. This may be time-averaged over recent history by a vendor-specific smoothing function.
BeaconRSSI	Integer	–100 to 40	The received signal strength in dBm of Beacon frames received on the channel. This may be time-averaged over recent history by a vendor-specific smoothing function.
BeaconSNR	Integer	0–100	The signal to noise ratio of the received data frames, in dB. This may be time-averaged over recent history by a vendor-specific smoothing function.
DataFrameSNR	Integer	0–100	The signal to noise ratio of the received Beacon frames, in dB. This may be time-averaged over recent history by a vendor-specific smoothing function.
DataThroughput	Integer	0 – 65 535	The data throughput in megabits per second, rounded to the nearest megabit. This may be time-averaged over recent history by a vendor-specific smoothing function.
MissedBeaconRate	Real	N/A	The rate at which beacons have not been received in missed beacons per second. This may be time-averaged over recent history by a vendor-specific smoothing function.

Table 6-7—ESS Link Parameter Set *(continued)*

Name	Type	Valid range	Description
FrameErrorRate	Real	N/A	The frame error rate of the network in errors per second. This may be time-averaged over recent history by a vendor-specific smoothing function.
VendorSpecific	Vendor Specific	As defined by 8.4.2.28	Additional vendor-specific parameters may be included in this event.

6.4.8.3.3 When generated

This event is generated when higher protocol layers wish to set the performance parameters for a network. Higher protocol layers are responsible for ensuring that the set of configured network parameters is consistent with all subscribers to those higher layer protocols.

6.4.8.3.4 Effect of receipt

Parameters supplied in the event are stored in the MIB, either in the dot11MACStateConfigTable or the dot11MACStateParameterTable.

6.4.8.4 MSGCF-Set-ESS-Link-Parameters.confirm

6.4.8.4.1 Function

This primitive indicates whether network parameters were accepted.

6.4.8.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MSGCF-Set-ESS-Link-Parameters.confirm(
                                      NonAPStaMacAddress,
                                      ESSIdentifier,
                                      EssLinkParameterSet,
                                      )
```

Name	Type	Valid range	Description
NonAPSTAMac Address	MacAddress	Any valid individual MAC Address	The MAC address of the non-AP STA that is reporting the new network.
ESSIdentifier	String	N/A	An identifier for the network, composed of the string value of the SSID element used to identify the network, concatenated with the value of the HESSID if it is in use.
EssLinkParamete rSet	As defined in Table 6-7	N/A	The EssLinkParameterSet is used to configure when event reports are sent to higher protocol layers.

6.4.8.4.3 When generated

This primitive is generated in response to the MSGCF-Set-ESS-Link-Parameters.request primitive and is used to indicate whether the parameter set was accepted.

6.4.8.4.4 Effect of receipt

The SME is notified of the new parameter set.

6.4.8.5 MSGCF-Get-ESS-Link-Parameters.request

6.4.8.5.1 Function

This primitive retrieves the current network parameters for a specific network.

6.4.8.5.2 Semantics of the service primitive

The primitive parameter is as follows:

```
MSGCF-Get-ESS-Link-Parameters.request(
                                      ESSIdentifier
                                      )
```

Name	Type	Valid range	Description
ESSIdentifier	String	N/A	An identifier for the network, composed of the string value of the SSID element used to identify the network, concatenated with the value of the HESSID if it is in use.

6.4.8.5.3 When generated

This primitive is used by higher layers to retrieve the currently stored parameters for a network.

6.4.8.5.4 Effect of receipt

The SME retrieves the network parameters and makes them available through the MSGCF-Get-ESS-Link-Parameters.confirm primitive.

6.4.8.6 MSGCF-Get-ESS-Link-Parameters.confirm

6.4.8.6.1 Function

This primitive reports the current network parameters.

6.4.8.6.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MSGCF-Get-ESS-Link-Parameters.confirm(
                                      ESSIdentifier,
                                      EssLinkParameterSet,
                                      )
```

Name	Type	Valid range	Description
ESSIdentifier	String	N/A	An identifier for the network, composed of the string value of the SSID element used to identify the network, concatenated with the value of the HESSID if it is in use.
EssLinkParameterSet	As defined 6.4.8.3	N/A	The EssLinkParameterSet is used to configure when event reports are sent to higher protocol layers.

6.4.8.6.3 When generated

This primitive is generated by the MSGCF as a result of the MSGCF-Get-ESS-Link-Parameters.request primitive.

6.4.8.6.4 Effect of receipt

The higher layer protocols are notified of the current network parameters.

6.4.9 Network events

6.4.9.1 MSGCF-ESS-Link-Threshold-Report.indication

6.4.9.1.1 Function

This event reports that the layer 2 network performance has crossed a threshold set by the operations described in Table 6-5.

6.4.9.1.2 Semantics of the service primitive

The primitive parameters are as follows:

```
   MSGCF-ESS-Link-Threshold-Report.indication(
                                   NonAPSTAMacAddress,
                                   ESSIdentifier,
                                   EssLinkParameterSet,
                                   ThresholdCrossingDirectionSet
                                   )
```

Name	Type	Valid range	Description
NonAPSTAMacAddress	MacAddress	Any valid individual MAC Address	The MAC address of the non-AP STA that is reporting the threshold crossing.
ESSIdentifier	String	N/A	An identifier for the network, composed of the string value of the SSID element used to identify the network, concatenated with the value of the HESSID if it is in use.
EssLinkParameterSet	As defined in Table 6-7	N/A	A list of EssLinkParameterSets and their current values that have crossed preset thresholds for alerts.
ThresholdCrossingDirectionSet	Set of ThresholdCrossing Directions, one for each value in the EssLinkParameterSet	UPWARD, DOWNWARD	Whether the parameter has crossed the threshold while rising or falling.

6.4.9.1.3 When generated

The convergence function is responsible for monitoring network performance. If the monitored parameters cross the configured threshold, this event is generated to inform higher layer protocols.

6.4.9.1.4 Effect of receipt

This event is made available to higher layer protocols by the convergence function. Actions taken by those higher layers are outside the scope of this standard, but may include preparations for handover or assessing whether handover should be imminent.

6.4.10 Network command interface

6.4.10.1 MSGCF-ESS-Link-Command.request

6.4.10.1.1 Function

This primitive requests that a STA take action for a network.

6.4.10.1.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MSGCF-ESS-Link-Command.request(
                                    NonAPSTAMacAddress,
                                    ESSIdentifier,
                                    CommandType
                                    )
```

Name	Type	Valid range	Description
NonAPSTAMacAddress	MacAddress	Any valid individual MAC Address	The MAC address of the non-AP STA that is reporting the threshold crossing.
ESSIdentifier	String	N/A	An identifier for the network, composed of the string value of the SSID element used to identify the network, concatenated with the value of the HESSID if it is in use.
CommandType	Enumerated	DISCONNECT, LOW_POWER, POWER_UP, POWER_DOWN, SCAN	Type of command to perform on the link as described in the following subclauses.

6.4.10.1.3 When generated

This primitive is generated by a higher layer protocol.

6.4.10.1.4 Effect of receipt

The convergence function issues commands to the SME to implement the requested action on behalf of higher layers.

When the DISCONNECT command type is specified, the higher layer is requesting that the STA disconnect from its peer. When the SME on a non-AP STA receives this command, the SME issues an MLME-DEAUTHENTICATE.request to disconnect from the network, and the SME refrains from reconnecting to that network.

When the POWER_DOWN command type is specified, the SME powers down the non-AP STA. Before doing so, it may choose to notify the AP.

When the POWER_UP command type is specified, the SME starts the non-AP STA.

When the LOW_POWER command type is specified, the higher layer is requesting that the IEEE 802.11 interface be placed in a low power mode. This action is accomplished by issuing an MLME-POWERMGT.request primitive with the PowerManagementMode parameter set to POWER_SAVE.

When the SCAN command type is specified, the higher layer is requesting that the STA search for IEEE 802.11 networks. This action is accomplished by issuing an MLME-SCAN.request primitive. Detected networks are made available in the dot11MACStateESSLinkDetectedTable, as well as through the MSGCF-ESS-Link-Detected.indication event.

6.4.11 MAC state SME SAP—mobility management

6.4.11.1 MSSME-ESS-Link-Down-Predicted.indication

6.4.11.1.1 Function

This primitive indicates that the SME is predicting a link failure.

6.4.11.1.2 Semantics of the service primitive

The primitive parameters are as follows:

```
   MSSME-ESS-Link-Going-Down.indication(
                                       NonAPSTAMacAddress,
                                       ESSIdentifier,
                                       TimeInterval,
                                       ReasonCode
                                       )
```

Name	Type	Valid range	Description
NonAPSTAMac Address	MacAddress	Any valid individual MAC Address	The MAC address of the non-AP STA that is reporting that an IEEE 802.11 ESS is expected to go down.
ESSIdentifier	String	N/A	An identifier for the network, composed of the string value of the SSID element used to identify the network, concatenated with the value of the HESSID if it is in use.
TimeInterval	Integer	N/A	Time Interval, in time units, in which the link is expected to go down. Connectivity is expected to be available at least for time specified by *TimeInterval*.
Reason Code	Enumerated	EXPLICIT_DISCONNECT, LINK_PARAMETER_DEGRADATION, KEY_EXPIRATION, LOW_POWER, QOS_UNAVAILABLE, VENDOR_SPECIFIC	Indicates the reason the link is expected to go down.

6.4.11.1.3 When generated

This notification is generated by the SME when the IEEE 802.11 network connection is currently established and is expected to go down. The details of the predictive algorithm used are beyond the scope of this standard. One method of implementing this function would be to generate this indication when link quality is fading and no better AP can be found.

6.4.11.1.4 Effect of receipt

This indication is received by the MSGCF and is used to generate the MSGCF-ESS-Link-Down.indication event due to link parameter degradation.

6.5 PLME SAP interface

6.5.1 General

The PHY management service interface consists of the generic PLMEGET and PLMESET primitives on PHY MIB attributes, as described previously, together with the PLME-RESET and PLME-CHARACTERISTICS primitives and the following specific primitives.

6.5.2 PLME-RESET.request

6.5.2.1 Function

This primitive is a request by the SME to reset the PHY. The PHY is always reset to the receive state to avoid accidental data transmission.

6.5.2.2 Semantics of the service primitive

This primitive has no parameters.

6.5.2.3 When generated

This primitive is generated at any time to reset the PHY.

6.5.2.4 Effect of receipt

Receipt of this primitive by the PHY causes the PHY entity to reset both the transmit and the receive state machines and places the PHY into the receive state.

6.5.3 PLME-CHARACTERISTICS.request

6.5.3.1 Function

This primitive is a request by the SME to provide the PHY operational characteristics.

6.5.3.2 Semantics of the service primitive

This primitive has no parameters.

6.5.3.3 When generated

This primitive is generated by the SME, at initialization time, to request the PHY entity to provide its operational characteristics.

6.5.3.4 Effect of receipt

The effect of receipt of this primitive by the PHY entity is the generation of a PLME-CHARACTERISTICS. confirm primitive that conveys its operational characteristics.

6.5.4 PLME-CHARACTERISTICS.confirm

6.5.4.1 Function

This primitive provides the PHY operational parameters.

6.5.4.2 Semantics of the service primitive

The primitive provides the following parameters:

```
PLME-CHARACTERISTICS.confirm(
                                        aSlotTime,
                                        aSIFSTime,
                                        aSignalExtension,
                                        aCCATime,
                                        aPHY-RX-START-Delay,
                                        aRxTxTurnaroundTime,
                                        aTxPLCPDelay,
                                        aRxPLCPDelay,
                                        aRxTxSwitchTime,
                                        aTxRampOnTime,
                                        aTxRampOffTime,
                                        aTxRFDelay,
                                        aRxRFDelay,
                                        aAirPropagationTime,
                                        aMACProcessingDelay,
                                        aPreambleLength,
                                        aRIFSTime,
                                        aSymbolLength,
                                        aSTFOneLength,
                                        aSTFTwoLength,
                                        aLTFOneLength,
                                        aLTFTwoLength,
                                        aPLCPHeaderLength,
                                        aPLCPSigTwoLength,
                                        aPLCPServiceLength,
                                        aPLCPConvolutionalTailLength,
                                        aMPDUDurationFactor,
                                        aMPDUMaxLength,
                                        aPSDUMaxLength,
                                        aPPDUMaxTime,
                                        aIUSTime,
                                        aDTT2UTTTime,
                                        aCWmin,
                                        aCWmax,
                                        aMaxCSIMatricesReportDelay
                                        aMaxTODError,
                                        aMaxTOAError,
                                        aTxPmdTxStartRFDelay,
                                        aTxPmdTxStartRMS
                                        )
```

The values assigned to the parameters is as specified in the PLME SAP interface specification contained within each PHY subclass of this standard. The parameter aMPDUDurationFactor is not used by all PHYs defined within this standard. The parameters aSignalExtension, aRIFSTime, aSymbolLength, aSTFOneLength, aSTFTwoLength, aLTFOneLength, aLTFTwoLength, aPLCPSigTwoLength, aPLCPServiceLength, aPLCPConvolutionalTailLength, aMPDUDurationFactor, aMPDUMaxLength, aPSDUMaxLength, aPPDUMaxTime, aIUSTime, aDTT2UTTTime, and aMaxCSIMatricesReportDelay are not used by all PHYs defined within this standard.

Name	Type	Description
aSlotTime	integer	The Slot Time (in microseconds) that the MAC uses for defining the PIFS and DIFS periods. See 9.3.7.
aSIFSTime	integer	The nominal time (in microseconds) that the MAC and PHY require in order to receive the last symbol of a frame at the air interface, process the frame, and respond with the first symbol on the air interface of the earliest possible response frame. See 9.3.7.
aSignalExtension	integer	Duration (in microseconds) of the signal extension (i.e., a period of no transmission) that is included at the end of certain PPDU formats; see 20.3.2 and 9.3.8.
aCCATime	integer	The maximum time (in microseconds) the CCA mechanism has available to assess the medium within every time slot to determine whether the medium is busy or idle.
aPHY-RX-START-Delay	integer	The delay, in microseconds, from a point in time specified by the PHY to the issuance of the PHY-RXSTART.indication primitive.
aRxTxTurnaroundTime	integer	The maximum time (in microseconds) that the PHY requires to change from receiving to transmitting the start of the first symbol. The following equation is used to derive the RxTxTurnaroundTime: aTxPLCPDelay + aRxTxSwitchTime + aTxRampOnTime + aTxRFDelay.
aTxPLCPDelay	integer	The nominal time (in microseconds) that the PLCP uses to deliver a symbol from the MAC interface to the transmit data path of the physical medium dependent (PMD).
aRxPLCPDelay	integer	The nominal time (in microseconds) that the PLCP uses to deliver the last bit of a received frame from the PMD receive path to the MAC.
aRxTxSwitchTime	integer	The nominal time (in microseconds) that the PMD takes to switch from Receive to Transmit.
aTxRampOnTime	integer	The maximum time (in microseconds) that the PMD takes to turn the Transmitter on.
aTxRampOffTime	integer	The nominal time (in microseconds) that the PMD takes to turn the Transmit Power Amplifier off.
aTxRFDelay	integer	The nominal time (in microseconds) between the issuance of a PMD_DATA.request primitive to the PMD and the start of the corresponding symbol at the air interface. The start of a symbol is defined to be 1/2 symbol period prior to the center of the symbol for FH, or 1/2 chip period prior to the center of the first chip of the symbol for DS, or 1/2 slot time prior to the center of the corresponding slot for infrared (IR).
aRxRFDelay	integer	The nominal time (in microseconds) between the end of a symbol at the air interface to the issuance of a PMD_DATA.indication primitive to the PLCP. The end of a symbol is defined to be 1/2 symbol period after the center of the symbol for FH, or 1/2 chip period after the center of the last chip of the symbol for DS, or 1/2 slot time after the center of the corresponding slot for IR.
aAirPropagationTime	integer	Twice the propagation time (in microseconds) for a signal to cross the maximum distance between the most distant allowable STAs that are slot synchronized.
aMACProcessingDelay	integer	The maximum time (in microseconds) available for the MAC to issue a PHY-TXSTART.request primitive pursuant to a PHY-RXEND.indication primitive (for response after SIFS) or PHY-CCA.indication(IDLE) primitive (for response at any slot boundary following a SIFS). This constraint on MAC performance is defined as a PHY-specific parameter because of its use, along with other PHY-specific time delays, in calculating the two PHY characteristics of primary concern to the MAC: aSlotTime and aSIFSTime. The relationship between aMACProcessingTime and the IFS and slot timing is described in 9.3.7 and illustrated in Figure 9-14.
aPreambleLength	integer	The current PHY's preamble length (in microseconds). If the actual value of the length of the modulated preamble is not an integral number of microseconds, the value is rounded up to the next higher value.

Name	Type	Description
aRIFSTime	integer	Value of the reduced interframe space (in microseconds), which is the time by which multiple transmissions from a single transmitter may be separated, when no SIFS-separated response transmission is expected. See 9.3.2.3.2
aSymbolLength	integer	The current PHY's Symbol length (in microseconds). If the actual value of the length is not an integral number of μs, the value is rounded up to the next higher value.
aSTFOneLength	integer	Length of the non-HT-STF (L-STF) for HT-mixed format, and the HT-greenfield STF (HT-GF-STF) for HT-greenfield format (in microseconds)
aSTFTwoLength	integer	Length of the HT-STF (in microseconds)
aLTFOneLength	integer	Length of the First HT-LTF (in microseconds)
aLTFTwoLength	integer	Length of the Additional HT-LTFs (in microseconds)
aPLCPHeaderLength	integer	The current PHY's PLCP header length (in microseconds), excluding aPLCPSigTwoLength if present. If the actual value of the length of the modulated header is not an integral number of microseconds, the value is rounded up to the next higher value.
aPLCPSigTwoLength	integer	Length of the HT SIGNAL field (HT-SIG) (in microseconds).
aPLCPServiceLength	integer	The length of the PLCP SERVICE field (in number of bits).
aPLCPConvolutionalTail Length	integer	The length of the sequence of convolutional code tail bits (in number of bits).
aMPDUDurationFactor	integer	The overhead added by the PHY to the MPDU as it is transmitted through the WM expressed as a scaling factor applied to the number of bits in the MPDU. The value of aMPDUDurationFactor is generated by the following equation: Truncate[((PPDUbits/PSDUbits)–1) × 10^9)]. The total time to transmit a PPDU over the air is generated by the following equation rounded up to the next integer μs: aPreambleLength + aPLCPHeaderLength + (((aMPDUDurationFactor × 8 × PSDUoctets) / 10^9) + (8 × PSDUoctets)) / data rate where data rate is in Mb/s. The total time (in μs) to the beginning of any octet in a PPDU from the first symbol of the preamble can be calculated using the duration factor in the following equation: Truncate[aPreambleLength + aPLCPHeaderLength + (((aMPDUDurationFactor × 8 × N) / 10^9) + (8 × N)) / data rate] + 1, where data rate is in Mb/s and where *N* counts the number of octets in the PPDU prior to the desired octet, but does not count the number of octets in the preamble PLCP header.
aMPDUMaxLength	integer	The maximum number of octets in an MPDU that can be conveyed by a PLCP protocol data unit (PPDU).
aPSDUMaxLength	integer	The maximum number of octets in a PSDU that can be conveyed by a PPDU.
aPPDUMaxTime	integer	The maximum duration of a PPDU in milliseconds.
aIUSTime	integer	The minimum time between the end of a PSMP-UTT and the start of the following PSMP-UTT in the same PSMP sequence.
aDTT2UTTTime	integer	The minimum time between the end of a PSMP-DTT and the start of the PSMP-UTT addressed to the same STA.
aCWmin	integer	The minimum size of the CW, in units of aSlotTime.
aCWmax	integer	The maximum size of the CW, in units of aSlotTime.
aMaxCSIMatriesReport Delay	integer	The maximum time (in milliseconds) between the reception of a frame containing a CSI Feedback Request or an NDP announcement and the transmission of the first CSI frame containing channel state information measured from the received Sounding Complete frame. See 9.29.2.4.4.
aMaxTODError	Integer	An estimate of the maximum error (in 10 ns units) in the TX_START_OF_FRAME_OFFSET value in the PHY-TXSTART.confirm(TXSTATUS) primitive. The estimated maximum error includes any error due to implementation component and environmental (including temperature) variability.

Name	Type	Description
aMaxTOAError	Integer	An estimate of the maximum error (in 10 ns units) in the RX_START_OF_FRAME_OFFSET value in the PHY-RXSTART.indicate(RXVECTOR) primitive. The estimated maximum error includes any error due to implementation component and environmental (including temperature) variability.
aTxPmdTxStartRFDelay	Integer	The delay (in units of 0.5 ns) between PMD_TXSTART.request being issued and the first frame energy sent by the transmitting port, for the current channel.
aTxPmdTxStartRMS	Integer	The RMS time of departure error (in units of 0.5 ns), where the time of departure error equals the difference between TIME_OF_DEPARTURE and the time of departure measured by a reference entity using a clock synchronized to the start time and mean frequency of the local PHY entity's clock.

6.5.4.3 When generated

This primitive is issued by the PHY entity in response to a PLME-CHARACTERISTICS.request primitive.

6.5.4.4 Effect of receipt

The receipt of this primitive provides the operational characteristics of the PHY entity.

6.5.5 PLME-DSSSTESTMODE.request

6.5.5.1 Function

This primitive requests that the DSSS PHY entity enter a test mode operation. The parameters associated with this primitive are considered as recommendations and are optional in any particular implementation.

6.5.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
PLME-DSSSTESTMODE.request(
                              TEST_ENABLE,
                              TEST_MODE,
                              SCRAMBLE_STATE,
                              SPREADING_STATE,
                              DATA_TYPE,
                              DATA_RATE;
                              PREAMBLE_TYPE;
                              MODULATION_CODE_TYPE;
                              )
```

Name	Type	Valid range	Description
TEST_ENABLE	Boolean	true, false	If true, enables the PHY test mode according to the remaining parameters.
TEST_MODE	integer	1, 2, 3	TEST_MODE selects one of three operational states: 01 = transparent receive 02 = continuous transmit 03 = 50% duty cycle
SCRAMBLE_STATE	Boolean	true, false	If true, sets the operational state of the scrambler to ON.

Name	Type	Valid range	Description
SPREADING_STATE	Boolean	true, false	If true, selects the operational state of the chipping.
DATA_TYPE	integer	1, 2, 3	Selects one of three data patterns to be used for the transmit portions of the tests, e.g., all ones, all zeros, and random data patterns.
DATA_RATE	integer	2, 3, 4, 5, 6, 9, 11, 12, 18, 22, 24, 27, 36, 44, 48, 54, 66, 72, 96, 108	Selects among rates: 02 = 1 Mb/s 03 = 1.5 Mb/s 04 = 2 Mb/s 05 = 2.5 Mb/s 06 = 3 Mb/s 09 = 4.5 Mb/s 11 = 5.5 Mb/s 12 = 6 Mb/s 18 = 9 Mb/s 22 = 11 Mb/s 24 = 12 Mb/s 27 = 13.5 Mb/s 36 = 18 Mb/s 44 = 22 Mb/s 48 = 24 Mb/s 54 = 27 Mb/s 66 = 33 Mb/s 72 = 36 Mb/s 96 = 48 Mb/s 108 = 54 Mb/s
PREAMBLE_TYPE	Boolean	null, 0, 1	Selects the preamble length: 0 = long 1 = short Can be null.
MODULATION_CODE_TYPE	Integer	null, 0, 1, 2	Selects among modulation options: 0 = no optional modulation modes 1 = optional ERP-PBCC modes 2 = optional DSSS-OFDM modes Can be null.

The rate for DATA_Rate=05 is rounded up to the next higher 0.5 Mb/s value.

6.5.5.3 When generated

This primitive is generated at any time to enter the DSSS PHY test mode.

6.5.5.4 Effect of receipt

Receipt of this primitive by the PHY causes the DSSS PHY entity to enter the test mode of operation.

6.5.6 PLME-DSSSTESTOUTPUT.request

6.5.6.1 Function

This optional primitive is a request by the SME to enable selected test signals from the PHY. The parameters associated with this primitive are considered as recommendations and are optional in any particular implementation.

6.5.6.2 Semantics of the service primitive

The primitive parameter is as follows:

```
PLME-DSSSTESTOUTPUT.request(
                              TEST_OUTPUT
                              )
```

Name	Type	Valid range	Description
TEST_OUTPUT	Boolean	true, false	If true, enables the selected test signals for testing DS PHY.

TEST_OUTPUT enables and disables selected signals for debugging and testing the PHY. Some signals that can be available for output are the PHY-TXSTART.request, PHY-RXSTART.indication(RXVECTOR), and PHY-CCA.indication primitives, the chipping clock, the data clock, the symbol clock, transmit (TX) data, and receive (RX) data.

6.5.6.3 When generated

This primitive is generated at any time to enable the test outputs when in the DSSS PHY test mode.

6.5.6.4 Effect of receipt

Receipt of this primitive by the DSSS PHY causes the DSSS PHY entity to enable the test outputs using the modes set by the most recent PLME-DSSSTESTMODE.request primitive.

6.5.7 PLME-TXTIME.request

6.5.7.1 Function

This primitive is a request for the PHY to calculate the time required to transmit onto the WM a PPDU containing a specified length PSDU, and using a specified format, data rate, and signalling.

6.5.7.2 Semantics of the service primitive

This primitive provides the following parameter:

```
PLME-TXTIME.request(
                          TXVECTOR
                          )
```

The TXVECTOR represents a list of parameters that the MAC sublayer provides to the local PHY entity in order to transmit a PSDU, as further described in 7.3.4.5, 18.4 and 20.4 (which defines the local PHY entity).

6.5.7.3 When generated

This primitive is issued by the MAC sublayer to the PHY entity when the MAC sublayer needs to determine the time required to transmit a particular PSDU.

6.5.7.4 Effect of receipt

The effect of receipt of this primitive by the PHY entity is to generate a PHY-TXTIME.confirm primitive that conveys the required transmission time.

6.5.8 PLME-TXTIME.confirm

6.5.8.1 Function

This primitive indicates the time required to transmit the PPDU described in the corresponding PLME-TXTIME.request.

6.5.8.2 Semantics of the service primitive

This primitive provides the following parameter:

```
PLME-TXTIME.confirm(
                                        TXTIME
                                        )
```

The TXTIME represents the time, in microseconds, required to transmit the PPDU described in the corresponding PLME-TXTIME.request primitive. If the calculated time includes a fractional microsecond, the TXTIME value is rounded up to the next higher integer.

6.5.8.3 When generated

This primitive is issued by the local PHY entity in response to a PLME-TXTIME.request primitive.

6.5.8.4 Effect of receipt

The receipt of this primitive provides the MAC sublayer with the PPDU transmission time.

7. PHY service specification

7.1 Scope

The PHY services provided to the IEEE 802.11 WLAN MAC are described in this clause. Different PHYs are defined as part of this standard. Each PHY can consist of two protocol functions as follows:

a) A PHY convergence function, which adapts the capabilities of the PMD system to the PHY service. This function is supported by the PLCP, which defines a method of mapping the IEEE 802.11 MPDUs into a framing format suitable for sending and receiving user data and management information between two or more STAs using the associated PMD system.

b) A PMD system, whose function defines the characteristics of, and method of transmitting and receiving data through, a WM between two or more STAs.

Each PMD sublayer may require the definition of a unique PLCP. If the PMD sublayer already provides the defined PHY services, the PHY convergence function might be null.

7.2 PHY functions

The protocol reference model for the IEEE 802.11 architecture is shown in Figure 4-14 (in 4.9). Most PHY definitions contain three functional entities: the PMD function, the PHY convergence function, and the layer management function.

The PHY service is provided to the MAC entity at the STA through a SAP, called the PHY-SAP, as shown in Figure 4-14. A set of primitives might also be defined to describe the interface between the PLCP sublayer and the PMD sublayer, called the PMD_SAP.

7.3 Detailed PHY service specifications

7.3.1 Scope and field of application

The services provided by the PHY to the IEEE 802.11 MAC are specified in this subclause. These services are described in an abstract way and do not imply any particular implementation or exposed interface.

7.3.2 Overview of the service

The PHY function as shown in Figure 4-14 is separated into two sublayers: the PLCP sublayer and the PMD sublayer. The function of the PLCP sublayer is to provide a mechanism for transferring MPDUs between two or more STAs over the PMD sublayer.

7.3.3 Overview of interactions

The primitives associated with communication between the IEEE 802.11 MAC sublayer and the IEEE 802.11 PHY fall into two basic categories:

a) Service primitives that support MAC peer-to-peer interactions;

b) Service primitives that have local significance and support sublayer-to-sublayer interactions.

7.3.4 Basic service and options

7.3.4.1 General

All of the service primitives described here are considered mandatory unless otherwise specified.

7.3.4.2 PHY-SAP peer-to-peer service primitives

Table 7-1 indicates the primitives for peer-to-peer interactions.

Table 7-1—PHY-SAP peer-to-peer service primitives

Primitive	Request	Indicate	Confirm
PHY-DATA	X	X	X

7.3.4.3 PHY-SAP sublayer-to-sublayer service primitives

Table 7-2 indicates the primitives for sublayer-to-sublayer interactions.

Table 7-2—PHY-SAP sublayer-to-sublayer service primitives

Primitive	Request	Indicate	Confirm
PHY-TXSTART	X		X
PHY-TXEND	X		X
PHY-CCARESET	X		X
PHY-CCA		X	
PHY-RXSTART		X	
PHY-RXEND		X	
PHY-CONFIG	X		X

7.3.4.4 PHY-SAP service primitives parameters

Table 7-3 shows the parameters used by one or more of the PHY-SAP service primitives.

Table 7-3—PHY-SAP service primitive parameters

Parameter	Associated primitive	Value
DATA	PHY-DATA.request PHY-DATA.indication	Octet value X'00'–X'FF'
TXVECTOR	PHY-TXSTART.request	A set of parameters
STATUS	PHY-CCA.indication	(BUSY, [channel-list]) (IDLE)
RXVECTOR	PHY-RXSTART.indication PHY-RXEND.indication	A set of parameters
RXERROR	PHY-RXEND.indication	NoError, FormatViolation, CarrierLost, UnsupportedRate

Table 7-3—PHY-SAP service primitive parameters *(continued)*

Parameter	Associated primitive	Value
IPI-STATE	PHY-CCARESET.request PHY-CCARESET.confirm	IPI-ON, IPI-OFF
IPI-REPORT	PHY-CCA.indication PHY-CCARESET.confirm	A set of IPI values for the preceding time interval
PHYCONFIG_VECTOR	PHY-CONFIG	A set of parameters
TXSTATUS	PHY-TXSTART.confirm	A set of parameters

7.3.4.5 Vector descriptions

Several service primitives include a parameter vector. This vector is a list of parameters that may vary depending on the PHY type. Table 7-4 lists the minimum parameter values required by the MAC or PHY in each of the parameter vectors. Parameters in the vectors that are management rather than MAC may be specific to the PHY and are listed in the clause covering that PHY.

Table 7-4—Vector descriptions

Parameter	Associated vector	Value
DATARATE	TXVECTOR, RXVECTOR	PHY dependent. The name of the field used to specify the Tx data rate and report the Rx data rate may vary for different PHYs.
LENGTH	TXVECTOR, RXVECTOR	PHY dependent
ACTIVE_RXCHAIN_SET	PHYCONFIG_VECTOR	The ACTIVE_RXCHAIN_SET parameter indicates which receive chains of the available receive chains are active. The length of the field is 8 bits. A 1 in bit position *n* indicates that the receive chain numbered *n* is used. At most 4 bits out of 8 may be set to 1.
OPERATING_CHANNEL	PHYCONFIG_VECTOR	The operating channel the PHY is configured use.
CHANNEL_OFFSET	PHYCONFIG_VECTOR	Enumerated type: CH_OFFSET_NONE indicates operation in 20 MHz HT STAs. CH_OFFSET_ABOVE indicates operation in 40 MHz with the secondary channel above the primary. CH_OFFSET_BELOW indicates operation in 40 MHz with the secondary channel below the primary.

The Clause 20 PHY TXVECTOR and RXVECTOR contain additional parameters related to the operation of the Clause 20 PHY modes of operation as described in 20.2. In certain modes of operation, the DATARATE parameter is replaced by a MCS value. The mapping from Clause 20 MCS to data rate is defined in 20.6.

7.3.5 PHY-SAP detailed service specification

7.3.5.1 Introduction

Subclause 7.3.5 describes the services provided by each PHY primitive.

7.3.5.2 PHY-DATA.request

7.3.5.2.1 Function

This primitive defines the transfer of an octet of data from the MAC sublayer to the local PHY entity.

7.3.5.2.2 Semantics of the service primitive

The primitive provides the following parameter:

```
  PHY-DATA.request(
                              DATA
                              )
```

The DATA parameter is an octet of value X'00' to X'FF'.

7.3.5.2.3 When generated

This primitive is generated by the MAC sublayer to transfer an octet of data to the PHY entity. This primitive can only be issued following a transmit initialization response (a PHY-TXSTART.confirm primitive) from the PHY.

7.3.5.2.4 Effect of receipt

The receipt of this primitive by the PHY entity causes the PLCP transmit state machine to transmit an octet of data. When the PHY entity receives the octet, it issues a PHY-DATA.confirm primitive to the MAC sublayer.

7.3.5.3 PHY-DATA.indication

7.3.5.3.1 Function

This primitive indicates the transfer of data from the PHY to the local MAC entity.

7.3.5.3.2 Semantics of the service primitive

The primitive provides the following parameter:

```
  PHY-DATA.indication(
                              DATA
                              )
```

The DATA parameter is an octet of value X'00' to X'FF'.

7.3.5.3.3 When generated

The PHY-DATA.indication primitive is generated by a receiving PHY entity to transfer the received octet of data to the local MAC entity. The time between receipt of the last bit of the provided octet from the WM and the receipt of this primitive by the MAC entity is the sum of aRXRFDelay + aRxPLCPDelay.

7.3.5.3.4 Effect of receipt

The effect of receipt of this primitive by the MAC is unspecified.

7.3.5.4 PHY-DATA.confirm

7.3.5.4.1 Function

This primitive is issued by the PHY to the local MAC entity to confirm the transfer of data from the MAC entity to the PHY.

7.3.5.4.2 Semantics of the service primitive

The semantics of the primitive are as follows:

```
   PHY-DATA.confirm
```

This primitive has no parameters.

7.3.5.4.3 When generated

This primitive is issued by the PHY to the MAC entity when the PLCP has completed the transfer of data from the MAC entity to the PHY. The PHY issues this primitive in response to every PHY-DATA.request primitive issued by the MAC sublayer.

7.3.5.4.4 Effect of receipt

The receipt of this primitive by the MAC causes the MAC to start the next MAC entity request.

7.3.5.5 PHY-TXSTART.request

7.3.5.5.1 Function

This primitive is a request by the MAC sublayer to the local PHY entity to start the transmission of a PSDU.

7.3.5.5.2 Semantics of the service primitive

The primitive provides the following parameter:

```
   PHY-TXSTART.request(
                              TXVECTOR
                              )
```

The TXVECTOR represents a list of parameters that the MAC sublayer provides to the local PHY entity in order to transmit a PSDU. This vector contains both PLCP and PHY management parameters. The minimum required PHY parameters are listed in 7.3.4.5.

7.3.5.5.3 When generated

This primitive is issued by the MAC sublayer to the PHY entity when the MAC sublayer needs to begin the transmission of a PSDU.

7.3.5.5.4 Effect of receipt

The effect of receipt of this primitive by the PHY entity is to start the local transmit state machine.

The behavior expected by the MAC pursuant to the issuance of PHY-TXSTART.request primitive is shown in Figure 9-14 (in 9.3.7).

7.3.5.6 PHY-TXSTART.confirm

7.3.5.6.1 Function

This primitive is issued by the PHY to the local MAC entity to confirm the start of a transmission and to indicate parameters related to the start of the transmission. The PHY issues this primitive in response to every PHY-TXSTART.request primitive issued by the MAC sublayer.

7.3.5.6.2 Semantics of the service primitive

The semantics of the primitive are as follows:

```
PHY-TXSTART.confirm(
                        TXSTATUS
                        )
```

The TXSTATUS represents a list of parameters that the local PHY entity provides to the MAC sublayer related to the transmission of an MPDU. This vector contains both PLCP and PHY operational parameters. The required PHY parameters are listed in 7.3.4.4.

7.3.5.6.3 When generated

This primitive is issued by the PHY to the MAC entity once all of the following conditions are met:

- The PHY has received a PHY-TXSTART.request primitive from the MAC entity.
- The PLCP has issued PMD.TX STATUS.request primitive if dot11MgmtOptionTODActivated is true and the TXVECTOR parameter TIME_OF_DEPARTURE_REQUESTED in the PHY-TXSTART.request(TXVECTOR) primitive is true.
- The PHY is ready to begin accepting outgoing data octets from the MAC.

7.3.5.6.4 Effect of receipt

The receipt of this primitive by the MAC entity causes the MAC to start the transfer of data octets. Parameters in the TXSTATUS vector may be included in transmitted frames so that recipients on multiple channels can compensate for differences in the transmit time of the frames, and so to determine the time differences of air propagation times between transmitter and pairs of recipients and hence to compute the location of the transmitter via multilateration. See Annex T. In addition, the TXSTATUS vector may include the TX_START_OF_FRAME_OFFSET.

7.3.5.7 PHY-TXEND.request

7.3.5.7.1 Function

This primitive is a request by the MAC sublayer to the local PHY entity that the current transmission of the PSDU be completed.

7.3.5.7.2 Semantics of the service primitive

The semantics of the primitive are as follows:

```
PHY-TXEND.request
```

This primitive has no parameters.

7.3.5.7.3 When generated

This primitive is generated when the MAC sublayer has received the last PHY-DATA.confirm primitive from the local PHY entity for the PSDU currently being transferred.

7.3.5.7.4 Effect of receipt

The effect of receipt of this primitive by the local PHY entity is to stop the transmit state machine.

7.3.5.8 PHY-TXEND.confirm

7.3.5.8.1 Function

This primitive is issued by the PHY to the local MAC entity to confirm the completion of a transmission. The PHY issues this primitive in response to every PHY-TXEND.request primitive issued by the MAC sublayer.

7.3.5.8.2 Semantics of the service primitive

The semantics of the primitive are as follows:

```
PHY-TXEND.confirm
```

This primitive has no parameters.

7.3.5.8.3 When generated

This primitive is issued by the PHY to the MAC entity when the PHY has received a PHY-TXEND.request primitive immediately after transmitting the end of the last bit of the last data octet indicating that the symbol containing the last data octet has been transferred and any Signal Extension has expired.

7.3.5.8.4 Effect of receipt

The receipt of this primitive by the MAC entity provides the time reference for the contention backoff protocol.

7.3.5.9 PHY-CCARESET.request

7.3.5.9.1 Function

This primitive is a request by the MAC sublayer to the local PHY entity to reset the CCA state machine and to turn IPI reporting on and off by means of the IPI-STATE parameter.

7.3.5.9.2 Semantics of the service primitive

The primitive provides the following parameter:

```
PHY-CCARESET.request(
                          IPI-STATE
                          )
```

The IPI-STATE parameter is present if dot11RadioMeasurementActivated is true. The IPI-STATE parameter can be one of two values: IPI-ON or IPI-OFF. The parameter value is IPI-ON when the MAC sublayer is requesting the PHY entity to report IPI values when the PHY is neither receiving nor transmitting an MPDU. IPI-ON turns on IPI reporting in the PHY entity. IPI-OFF turns off IPI reporting in the PHY entity.

7.3.5.9.3 When generated

This primitive is generated by the MAC sublayer for the local PHY entity at the end of a NAV timer. This request can be used by some PHY implementations that may synchronize antenna diversity with slot timings.

7.3.5.9.4 Effect of receipt

The effect of receipt of this primitive by the PHY entity is to reset the PLCP CS/CCA timers to the state appropriate for the end of a received frame. If IPI-STATE parameter is IPI-ON, the PHY entity collects IPI values when it is not transmitting or receiving and provides those values to the MAC sublayer using the IPI-REPORT parameter.

7.3.5.10 PHY-CCARESET.confirm

7.3.5.10.1 Function

This primitive is issued by the PHY to the local MAC entity to confirm that the PHY has reset the CCA state machine and to provide observed IPI values when IPI reporting is turned on.

7.3.5.10.2 Semantics of the service primitive

The primitive provides the following parameters:

```
  PHY-CCARESET.confirm(
                              IPI-STATE,
                              IPI-REPORT
                              )
```

The IPI-STATE parameter is present if dot11RadioMeasurementActivated is true. The IPI-STATE parameter can be one of two values: IPI-ON or IPI-OFF. The IPI-STATE value shall be set to the value of IPI-STATE received by the PHY entity in the most recent PHY-CCARESET.request primitive.

The IPI-REPORT parameter is present if dot11RadioMeasurementActivated is true and if IPI reporting was turned on prior to the receipt of the latest PHY-CCARESET.request primitive. The IPI-REPORT parameter provides a set of IPI values for a time interval. The set of IPI values are recent values observed by the PHY entity since the generation of the most recent PHY-TXEND.confirm, PHY-RXEND.indication, PHY-CCARESET.confirm, or PHY_CCA.indication primitive, whichever occurred latest.

7.3.5.10.3 When generated

This primitive is issued by the PHY to the MAC entity when the PHY has received a PHY-CCA-RESET.request primitive.

7.3.5.10.4 Effect of receipt

The effect of receipt of this primitive by the MAC is unspecified.

7.3.5.11 PHY-CCA.indication

7.3.5.11.1 Function

This primitive is an indication by the PHY to the local MAC entity of the current state of the medium and to provide observed IPI values when IPI reporting is turned on.

7.3.5.11.2 Semantics of the service primitive

The primitive provides the following parameters:

```
PHY-CCA.indication(
                        STATE,
                        IPI-REPORT,
                        channel-list
                        )
```

The STATE parameter can be one of two values: BUSY or IDLE. The parameter value is BUSY if the assessment of the channel(s) by the PHY determines that the channel(s) are not available. Otherwise, the value of the parameter is IDLE.

The IPI-REPORT parameter is present if dot11RadioMeasurementActivated is true and if IPI reporting has been turned on by the IPI-STATE parameter. The IPI-REPORT parameter provides a set of IPI values for a time interval. The set of IPI values may be used by the MAC sublayer for Radio Measurement purposes. The set of IPI values are recent values observed by the PHY entity since the generation of the most recent PHY-TXEND.confirm, PHY-RXEND.indication, PHY-CCARESET.confirm, or PHY_CCA.indication primitive, whichever occurred latest.

When STATE is IDLE or when, for the type of PHY in operation, CCA is determined by a single channel, the channel-list parameter is absent. Otherwise, it carries a set indicating which channels are busy, represented by the values {primary}, {primary, secondary}, and {secondary}.

7.3.5.11.3 When generated

This primitive is generated within aCCATime of the occurrence of a change in the status of the channel(s) from channel idle to channel busy or from channel busy to channel idle. This includes the period of time when the PHY is receiving data. Refer to specific PHY clauses for details about CCA behavior for a given PHY.

If the STA is an HT STA and the operating channel width is 20 MHz, the PHY maintains the channel busy indication until the period indicated by the LENGTH field has expired, where the LENGTH field is

- In a valid SIG field if the format of the PPDU is NON_HT
- In a valid HT-SIG field if the format of the PPDU is HT_MF or HT_GF

If the STA is an HT STA and the operating channel width is 40 MHz, the PHY maintains the channel busy indication until the period indicated by the LENGTH field has expired, where the LENGTH field is

- In a valid SIG field if the format of the PPDU is NON_HT and the PPDU is received in the primary channel
- In a valid HT-SIG field if the format of the PPDU is HT_MF or HT_GF provided that the PPDU is either a 20 MHz PPDU received in the primary channel or a 40 MHz PPDU

7.3.5.11.4 Effect of receipt

The effect of receipt of this primitive by the MAC is unspecified.

7.3.5.12 PHY-RXSTART.indication

7.3.5.12.1 Function

This primitive is an indication by the PHY to the local MAC entity that the PLCP has received a valid start of a PPDU, including a valid PLCP header.

7.3.5.12.2 Semantics of the service primitive

The primitive provides the following parameter:

```
PHY-RXSTART.indication(
                                RXVECTOR
                                )
```

The RXVECTOR represents a list of parameters that the PHY provides the local MAC entity upon receipt of a valid PLCP header or upon receipt of the last PSDU data bit in the received frame. The required parameters are listed in 7.3.4.5.

7.3.5.12.3 When generated

This primitive is generated by the local PHY entity to the MAC sublayer when the PHY has successfully validated the PLCP header at the start of a new PPDU.

After generating a PHYRXSTART.indication primitive, the PHY is expected to maintain physical medium busy status (not generating a PHY-CCA.indication(IDLE) primitive) during the period required by that PHY to transfer a frame of the indicated LENGTH at the indicated DATARATE. This physical medium busy condition should be maintained even if a PHY-RXEND.indication(CarrierLost) or a PHYRXEND.indication(Format-Violation) primitive is generated by the PHY prior to the end of this period.

7.3.5.12.4 Effect of receipt

The effect of receipt of this primitive by the MAC is unspecified.

7.3.5.13 PHY-RXEND.indication

7.3.5.13.1 Function

This primitive is an indication by the PHY to the local MAC entity that the PSDU currently being received is complete.

7.3.5.13.2 Semantics of the service primitive

The primitive provides the following parameters:

```
PHY-RXEND.indication(
                                RXERROR,
                                RXVECTOR
                                )
```

The RXERROR parameter can convey one or more of the following values: NoError, FormatViolation, CarrierLost, or UnsupportedRate. A number of error conditions may occur after the PLCP's receive state machine has detected what appears to be a valid preamble and SFD. The following describes the parameter returned for each of those error conditions.

— *NoError*. This value is used to indicate that no error occurred during the receive process in the PLCP.

— *FormatViolation*. This value is used to indicate that the format of the received PPDU was in error.

— *CarrierLost*. This value is used to indicate that during the reception of the incoming PSDU, the carrier was lost and no further processing of the PSDU can be accomplished.

— *UnsupportedRate*. This value is used to indicate that during the reception of the incoming PPDU, a nonsupported date rate was detected.

The RXVECTOR represents a list of parameters that the PHY provides the local MAC entity upon receipt of a valid PLCP header or upon receipt of the last PSDU data bit in the received frame. RXVECTOR is an included parameter only when dot11RadioMeasurementActivated is true. This vector may contain both MAC and MAC management parameters. The required parameters are listed in 7.3.4.5.

7.3.5.13.3 When generated

This primitive is generated by the PHY for the local MAC entity to indicate that the receive state machine has completed a reception with or without errors. When a Signal Extension is present, the primitive is generated at the end of the Signal Extension.

In the case of an RXERROR value of NoError, the MAC uses the PHY-RXEND.indication primitive as reference for channel access timing, as shown in Figure 9-14 (in 9.3.7).

7.3.5.13.4 Effect of receipt

The effect of receipt of this primitive is for the MAC to begin inter-frame space processing, as described in 9.3.7.

7.3.5.14 PHY-CONFIG.request

7.3.5.14.1 Function

This primitive is a request by the MAC sublayer to the local PHY entity to configure the PHY.

7.3.5.14.2 Semantics of the service primitive

The primitive provides the following parameter:

```
  PHY-CONFIG.request(
                                PHYCONFIG_VECTOR
                                )
```

7.3.5.14.3 When generated

This primitive is generated by the MAC sublayer for the local PHY entity when it desires to change the configuration of the PHY.

7.3.5.14.4 Effect of receipt

The effect of receipt of this primitive by the PHY is to apply the parameters provided with the primitive and to configure the PHY for future operation.

7.3.5.15 PHY-CONFIG.confirm

7.3.5.15.1 Function

This primitive is issued by the PHY to the local MAC entity to confirm that the PHY has applied the parameters provided in the PHY-CONFIG.request primitive.

7.3.5.15.2 Semantics of the service primitive

The semantics of the primitive are as follows:

```
                PHY-CONFIG.confirm
```

This primitive has no parameters.

7.3.5.15.3 When generated

This primitive is issued by the PHY to the MAC entity when the PHY has received and successfully applied the parameters in the PHY-CONFIG.request primitive.

7.3.5.15.4 Effect of receipt

The effect of the receipt of this primitive by the MAC is unspecified.

7.4 PHY management

The MIB comprises the managed objects, attributes, actions, and notifications required to manage a STA. The definition of these managed objects, attributes, actions, and notifications, as well as their structure, is presented in Annex C.

8. Frame formats

8.1 General requirements

The format of the MAC frames is specified in this clause. A STA shall be able properly to construct a subset of the frames specified in this clause for transmission and to decode a (potentially different) subset of the frames specified in this clause upon validation following reception. The particular subset of these frames that a STA constructs and decodes is determined by the functions supported by that particular STA. All STAs shall be able to validate every received frame using the frame check sequence (FCS) and to interpret certain fields from the MAC headers of all frames.

A compliant STA shall transmit frames using only the frame formats described in Clause 8.

8.2 MAC frame formats

8.2.1 Basic components

Each frame consists of the following basic components:

a) A *MAC header*, which comprises frame control, duration, address, optional sequence control information, optional QoS Control information (QoS data frames only), and optional HT Control fields (+HTC frames only);

b) A variable-length *frame body*, which contains information specific to the frame *type* and *subtype*;

c) A *FCS*, which contains an IEEE 32-bit CRC.

8.2.2 Conventions

Structures defined in the MAC sublayer are described as a sequence of fields in specific order. Each figure in Clause 8 depicts the fields/subfields as they appear in the MAC frame and in the order in which they are passed to the physical layer convergence procedure (PLCP), from left to right.

In figures, all bits within fields are numbered, from 0 to k, where the length of the field is $k + 1$ bits. Bits within numeric fields that are longer than a single bit are depicted in increasing order of significance, i.e., with the lowest numbered bit having the least significance. The octet boundaries within a field can be obtained by taking the bit numbers of the field modulo 8. Octets within numeric fields that are longer than a single octet are depicted in increasing order of significance, from lowest numbered bit to highest numbered bit. The octets in fields longer than a single octet are sent to the PLCP in order from the octet containing the lowest numbered bits to the octet containing the highest numbered bits.

Any field containing a CRC is an exception to this convention and is transmitted commencing with the coefficient of the highest-order term.

MAC addresses are assigned as ordered sequences of bits. The Individual/Group bit is always transferred first and is bit 0 of the first octet.

Organizationally unique identifiers (OUIs) and Organization Identifiers are specified in two forms: an ordered sequence of octets, and a numeric form. Treating the OUI or Organization Identifier as an ordered sequence of octets, the leftmost octet is always transferred first. This is equivalent to transmitting the most significant octet of the numeric form first.

Values specified in decimal are coded in natural binary unless otherwise stated. The values in Table 8-1 are in binary, with the bit assignments shown in the table. Values in other tables are shown in decimal notation.

Reception, in references to frames or fields within frames (e.g., received Beacon frames or a received Duration/ID field), applies to MPDUs or MAC management protocol data units (MMPDUs) indicated from the PHY layer without error and validated by FCS within the MAC sublayer. Without further qualification, *reception* by the MAC sublayer implies that the frame contents are valid, and that the protocol version is supported (see 8.2.4.1.2), with no implication regarding frame addressing or regarding whether the frame type or other fields in the MAC header are meaningful to the MAC entity that has received the frame.

A frame that contains the HT Control field, including the Control Wrapper frame, is referred to as a +HTC frame.

A QoS Data frame that is transmitted by a mesh STA is referred to as a Mesh Data frame.

Parentheses enclosing portions of names or acronyms are used to designate a set of related names that vary based on the inclusion of the parenthesized portion. For example,

— *QoS +CF-Poll frame* refers to the three QoS data subtypes that include "+CF-Poll": the QoS Data+CF-Poll frame, subtype 1010; QoS Data+CF-Ack+CF-Poll frame, subtype 1011; and QoS CF-Ack+CF-Poll frame, subtype 1111.

— *QoS CF-Poll frame* refers specifically to the QoS CF-Poll frame, subtype 1110.

— *QoS (+)CF-Poll frame* refers to all four QoS data subtypes with CF-Poll: the QoS CF-Poll frame, subtype 1110; the QoS CF-Ack+CF-Poll frame, subtype 1111; the QoS Data+CF-Poll frame, subtype 1010; and the QoS Data+CF-Ack+CF-Poll frame, subtype 1011.

— *QoS (+)Null frame* refers to all three QoS data subtypes with "no data": the QoS Null (no data) frame, subtype 1100; the QoS CF-Poll (no data) frame, subtype 1110; and the QoS CF-Ack+CF-Poll frame, subtype 1111.

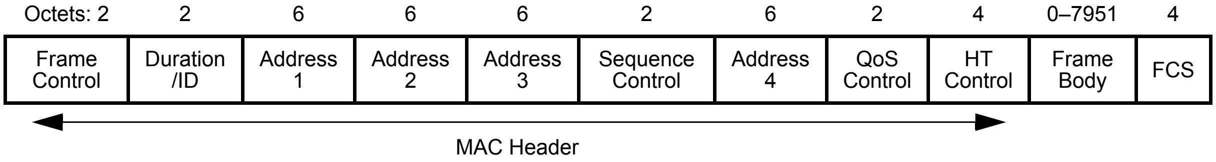
— *QoS +CF-Ack frame* refers to the three QoS data subtypes that include "+CF-Ack": the QoS Data+CF-Ack frame, subtype 1001; QoS Data+CF-Ack+CF-Poll frame, subtype 1011; and QoS CF-Ack+CF-Poll frame, subtype 1111.

— Whereas *(QoS) CF-Poll frame* refers to the QoS CF-Poll frame, subtype 1110, and the CF-Poll frame, subtype 0110.

Reserved fields and subfields are set to 0 upon transmission and are ignored upon reception.

8.2.3 General frame format

The MAC frame format comprises a set of fields that occur in a fixed order in all frames. Figure 8-1 depicts the general MAC frame format. The first three fields (Frame Control, Duration/ID, and Address 1) and the last field (FCS) in Figure 8-1 constitute the minimal frame format and are present in all frames, including reserved types and subtypes. The fields Address 2, Address 3, Sequence Control, Address 4, QoS Control, HT Control, and Frame Body are present only in certain frame types and subtypes. Each field is defined in 8.2.4. The format of each of the individual subtypes of each frame type is defined in 8.3. The components of management frame bodies are defined in 8.4. The formats of management frames of subtype Action are defined in 8.5.



Octets: 2	2	6	6	6	2	6	2	4	0–7951	4
Frame Control	Duration /ID	Address 1	Address 2	Address 3	Sequence Control	Address 4	QoS Control	HT Control	Frame Body	FCS

Figure 8-1—MAC frame format

The Frame Body field is of variable size. The maximum frame body size is determined by the maximum MSDU size (2304 octets), plus the length of the Mesh Control field (6, 12, or 18 octets) if present, the maximum unencrypted MMPDU size excluding the MAC header and FCS (2304 octets) or the maximum A-MSDU size (3839 or 7935 octets, depending upon the STA’s capability), plus any overhead from security encapsulation.

8.2.4 Frame fields

8.2.4.1 Frame Control field

8.2.4.1.1 General

The Frame Control field consists of the following subfields: Protocol Version, Type, Subtype, To DS, From DS, More Fragments, Retry, Power Management, More Data, Protected Frame, and Order. The format of the Frame Control field is illustrated in Figure 8-2.

	B0 B1	B2 B3	B4 B7	B8	B9	B10	B11	B12	B13	B14	B15
	Protocol Version	Type	Subtype	To DS	From DS	More Fragments	Retry	Power Management	More Data	Protected Frame	Order
Bits:	2	2	4	1	1	1	1	1	1	1	1

Figure 8-2—Frame Control field

8.2.4.1.2 Protocol Version field

The Protocol Version field is 2 bits in length and is invariant in size and placement across all revisions of this standard. For this standard, the value of the protocol version is 0. All other values are reserved. The revision level will be incremented only when a fundamental incompatibility exists between a new revision and the prior edition of the standard. See 9.24.2.

8.2.4.1.3 Type and Subtype fields

The Type field is 2 bits in length, and the Subtype field is 4 bits in length. The Type and Subtype fields together identify the function of the frame. There are three frame types: control, data, and management. Each of the frame types has several defined subtypes. In data frames, the most significant bit (MSB) of the Subtype field, b7, is defined as the QoS subfield. Table 8-1 defines the valid combinations of type and subtype. (The numeric values in Table 8-1 are shown in binary.)

Table 8-1—Valid type and subtype combinations

Type value b3 b2	Type description	Subtype value b7 b6 b5 b4	Subtype description
00	Management	0000	Association request
00	Management	0001	Association response
00	Management	0010	Reassociation request
00	Management	0011	Reassociation response
00	Management	0100	Probe request
00	Management	0101	Probe response
00	Management	0110	Timing Advertisement

Table 8-1—Valid type and subtype combinations *(continued)*

Type value b3 b2	Type description	Subtype value b7 b6 b5 b4	Subtype description
00	Management	0111	Reserved
00	Management	1000	Beacon
00	Management	1001	ATIM
00	Management	1010	Disassociation
00	Management	1011	Authentication
00	Management	1100	Deauthentication
00	Management	1101	Action
00	Management	1110	Action No Ack
00	Management	1111	Reserved
01	Control	0000–0110	Reserved
01	Control	0111	Control Wrapper
01	Control	1000	Block Ack Request (BlockAckReq)
01	Control	1001	Block Ack (BlockAck)
01	Control	1010	PS-Poll
01	Control	1011	RTS
01	Control	1100	CTS
01	Control	1101	ACK
01	Control	1110	CF-End
01	Control	1111	CF-End + CF-Ack
10	Data	0000	Data
10	Data	0001	Data + CF-Ack
10	Data	0010	Data + CF-Poll
10	Data	0011	Data + CF-Ack + CF-Poll
10	Data	0100	Null (no data)
10	Data	0101	CF-Ack (no data)
10	Data	0110	CF-Poll (no data)
10	Data	0111	CF-Ack + CF-Poll (no data)
10	Data	1000	QoS Data
10	Data	1001	QoS Data + CF-Ack
10	Data	1010	QoS Data + CF-Poll
10	Data	1011	QoS Data + CF-Ack + CF-Poll
10	Data	1100	QoS Null (no data)
10	Data	1101	Reserved
10	Data	1110	QoS CF-Poll (no data)
10	Data	1111	QoS CF-Ack + CF-Poll (no data)
11	Reserved	0000–1111	Reserved

Each Subtype field bit position is used to indicate a specific modification of the basic data frame (subtype 0). Frame Control bit 4 is set to 1 in data subtypes that include +CF-Ack, bit 5 is set to 1 in data subtypes that include +CF-Poll, bit 6 is set to 1 in data subtypes that contain no Frame Body field, and bit 7 is set to 1 in the QoS data subtypes, which have QoS Control fields in their MAC headers.

8.2.4.1.4 To DS and From DS fields

The meaning of the combinations of values for the To DS and From DS fields are shown in Table 8-2.

Table 8-2—To/From DS combinations in data frames

To DS and From DS values	Meaning
To DS = 0 From DS = 0	A data frame direct from one STA to another STA within the same IBSS, a data frame direct from one non-AP STA to another non-AP STA within the same BSS, or a data frame outside the context of a BSS, as well as all management and control frames.
To DS = 1 From DS = 0	A data frame destined for the DS or being sent by a STA associated with an AP to the Port Access Entity in that AP.
To DS = 0 From DS = 1	A data frame exiting the DS or being sent by the Port Access Entity in an AP, or a group addressed Mesh Data frame with Mesh Control field present using the three-address MAC header format.
To DS = 1 From DS = 1	A data frame using the four-address MAC header format. This standard defines procedures for using this combination of field values only in a mesh BSS.

8.2.4.1.5 More Fragments field

The More Fragments field is 1 bit in length and is set to 1 in all data or management type frames that have another fragment of the current MSDU or current MMPDU to follow. It is set to 0 in all other frames.

8.2.4.1.6 Retry field

The Retry field is 1 bit in length and is set to 1 in any data or management type frame that is a retransmission of an earlier frame. It is set to 0 in all other frames. A receiving STA uses this indication to aid in the process of eliminating duplicate frames.

8.2.4.1.7 Power Management field

The Power Management field is 1 bit in length and is used to indicate the power management mode of a STA. The value of this field is either reserved (as defined below) or remains constant in each frame from a particular STA within a frame exchange sequence (see Annex G). The value indicates the mode of the STA after the successful completion of the frame exchange sequence.

In an infrastructure BSS, the following applies:

- The Power Management field is reserved in all management frames that are not bufferable management frames.
- The Power Management field is reserved in all management frames transmitted by a STA to an AP with which it is not associated.
- The Power Management field is reserved in all frames transmitted by the AP.
- Otherwise, a value of 1 indicates that the STA will be in PS mode. A value of 0 indicates that the STA will be in active mode.

In an IBSS, the following applies:

- The Power Management field is reserved in all management frames that are not bufferable management frames and that are not individually addressed Probe Request frames.
- Otherwise, a value of 1 indicates that the STA will be in PS mode. A value of 0 indicates that the STA will be in active mode.

In an MBSS, the following applies:

- A value of 0 in group addressed frames, in management frames transmitted to nonpeer STAs, and in Probe Response frames indicates that the mesh STA will be in active mode towards all neighbor mesh STAs. A value of 1 in group addressed frames, in management frames transmitted to nonpeer STAs, and in Probe Response frames indicates that the mesh STA will be in deep sleep mode towards all nonpeer mesh power STAs.
- A value of 0 in individually addressed frames transmitted to a peer mesh STA indicates that the mesh STA will be in active mode towards this peer mesh STA A value of 1 in individually addressed frames transmitted to a peer mesh STA, except Probe Response frames, indicates that the mesh STA will be in either light sleep mode or deep sleep mode towards this peer mesh STA. When the QoS Control field is present in the frame, the Mesh Power Save Level subfield in the QoS Control field indicates whether the mesh STA will be in light sleep mode or in deep sleep mode for the recipient mesh STA as specified in 8.2.4.5.11.

The mesh power mode transition rules are described in 13.14.3.

8.2.4.1.8 More Data field

The More Data field is 1 bit in length and is used to indicate to a STA in PS mode that more BUs are buffered for that STA at the AP. The More Data field is valid in individually addressed data or management type frames transmitted by an AP to a STA in PS mode. A value of 1 indicates that at least one additional buffered BU is present for the same STA.

The More Data field is optionally set to 1 in individually addressed data type frames transmitted by a CF-Pollable STA to the PC in response to a CF-Poll to indicate that the STA has at least one additional buffered MSDU available for transmission in response to a subsequent CF-Poll.

For a STA in which the More Data Ack subfield of its QoS Capability element is 1 and that has APSD enabled, an AP optionally sets the More Data field to 1 in ACK frames to this STA to indicate that the AP has a pending transmission for the STA.

For a STA with TDLS peer PSM enabled and the More Data Ack subfield equal to 1 in the QoS Capability element of its transmitted TDLS Setup Request frame or TDLS Setup Response frame, a TDLS peer STA optionally sets the More Data field to 1 in ACK frames to this STA to indicate that it has a pending transmission for the STA.

The More Data field is 1 in individually addressed frames transmitted by a mesh STA to a peer mesh STA that is either in light sleep mode or in deep sleep mode for the corresponding mesh peering, when additional BUs remain to be transmitted to this peer mesh STA.

The More Data field is set to 0 in all other individually addressed frames.

The More Data field is set to 1 in group addressed frames transmitted by the AP when additional group addressed bufferable units (BUs) remain to be transmitted by the AP during this beacon interval. The More Data field is set to 0 in group addressed frames transmitted by the AP when no more group addressed BUs remain to be transmitted by the AP during this beacon interval and in all group addressed frames transmitted by non-AP STAs.

The More Data field is 1 in group addressed frames transmitted by a mesh STA when additional group addressed BUs remain to be transmitted. The More Data field is 0 in group addressed frames transmitted by a mesh STA when no more group addressed BUs remain to be transmitted.

8.2.4.1.9 Protected Frame field

The Protected Frame field is 1 bit in length. The Protected Frame field is set to 1 if the Frame Body field contains information that has been processed by a cryptographic encapsulation algorithm. The Protected Frame field is set to 1 only within data frames and within management frames of subtype Authentication, and individually addressed robust management frames. The Protected Frame field is set to 0 in all other frames. When the Protected Frame field is equal to 1, the Frame Body field is protected utilizing the cryptographic encapsulation algorithm and expanded as defined in Clause 11. The Protected Frame field is set to 0 in Data frames of subtype Null Function, CF-ACK (no data), CF-Poll (no data), CF-ACK+CF-Poll (no data), QoS Null (no data), QoS CF-Poll (no data), and QoS CF-ACK+CF-Poll (no data) (see, for example, 11.4.2.2 and 11.4.3.1 that show that the frame body needs to be 1 octet or longer to apply the encapsulation).

8.2.4.1.10 Order field

The Order field is 1 bit in length. It is used for two purposes:

- It is set to 1 in a non-QoS data frame transmitted by a non-QoS STA to indicate that the frame contains an MSDU, or fragment thereof, that is being transferred using the StrictlyOrdered service class.
- It is set to 1 in a QoS data or management frame transmitted with a value of HT_GF or HT_MF for the FORMAT parameter of the TXVECTOR to indicate that the frame contains an HT Control field.

Otherwise, the Order field is set to 0.

8.2.4.2 Duration/ID field

The Duration/ID field is 16 bits in length. The contents of this field vary with frame type and subtype, with whether the frame is transmitted during the CFP, and with the QoS capabilities of the sending STA. The contents of the field are defined as follows:

a) In control frames of subtype PS-Poll, the Duration/ID field carries the association identifier (AID) of the STA that transmitted the frame in the 14 least significant bits (LSB), and the 2 most significant bits (MSB) both set to 1. The value of the AID is in the range 1–2007.

b) In frames transmitted by the PC and non-QoS STAs, during the CFP, the Duration/ID field is set to a fixed value of 32 768.

c) In all other frames sent by non-QoS STAs and control frames sent by QoS STAs, the Duration/ID field contains a duration value as defined for each frame type in 8.3.

d) In data and management frames sent by QoS STAs, the Duration/ID field contains a duration value as defined for each frame type in 8.2.5.

See 9.24.3 on the processing of this field in received frames.

The encoding of the Duration/ID field is given in Table 8-3.

The Duration/ID fields in the MAC headers of MPDUs in an A-MPDU all carry the same value.

NOTE—The reference point for the Duration/ID field is the end of the PPDU carrying the MPDU. Setting the Duration/ID field to the same value in the case of A-MPDU aggregation means that each MPDU consistently specifies the same NAV setting.

Table 8-3—Duration/ID field encoding

Bits 0–13	Bit 14	Bit 15	Usage
0–32 767		0	Duration value (in microseconds) within all frames other than PS-Poll frames transmitted during the CP, and under HCF for frames transmitted during the CFP
0	0	1	Fixed value under point coordination function (PCF) within frames transmitted during the CFP
1–16 383	0	1	Reserved
0	1	1	Reserved
1–2007	1	1	AID in PS-Poll frames
2008–16 383	1	1	Reserved

8.2.4.3 Address fields

8.2.4.3.1 General

There are four address fields in the MAC frame format. These fields are used to indicate the basic service set identifier (BSSID), source address (SA), destination address (DA), transmitting STA address (TA), and receiving STA address (RA). Certain frames may not contain some of the address fields.

Certain address field usage is specified by the relative position of the address field (1–4) within the MAC header, independent of the type of address present in that field. For example, receiver address matching is always performed on the contents of the Address 1 field in received frames, and the receiver address of CTS and ACK frames is always obtained from the Address 2 field in the corresponding RTS frame, or from the frame being acknowledged.

8.2.4.3.2 Address representation

Each Address field contains a 48-bit address as defined in 9.2 of IEEE Std 802-2001.

8.2.4.3.3 Address designation

A MAC sublayer address is one of the following two types:

a) *Individual address.* The address assigned to a particular STA on the network.

b) *Group address.* A multidestination address, which may be in use by one or more STAs on a given network. The two kinds of group addresses are as follows:

   1) *Multicast-group address.* An address associated by higher level convention with a group of logically related STAs.

   2) *Broadcast address.* A distinguished, predefined group address that always denotes the set of all STAs on a given LAN. All ones are interpreted to be the broadcast address. This group is predefined for each communication medium to consist of all STAs actively connected to that medium; it is used to broadcast to all the active STAs on that medium.

The address space is also partitioned into locally administered and universal (globally administered) addresses. The nature of a body and the procedures by which it administers these universal (globally administered) addresses is beyond the scope of this standard. See IEEE Std 802-2001 for more information.

8.2.4.3.4 BSSID field

The BSSID field is a 48-bit field of the same format as an IEEE 802 MAC address. When dot11OCBActivated is false, the value of this field uniquely identifies each BSS. The value of this field, in an infrastructure BSS, is the MAC address currently in use by the STA in the AP of the BSS.

The value of this field in an IBSS is a locally administered IEEE MAC address formed from a 46-bit random number generated according to the procedure defined in 10.1.4. The individual/group bit of the address is set to 0. The universal/local bit of the address is set to 1. This mechanism is used to provide a high probability of selecting a unique BSSID.

The value of all 1s is used to indicate the wildcard BSSID. The wildcard value is not used in the BSSID field except where explicitly permitted in this standard. When dot11OCBActivated is true, the wildcard value shall be used in the BSSID field. When dot11OCBActivated is false and the BSSID field contains the wildcard value, the Address 1 (DA) field is also set to all 1s to indicate the broadcast address.

8.2.4.3.5 DA field

The DA field contains an IEEE MAC individual or group address that identifies the MAC entity or entities intended as the final recipient(s) of the MSDU (or fragment thereof) or A-MSDU, as defined in 8.3.2.1, contained in the frame body field.

8.2.4.3.6 SA field

The SA field contains an IEEE MAC individual address that identifies the MAC entity from which the transfer of the MSDU (or fragment thereof) or A-MSDU, as defined in 8.3.2.1, contained in the frame body field was initiated. The individual/group bit is always transmitted as a 0 in the source address.

8.2.4.3.7 RA field

The RA field contains an IEEE MAC individual or group address that identifies the intended immediate recipient STA(s), on the WM, for the information contained in the frame body field.

8.2.4.3.8 TA field

The TA field contains an IEEE MAC individual address that identifies the STA that has transmitted, onto the WM, the MPDU contained in the frame body field. The Individual/Group bit is always transmitted as a 0 in the transmitter address.

8.2.4.4 Sequence Control field

8.2.4.4.1 Sequence Control field structure

The Sequence Control field is 16 bits in length and consists of two subfields, the Sequence Number and the Fragment Number. The format of the Sequence Control field is illustrated in Figure 8-3. The sequence Control field is not present in control frames.

	B0 B3	B4 B15
	Fragment Number	Sequence Number
Bits:	4	12

Figure 8-3—Sequence Control field

8.2.4.4.2 Sequence Number field

The Sequence Number field is a 12-bit field indicating the sequence number of an MSDU, A-MSDU, or MMPDU. Each MSDU, A-MSDU, or MMPDU transmitted by a STA is assigned a sequence number. Sequence numbers are not assigned to control frames, as the Sequence Control field is not present.

Each fragment of an MSDU or MMPDU contains a copy of the sequence number assigned to that MSDU or MMPDU. The sequence number remains constant in all retransmissions of an MSDU, MMPDU, or fragment thereof.

8.2.4.4.3 Fragment Number field

The Fragment Number field is a 4-bit field indicating the number of each fragment of an MSDU or MMPDU. The fragment number is set to 0 in the first or only fragment of an MSDU or MMPDU and is incremented by one for each successive fragment of that MSDU or MMPDU. The fragment number is set to 0 in the only fragment of an A-MSDU. The fragment number remains constant in all retransmissions of the fragment.

8.2.4.5 QoS Control field

8.2.4.5.1 QoS Control field structure

The QoS Control field is a 16-bit field that identifies the TC or TS to which the frame belongs as well as various other QoS-related, A-MSDU related, and mesh-related information about the frame that varies by frame type, subtype, and type of transmitting STA. The QoS Control field is present in all data frames in which the QoS subfield of the Subtype field is equal to 1 (see 8.2.4.1.3). Each QoS Control field comprises five or eight subfields, as defined for the particular sender (HC or non-AP STA) and frame type and subtype. The usage of these subfields and the various possible layouts of the QoS Control field are described 8.2.4.5.2 to 8.2.4.5.12 and illustrated in Table 8-4.

See 9.12.1 for constraints on the contents of the QoS Control field when present in an A-MPDU.

Table 8-4—QoS Control field

Applicable frame (sub) types	Bits 0–3	Bit 4	Bits 5-6	Bit 7	Bits 8	Bit 9	Bit 10	Bits 11-15
QoS CF-Poll and QoS CF-Ack+CF-Poll frames sent by HC	TID	EOSP	Ack Policy	Reserved	TXOP Limit			
QoS Data+CF-Poll and QoS Data+CF-Ack+CF-Poll frames sent by HC	TID	EOSP	Ack Policy	A-MSDU Present	TXOP Limit			
QoS Data and QoS Data+CF-Ack frames sent by HC	TID	EOSP	Ack Policy	A-MSDU Present	AP PS Buffer State			
QoS Null frames sent by HC	TID	EOSP	Ack Policy	Reserved	AP PS Buffer State			
QoS Data and QoS Data+CF-Ack frames sent by non-AP STAs that are not a TPU buffer STA or a TPU sleep STA in a nonmesh BSS	TID	0	Ack Policy	A-MSDU Present	TXOP Duration Requested			
	TID	1	Ack Policy	A-MSDU Present	Queue Size			

Table 8-4—QoS Control field *(continued)*

Applicable frame (sub) types	Bits 0–3	Bit 4	Bits 5-6	Bit 7	Bits 8	Bit 9	Bit 10	Bits 11-15
QoS Null frames sent by non-AP STAs that are not a TPU buffer STA or a TPU sleep STA in a nonmesh BSS	TID	0	Ack Policy	Reserved	TXOP Duration Requested			
	TID	1	Ack Policy	Reserved	Queue Size			
QoS Data and QoS Data+CF-Ack frames sent by TPU buffer STAs in a nonmesh BSS	TID	EOSP	Ack Policy	A-MSDU Present	Reserved			
QoS Null frames sent by TPU buffer STAs in a nonmesh BSS	TID	EOSP	Ack Policy	Reserved	Reserved			
QoS Data and QoS Data+CF-Ack frames sent by TPU sleep STAs in a nonmesh BSS	TID	Reserved	Ack Policy	A-MSDU Present	Reserved			
QoS Null frames sent by TPU sleep STAs in a nonmesh BSS	TID	Reserved	Ack Policy	Reserved	Reserved			
All frames sent by mesh STAs in a mesh BSS	TID	EOSP	Ack Policy	A-MSDU Present	Mesh Control Present	Mesh Power Save Level	RSPI	Reserved

8.2.4.5.2 TID subfield

The TID subfield identifies the TC or TS to which the corresponding MSDU (or fragment thereof) or A-MSDU in the Frame Body field belongs. The TID subfield also identifies the TC or TS of traffic for which a TXOP is being requested, through the setting of TXOP duration requested or queue size. The encoding of the TID subfield depends on the access policy (see 8.4.2.32) and is shown in Table 8-5. Additional information on the interpretation of the contents of this field appears in 5.1.1.4.

Table 8-5—TID subfield

Access policy	Usage	Allowed values in bits 0–3 (TID subfield)
EDCA	UP for either TC or TS, regardless of whether admission control is required	0–7
HCCA	TSID	8–15
HEMM	TSID, regardless of the access mechanism used	8–15

For QoS Data+CF-Poll, the TID subfield in the QoS Control field indicates the TID of the data. For all QoS (+)CF-Poll frames of subtype Null, the TID subfield in the QoS Control field indicates the TID for which the poll is intended. The requirement to respond to that TID is nonbinding, and a STA may respond with any frame. For STAs where dot11OCBActivated is true, traffic streams are not used and the TID always corresponds to a TC.

8.2.4.5.3 EOSP (end of service period) subfield

The EOSP subfield is 1 bit in length and is used by the HC to indicate the end of the current service period (SP). The HC sets the EOSP subfield to 1 in its transmission and retransmissions of the SP's final frame to end a scheduled/unscheduled SP and sets it to 0 otherwise.

The mesh STA uses the EOSP subfield to indicate the end of the current mesh peer service period (MPSP) in which it operates as the owner. The mesh STA sets the EOSP subfield to 1 in its transmission and retransmissions of the MPSP's final frame to end an MPSP, and sets it to 0 otherwise. See 13.14.9.4 for details.

8.2.4.5.4 Ack Policy subfield

The Ack Policy subfield is 2 bits in length and identifies the acknowledgment policy that is followed upon the delivery of the MPDU. The interpretation of these 2 bits is given in Table 8-6.

Table 8-6—Ack Policy subfield in QoS Control field of QoS data frames

Bits in QoS Control field		Meaning
Bit 5	Bit 6	
0	0	Normal Ack or Implicit Block Ack Request. In a frame that is a non-A-MPDU frame: The addressed recipient returns an ACK or QoS +CF-Ack frame after a short interframe space (SIFS) period, according to the procedures defined in 9.3.2.8 and 9.19.3.5. This is the only permissible value for the Ack Policy subfield for individually addressed QoS Null (no data) frames. In a frame that is part of an A-MPDU: The addressed recipient returns a BlockAck MPDU, either individually or as part of an A-MPDU starting a SIFS after the PPDU carrying the frame, according to the procedures defined in 9.3.2.9, 9.21.7.5, 9.21.8.3, 9.25.3, 9.25.4, and 9.29.3.
1	0	No Ack The addressed recipient takes no action upon receipt of the frame. More details are provided in 9.22. The Ack Policy subfield is set to this value in all individually addressed frames in which the sender does not require acknowledgment. This combination is also used for group addressed frames that use the QoS frame format. This combination is not used for QoS data frames with a TID for which a Block Ack agreement exists. This is the only permissible value for the Ack Policy subfield for group addressed QoS Null (no data) frames.

Table 8-6—Ack Policy subfield in QoS Control field of QoS data frames *(continued)*

Bits in QoS Control field		Meaning
Bit 5	Bit 6	
0	1	No explicit acknowledgment or PSMP Ack. When bit 6 of the Frame Control field (see 8.2.4.1.3) is set to 1: There may be a response frame to the frame that is received, but it is neither the ACK nor any data frame of subtype +CF-Ack. For QoS CF-Poll and QoS CF-Ack+CF-Poll data frames, this is the only permissible value for the Ack Policy subfield. When bit 6 of the Frame Control field (see 8.2.4.1.3) is set to 0: The acknowledgment for a frame indicating PSMP Ack when it appears in a PSMP downlink transmission time (PSMP-DTT) is to be received in a later PSMP uplink transmission time (PSMP-UTT). The acknowledgment for a frame indicating PSMP Ack when it appears in a PSMP-UTT is to be received in a later PSMP-DTT. NOTE—Bit 6 of the Frame Control field (see 8.2.4.1.3) indicates the absence of a data payload. When equal to 1, the QoS data frame contains no payload, and any response is generated in response to a QoS CF-Poll or QoS CF-Ack+CF-Poll frame, but does not signify an acknowledgment of data. When set to 0, the QoS data frame contains a payload, which is acknowledged as described in 9.26.1.7.
1	1	Block Ack The addressed recipient takes no action upon the receipt of the frame except for recording the state. The recipient can expect a BlockAckReq frame in the future to which it responds using the procedure described in 9.21.

An MSDU is sent using an acknowledgment policy of Normal Ack, Implicit Block Ack Request, PSMP Ack or Block Ack if the service class parameter in the MA-UNITDATA.request primitive is QoSAck and of No Ack if the service class parameter in the MA-UNITDATA.request primitive is equal to QoSNoAck.

8.2.4.5.5 TXOP Limit subfield

The TXOP Limit subfield is an 8-bit field that is present in QoS data frames of subtypes that include CF-Poll and specifies the time limit on a TXOP granted by a QoS (+)CF-Poll frame from an HC in a BSS. In QoS data frames with subtypes that include CF-Poll, the addressed STA is granted a TXOP that begins a SIFS period after this frame and lasts no longer than the number of 32 μs periods specified by the TXOP limit value. The range of time values is 32 μs to 8160 μs. A TXOP limit value of 0 implies that one MPDU or one QoS Null frame is to be transmitted immediately following the QoS (+)CF-Poll frame.

8.2.4.5.6 Queue Size subfield

The Queue Size subfield is an 8-bit field that indicates the amount of buffered traffic for a given TC or TS at the STA sending this frame. The Queue Size subfield is present in QoS data frames sent by non-AP STAs with bit 4 of the QoS Control field equal to 1. The AP may use information contained in the Queue Size subfield to determine the TXOP duration assigned to the STA.

The queue size value is the total size, rounded up to the nearest multiple of 256 octets and expressed in units of 256 octets, of all MSDUs and A-MSDUs buffered at the STA (excluding the MSDU or A-MSDU of the present QoS data frame) in the delivery queue used for MSDUs and A-MSDUs with TID values equal to the value in the TID subfield of this QoS Control field. A queue size value of 0 is used solely to indicate the absence of any buffered traffic in the queue used for the specified TID. A queue size value of 254 is used for all sizes greater than 64 768 octets. A queue size value of 255 is used to indicate an unspecified or unknown size. If a QoS data frame is fragmented, the queue size value may remain constant in all fragments even if the amount of queued traffic changes as successive fragments are transmitted.

8.2.4.5.7 TXOP Duration Requested subfield

The TXOP Duration Requested subfield is present in QoS data frames sent by STAs associated in a BSS with bit 4 of the QoS Control field equal to 0. The TXOP Duration Requested subfield is an 8-bit field that indicates the duration, in units of 32 µs, that the sending STA determines it needs for its next TXOP for the specified TID. A value of 0 indicates that no TXOP is requested for the specified TID in the current SP. A nonzero value represents a requested TXOP duration in the range 32 µs to 8 160 µs in increments of 32 µs. See 9.19.3.5.2.

8.2.4.5.8 AP PS Buffer State subfield

The AP PS Buffer State subfield, defined in Figure 8-4, is an 8-bit field that indicates the PS buffer state at the AP for a STA. The AP PS Buffer State subfield is further subdivided into three subfields: Buffer State Indicated, Highest-Priority Buffered AC, and AP Buffered Load.

	B8	B9	B10 B11	B12 B15
	Reserved	Buffer State Indicated	Highest Priority Buffered AC	QoS AP Buffered Load
Bits:	1	1	2	4

Figure 8-4—QoS AP PS Buffer State subfield

The Buffered State Indicated subfield is 1 bit in length and is used to indicate whether the AP PS buffer state is specified. A value of 1 indicates that the AP PS buffer state is specified.

The Highest-Priority Buffered AC subfield is 2 bits in length and is used to indicate the AC of the highest priority traffic remaining that is buffered at the AP, excluding the MSDU or A-MSDU of the present frame.

The AP Buffered Load subfield is 4 bits in length and is used to indicate the total buffer size, rounded up to the nearest multiple of 4096 octets and expressed in units of 4096 octets, of all MSDUs and A-MSDUs buffered at the QoS AP (excluding the MSDU or A-MSDU of the present QoS data frame). An AP Buffered Load field value of 15 indicates that the buffer size is greater than 57 344 octets. An AP Buffered Load subfield value of 0 is used solely to indicate the absence of any buffered traffic for the indicated highest priority buffered AC when the Buffer State Indicated bit is 1.

When the Buffered State Indicated subfield is equal to 0, the Highest-Priority Buffered AC subfield and the AP Buffered Load subfield are reserved.

8.2.4.5.9 A-MSDU Present subfield

The A-MSDU Present subfield is 1 bit in length and indicates the presence of an A-MSDU. The A-MSDU Present subfield is set to 1 to indicate that the Frame Body field contains an entire A-MSDU as defined in 8.3.2.2. The A-MSDU Present subfield is set to 0 to indicate that the Frame Body field contains an MSDU or fragment thereof as defined in 8.3.2.1.

8.2.4.5.10 Mesh Control Present subfield

The Mesh Control Present subfield is 1 bit in length, and indicates the presence of a Mesh Control field in the frame body. When the Mesh Control Present subfield is 1, the Frame Body field contains a Mesh Control field as defined in 8.2.4.7.3. The mesh STA sets the Mesh Control Present subfield to 1 in the Mesh Data frame containing an unfragmented MSDU, an A-MSDU, or the first fragment of an MSDU.

8.2.4.5.11 Mesh Power Save Level subfield

The Mesh Power Save Level subfield is 1 bit in length and indicates whether the mesh STA's peer-specific mesh power mode will be deep sleep mode or light sleep mode after the successful completion of the frame exchange sequence.

When the Power Management field in the Frame Control field in the frame is 1, the following applies:

In individually addressed Mesh Data frames, a value of 0 indicates that the mesh STA's peer-specific mesh power mode for the recipient mesh STA will be light sleep mode (see 13.14.8.4). In individually addressed Mesh Data frames, a value of 1 indicates that the mesh STA's peer-specific mesh power mode for the recipient mesh STA will be deep sleep mode (see 13.14.8.5).

In group addressed Mesh Data frames, a value of 0 indicates that none of the peer-specific mesh power modes of the mesh STA will be deep sleep mode. In group addressed Mesh Data frames, a value of 1 indicates that at least one of the peer-specific mesh power modes of the mesh STA is deep sleep mode.

The Mesh Power Save Level subfield is reserved if the Power Management field in the Frame Control field is 0.

8.2.4.5.12 Receiver Service Period Initiated (RSPI) subfield

The Receiver Service Period Initiated (RSPI) subfield is 1 bit in length. The subfield is set to 0 to indicate that the mesh peer service period, of which the receiver of this frame is the owner, is not initiated. The subfield is set to 1 to indicate that the mesh peer service period, of which the receiver of this frame is the owner, is initiated. The use of the RSPI subfield is described in 13.14.9.2. The RSPI subfield is reserved in group addressed frames.

8.2.4.6 HT Control field

The HT Control field is always present in a Control Wrapper frame and is present in QoS Data and management frames as determined by the Order bit of the Frame Control field as defined in 8.2.4.1.10.

NOTE—The only Control frame subtype for which HT Control field is present is the Control Wrapper frame. A control frame that is described as +HTC (e.g., RTS+HTC, CTS+HTC, BlockAck+HTC or BlockAckReq+HTC) implies the use of the Control Wrapper frame to carry that control frame.

The format of the 4-octet HT Control field is shown in Figure 8-5.

	B0 B15	B16 B17	B18 B19	B20 B21	B22 B23	B24	B25 B29	B30	B31
	Link Adaptation Control	Calibration Position	Calibration Sequence	Reserved	CSI/ Steering	NDP Announce-ment	Reserved	AC Constraint	RDG/ More PPDU
Bits:	16	2	2	2	2	1	5	1	1

Figure 8-5—HT Control field

The format of the Link Adaptation Control subfield of the HT Control field is defined in Figure 8-6.

	B0	B1	B2 B5	B6 B8	B9 B15
	Reserved	TRQ	MAI	MFSI	MFB/ASELC
Bits:	1	1	4	3	7

Figure 8-6—Link Adaptation Control subfield

The subfields of the Link Adaptation Control subfield are defined in Table 8-7.

Table 8-7—Subfields of Link Adaptation Control subfield

Subfield	Meaning	Definition
TRQ	Training request	Set to 1 to request the responder to transmit a sounding PPDU. Set to 0 to indicate that the responder is not requested to transmit a sounding PPDU. See 9.29.2 and 9.31.2.
MAI	MCS request (MRQ) or ASEL indication	Set to 14 (indicating ASELI) to indicate that the MFB/ASELC subfield is interpreted as ASELC. Otherwise, the MAI subfield is interpreted as shown in Figure 8-7, and the MFB/ASELC subfield is interpreted as MCS feedback (MFB).
MFSI	MCS feedback sequence identifier	Set to the received value of MSI contained in the frame to which the MFB information refers. Set to 7 for unsolicited MFB.
MFB/ASELC	MCS feedback and antenna selection command/data	When the MAI subfield is equal to the value ASELI, this subfield is interpreted as defined in Figure 8-8 and Table 8-9. Otherwise, this subfield contains recommended MFB. A value of 127 indicates that no feedback is present.

The structure of the MAI subfield of the Link Adaptation Control subfield is defined in Figure 8-7. The subfields of the MAI subfield are defined in Table 8-8.

	B0	B1 B3
	MRQ	MSI
Bits:	1	3

Figure 8-7—MAI subfield

Table 8-8—Subfields of the MAI subfield

Subfield	Meaning	Definition
MRQ	MCS request	Set to 1 to indicate that MFB is requested. Set to 0 to indicate that no MFB is requested.
MSI	MRQ sequence identifier	When the MRQ subfield is equal to 1, the MSI subfield contains a sequence number in the range 0 to 6 that identifies the specific request.When the MRQ subfield is equal to 0, the MSI subfield is reserved.

The ASELC subfield of the Link Adaptation Control subfield contains the ASEL Command and ASEL Data subfields, as shown in Figure 8-8. The encoding of these subfields is shown in Table 8-9.

	B0 B2	B3 B6
	ASEL Command	ASEL Data
Bits:	3	4

Figure 8-8—ASELC subfield

Table 8-9—ASEL Command and ASEL Data subfields

ASEL Command	Interpretation of ASEL Command	ASEL Data
0	Transmit Antenna Selection Sounding Indication (TXASSI)	Number of remaining sounding PPDUs to be transmitted 0 to 15 See NOTE
1	Transmit Antenna Selection Sounding Request (TXASSR) or Transmit ASEL Sounding Resumption	0 when the command is Transmit ASEL Sounding Request A number in the range of values of 1 to 15, the number being the number of the first sounding PPDU to be transmitted when the command is Transmit ASEL Sounding Resumption, where 0 corresponds to the first sounding PPDU in the original ASEL training sequence
2	Receive Antenna Selection Sounding Indication (RXASSI)	Number of remaining sounding PPDUs to be received 0 to 15 See NOTE
3	Receive Antenna Selection Sounding Request (RXASSR)	Number of sounding PPDUs required 0 to 15
4	Sounding Label	Sequence number of the sounding PPDU corresponding to a channel state information (CSI) frame in ASEL feedback 0 to 15
5	No Feedback Due to ASEL Training Failure or Stale Feedback	A number in the range of values of 0 to 15, the number being the number of the first sounding PPDU that was not received properly, where 0 corresponds to the first sounding PPDU in the ASEL training sequence, or 0 if no sounding PPDUs were received properly, or 0 if this is a request for a full retraining sequence
6	Transmit Antenna Selection Sounding Indication requesting feedback of explicit CSI (TXASSI-CSI)	Number of remaining sounding PPDUs to be transmitted 0 to 15 See NOTE
7	Reserved	Reserved

NOTE—If the HT Control field is carried in a sounding PPDU, then the value of the ASEL Data field contains the remaining number of sounding frames following the current one. If null data packet (NDP) sounding frame is used, then the value in the ASEL Data field contains the number of NDPs following a non-NDP+HTC. The NDP Announcement subfield in the HT Control field is set to 1 to indicate NDP sounding.

The Calibration Position and Calibration Sequence subfields of the HT Control field are defined in Table 8-10.

The Calibration Sequence subfield identifies an instance of the calibration procedure. The subfield is included in each frame within a calibration procedure, and its value is unchanged for frames within the same calibration procedure.

Table 8-10—Calibration control subfields

Subfield	Meaning	Definition
Calibration Position	Position in calibration sounding exchange sequence	Set to 0 indicates this is not a calibration frame. Set to 1 indicates calibration start. Set to 2 indicates sounding response. Set to 3 indicates sounding complete.
Calibration Sequence	Calibration sequence identifier	The field is included in each frame within the calibration procedure and its value is unchanged for the frame exchanges during one calibration procedure. See 9.29.2.4.3.

The CSI/Steering subfield of the HT Control field indicates the type of feedback, as shown in Table 8-11.

Table 8-11—CSI/Steering subfield values

Value	Definition
0	No feedback required
1	CSI
2	Noncompressed beamforming
3	Compressed beamforming

The NDP Announcement subfield of the HT Control field indicates that an NDP will be transmitted after the frame (according to the rules described in 9.31). It is set to 1 to indicate that an NDP will follow; otherwise, it is set to 0.

The AC Constraint subfield of the HT Control field indicates whether the mapped AC of an RD data frame is constrained to a single AC, as defined in Table 8-12.

Table 8-12—AC Constraint subfield values

Value	Description
0	The response to a reverse direction grant (RDG) may contain data frames from any TID
1	The response to an RDG may contain data frames only from the same AC as the last data frame received from the RD initiator

The RDG/More PPDU subfield of the HT Control field is interpreted differently depending on whether it is transmitted by an RD initiator or an RD responder, as defined in Table 8-13.

Table 8-13—RDG/More PPDU subfield values

Value	Role of transmitting STA	Interpretation of value
0	RD initiator	No reverse grant
	RD responder	The PPDU carrying the frame is the last transmission by the RD responder
1	RD initiator	An RDG is present, as defined by the Duration/ID field
	RD responder	The PPDU carrying the frame is followed by another PPDU

8.2.4.7 Frame Body field

8.2.4.7.1 General

The Frame Body is a variable-length field that contains information specific to individual frame types and subtypes. The minimum length of the frame body is 0 octets. The maximum length of the frame body is defined by the maximum length MSDU plus the length of Mesh Control field as defined in 8.2.4.7.3, if present, plus any overhead for encryption as defined in Clause 11, or by the maximum length A-MSDU plus any overhead for encryption as defined in Clause 11.

8.2.4.7.2 Overhead for encryption

The overhead for encryption is described in Clause 11. When the Mesh Control field is present in the frame body, the Mesh Control field is encrypted as a part of data.

8.2.4.7.3 Mesh Control field

The Mesh Control field is present in the unfragmented Mesh Data frame, in the first fragment of the Mesh Data frame, and in the management frame of subtype Action, Category Multihop Action (Multihop Action frame) transmitted by a mesh STA.

In Mesh Data frames, when the Mesh Control Present subfield in the QoS Control field is 1, the Mesh Control field is prepended to the MSDU and located as follows:

- When the frame body contains an MSDU (or a fragment thereof) and the frame is not encrypted, the Mesh Control field is located in the first octets of the frame body.
- When the frame body contains an MSDU (or a fragment thereof) and the frame is encrypted, the Mesh Control field is located in the first octets of the encrypted data portion.
- When the frame body contains an A-MSDU, the Mesh Control field is located in the Aggregate MSDU subframe header as shown in Figure 8-33.

In the Multihop Action frame, the Mesh Control field is present as specified in 8.5.18.

The Mesh Control field is of variable length (6, 12, or 18 octets). The structure of the Mesh Control field is defined in Figure 8-9.

	Mesh Flags	Mesh TTL	Mesh Sequence Number	Mesh Address Extension
Octets:	1	1	4	0, 6, or 12

Figure 8-9—Mesh Control field

The Mesh Flags subfield is 1 octet in length and contains the Address Extension Mode subfield. The structure of the Mesh Flags subfield is shown in Figure 8-10.

	B0 B1	B2 B7
	Address Extension Mode	Reserved
Bits	Bits: 2	6

Figure 8-10—Mesh Flags subfield

The Address Extension Mode subfield indicates the contents of the Mesh Address Extension subfield. Table 8-14 defines valid values for the Address Extension Mode and describes the corresponding contents of the Mesh Address Extension subfield. If the Address Extension Mode is 0, the Mesh Address Extension subfield is not present. For values 1 and 2, the Mesh Address Extension subfield is present following the Mesh Sequence Number subfield.

Table 8-14—Valid values for the Address Extension Mode

Address Extension Mode value	Address Extension Mode description	Mesh Address Extension subfield length (octets)	Applicable frame types
0	No Mesh Address Extension subfield	0	Data, Management (Multihop Action, group addressed)
1	Mesh Address Extension subfield contains Address 4	6	Management (Multihop Action, individually addressed), Data (proxied, group addressed)
2	Mesh Address Extension subfield contains Address 5 and Address 6	12	Data (proxied, individually addressed)
3	Reserved	—	—

The Mesh TTL subfield is 1 octet in length and contains an unsigned integer corresponding to the remaining number of hops the MSDU/MMPDU is forwarded. How the Mesh TTL is used in both individually and group addressed frames is described in 9.32.4 and 9.32.5.

The Mesh Sequence Number subfield is 4 octets in length and contains an unsigned integer sequence number counter value. Source mesh STAs assign mesh sequence numbers from a single modulo-2^{32} counter, starting at 0 and incrementing by 1 for each MSDU or MMPDU that is transmitted with a Mesh Control field. Usage of the Mesh Sequence Number is described in 9.32.7.

NOTE—It is believed that a 32-bit sequence number is sufficient as the rollover would occur after a period of 5 days assuming a source continuously transmitting at a rate of 10^4 frames per second.

The Mesh Address Extension subfield, shown in Figure 8-11, is 6 or 12 octets in length and is present only when the Address Extension Mode subfield of the Mesh Flags subfield is a nonzero nonreserved value. The Mesh Address Extension subfield provides additional address fields for mesh address extension as defined in Table 8-14. The interpretation of the extended Address fields is described in 9.32.3.

	Address 4	Address 5	Address 6
Octets:	6	6	6

Figure 8-11—Mesh Address Extension subfield

The Address 4 subfield is present when the Address Extension Mode subfield in the Mesh Flags subfield is 1 . It carries a fourth address that is not included as a part of the MAC header for these frames.

The Address 5 subfield and Address 6 subfield are present when the Address Extension Mode subfield in the Mesh Flags subfield is 2. It carries the addresses of source and destination end station of the end-to-end IEEE 802 communication in cases where either (or both) of the end stations are not mesh STAs at the beginning or end of a single mesh path. (See Figure 9-42.)

NOTE—This is useful, for example, when the end stations of IEEE 802 communication are nonmesh, external STAs that communicate over a mesh BSS via proxy mesh gates.

Details on the usage of these optional address fields are given in 9.32.3.

8.2.4.8 FCS field

The FCS field is a 32-bit field containing a 32-bit CRC. The FCS is calculated over all the fields of the MAC header and the Frame Body field. These are referred to as the *calculation fields*.

The FCS is calculated using the following standard generator polynomial of degree 32:

$$G(x) = x^{32} + x^{26} + x^{23} + x^{22} + x^{16} + x^{12} + x^{11} + x^{10} + x^{8} + x^{7} + x^{5} + x^{4} + x^{2} + x + 1$$

The FCS is the ones complement of the sum (modulo 2) of the following:

a) The remainder of $x^{k} \times (x^{31} + x^{30} + x^{29} + \ldots + x^{2} + x + 1)$ divided (modulo 2) by $G(x)$, where k is the number of bits in the calculation fields, and

b) The remainder after multiplication of the contents (treated as a polynomial) of the calculation fields by x^{32} and then division by $G(x)$.

The FCS field is transmitted commencing with the coefficient of the highest-order term.

As a typical implementation, at the transmitter, the initial remainder of the division is preset to all ones and is then modified by division of the calculation fields by the generator polynomial $G(x)$. The ones complement of this remainder is transmitted, with the highest-order bit first, as the FCS field.

At the receiver, the initial remainder is preset to all ones and the serial incoming bits of the calculation fields and FCS, when divided by $G(x)$, results (in the absence of transmission errors) in a unique nonzero remainder value. The unique remainder value is the polynomial:

$$x^{31} + x^{30} + x^{26} + x^{25} + x^{24} + x^{18} + x^{15} + x^{14} + x^{12} + x^{11} + x^{10} + x^{8} + x^{6} + x^{5} + x^{4} + x^{3} + x + 1$$

8.2.5 Duration/ID field (QoS STA)

8.2.5.1 General

The value in the Duration/ID field in a frame transmitted by a QoS STA is defined in 8.2.5.2 through 8.2.5.8.

All times are calculated in microseconds. If a calculated duration includes a fractional microsecond, that value inserted in the Duration/ID field is rounded up to the next higher integer.

8.2.5.2 Setting for single and multiple protection under enhanced distributed channel access (EDCA)

Within a frame (excluding data frames containing QoS CF-Poll, PSMP frames, and frames that have the RDG/More PPDU subfield equal to 1) transmitted under EDCA by a STA that initiates a TXOP, there are two classes of duration settings: single protection and multiple protection. In single protection, the value of the Duration/ID field of the frame can set a NAV value at receiving STAs that protects up to the end of any following data, management, or response frame plus any additional overhead frames as described below. In multiple protection, the value of the Duration/ID field of the frame can set a NAV that protects up to the estimated end of a sequence of multiple frames. Frames that have the RDG/More PPDU subfield equal to 1 always use multiple protection. PSMP frames always use multiple protection. The STA selects between single and multiple protection when it transmits the first frame of a TXOP. All subsequent frames transmitted by the STA in the same TXOP use the same class of duration settings.

The Duration/ID field is determined as follows:

a) Single protection settings.
   1) For an RTS that is not part of a dual clear-to-send (CTS) exchange, the Duration/ID field is set to the estimated time, in microseconds, required to transmit the pending frame, plus one CTS frame, plus one ACK or BlockAck frame if required, plus any NDPs required, plus explicit feedback if required, plus applicable IFS durations.
   2) For all CTS frames sent by STAs as the first frame in the exchange under EDCA and with the receiver address (RA) matching the MAC address of the transmitting STA, the Duration/ID field is set to one of the following:
      i) If there is a response frame, the estimated time required to transmit the pending frame, plus one SIFS interval, plus the response frame (ACK or BlockAck), plus any NDPs required, plus explicit feedback if required, plus an additional SIFS interval
      ii) If there is no response frame, the time required to transmit the pending frame, plus one SIFS interval
   3) For a BlockAckReq frame, the Duration/ID field is set to the estimated time required to transmit one ACK or BlockAck frame, as applicable, plus one SIFS interval.
   4) For a BlockAck frame that is not sent in response to a BlockAckReq or an implicit Block Ack request, the Duration/ID field is set to the estimated time required to transmit an ACK frame plus a SIFS interval.
   5) For management frames, non-QoS data frames (i.e., with bit 7 of the Frame Control field equal to 0), and individually addressed data frames with the Ack Policy subfield equal to Normal Ack only, the Duration/ID field is set to one of the following:
      i) If the frame is the final fragment of the TXOP, the estimated time required for the transmission of one ACK frame (including appropriate IFS values)
      ii) Otherwise, the estimated time required for the transmission of one ACK frame, plus the time required for the transmission of the following MPDU and its response if required, plus applicable IFS durations.

6) For individually addressed QoS data frames with the Ack Policy subfield equal to No Ack or Block Ack, for management frames of subtype Action No Ack, and for group addressed frames, the Duration/ID field is set to one of the following:

   i) If the frame is the final fragment of the TXOP, 0

   ii) Otherwise, the estimated time required for the transmission of the following frame and its response frame, if required (including appropriate IFS values)

b) Multiple protection settings. The Duration/ID field is set to a value D as follows:

   1) If $T_{TXOP} = 0$ and $T_{END\_NAV} = 0$, then $D = T_{SINGLE\text{-}MSDU} - T_{\text{PPDU}}$

   2) Else if $T_{TXOP} = 0$ and $T_{END\_NAV} > 0$, then $D = T_{END\text{-}NAV} - T_{PPDU}$

   3) Else if $T_{END\text{-}NAV} = 0$, then $\min(T_{PENDING}, T_{TXOP} - T_{PPDU}) \leq D \leq T_{TXOP} - T_{PPDU}$

   4) Else $T_{END-NAV} - T_{PPDU} \leq D \leq T_{TXOP-REMAINING} - T_{PPDU}$

   where

   $T_{SINGLE\text{-}MSDU}$ is the estimated time required for the transmission of the allowed frame exchange sequence defined in 8.4.2.31 (for a TXOP limit value of 0), including applicable IFS durations

   $T_{PENDING}$ is the estimated time required for the transmission of

   — Pending MPDUs of the same AC

   — Any associated immediate response frames

   — Any NDP transmissions and explicit feedback response frames

   — Applicable IFS durations

   — Any RDG

   T_{TXOP} is the value of dot11EDCATableTXOPLimit (dot11EDCAQAPTableTXOPLimit for the AP) for that AC

   $T_{TXOP\text{-}REMAINING}$ is T_{TXOP} less the time already used time within the TXOP

   $T_{END\text{-}NAV}$ is the remaining duration of any NAV set by the TXOP holder, or 0 if no NAV has been established

   T_{PPDU} is the time required for transmission of the current PPDU

8.2.5.3 Setting for QoS CF-Poll frames

Within a data frame containing QoS CF-Poll, the Duration/ID field value is set to one of the following:

a) One SIFS duration plus the TXOP limit, if the TXOP limit is nonzero, or

b) The time required for the transmission of one MPDU of nominal MSDU size and the associated ACK frame plus two SIFS intervals, if the TXOP limit is 0.

8.2.5.4 Setting for frames sent by a TXOP holder under HCCA

Within a frame sent by a TXOP holder under hybrid coordination function (HCF) controlled channel access (HCCA), to provide NAV protection for the entire controlled access phase (CAP), the Duration/ID field is set to one of the following values:

a) For an RTS frame

   1) If the pending frame is the final frame, the time required to transmit the pending frame, plus one CTS frame, plus one ACK frame if required, plus three SIFS intervals

   2) If the pending frame is not the final frame in the TXOP, the remaining duration of the TXOP

b) For a CTS frame

   1) If the pending frame is the sole frame in the TXOP, one of the following:

      i) If there is a response frame, the time required to transmit the pending frame, plus one SIFS interval, plus the response frame (ACK or BlockAck), plus an additional SIFS interval

      ii) If there is no response frame, the time required to transmit the pending frame, plus one SIFS interval

   2) If the pending frame is not the final frame in the TXOP, the remaining duration of the TXOP

c) Otherwise

   1) If the frame is a nonfinal frame in a TXOP with multiple frame exchanges, the remaining duration of the TXOP

   2) If the frame is the sole or final frame in the TXOP, the actual remaining time needed for this frame exchange sequence

8.2.5.5 Settings within a PSMP sequence

Within a PSMP frame, the Duration/ID field is set to a value that is no less than the time required to complete all PSMP-DTT and PSMP-UTT periods described in the frame.

Within the PSMP-DTT and PSMP-UTT of a PSMP sequence, the Duration/ID field is set to the Duration/ID value of the preceding PSMP frame minus the time between the end of the PSMP frame and the end of the PPDU carrying the frame.

NOTE—In other words, all frames transmitted within a PSMP sequence locate the same NAV endpoint.

8.2.5.6 Settings within a dual CTS sequence

Within a frame (“Frame1”) (excluding a second CTS (CTS2) transmission, as defined in 9.3.2.7) sent by a QoS STA that is not a TXOP holder in a PPDU that contains an immediate response or that is sent by an RD responder, the Duration/ID field is set to the Duration/ID value from the frame(s) (“Frames2”) that elicited the response or that carried the RDG minus the time interval between the end of the PPDU that carried Frame1 and the end of the PPDU that carries Frames2.

Within a frame (“Frame1”) (excluding a CTS2 transmission, as defined in 9.3.2.7) sent by a QoS STA that is a TXOP holder, the Duration/ID field is set according to the rules in the following subclauses:

— 8.2.5.2 rule b) for multiple protection if Frame1 is not a QoS+CF-Poll frame and the TXOP holder is not operating under HCCA or PSMP

— 8.2.5.3 if Frame1 is a QoS+CF-Poll frame and the TXOP holder is not operating under HCCA or PSMP

— 8.2.5.4 if the TXOP holder is operating under HCCA

— 8.2.5.5. if the TXOP holder is operating under PSMP

Within the CTS2 of a dual CTS exchange, defined in 9.3.2.7, the Duration/ID field is set to the value of the Duration/ID field of the RTS that initiated the exchange minus the time required to transmit the first clear-to-sent (CTS1), CTS2, and the applicable IFS intervals.

8.2.5.7 Setting for control response frames

This subclause describes how to set the Duration/ID field for CTS, ACK, and BlockAck control response frames transmitted by a QoS STA.

For a CTS frame that is not part of a dual CTS sequence transmitted in response to an RTS frame, the Duration/ID field is set to the value obtained from the Duration/ID field of the RTS frame that elicited the response minus the time, in microseconds, between the end of the PPDU carrying the RTS frame and the end of the PPDU carrying the CTS frame.

For an ACK frame, the Duration/ID field is set to the value obtained from the Duration/ID field of the frame that elicited the response minus the time, in microseconds between the end of the PPDU carrying the frame that elicited the response and the end of the PPDU carrying the ACK frame.

For a BlockAck frame transmitted in response to a BlockAckReq frame or transmitted in response to a frame containing an implicit Block Ack request, the Duration/ID field is set to the value obtained from the Duration/ID field of the frame that elicited the response minus the time, in microseconds between the end of the PPDU carrying the frame that elicited the response and the end of the PPDU carrying the BlockAck frame.

8.2.5.8 Setting for other response frames

For any frame transmitted by a STA that is not the TXOP holder and is not specified by 8.2.5.1 through 8.2.5.7, the Duration/ID field is set to the value obtained from the Duration/ID field of the frame that elicited the response minus the time, in microseconds, between the end of the PPDU carrying the frame that elicited the response and the end of the PPDU carrying the frame.

8.3 Format of individual frame types

8.3.1 Control frames

8.3.1.1 Format of control frames

In the following descriptions, “immediately previous” frame means a frame whose reception concluded within the SIFS interval preceding the start of the current frame.

The subfields within the Frame Control field of control frames are set as illustrated in Figure 8-12.

	B0 B1	B2 B3	B4 B7	B8	B9	B10	B11	B12	B13	B13	B15
	Protocol Version	Type (Control)	Subtype	To DS (0)	From DS (0)	More Frag (0)	Retry (0)	Power Man-age-ment	More Data (0)	Protected Frame (0)	Order (0)
Bits:	2	2	4	1	1	1	1	1	1	1	1

Figure 8-12—Frame Control field subfield values within control frames

8.3.1.2 RTS frame format

The frame format for the RTS frame is as defined in Figure 8-13.

Octets:	2	2	6	6	4
	Frame Control	Duration	RA	TA	FCS

MAC Header

Figure 8-13—RTS frame

The RA field of the RTS frame is the address of the STA, on the WM, that is the intended immediate recipient of the pending individually addressed data, management, or control frame.

The TA field is the address of the STA transmitting the RTS frame.

For all RTS frames sent by non-QoS STAs, the duration value is the time, in microseconds, required to transmit the pending data or management frame, plus one CTS frame, plus one ACK frame, plus three SIFS intervals. If the calculated duration includes a fractional microsecond, that value is rounded up to the next higher integer. For RTS frames sent by QoS STAs, see 8.2.5.

8.3.1.3 CTS frame format

The frame format for the CTS frame is as defined in Figure 8-14.

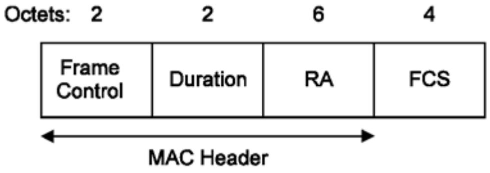


Figure 8-14—CTS frame

When the CTS frame follows an RTS frame, the RA field of the CTS frame is copied from the TA field of the immediately previous RTS frame to which the CTS is a response. When the CTS is the first frame in a frame exchange, the RA field is set to the MAC address of the transmitter.

For all CTS frames transmitted by a non-QoS STA in response to RTS frames, the duration value is the value obtained from the Duration field of the immediately previous RTS frame, minus the time, in microseconds, required to transmit the CTS frame and its SIFS interval. If the calculated duration includes a fractional microsecond, that value is rounded up to the next higher integer.

At a non-QoS STA, if the CTS is the first frame in the exchange and the pending data or management frame requires acknowledgment, the duration value is the time, in microseconds, required to transmit the pending data or management frame, plus two SIFS intervals plus one ACK frame. At a non-QoS STA, if the CTS is the first frame in the exchange and the pending data or management frame does not require acknowledgment, the duration value is the time, in microseconds, required to transmit the pending data or management frame, plus one SIFS interval. If the calculated duration includes a fractional microsecond, that value is rounded up to the next higher integer.

For other CTS transmissions by a QoS STA, the duration value is set as defined in 8.2.5.

8.3.1.4 ACK frame format

The frame format for the ACK frame is as defined in Figure 8-15.

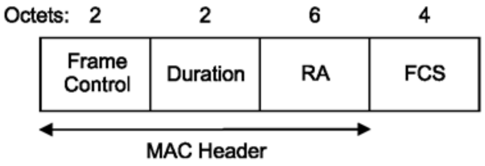

Figure 8-15—ACK frame

The RA field of the ACK frame is copied from the Address 2 field of the immediately previous individually addressed data, management, BlockAckReq, BlockAck, or PS-Poll frames.

For ACK frames sent by non-QoS STAs, if the More Fragments bit was equal to 0 in the Frame Control field of the immediately previous individually addressed data or management frame, the duration value is set to 0. In other ACK frames sent by non-QoS STAs, the duration value is the value obtained from the Duration/ID field of the immediately previous data, management, PS-Poll, BlockAckReq, or BlockAck frame minus the time, in microseconds, required to transmit the ACK frame and its SIFS interval. If the calculated duration includes a fractional microsecond, that value is rounded up to the next higher integer.

In all other ACK frames, the duration value is specified by 8.2.5.

8.3.1.5 PS-Poll frame format

The frame format for the PS-Poll frame is as defined in Figure 8-16.

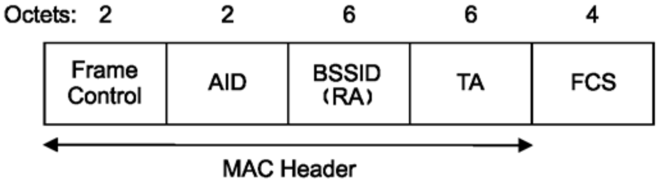

Figure 8-16—PS-Poll frame

The BSSID is the address of the STA contained in the AP. The TA field is the address of the STA transmitting the frame. The AID is the value assigned to the STA transmitting the frame by the AP in the association response frame that established that STA’s current association.

The AID value always has its two MSBs set to 1.

8.3.1.6 CF-End frame format

The frame format for the CF-End frame is as defined in Figure 8-17.

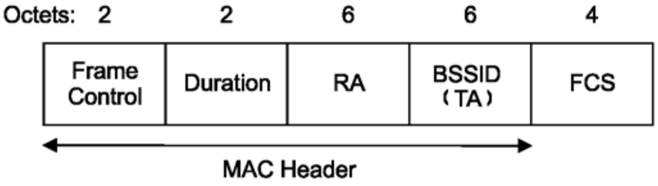

Figure 8-17—CF-End frame

The BSSID field is the address of the STA contained in the AP. The RA field is the broadcast group address.

The Duration field is set to 0.

8.3.1.7 CF-End+CF-Ack frame format

The frame format for the CF-End+CF-Ack frame is as defined in Figure 8-18.

Octets:	2	2	6	6	4
	Frame Control	Duration	RA	BSSID (TA)	FCS

MAC Header

Figure 8-18—CF-End+CF-Ack frame

The BSSID field is the address of the STA contained in the AP. The RA field is the broadcast group address.

The Duration field is set to 0.

8.3.1.8 BlockAckReq frame format

8.3.1.8.1 Overview

The frame format of the BlockAckReq frame is defined in Figure 8-19.

Octets:	2	2	6	6	2	Variable	4
	Frame Control	Duration/ID	RA	TA	BAR Control	BAR Information	FCS

MAC Header

Figure 8-19—BlockAckReq frame

The Duration/ID field value is set as defined in 8.2.5.

The RA field of the BlockAckReq frame is the address of the recipient STA.

The TA field is the address of the STA transmitting the BlockAckReq frame.

The BAR Control field is shown in Figure 8-20.

	B0	B1	B2	B3 B11	B12 B15
	BAR Ack Policy	Multi-TID	Compressed Bitmap	Reserved	TID_INFO
Bits:	1	1	1	9	4

Figure 8-20—BAR Control field

For BlockAckReq frames sent under Delayed and HT-Delayed agreements, the BAR Ack Policy subfield of the BAR Control field has the meaning shown in Table 8-15. For BlockAckReq frames sent under other types of agreement, the BAR Ack Policy subfield is reserved.

Table 8-15—BAR Ack Policy subfield

Value	Meaning
0	Normal Acknowledgment. The BAR Ack Policy subfield is set to this value when the sender requires immediate acknowledgment. The addressee returns an ACK. See 9.26.1.7.
1	No Acknowledgment. The addressee sends no immediate response upon receipt of the frame. The BAR Ack Policy subfield is set to this value when the sender does not require immediate acknowledgment. The value 1 is not used in a Basic BlockAckReq frame outside a PSMP sequence. The value 1 is not used in an Multi-TID BlockAckReq frame.

The values of the Multi-TID and Compressed Bitmap subfields determine which of three possible BlockAckReq frame variants is represented, as indicated in Table 8-16.

Table 8-16—BlockAckReq frame variant encoding

Multi-TID subfield value	Compressed Bitmap subfield value	BlockAckReq frame variant
0	0	Basic BlockAckReq
0	1	Compressed BlockAckReq
1	0	Reserved
1	1	Multi-TID BlockAckReq

The meaning of the TID_INFO subfield of the BAR Control field depends on the BlockAckReq frame variant type. The meaning of this subfield is explained within the subclause for each of the BlockAckReq frame variants.

The meaning of the BAR Information field of the BlockAckReq frame depends on the BlockAckReq frame variant type. The meaning of this field is explained within the subclause for each of the BlockAckReq frame variants.

NOTE—Reference to "a BlockAckReq" frame without any other qualification from other subclauses applies to any of the variants, unless specific exclusions are called out.

8.3.1.8.2 Basic BlockAckReq variant

The TID_INFO subfield of the BAR Control field of the Basic BlockAckReq frame contains the TID for which a Basic BlockAck frame is requested.

The BAR Information field of the Basic BlockAckReq frame contains the Block Ack Starting Sequence Control subfield, as shown in Figure 8-21. The Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield contains the sequence number of the first MSDU for which this Basic BlockAckReq frame is sent. The Fragment Number subfield is set to 0.

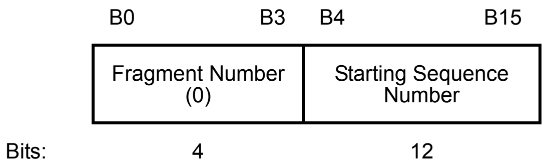

Figure 8-21—Block Ack Starting Sequence Control field

8.3.1.8.3 Compressed BlockAckReq variant

The TID_INFO subfield of the BAR Control field of the Compressed BlockAckReq frame contains the TID for which a BlockAck frame is requested.

The BAR Information field of the Compressed BlockAckReq frame contains the Block Ack Starting Sequence Control subfield, as shown in Figure 8-21. The Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield contains the sequence number of the first MSDU or A-MSDU for which this BlockAckReq frame is sent. The Fragment Number subfield of the Block Ack Starting Sequence Control subfield is set to 0.

8.3.1.8.4 Multi-TID BlockAckReq variant

The TID_INFO subfield of the BAR Control field of the Multi-TID BlockAckReq frame determines the number of TIDs present in the Multi-TID BlockAckReq frame as given by TID_INFO + 1, e.g., a value of 2 in the TID_INFO subfield means that three TID values are present in the Multi-TID BlockAckReq frame's BAR Information field.

The BAR Information field of the Multi-TID BlockAckReq frame comprises multiple sets of Per TID Info subfields and Block Ack Starting Sequence Control subfields, as shown in Figure 8-22. The Per TID Info subfield is shown in Figure 8-23. The Block Ack Starting Sequence Control subfield is shown in Figure 8-21. The Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield contains the sequence number of the first MSDU or A-MSDU for which this BlockAckReq frame is sent. The Fragment Number subfield of the Block Ack Starting Sequence Control subfield is set to 0.

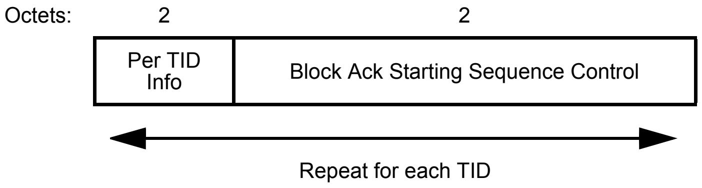

Figure 8-22—BAR Information field (Multi-TID BlockAckReq)

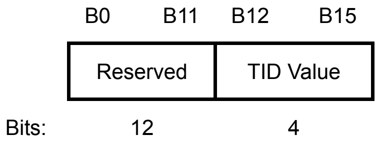

Figure 8-23—Per TID Info subfield

8.3.1.9 BlockAck frame format

8.3.1.9.1 Overview

The frame format of the BlockAck frame is defined in Figure 8-24.

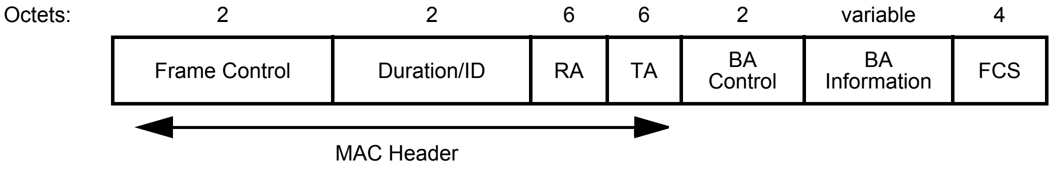

Figure 8-24—BlockAck frame

The Duration/ID field value is set as defined in 8.2.5.

The RA field of the BlockAck frame is the address of the recipient STA that requested the Block Ack.

The TA field is the address of the STA transmitting the BlockAck frame.

The BA Control field is defined in Figure 8-25.

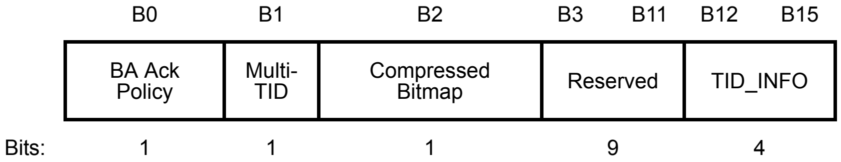

Figure 8-25—BA Control field

For BlockAck frames sent under Delayed and HT-Delayed agreements, the BA Ack Policy subfield of the BA Control field has the meaning shown in Table 8-17. For BlockAck frames sent under other types of agreement, the BA Ack Policy subfield is reserved.

Table 8-17—BA Ack Policy subfield

Value	Meaning
0	Normal Acknowledgment. The BA Ack Policy subfield is set to this value when the sender requires immediate acknowledgment. The addressee returns an ACK. The value 0 is not used for data sent under HT-delayed BlockAck during a PSMP sequence.
1	No Acknowledgment. The addressee sends no immediate response upon receipt of the frame. The BA Ack Policy is set to this value when the sender does not require immediate acknowledgment. The value 1 is not used in a Basic BlockAck frame outside a PSMP sequence. The value 1 is not used in an Multi-TID BlockAck frame.

The values of the Multi-TID and Compressed Bitmap subfields of the BA Control field determine which of three possible BlockAck frame variants is represented, as indicated in the Table 8-18.

Table 8-18—BlockAck frame variant encoding

Multi-TID subfield value	Compressed Bitmap subfield value	BlockAck frame variant
0	0	Basic BlockAck
0	1	Compressed BlockAck
1	0	Reserved
1	1	Multi-TID BlockAck

NOTE—Reference to “a BlockAck” frame without any other qualification from other subclauses applies to any of the variants, unless specific exclusions are called out.

The meaning of the TID_INFO subfield of the BA Control field depends on the BlockAck frame variant type. The meaning of this subfield is explained within the subclause for each of the BlockAck frame variants.

The meaning of the BA Information field depends on the BlockAck frame variant type. The meaning of this field is explained within the subclause for each of the BlockAck frame variants.

8.3.1.9.2 Basic BlockAck variant

The TID_INFO subfield of the BA Control field of the Basic BlockAck frame contains the TID for which this BlockAck frame is sent.

The BA Information field of the Basic BlockAck frame comprises the Block Ack Starting Sequence Control subfield and the Block Ack Bitmap subfield, as shown in Figure 8-26. The format of the Block Ack Starting Sequence Control subfield is shown in Figure 8-21. The Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield contains the sequence number of the first MSDU for which this Basic BlockAck frame is sent and is set to the same value as in the immediately previously received Basic BlockAckReq frame.

	Block Ack Starting Sequence Control	Block Ack Bitmap
Octets:	2	128

Figure 8-26—BA Information field (BlockAck)

The Block Ack Bitmap subfield is 128 octets in length and is used to indicate the received status of up to 64 MSDUs. Bit position *n* of the Block Ack bitmap, if equal to 1, acknowledges receipt of an MPDU with an MPDU sequence control value equal to (Block Ack Starting Sequence Control + *n*). Bit position *n* of the Block Ack bitmap, if equal to 0, indicates that an MPDU with MPDU sequence control value equal to (Block Ack Starting Sequence Control + *n*) has not been received. Each of the MPDU Sequence Control field and Block Ack Starting Sequence Control subfield values are treated as a 16-bit unsigned integer. For unused fragment numbers of an MSDU, the corresponding bits in the bitmap are set to 0.

8.3.1.9.3 Compressed BlockAck variant

The TID_INFO subfield of the BA Control field of the Compressed BlockAck frame contains the TID for which this BlockAck frame is sent.

The BA Information field of the Compressed BlockAck frame comprises the Block Ack Starting Sequence Control subfield and the Block Ack Bitmap subfield, as shown in Figure 8-27. The Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield contains the sequence number of the first MSDU or A-MSDU for which this BlockAck frame is sent. The value of this subfield is defined in 9.21.7.5. The Fragment Number subfield of the Block Ack Starting Sequence Control subfield is set to 0.

	Block Ack Starting Sequence Control	Block Ack Bitmap
Octets:	2	8

Figure 8-27—BA Information field (Compressed BlockAck)

The Block Ack Bitmap subfield of the BA Information field of the Compressed BlockAck frame is 8 octets in length and is used to indicate the received status of up to 64 MSDUs and A-MSDUs. Each bit that is equal to 1 in the compressed Block Ack bitmap acknowledges the successful reception of a single MSDU or A-MSDU in the order of sequence number, with the first bit of the Block Ack bitmap corresponding to the MSDU or A-MSDU with the sequence number that matches the value of the Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield.

8.3.1.9.4 Multi-TID BlockAck variant

The TID_INFO subfield of the BA Control field of the Multi-TID BlockAck frame contains the number of TIDs, less one, for which information is reported in the BA Information field. For example, a value of 2 in the TID_INFO subfield means that information for three TIDs is present.

The BA Information field of the Multi-TID BlockAck frame comprises 1 or more instances of the Per TID Info, Block Ack Starting Sequence Control, and the Block Ack Bitmap subfields, as shown in Figure 8-28. The Per TID Info subfield is shown in Figure 8-23, and the Block Ack Starting Sequence Control subfield is shown in Figure 8-21.

The Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield is the sequence number of the first MSDU or A-MSDU for which this BlockAck frame is sent. The value of this subfield is defined in 9.21.7.5. The Fragment Number subfield of the Block Ack Starting Sequence Control subfield is set to 0. The first instance of the Per TID Info, Block Ack Starting Sequence Control, and Block Ack Bitmap subfields that is transmitted corresponds to the lowest TID value, with subsequent instances ordered by increasing values of the Per TID Info subfield.

Octets:	2	2	8
	Per TID Info	Block Ack Starting Sequence Control	Block Ack Bitmap

Repeat for each TID

Figure 8-28—BA Information field (Multi-TID BlockAck)

The Block Ack Bitmap subfield of the BA Information field of the Multi-TID BlockAck frame contains an 8-octet Block Ack bitmap. Each bit that is equal to 1 in the Block Ack bitmap acknowledges the successful reception of a single MSDU or A-MSDU in the order of sequence number with the first bit of the Block Ack bitmap corresponding to the MSDU or A-MSDU with the sequence number that matches the value of the Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield.

8.3.1.10 Control Wrapper frame

The format of the Control Wrapper frame is shown in Figure 8-29.

	Frame Control	Duration/ ID	Address 1	Carried Frame Control	HT Control	Carried Frame	FCS
Octets:	2	2	6	2	4	variable	4

Figure 8-29—Control Wrapper frame

The Control Wrapper frame is used to carry any other control frame (i.e., excluding the Control Wrapper frame) together with a HT Control field.

The Frame Control field is defined in 8.3.1. The value for the subtype field is the value from Table 8-1 of 8.2.4.1.3 that corresponds to Control Wrapper frame.

The value for the Duration/ID field of the Control Wrapper frame is generated by following the rules for the Duration/ID field of the control frame that is being carried.

The value for the Address 1 field of the Control Wrapper frame is generated by following the rules for the Address 1 field of the control frame that is being carried.

The Carried Frame Control field contains the value of the Frame Control field of the carried control frame.

The HT Control field is defined in 8.2.4.6.

The Carried Frame field contains the fields that follow the Address 1 field of the control frame that is being carried, excluding the FCS field.

The FCS field is defined in 8.2.4.8.

8.3.2 Data frames

8.3.2.1 Data frame format

The format of a data frame is defined in Figure 8-30. The Frame Control, Duration/ID, Address 1, Address 2, Address 3, and Sequence Control fields are present in all data frame subtypes. The presence of the Address 4 field is determined by the setting of the To DS and From DS subfields of the Frame Control field (see below). The QoS Control field is present when the QoS subfield of the Subtype field is set to 1.

Octets: 2	2	6	6	6	2	6	2	4	0–7951	4
Frame Control	Duration/ ID	Address 1	Address 2	Address 3	Sequence Control	Address 4	QoS Control	HT Control	Frame Body	FCS

◄────────────────────────►
MAC Header

Figure 8-30—Data frame

NOTE—The maximum frame body size shown in Figure 8-30 is for CCMP encryption of a maximum-size A-MSDU (note that TKIP encryption is not allowed in this case and any Mesh Control fields are part of the A-MSDU subframes). The maximum frame body size if A-MSDUs are not used is 2338 octets for CCMP encryption of a maximum-size MSDU and 2342 octets for TKIP encryption of a maximum-size MSDU, including in both cases an 18-octet Mesh Control field. The frame body size might in all cases be greater if a vendor-specific cipher suite is used.

Data frames with a value of 1 in the QoS subfield of the Subtype field are collectively referred to as *QoS data frames*. Each of these data subtypes contains QoS in their names, and this frame format is distinguished by the presence of a QoS Control field in the MAC header.

A QoS STA always uses QoS data frames for data transmissions to other QoS STAs. A QoS STA uses frames with the QoS subfield of the Subtype field set to 0 for data transmissions to non-QoS STAs. A non-QoS STA always uses frames with the QoS subfield of the Subtype field set to 0 for data transmissions to other STAs. All STAs use frames with the QoS subfield of the Subtype field set to 0 for broadcast data frames unless a transmitting STA knows that all STAs in a BSS have QoS capability, in which case the transmitting STAs use QoS data frames. All STAs use frames with the QoS subfield of the Subtype field set to 0 for group addressed data frames unless it is known to the transmitter that all STAs in the BSS that are members of the multicast group have QoS capability, in which case STAs use QoS data frames.

The content of the address fields of data frames are dependent upon the values of the To DS and From DS fields in the Frame Control field and whether the Frame Body field contains either an MSDU (or fragment thereof) or an entire A-MSDU, as determined by the A-MSDU Present subfield of the QoS Control field (see 8.2.4.5.9). The content of the address fields is defined in Table 8-19. Where the content of a field is shown as not applicable (N/A), the field is omitted. Note that Address 1 always holds the receiver address of the intended receiver (or, in the case of group addressed frames, receivers), and that Address 2 always holds the address of the STA that is transmitting the frame.

Table 8-19—Address field contents

To DS	From DS	Address 1	Address 2	Address 3		Address 4	
				MSDU case	A-MSDU case	MSDU case	A-MSDU case
0	0	RA = DA	TA = SA	BSSID	BSSID	N/A	N/A
0	1	RA = DA	TA = BSSID	SA	BSSID	N/A	N/A
1	0	RA = BSSID	TA = SA	DA	BSSID	N/A	N/A
1	1	RA	TA	DA	BSSID	SA	BSSID

A STA uses the contents of the Address 1 field to perform address matching for receive decisions. A mesh STA also uses the address matching rules described in 9.32.4, when it receives an individually addressed frame. When a STA other than mesh STA (nonmesh STA) receives a frame with the Address 1 field equal to a group address, the STA also validates the BSSID to verify either that the group addressed frame originated from a STA in the BSS of which the receiving STA is a member, or that it contains the wildcard BSSID value, indicating a data frame sent outside the context of a BSS (dot11OCBActivated is true in the transmitting STA). When a mesh STA receives a frame with the Address 1 field equal to a group address, the mesh STA also validates the TA to ensure that the group addressed frame originated from one of its peer mesh STA. A mesh STA also uses the address matching rules described in 9.32.5.

A STA uses the contents of the Address 2 field to direct the acknowledgment if an acknowledgment is necessary.

The DA field contains the destination of the MSDU (or fragment thereof) or A-MSDU in the Frame Body field.

The SA field contains the address of the MAC entity that initiated the MSDU (or fragment thereof) or A-MSDU in the Frame Body field.

When a data frame carries an MSDU (or fragment thereof), the DA and SA values related to that MSDU are carried in the Address 1, Address 2, Address 3, and Address 4 fields (according to the setting of the To DS and From DS fields) as defined in Table 8-19.

When a data frame carries an A-MSDU, the DA and SA values related to each MSDU carried by the A-MSDU are carried within the A-MSDU. One or both of these fields may also be present in the Address 1 and Address 2 fields as indicated in Table 8-19.

NOTE—If a DA or SA value also appears in any of these address fields, the value is necessarily the same for all MSDUs within the A-MSDU because this is guaranteed by the To DS and From DS field settings.

The RA field is the individual address of the STA that is the immediate intended receiver of the frame or the group address of the STAs that are the immediate intended receivers of the frame.

The TA field is the address of the STA that is transmitting the frame.

The BSSID of the Data frame is determined as follows:

a) If the STA is contained within an AP or is associated with an AP, the BSSID is the address currently in use by the STA contained in the AP.
b) If the STA is a member of an IBSS, the BSSID is the BSSID of the IBSS.
c) If the STA is transmitting a data frame when dot11OCBActivated is true, the BSSID is the wildcard BSSID.
d) If the STA is a member of an MBSS, the BSSID is the address of the transmitter and is equal to the Data frame’s TA.

The Sequence Control field is defined in 8.2.4.4. The Sequence Control field for QoS (+)Null frames is ignored by the receiver upon reception.

The QoS Control field is defined in 8.2.4.5.

The HT Control field is defined in 8.2.4.6. The presence of the HT Control field is determined by the Order subfield of the Frame Control field, as specified in 8.2.4.1.10.

The frame body consists of either:

— The MSDU (or a fragment thereof), the Mesh Control field (present if the frame is transmitted by a mesh STA and the Mesh Control Present subfield of the QoS Control field is 1, otherwise absent), and a security header and trailer (present if the Protected Frame subfield in the Frame Control field is 1, otherwise absent)
— The A-MSDU and a security header and trailer (present if the Protected Frame subfield in the Frame Control field is 1, otherwise absent)

The presence of an A-MSDU in the frame body is indicated by setting the A-MSDU Present subfield of the QoS Control field to 1, as shown in Table 8-4.

For data frames of subtype Null (no data), CF-Ack (no data), CF-Poll (no data), and CF-Ack+CF-Poll (no data) and for the corresponding QoS data frame subtypes, the Frame Body field is null (i.e., has a length of 0 octets); these subtypes are used for MAC control purposes. For data frames of subtypes Data, Data+CF-Ack, Data+CF-Poll, and Data+CF-Ack+CF-Poll, the Frame Body field contains all of, or a fragment of, an MSDU after any encapsulation for security. For data frames of subtypes QoS Data, QoS Data+CF-Ack, QoS Data+CF-Poll, and QoS Data+CF-Ack+CF-Poll, the Frame Body field contains an MSDU (or fragment thereof) or A-MSDU after any encapsulation for security. For data frames of subtype QoS Data that are transmitted by a mesh STA, the Frame Body field also contains a Mesh Control field, as described in 8.2.4.7.3.

The maximum length of the Frame Body field can be determined from the maximum MSDU length plus the length of the Mesh Control field (if present) plus any overhead from encapsulation for encryption (i.e., it is always possible to send a maximum length MSDU, with any encapsulations provided by the MAC layer within a single data MPDU). When the frame body carries an A-MSDU, the size of the frame body field is limited by:

- The PHY's maximum PLCP service data unit (PSDU) length
- If A-MPDU aggregation is used, a maximum MPDU length of 4095 octets (see 8.6)

Within all data frames sent by STAs during the CFP under PCF, the Duration/ID field is set to 32 768. Within all data frames sent by the QoS STA, the Duration/ID field contains a duration value as defined in 8.2.5. Within all data frames sent during the CP by non-QoS STAs, the Duration/ID field is set according to the following rules:

- If the Address 1 field contains a group address, the duration value is set to 0.
- If the More Fragments bit is 0 in the Frame Control field of a frame and the Address 1 field contains an individual address, the duration value is set to the time, in microseconds, required to transmit one ACK frame, plus one SIFS interval.
- If the More Fragments bit is 1 in the Frame Control field of a frame and the Address 1 field contains an individual address, the duration value is set to the time, in microseconds, required to transmit the next fragment of this data frame, plus two ACK frames, plus three SIFS intervals.

The duration value calculation for the data frame is based on the rules in 9.7 that determine the data rate at which the control frames in the frame exchange sequence are transmitted. If the calculated duration includes a fractional microsecond, that value is rounded up to the next higher integer. All STAs process Duration/ID field values less than or equal to 32 767 from valid data frames (without regard for the RA, DA, and/or BSSID address values that might be present in these frames) to update their NAV settings as appropriate under the coordination function rules.

8.3.2.2 A-MSDU format

An A-MSDU is a sequence of A-MSDU subframes as shown in Figure 8-31. Each A-MSDU subframe consists of an A-MSDU subframe header followed by an MSDU and 0 to 3 octets of padding as shown in Figure 8-32. Each A-MSDU subframe (except the last) is padded so that its length is a multiple of 4 octets. The last A-MSDU subframe has no padding.

A-MSDU subframe 1	A-MSDU subframe 2	…	A-MSDU subframe n

Figure 8-31—A-MSDU structure

Octets:	6	6	2	0–2304	0–3
	DA	SA	Length	MSDU	Padding

A-MSDU subframe header

Figure 8-32—A-MSDU subframe structure

The A-MSDU subframe header contains three fields: DA, SA, and Length. The order of these fields and the bits within these fields are the same as the IEEE 802.3 frame format. The DA and SA fields of the A-MSDU subframe header contain the values passed in the MA-UNITDATA.request and MA-UNITDATA.indication primitives. The Length field contains the length in octets of the MSDU.

An A-MSDU contains only MSDUs whose DA and SA parameter values map to the same receiver address (RA) and transmitter address (TA) values, i.e., all the MSDUs are intended to be received by a single receiver, and necessarily they are all transmitted by the same transmitter. The rules for determining RA and TA are independent of whether the frame body carries an A-MSDU.

NOTE—It is possible to have different DA and SA parameter values in A-MSDU subframe headers of the same A-MSDU as long as they all map to the same Address 1 and Address 2 parameter values.

The MPDU containing the A-MSDU is carried in any of the following data frame subtypes: QoS Data, QoS Data + CF-Ack, QoS Data + CF-Poll, QoS Data + CF-Ack + CF-Poll. The A-MSDU structure is contained in the frame body of a single MPDU. If encrypted, the MPDU is encrypted as a single unit.

NOTE 1—The value of TID present in the QoS Control field of the MPDU carrying the A-MSDU indicates the TID for all MSDUs in the A-MSDU. Because this value of TID is common to all MSDUs in the A-MSDU, only MSDUs delivered to the MAC by an MA-UNITDATA.request primitive with an integer priority parameter that maps to the same TID can be aggregated together using A-MSDU.

NOTE 2—The maximum MPDU length that can be transported using A-MPDU aggregation is 4095 octets. An A-MSDU cannot be fragmented. Therefore, an A-MSDU of a length that exceeds 4065 octets (4095 minus the QoS data MPDU overhead) cannot be transported in an A-MPDU.

When Mesh Data frames are aggregated, the Aggregate MSDU subframe header includes Mesh DA, Mesh SA, Length, and Mesh Control. The A-MSDU subframe structure for Mesh Data is defined in Figure 8-33.

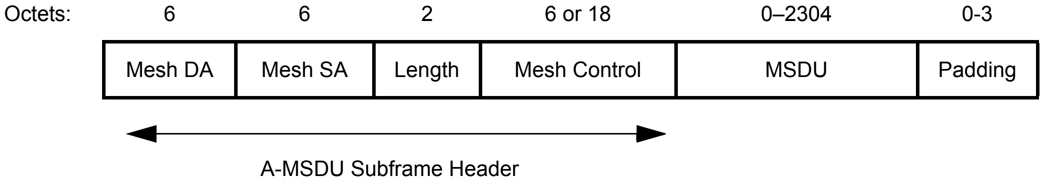

Figure 8-33—A-MSDU Subframe structure for Mesh Data

The Mesh DA and Mesh SA fields contain the addresses of the destination mesh STA and the source mesh STA, respectively, determined in 9.32.3.

The Length field contains the length in octets of the MSDU.

The format of the Mesh Control field is described in 8.2.4.7.3.

NOTE—It is possible to have different Mesh DA, Mesh SA, and Mesh Control in Subframe Headers of the same A-MSDU as long as they all map to the same Address 1 and Address 2 values.

8.3.3 Management frames

8.3.3.1 Format of management frames

The format of a management frame is defined in Figure 8-34. The Frame Control, Duration, Address 1, Address 2, Address 3, and Sequence Control fields are present in all management frame subtypes. The maximum unencrypted MMPDU size, excluding the MAC header and FCS, is 2304 octets.

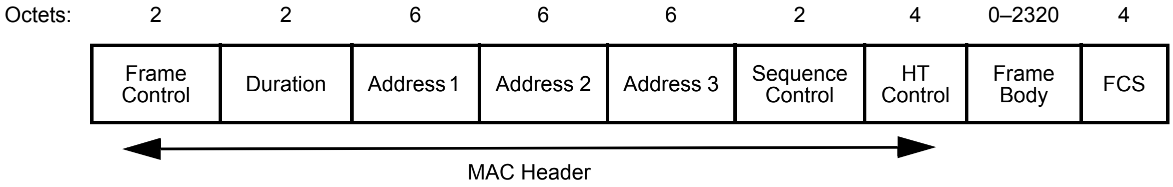

Figure 8-34—Management frame format

NOTE—The maximum frame body size shown in Figure 8-34 is for CCMP encryption with a maximum-size MMPDU (note TKIP encryption is not allowed and any Mesh Control field is held within the MMPDU, not as a separate header). The frame body size might be greater if a vendor-specific cipher suite is used.

A STA uses the contents of the Address 1 field to perform the address matching for receive decisions. In the case where the Address 1 field contains a group address and the frame subtype is other than Beacon or the frame subtype Action, Category Multihop Action (Multihop Action frame), the Address 3 field also is validated to verify that the group addressed frame originated from a STA in the BSS of which the receiving STA is a member or from a mesh STA to which mesh peering is maintained. Details of addressing and forwarding of the group addressed frame in an MBSS are defined in 9.32.5. When the Address 1 field contains a group address and the frame subtype is either Probe Request or Action with Category Public, a wildcard BSSID value matches all receiving STA's BSSIDs. If the frame subtype is Beacon, other address matching rules apply, as specified in 10.1.3.5. Frames of subtype Probe Request with a group address in the Address 1 field are additionally processed as described in 10.1.4.3.2. If the frame subtype is Action, the Category is Public, and the Action is 20/40 BSS Coexistence Management, then additional address matching rules for receive decisions apply as specified in 10.15 and 10.17.

The address fields for all management frames except Multihop Action frames are as follows:

a) The Address 1 field of the management frame is the RA (=DA) and is determined as the destination of the frame.
b) The Address 2 field of the management frame is the TA (=SA) and is determined as the address of the STA transmitting the frame.
c) The Address 3 field of the management frame is set and determined as follows:
    1) In management frames of subtype Probe Request, the Address 3 field is the BSSID. The BSSID is either a specific BSSID as described in item 4) below or the wildcard BSSID as defined in the procedures specified in 10.1.4.
    2) In management frames of subtype Action, Category Public, the Address 3 field is the BSSID. The BSSID value is set according to 10.19.
    3) If dot11OCBActivated is true, the Address 3 field is the wildcard BSSID.
    4) Otherwise:
        i) If the STA is contained within an AP or is associated with an AP, the Address 3 field is the BSSID. The BSSID is the address currently in use by the STA contained in the AP.
        ii) If the STA is contained within an AP or is transmitting the management frame to an AP, the Address 3 field is the BSSID. The BSSID is the address currently in use by the STA contained in the AP.
        iii) If the STA is transmitting the management frame to one or more members of an IBSS, the Address 3 field is the BSSID of the IBSS.
        iv) If the STA is a mesh STA, the Address 3 field is the TA.

The address fields for the Multihop Action frame are as follows:

— The Address 1 field is the RA and is determined as the address of the receiver of the frame.

- The Address 2 field is the TA and is determined as the address of the transmitter of the frame.
- The Address 3 field is the DA and is determined as the address of the destination mesh STA of the frame.

NOTE—Address 4 is included in the Mesh Control field.

Within all management frames sent by STAs during the CFP under PCF, the Duration field is set to the value 32 768. Within all management frames sent by the QoS STA, the Duration field contains a duration value as defined in 8.2.5. Within all management frames sent during the CP by non-QoS STAs, the Duration field is set according to the following rules:

- If the DA field contains a group address, the duration value is set to 0.
- If the More Fragments bit is 0 in the Frame Control field of a frame and the DA field contains an individual address, the duration value is set to the time, in microseconds, required to transmit one ACK frame, plus one SIFS interval.
- If the More Fragments bit is 1 in the Frame Control field of a frame, and the DA field contains an individual address, the duration value is set to the time, in microseconds, required to transmit the next fragment of this management frame, plus two ACK frames, plus three SIFS intervals.

The duration value calculation for the management frame is based on the rules in 9.7 that determine the data rate at which the control frames in the frame exchange sequence are transmitted. If the calculated duration includes a fractional microsecond, that value is rounded up to the next higher integer. All STAs process Duration field values less than or equal to 32 767 from valid management frames to update their NAV settings as appropriate under the coordination function rules.

The HT Control field is defined in 8.2.4.6. The presence of the HT Control field is determined by the Order subfield of the Frame Control field, as specified in 8.2.4.1.10.

The frame body consists of the fields followed by the elements defined for each management frame subtype. All fields and elements are mandatory unless stated otherwise and appear in the specified, relative order. STAs that encounter an element ID they do not recognize in the frame body of a received management frame ignore that element and continue to parse the remainder of the management frame body (if any) for additional elements with recognizable element IDs. See 9.24.7. Unused element ID codes are reserved.

Gaps may exist in the ordering of fields and elements within frames. The order that remains is ascending.

8.3.3.2 Beacon frame format

The frame body of a management frame of subtype Beacon contains the information shown in Table 8-20.

Table 8-20—Beacon frame body

Order	Information	Notes
1	Timestamp	
2	Beacon interval	
3	Capability	
4	Service Set Identifier (SSID)	If dot11MeshActivated is true, the SSID element is the wildcard value as described in 8.4.2.2.
5	Supported rates	
6	Frequency-Hopping (FH) Parameter Set	The FH Parameter Set element is present within Beacon frames generated by STAs using FH PHYs.

Table 8-20—Beacon frame body *(continued)*

Order	Information	Notes
7	DSSS Parameter Set	The DSSS Parameter Set element is present within Beacon frames generated by STAs using Clause 16, Clause 17, and Clause 19 PHYs. The element is present within Beacon frames generated by STAs using a Clause 20 PHY in the 2.4 GHz band.
8	CF Parameter Set	The CF Parameter Set element is present only within Beacon frames generated by APs supporting a PCF. This element is not present if dot11HighThroughputOptionImplemented is true and the Dual CTS Protection field of the HT Operation element is 1.
9	IBSS Parameter Set	The IBSS Parameter Set element is present only within Beacon frames generated by STAs in an IBSS.
10	Traffic indication map (TIM)	The TIM element is present only within Beacon frames generated by APs or mesh STAs.
11	Country	The Country element is present if dot11MultiDomainCapabilityActivated is true or dot11SpectrumManagementRequired is true or dot11RadioMeasurementActivated is true.
12	FH Parameters	FH Parameters as specified in 8.4.2.11 are optionally present if dot11MultiDomainCapabilityActivated is true.
13	FH Pattern Table	FH Pattern Table information as specified in 8.4.2.12 are optionally present if dot11MultiDomainCapabilityActivated is true.
14	Power Constraint	The Power Constraint element is present if dot11SpectrumManagementRequired is true and is optionally present if dot11RadioMeasurementActivated is true.
15	Channel Switch Announcement	Channel Switch Announcement element is optionally present if dot11SpectrumManagementRequired is true.
16	Quiet	The Quiet element is optionally present if dot11SpectrumManagementRequired is true or dot11RadioMeasurementActivated is true.
17	IBSS DFS	IBSS DFS element is present if dot11SpectrumManagementRequired is true in an IBSS.
18	TPC Report	The TPC Report element is present if dot11SpectrumManagementRequired is true or dot11RadioMeasurementActivated is true.
19	ERP	The ERP element is present within Beacon frames generated by STAs using extended rate PHYs (ERPs) defined in Clause 19 and is optionally present in other cases.
20	Extended Supported Rates	The Extended Supported Rates element is present if there are more than eight supported rates, and it is optional otherwise.
21	RSN	The RSNE is present within Beacon frames generated by STAs that have dot11RSNAActivated equal to true.
22	BSS Load	The BSS Load element is present if dot11QosOptionImplemented and dot11QBSSLoadImplemented are both true.
23	EDCA Parameter Set	The EDCA Parameter Set element is present if dot11QosOptionImplemented is true, and dot11MeshActivated is false, and the QoS Capability element is not present.

Table 8-20—Beacon frame body *(continued)*

Order	Information	Notes
24	QoS Capability	The QoS Capability element is present if dot11QosOptionImplemented is true, and dot11MeshActivated is false, and EDCA Parameter Set element is not present.
25	AP Channel Report	If dot11RMAPChannelReportActivated is true, one AP Channel Report element is present for each operating class that has at least 1 channel to report.
26	BSS Average Access Delay	The BSS Average Access Delay element is present if dot11RMBSSAverageAccessDelayActivated is true and the value of the AP Average Access Delay field is not equal to 255 (measurement not available); otherwise, the BSS Average Access Delay element is optionally present if dot11RMBSSAverageAccessDelayActivated is true.
27	Antenna	The Antenna element is present if dot11RMAntennaInformationActivated is true and the value of the Antenna ID field is not equal to 0 (unknown antenna); otherwise, the Antenna element is optionally present if dot11RMAntennaInformationActivated is true.
28	BSS Available Admission Capacity	The BSS Available Admission Capacity element is present if dot11RMBSSAvailableAdmissionCapacityActivated is true with the following exceptions: 1) when Available Admission Capacity Bitmask equals 0 (Available Admission Capacity List contains no entries), or 2) when the BSS Load element is present and the Available Admission Capacity Bitmask states that only AC_VO is present in the Available Admission Capacity List field.
29	BSS AC Access Delay	The BSS AC Access Delay element is present if dot11RMBSSAverageAccessDelayActivated is true and at least one field of the element is not equal to 255 (measurement not available); otherwise, the BSS AC Access Delay element is optionally present if dot11RMBSSAverageAccessDelayActivated is true.
30	Measurement Pilot Transmission	The Measurement Pilot Transmission element is present if dot11RMMeasurementPilotActivated is a value between 2 and 7.
31	Multiple BSSID	One or more Multiple BSSID elements are present if dot11RMMeasurementPilotActivated is a value between 2 and 7 and the AP is a member of a Multiple BSSID Set (see 10.11.14) with two or more members, or if dot11MgmtOptionMultiBSSIDActivated is true, or if dot11InterworkingServiceActivated is true and the AP is a member of a Multiple BSSID Set with two or more members and at least one dot11GASAdvertisementID MIB attribute exists.
32	RM Enabled Capabilities	RM Enabled Capabilities element is present if dot11RadioMeasurementActivated is true.
33	Mobility Domain	The Mobility Domain element (MDE) is present if dot11FastBSSTransitionActivated is true.
34	DSE registered location	The DSE Registered Location element is present if dot11LCIDSERequired is true.
35	Extended Channel Switch Announcement	The Extended Channel Switch Announcement element is optionally present if dot11ExtendedChannelSwitchActivated is true.
36	Supported Operating Classes	The Supported Operating Classes element is present if dot11ExtendedChannelSwitchActivated is true.

Table 8-20—Beacon frame body *(continued)*

Order	Information	Notes
37	HT Capabilities	The HT Capabilities element is present when dot11HighThroughputOptionImplemented attribute is true.
38	HT Operation	The HT Operation element is included by an AP and a mesh STA when dot11HighThroughputOptionImplemented attribute is true.
39	20/40 BSS Coexistence	The 20/40 BSS Coexistence element is optionally present when the dot112040BSSCoexistenceManagementSupport attribute is true.
40	Overlapping BSS Scan Parameters	The Overlapping BSS Scan Parameters element is optionally present if the dot11FortyMHzOptionImplemented attribute is true.
41	Extended Capabilities	The Extended Capabilities element is optionally present if any of the fields in this element are nonzero.
42	FMS Descriptor	The FMS Descriptor element is present if dot11MgmtOptionFMSActivated is true.
43	QoS Traffic Capability	The QoS Traffic Capability element is optionally present if dot11MgmtOptionACStationCountActivated is true.
44	Time Advertisement	The Time Advertisement element is present every dot11TimeAdvertisementIntervalDTIMs if dot11MgmtOptionUTCTSFOffsetActivated is true.
45	Interworking	The Interworking element is present if dot11InterworkingServiceActivated is true.
46	Advertisement Protocol	Advertisement Protocol element is present if dot11InterworkingServiceActivated is true and at least one dot11GASAdvertisementID MIB attribute exists.
47	Roaming Consortium	The Roaming Consortium element is present if dot11InterworkingServiceActivated is true and the dot11RoamingConsortiumTable has at least one entry.
48	Emergency Alert Identifier	One or more Emergency Alert Identifier elements are present if dot11EASActivated is true and there are one or more EAS message(s) active in the network.
49	Mesh ID	The Mesh ID element is present if dot11MeshActivated is true.
50	Mesh Configuration	The Mesh Configuration element is present if dot11MeshActivated is true.
51	Mesh Awake Window	The Mesh Awake Window element is optionally present if dot11MeshActivated is true.
52	Beacon Timing	The Beacon Timing element is optionally present if both dot11MeshActivated and dot11MBCAActivated are true.
53	MCCAOP Advertisement Overview	The MCCAOP Advertisement Overview element is optionally present if both dot11MeshActivated and dot11MCCAActivated are true.
54	MCCAOP Advertisement	One or more MCCAOP Advertisement elements are optionally present if both dot11MeshActivated and dot11MCCAActivated are true.

Table 8-20—Beacon frame body *(continued)*

Order	Information	Notes
55	Mesh Channel Switch Parameters	The Mesh Channel Switch Parameters element is present when dot11MeshActivated is true and either Channel Switch Announcement element or Extended Channel Switch Announcement element is present.
Last	Vendor Specific	One or more vendor-specific elements are optionally present. These elements follow all other elements.

8.3.3.3 ATIM frame format

The frame body of a management frame of subtype ATIM is null.

8.3.3.4 Disassociation frame format

The frame body of a management frame of subtype Disassociation contains the information shown in Table 8-21.

Table 8-21—Disassociation frame body

Order	Information
1	Reason code
2 – (Last – 1)	One or more vendor-specific elements are optionally present.
Last	The Management MIC element (MME) is present when management frame protection is enabled at the AP and the frame is a group addressed frame.
NOTE—The MME appears after all fields that it protects. Therefore, it appears last in the frame body to protect the frames as specified in 11.4.4.	

8.3.3.5 Association Request frame format

The frame body of a management frame of subtype Association Request contains the information shown in Table 8-22.

Table 8-22—Association Request frame body

Order	Information	Notes
1	Capability	
2	Listen Interval	
3	SSID	
4	Supported rates	
5	Extended Supported Rates	The Extended Supported Rates element is present if there are more than eight supported rates, and it is optional otherwise.

Table 8-22—Association Request frame body *(continued)*

Order	Information	Notes
6	Power Capability	The Power Capability element is present if dot11SpectrumManagementRequired is true or dot11RadioMeasurementActivated is true.
7	Supported Channels	The Supported Channels element is present if dot11SpectrumManagementRequired is true and dot11ExtendedChannelSwitchActivated is false.
8	RSN	The RSNE is present if dot11RSNAActivated is true.
9	QoS Capability	The QoS Capability element is present if dot11QosOption-Implemented is true.
10	RM Enabled Capabilities	RM Enabled Capabilities element is present if dot11RadioMeasurementActivated is true.
11	Mobility Domain	The MDE is present in an Association Request frame if dot11FastBSSTransitionActivated is true and if the frame is being sent to an AP that advertised its FT capability in the MDE in its Beacon or Probe Response frame (i.e., AP also has dot11FastBSSTransitionActivated equal to true).
12	Supported Operating Classes	The Supported Operating Classes element is present if dot11ExtendedChannelSwitchActivated is true.
13	HT Capabilities	The HT Capabilities element is present when dot11HighThroughputOptionImplemented attribute is true.
14	20/40 BSS Coexistence	The 20/40 BSS Coexistence element is optionally present when the dot112040BSSCoexistenceManagementSupport attribute is true.
15	Extended Capabilities	The Extended Capabilities element is optionally present if any of the fields in this element are nonzero.
16	QoS Traffic Capability	The QoS Traffic Capability element is present if dot11MgmtOptionQoSTrafficCapabilityActivated is true.
17	TIM Broadcast Request	The TIM Broadcast Request element is present if dot11MgmtOptionTIMBroadcastActivated is true.
18	Interworking	The Interworking element is present if dot11InterworkingServiceActivated is true and the non-AP STA is requesting unauthenticated access to emergency services (see 10.3.5).
Last	Vendor Specific	One or more vendor-specific elements are optionally present. These elements follow all other elements.

8.3.3.6 Association Response frame format

The frame body of a management frame of subtype Association Response contains the information shown in Table 8-23.

Table 8-23—Association Response frame body

Order	Information	Notes
1	Capability	
2	Status code	
3	AID	
4	Supported rates	
5	Extended Supported Rates	The Extended Supported Rates element is present if there are more than eight supported rates, and is optionally present otherwise.
6	EDCA Parameter Set	
7	RCPI	The RCPI element is present if dot11RMRCPIMeasurementActivated is true.
8	RSNI	The RSNI element is present if dot11RMRSNIMeasurementActivated is true.
9	RM Enabled Capabilities	RM Enabled Capabilities element is present if dot11RadioMeasurementActivated is true.
10	Mobility Domain	An MDE is present in an Association Response frame when dot11FastBSSTransitionActivated is true and this frame is a response to an Association Request frame that contained an MDE (i.e., an FT initial mobility domain association exchange).
11	Fast BSS Transition	A Fast BSS Transition element (FTE) is present in an Association Response frame when dot11FastBSSTransitionActivated is true, dot11RSNAActivated is true, and this frame is a response to an Association Request frame that contained an MDE (i.e., an FT initial mobility domain association exchange in an RSN).
12	DSE registered location	The DSE Registered Location element is present if dot11LCIDSERequired is true.
13	Timeout Interval (Association Comeback time)	A Timeout Interval element (TIE) containing the Association Comeback time is present when dot11RSNAActivated is true, dot11RSNAProtectedManagementFramesActivated is true, and the association request is rejected with a status code 30.
14	HT Capabilities	The HT Capabilities element is present when dot11HighThroughputOptionImplemented attribute is true.
15	HT Operation	The HT Operation element is included by an AP when dot11HighThroughputOptionImplemented attribute is true.
16	20/40 BSS Coexistence	The 20/40 BSS Coexistence element is optionally present when the dot112040BSSCoexistenceManagementSupport attribute is true.
17	Overlapping BSS Scan Parameters	The Overlapping BSS Scan Parameters element is optionally present if the dot11FortyMHzOptionImplemented attribute is true.
18	Extended Capabilities	The Extended Capabilities element is optionally present if any of the fields in this element are nonzero.

Table 8-23—Association Response frame body *(continued)*

Order	Information	Notes
19	BSS Max Idle Period	The BSS Max Idle Period element is present if dot11WirelessManagementImplemented is true.
20	TIM Broadcast Response	The TIM Broadcast Response element is present if dot11MgmtOptionTIMBroadcastActivated is true and the TIM Broadcast Request element is present in the Association Request that elicited this Association Response frame.
21	QoS Map	QoS Map is present if dot11QosMapActivated is true and the QoS Map field in the Extended Capabilities element of the corresponding Association Request frame is 1.
Last	Vendor Specific	One or more vendor-specific elements are optionally present. These elements follow all other elements.

8.3.3.7 Reassociation Request frame format

The frame body of a management frame of subtype Reassociation Request contains the information shown in Table 8-24.

Table 8-24—Reassociation Request frame body

Order	Information	Notes
1	Capability	
2	Listen Interval	
3	Current AP address	
4	SSID	
5	Supported rates	
6	Extended Supported Rates	The Extended Supported Rates element is present if there are more than eight supported rates, and it is optional otherwise.
7	Power Capability	The Power Capability element is present if dot11SpectrumManagementRequired is true or dot11RadioMeasurementActivated is true.
8	Supported Channels	The Supported Channels element is present if dot11SpectrumManagementRequired is true and dot11ExtendedChannelSwitchActivated is false.
9	RSN	The RSNE is present only if dot11RSNAActivated is true.
10	QoS Capability	The QoS Capability element is present if dot11QosOptionImplemented is true.
11	RM Enabled Capabilities	RM Enabled Capabilities element is present if dot11RadioMeasurementActivated is true.
12	Mobility Domain	The MDE is present in a Reassociation Request frame if dot11FastBSSTransitionActivated is true and the frame is being sent to an AP that advertised its FT Capability in the MDE in its Beacon or Probe Response frame (i.e., AP also has dot11FastBSSTransitionActivated is true).

Table 8-24—Reassociation Request frame body *(continued)*

Order	Information	Notes
13	Fast BSS Transition	An FTE is present in a Reassociation Request frame if dot11FastBSSTransitionActivated is true and dot11RSNAAuthenticationSuiteSelected is 00-0F-AC:3, 00-0F-AC:4, or 00-0F-AC:9 (i.e., part of a fast BSS transition in an RSN).
14	Resource information container (RIC)	The set of elements that formulate a RIC-Request is optionally present in a Reassociation Request frame if — dot11FastBSSTransitionActivated is true, — The FT Resource Request Protocol is not used, — The frame is being sent to an AP that advertised its FT capability in the MDE in its Beacon or Probe Response frame (i.e., AP also has dot11FastBSSTransitionActivated is true), and — Either dot11RSNAAuthenticationSuiteSelected is 00-0F-AC:3 or 00-0F-AC:4 (i.e., part of a fast BSS transition in an RSN) or dot11RSNAActivated is false (i.e., not in an RSN).
15	Supported Operating Classes	The Supported Operating Classes element is present if dot11ExtendedChannelSwitchActivated is true.
16	HT Capabilities	The HT Capabilities element is present when dot11HighThroughputOptionImplemented attribute is true.
17	20/40 BSS Coexistence	The 20/40 BSS Coexistence element is optionally present when the dot112040BSSCoexistenceManagementSupport attribute is true.
18	Extended Capabilities	The Extended Capabilities element is optionally present if any of the fields in this element are nonzero.
19	QoS Traffic Capability	The QoS Traffic Capability element is present if dot11MgmtOptionQoSTrafficCapabilityActivated is true.
20	TIM Broadcast Request	The TIM Broadcast Request element is present if dot11MgmtOptionTIMBroadcastActivated is true.
21	FMS Request	The FMS Request element may be present if dot11MgmtOptionFMSActivated is true.
22	DMS Request	The DMS Request element may be present if dot11MgmtOptionDMSActivated is true.
23	Interworking	The Interworking element is present if dot11InterworkingServiceActivated is true and the non-AP STA is requesting unauthenticated access to emergency services (see 10.3.5).
Last	Vendor Specific	One or more vendor-specific elements are optionally present. These elements follow all other elements.

8.3.3.8 Reassociation Response frame format

The frame body of a management frame of subtype Reassociation Response contains the information shown in Table 8-25.

Table 8-25—Reassociation Response frame body

Order	Information	Notes
1	Capability	
2	Status code	
3	AID	
4	Supported rates	
5	Extended Supported Rates	The Extended Supported Rates element is present if there are more than eight supported rates, and it is optional otherwise.
6	EDCA Parameter Set	
7	RCPI	The RCPI element is present if dot11RMRCPIMeasurementActivated is true.
8	RSNI	The RSNI element is present if dot11RMRSNIMeasurementActivated is true.
9	RM Enabled Capabilities	RM Enabled Capabilities element is present if dot11RadioMeasurementActivated is true.
10	RSN	An RSNE is present in a Reassociation Response frame if dot11FastBSSTransitionActivated is true, dot11RSNAActivated is true, and this frame is a response to a Reassociation Request frame that contained an FTE (i.e., part of a fast BSS transition in an RSN).
11	Mobility Domain	An MDE is present in a Reassociation Response frame if dot11FastBSSTransitionActivated is true and this frame is a response to a Reassociation Request frame that contained an MDE (i.e., either an FT initial mobility domain association exchange or part of a fast BSS transition).
12	Fast BSS Transition	An FTE is present in a Reassociation Response frame if dot11FastBSSTransitionActivated is true, dot11RSNAActivated is true, and this frame is a response to a Reassociation Request frame that contained an MDE (i.e., either an FT initial mobility domain association exchange or part of a fast BSS transition in an RSN).
13	RIC	The set of elements that formulate a RIC-Response is present in a Reassociation Response frame if dot11FastBSSTransitionActivated is true and this frame is a response to a Reassociation Request frame that contained a RIC-Request.
14	DSE registered location	The DSE Registered Location element is present if dot11LCIDSERequired is true.
15	Timeout Interval (Association Comeback time)	A TIE containing the Association Comeback time is present when dot11RSNAActivated is true, dot11RSNAProtectedManagementFramesActivated is true, and the reassociation is rejected with status code 30.
16	HT Capabilities	The HT Capabilities element is present when dot11HighThroughputOptionImplemented attribute is true.

Table 8-25—Reassociation Response frame body *(continued)*

Order	Information	Notes
17	HT Operation	The HT Operation element is included by an AP when dot11HighThroughputOptionImplemented attribute is true.
18	20/40 BSS Coexistence	The 20/40 BSS Coexistence element is optionally present when the dot112040BSSCoexistenceManagementSupport attribute is true.
19	Overlapping BSS Scan Parameters	The Overlapping BSS Scan Parameters element is optionally present if the dot11FortyMHzOptionImplemented attribute is true.
20	Extended Capabilities	The Extended Capabilities element is optionally present if any of the fields in this element are nonzero.
21	BSS Max Idle Period	The BSS Max Idle Period element is present if dot11WirelessManagementImplemented is true.
22	TIM Broadcast Response	The TIM Broadcast Response element is present if dot11MgmtOptionTIMBroadcastActivated is true and the TIM Broadcast Request element is present in the Reassociation Request frame that elicited this Reassociation Response frame.
23	FMS Response	The FMS Response element is present if dot11MgmtOptionFMSActivated is true and the FMS Request element is present in the Reassociation Request frame that elicited this Reassociation Response frame.
24	DMS Response	The DMS Response element is present if dot11MgmtOptionDMSActivated is true and the DMS Request element is present in the Reassociation Request frame that elicited this Reassociation Response frame.
25	QoS Map	QoS Map is present if dot11QosMapActivated is true and the QoS Map field in the Extended Capabilities element of the corresponding Reassociation Request frame is 1.
Last	Vendor Specific	One or more vendor-specific elements are optionally present. These elements follow all other elements.

8.3.3.9 Probe Request frame format

The frame body of a management frame of subtype Probe Request contains the information shown in Table 8-26.

Table 8-26—Probe Request frame body

Order	Information	Notes
1	SSID	If dot11MeshActivated is true, the SSID element is the wildcard value as described in 8.4.2.2.
2	Supported rates	
3	Request information	The Request element is optionally present if dot11MultiDomainCapabilityActivated is true.
4	Extended Supported Rates	The Extended Supported Rates element is present if there are more than eight supported rates, and is optionally present otherwise.

Table 8-26—Probe Request frame body *(continued)*

Order	Information	Notes
5	DSSS Parameter Set	The DSSS Parameter Set element is present within Probe Request frames generated by STAs using Clause 16, Clause 17, or Clause 19 PHYs if dot11RadioMeasurementActivated is true. The DSSS Parameter Set element is present within Probe Request frames generated by STAs using a Clause 20 PHY in the 2.4 GHz band if dot11RadioMeasurementActivated is true. The DSSS Parameter Set element is optionally present within Probe Request frames generated by STAs using Clause 16, Clause 17, or Clause 19 PHYs if dot11RadioMeasurementActivated is false. The DSSS Parameter Set element is optionally present within Probe Request frames generated by STAs using a Clause 20 PHY in the 2.4 GHz band if dot11RadioMeasurementActivated is false.
6	Supported Operating Classes	The Supported Operating Classes element is present if dot11ExtendedChannelSwitchActivated is true.
7	HT Capabilities	The HT Capabilities element is present when dot11HighThroughputOptionImplemented attribute is true.
8	20/40 BSS Coexistence	The 20/40 BSS Coexistence element is optionally present when the dot112040BSSCoexistenceManagementSupport attribute is true.
9	Extended Capabilities	The Extended Capabilities element is optionally present if any of the fields in this element are nonzero.
10	SSID List	The SSID List element is optionally present if dot11MgmtOptionSSIDListActivated is true.
11	Channel Usage	The Channel Usage element is optionally present if dot11MgmtOptionChannelUsageActivated is true.
12	Interworking	The Interworking element is present if dot11InterworkingServiceActivated is true.
13	Mesh ID	The Mesh ID element is present if dot11MeshActivated is true.
Last	Vendor Specific	One or more vendor-specific elements are optionally present. These elements follow all other elements.

8.3.3.10 Probe Response frame format

The frame body of a management frame of subtype Probe Response contains the information shown in Table 8-27. See additional details and procedures in 9.18.3 and 10.1.4.

Table 8-27—Probe Response frame body

Order	Information	Notes
1	Timestamp	
2	Beacon interval	
3	Capability	

Table 8-27—Probe Response frame body *(continued)*

Order	Information	Notes
4	SSID	If dot11MeshActivated is true, the SSID element is the wildcard value as described in 8.4.2.2.
5	Supported rates	
6	FH Parameter Set	The FH Parameter Set element is present within Probe Response frames generated by STAs using FH PHYs.
7	DSSS Parameter Set	The DSSS Parameter Set element is present within Probe Response frames generated by STAs using Clause 16, Clause 17, and Clause 19 PHYs. The DSSS Parameter Set element is present within Probe Response frames generated by STAs using a Clause 20 PHY in the 2.4 GHz band.
8	CF Parameter Set	The CF Parameter Set element is present only within Probe Response frames generated by APs supporting a PCF.
9	IBSS Parameter Set	The IBSS Parameter Set element is present only within Probe Response frames generated by STAs in an IBSS.
10	Country	The Country element is present if dot11MultiDomainCapabilityActivated is true or dot11SpectrumManagementRequired is true or dot11RadioMeasurementActivated is true.
11	FH Parameters	The FH Parameters element, as specified in 8.4.2.11, is optionally present if dot11MultiDomainCapabilityActivated is true.
12	FH Pattern Table	The FH Pattern Table element, as specified in 8.4.2.12, is optionally present if dot11MultiDomainCapabilityActivated is true.
13	Power Constraint	The Power Constraint element is present if dot11SpectrumManagementRequired is true and is optionally present if dot11RadioMeasurementActivated is true.
14	Channel Switch Announcement	The Channel Switch Announcement element is optionally present if dot11SpectrumManagementRequired is true.
15	Quiet	The Quiet element is optionally present if dot11SpectrumManagementRequired is true or if dot11RadioMeasurementActivated is true.
16	IBSS DFS	The IBSS DFS element is present if dot11SpectrumManagementRequired is true in an IBSS.
17	TPC Report	The TPC Report element is present if dot11SpectrumManagementRequired is true or dot11RadioMeasurementActivated is true.
18	ERP	The ERP element is present within Probe Response frames generated by STAs using ERPs and is optionally present otherwise.
19	Extended Supported Rates	The Extended Supported Rates element is present if there are more than eight supported rates, and it is optionally present otherwise.
20	RSN	The RSNE is present only if dot11RSNAActivated is true.
21	BSS Load	The BSS Load element is present if dot11QosOption-Implemented and dot11QBSSLoadImplemented are both true.
22	EDCA Parameter Set	The EDCA Parameter Set element is present if dot11QosOptionImplemented is true and dot11MeshActivated is false.

Table 8-27—Probe Response frame body *(continued)*

Order	Information	Notes
23	Measurement Pilot Transmission	The Measurement Pilot Transmission element is present if dot11RMMeasurementPilotActivated is between 2 and 7.
24	Multiple BSSID	One or more Multiple BSSID elements are present if dot11RMMeasurementPilotActivated is between 2 and 7 and the AP is a member of a Multiple BSSID Set (see 10.11.14) with two or more members, or if dot11MgmtOptionMultiBSSIDActivated is true, or if dot11InterworkingServiceActivated is true and the AP is a member of a Multiple BSSID Set with two or more members and at least one dot11GASAdvertisementID MIB attribute exists.
25	RM Enabled Capabilities	The RM Enabled Capabilities element is present if dot11RadioMeasurementActivated is true.
26	AP Channel Report	If dot11RMAPChannelReportActivated is true, one AP Channel Report element is optionally present for each operating class that has at least 1 channel to report.
27	BSS Average Access Delay	The BSS Average Access Delay element is optionally present if dot11RMBSSAverageAccessDelayActivated is true and the value of the AP Average Access Delay field is not equal to 255 (measurement not available).
28	Antenna	The Antenna element is optionally present if dot11RMAntennaInformationActivated is true and the value of the Antenna ID field is not equal to 0 (unknown antenna).
29	BSS Available Admission Capacity	The BSS Available Admission Capacity element is optionally present if dot11RMBSSAvailableAdmissionCapacityActivated is true with the following exceptions: 1) when Available Admission Capacity Bitmask equals 0 (Available Admission Capacity List contains no entries), or 2) when the BSS Load element is present and the Available Capacity Bitmask equals 256 (Available Admission Capacity List contains only the AC_VO entry).
30	BSS AC Access Delay	The BSS AC Access Delay element is optionally present if dot11RMBSSAverageAccessDelayActivated is true and at least one field of the element is not equal to 255 (measurement not available).
31	Mobility Domain	The MDE is present if dot11FastBSSTransitionActivated is true.
32	DSE registered location	The DSE Registered Location element is present if dot11LCIDSERequired is true.
33	Extended Channel Switch Announcement	The Extended Channel Switch Announcement element is optionally present if dot11ExendedChannelSwitchActivated is true.
34	Supported Operating Classes	The Supported Operating Classes element is present if dot11ExtendedChannelSwitchActivated is true.
35	HT Capabilities	The HT Capabilities element is present when dot11HighThroughputOptionImplemented attribute is true.
36	HT Operation	The HT Operation element is included by an AP and a mesh STA when dot11HighThroughputOptionImplemented attribute is true.
37	20/40 BSS Coexistence	The 20/40 BSS Coexistence element is optionally present when the dot112040BSSCoexistenceManagementSupport attribute is true.
38	Overlapping BSS Scan Parameters	The Overlapping BSS Scan Parameters element is optionally present if the dot11FortyMHzOptionImplemented attribute is true.
39	Extended Capabilities	The Extended Capabilities element is optionally present if any of the fields in this element are nonzero.

Table 8-27—Probe Response frame body *(continued)*

Order	Information	Notes
40	QoS Traffic Capability	The QoS Traffic Capability element is optionally present if dot11MgmtOptionACStationCountActivated is true.
41	Channel Usage	The Channel Usage element is present if the Channel Usage element is present in the Probe Request frame and dot11MgmtOptionChannelUsageActivated is true.
42	Time Advertisement	The Time Advertisement element is present if dot11MgmtOptionUTCTSFOffsetActivated is true.
43	Time Zone	The Time Zone element is present if dot11MgmtOptionUTCTSFOffsetActivated is true.
44	Interworking	The Interworking element is present if dot11InterworkingServiceActivated is true.
45	Advertisement Protocol	Advertisement Protocol element is present if dot11InterworkingServiceActivated is true and at least one dot11GASAdvertisementID MIB attribute exists.
46	Roaming Consortium	The Roaming Consortium element is present if dot11InterworkingServiceActivated is true and the dot11RoamingConsortiumTable has at least one entry.
47	Emergency Alert Identifier	One or more Emergency Alert Identifier elements are present if dot11EASActivated is true and there are one or more EAS message(s) active in the network.
48	Mesh ID	The Mesh ID element is present if dot11MeshActivated is true.
49	Mesh Configuration	The Mesh Configuration element is present if dot11MeshActivated is true.
50	Mesh Awake Window	The Mesh Awake Window element is optionally present if dot11MeshActivated is true.
51	Beacon Timing	The Beacon Timing element is optionally present if both dot11MeshActivated and dot11MBCAActivated are true.
52	MCCAOP Advertisement Overview	The MCCAOP Advertisement Overview element is optionally present if both dot11MeshActivated and dot11MCCAActivated are true.
53	MCCAOP Advertisement	One or more MCCAOP Advertisement elements are optionally present if both dot11MeshActivated and dot11MCCAActivated are true.
54	Mesh Channel Switch Parameters	The Mesh Channel Switch Parameters element is present if dot11MeshActivated is true and either Channel Switch Announcement element or Extended Channel Switch Announcement element is present.
Last–*1*	Vendor Specific	One or more vendor-specific elements are optionally present. These elements follow all other elements, except the Requested elements.
Last–*n*	Requested elements	Elements requested by the Request element of the Probe Request frame are present if dot11MultiDomainCapabilityActivated is true. See 10.1.4.3.2.

8.3.3.11 Authentication frame format

The frame body of a management frame of subtype Authentication contains the information shown in Table 8-28. FT authentication is used when FT support is advertised by the AP and dot11FastBSSTransitionActivated is true in the STA. SAE authentication is used when dot11MeshActiveAuthenticationProtocol is sae (1).

Table 8-28—Authentication frame body

Order	Information	Notes
1	Authentication algorithm number	
2	Authentication transaction sequence number	
3	Status code	The status code information is reserved in certain Authentication frames as defined in Table 8-29.
4	Challenge text	The challenge text element is present only in certain Authentication frames as defined in Table 8-29.
5	RSN	The RSNE is present in the FT Authentication frames as defined in Table 8-29.
6	Mobility Domain	The MDE is present in the FT Authentication frames as defined in Table 8-29.
7	Fast BSS Transition	An FTE is present in the FT Authentication frames as defined in Table 8-29.
8	Timeout Interval (reassociation deadline)	A TIE containing the reassociation deadline interval is present in the FT Authentication frames as defined in Table 8-29.
9	RIC	A resource information container, containing a variable number of elements, is present in the FT Authentication frames as defined in Table 8-29.
10	Finite Cyclic Group	An unsigned integer indicating a finite cyclic group as described in 11.3.4. This is present in SAE authentication frames as defined in Table 8-29.
11	Anti-Clogging Token	A random bit-string used for anti-clogging purposes as described in 11.3.6. This is present in SAE authentication frames as defined in Table 8-29.
12	Send-Confirm	A binary encoding of an integer used for anti-replay purposes as described in 11.3.7.5. This is present in SAE authentication frames as defined in Table 8-29.
13	Scalar	An unsigned integer encoded as described in 11.3.7.4. This is present in SAE authentication frames as defined in Table 8-29.
14	Element	A field element from a finite field encoded as described in 11.3.7.4. This is present in SAE authentication frames as defined in Table 8-29.
15	Confirm	An unsigned integer encoded as described in 11.3.7.5. This is present in SAE authentication frames as defined in Table 8-29.
Last	Vendor Specific	One or more vendor-specific elements are optionally present. These elements follow all other elements.

Table 8-29—Presence of fields and elements in Authentication frames

Authentication algorithm	Authentication transaction sequence no.	Status code	Presence of fields 4-15
Open System	1	Reserved	Not present
Open System	2	Status	Not present
Shared Key	1	Reserved	Not present
Shared Key	2	Status	The Challenge text element is present
Shared Key	3	Reserved	The Challenge text element is present
Shared Key	4	Status	Not present
FT	1	Reserved	The Mobility Domain element is present. The Fast BSS Transition and RSNEs are present if dot11RSNAActivated is true.
FT	2	Status	The Mobility Domain element is present if Status is 0. The Fast BSS Transition and RSNEs are present if Status is 0 and dot11RSNAActivated is true.
FT	3	Reserved	The Mobility Domain element is present. The Fast BSS Transition and RSNEs are present if dot11RSNAActivated is true. The RIC element is optionally present.
FT	4	Status	The Mobility Domain element is present if Status is 0. The Fast BSS Transition and RSNEs are present if dot11RSNAActivated is true. The RIC element is optionally present if Status is 0. The TIE (reassociation deadline) is present if a RIC element is present.
SAE	1	Status	Scalar is present if Status is zero. Element is present if Status is zero. Anti-Clogging Token is present if status is 76 or if frame is in response to a previous rejection with Status 76. Finite Cyclic Group is present if Status is zero or 76.
SAE	2	Status	Send-Confirm is present. Confirm is present.

8.3.3.12 Deauthentication

The frame body of a management frame of subtype Deauthentication contains the information shown in Table 8-30.

Table 8-30—Deauthentication frame body

Order	Information
1	Reason code
2 – (Last – 1)	One or more vendor-specific elements are optionally present.
Last	The Management MIC element (MME) is present when management frame protection is enabled at the AP and the frame is a group addressed frame.
NOTE—The MME appears after all fields that it protects. Therefore, it appears last in the frame body to protect the frames as specified in 11.4.4.	

8.3.3.13 Action frame format

The frame body of a management frame of subtype Action contains the information shown in Table 8-31.

Table 8-31—Action frame body

Order	Information
1	Action
2 – (Last – 1)	One or more vendor-specific elements are optionally present. These elements are absent when the Category subfield of the Action field is Vendor-Specific, Vendor-Specific Protected, or Self-protected.
Last	The Management MIC element (MME) is present when management frame protection is enabled at the AP, the frame is a group addressed robust Action frame, and the category of the action frame does not receive privacy as indicated by Table 8-38.
NOTE—The MME appears after any fields that it protects. Therefore, it appears last in the frame body to protect the frames as specified in 11.4.4.	

8.3.3.14 Action No Ack frame format

The frame body of a management frame of subtype Action No Ack contains the information shown in Table 8-32.

Table 8-32—Action No Ack frame body

Order	Information
1	Action
Last	One or more vendor-specific elements may appear in this frame. This element follows all other elements.

NOTE—The selection of Action or Action No Ack is made per frame that uses these formats.

Unless specified as allowing the use of the Action No Ack management frame subtype, a frame described as an "Action frame" uses only the Action subtype.

8.3.3.15 Timing Advertisement frame format

The frame body of a management frame of subtype Timing Advertisement contains the information shown in Table 8-33.

Table 8-33—Timing Advertisement frame body

Order	Information	Notes
1	Timestamp	See 8.4.1.10 for Timestamp format.
2	Capability	
3	Country	The Country element is present if dot11MultidomainCapabilityActivated is true or dot11SpectrumManagementRequired is true.
4	Power Constraint	The Power Contraint element is optionally present only if the Country element is present.
5	Time Advertisement	The Time Advertisement element is optionally present. See 8.4.2.63.
6	Extended Capabilities	The Extended Capabilities element is optionally present.
Last	Vendor specific	One or more vendor-specific elements are optionally present. These elements follow all other elements.

8.4 Management frame body components

8.4.1 Fields that are not information elements

8.4.1.1 Authentication Algorithm Number field

The Authentication Algorithm Number field indicates a single authentication algorithm. The length of the Authentication Algorithm Number field is 2 octets. The Authentication Algorithm Number field is illustrated in Figure 8-35. The following values are defined for authentication algorithm number:

Authentication algorithm number = 0: Open System
Authentication algorithm number = 1: Shared Key
Authentication algorithm number = 2: Fast BSS Transition
Authentication algorithm number = 3: simultaneous authentication of equals (SAE)
Authentication algorithm number = 65 535: Vendor specific use

NOTE—The use of this value implies that a Vendor Specific element is included with more information.

All other values of authentication algorithm number are reserved.

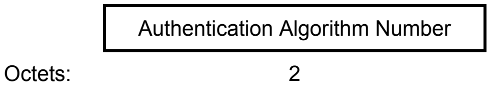

Figure 8-35—Authentication Algorithm Number field

8.4.1.2 Authentication Transaction Sequence Number field

The Authentication Transaction Sequence Number field indicates the current state of progress through a multistep transaction. The length of the Authentication Transaction Sequence Number field is 2 octets. The Authentication Transaction Sequence Number field is illustrated in Figure 8-36.

	Authentication Transaction Sequence Number
Octets:	2

Figure 8-36—Authentication Transaction Sequence Number field

8.4.1.3 Beacon Interval field

The Beacon Interval field represents the number of time units (TUs) between target beacon transmission times (TBTTs). The length of the Beacon Interval field is 2 octets. The Beacon Interval field is illustrated in Figure 8-37.

	Beacon Interval
Octets:	2

Figure 8-37—Beacon Interval field

8.4.1.4 Capability Information field

The Capability Information field contains a number of subfields that are used to indicate requested or advertised optional capabilities.

The length of the Capability Information field is 2 octets. The format of the Capability Information field is defined in Figure 8-38. No subfield is supplied for ERP as a STA supports ERP operation if it includes all of the Clause 19 mandatory rates in its supported rate set.

B0	B1	B2	B3	B4	B5	B6	B7
ESS	IBSS	CF Pollable	CF-Poll Request	Privacy	Short Preamble	PBCC	Channel Agility

B8	B9	B10	B11	B12	B13	B14	B15
Spectrum Mgmt	QoS	Short Slot Time	APSD	Radio Measurement	DSSS-OFDM	Delayed Block Ack	Immediate Block Ack

Figure 8-38—Capability Information field

Each Capability Information subfield is interpreted according to the management frame subtype, as defined in this subclause.

An AP sets the ESS subfield to 1 and the IBSS subfield to 0 within transmitted Beacon or Probe Response management frames. A STA within an IBSS sets the ESS subfield to 0 and the IBSS subfield to 1 in transmitted Beacon or Probe Response management frames. A mesh STA sets the ESS and IBSS subfields to 0 in transmitted Beacon or Probe Response management frames.

A non-AP STA sets the QoS, CF-Pollable, and CF-Poll Request subfields in Association and Reassociation Request management frames according to Table 8-34. A mesh STA sets the CF-Pollable and CF-Poll Request subfields to 0.

Table 8-34—Non-AP STA usage of QoS, CF-Pollable, and CF-Poll Request

QoS	CF-Pollable	CF-Poll request	Meaning
0	0	0	STA is not CF-Pollable
0	0	1	STA is CF-Pollable, not requesting to be placed on the CF-Polling list
0	1	0	STA is CF-Pollable, requesting to be placed on the CF-Polling list
0	1	1	STA is CF-Pollable, requesting never to be polled
1	0	0	QoS STA requesting association in a QoS BSS
1	0	1	Reserved
1	1	0	Reserved
1	1	1	Reserved

An AP sets the CF-Pollable and CF-Poll Request subfields in Beacon and Probe Response management frames according to Table 8-35. A non-QoS AP sets the CF-Pollable and CF-Poll Request subfield values in Association Response and Reassociation Response management frames equal to the values in the last Beacon or Probe Response frame that it transmitted.

Table 8-35—AP usage of QoS, CF-Pollable, and CF-Poll Request

QoS	CF-Pollable	CF-Poll Request	Meaning
0	0	0	No PC at non-QoS AP
0	0	1	PC at non-QoS AP for delivery only (no polling)
0	1	0	PC at non-QoS AP for delivery and polling
0	1	1	Reserved
1	0	0	QoS AP (HC) does not use CFP for delivery of individually addressed data frames
1	0	1	QoS AP (HC) uses CFP for delivery, but does not send CF-Polls to non-QoS STAs
1	1	0	QoS AP (HC) uses CFP for delivery, and sends CF-Polls to non-QoS STAs
1	1	1	Reserved

An AP sets the Privacy subfield to 1 within transmitted Beacon, Probe Response, Association Response, and Reassociation Response management frames if data confidentiality is required for all data frames exchanged within the BSS. If data confidentiality is not required, the Privacy subfield is set to 0.

In an RSNA, a non-AP STA in an ESS sets the Privacy subfield to 0 within transmitted Association and Reassociation Request management frames. An AP ignores the Privacy subfield within received Association and Reassociation Request management frames.

A STA within an ESS sets the Privacy subfield to 1 in DLS Request and DLS Response frames if encryption is required for all data frames exchanged. If encryption is not required, the Privacy subfield is set to 0.

A STA within an IBSS sets the Privacy subfield to 1 in transmitted Beacon or Probe Response management frames if data confidentiality is required for all data frames exchanged within the IBSS. If data confidentiality is not required, A STA in an IBSS sets the Privacy subfield to 0 within these management frames.

A mesh STA sets the Privacy subfield to 1 in transmitted Beacon or Probe Response management frames if data confidentiality is required for all data frames exchanged within the MBSS. If data confidentiality is not required, a mesh STA sets the Privacy subfield to 0 within these management frames.

A STA that includes the RSNE in Beacon and Probe Response frames sets the Privacy subfield to 1 in any frame that includes the RSNE.

An AP sets the Short Preamble subfield to 1 in transmitted Beacon, Probe Response, Association Response, and Reassociation Response MMPDUs to indicate that the use of the short preamble, as described in 17.2.2.3, is allowed within this BSS; a STA in an IBSS sets the Short Preamble subfield to 1 in transmitted Beacon when dot11ShortPreambleOptionImplemented is true. Otherwise an AP or a STA in an IBSS sets the Short Preamble subfield to 0.

A mesh STA sets the Short Preamble subfield to 1 when dot11ShortPreambleOptionImplemented is true. Otherwise, a mesh STA sets the Short Preamble subfield to 0.

An ERP STA sets dot11ShortPreambleOptionImplemented to true as all ERP devices support both long and short preamble formats.

A STA sets the Short Preamble subfield to 1 in transmitted Association Request and Reassociation Request management frames and in DLS Request and DLS Response frames when dot11ShortPreambleOptionImplemented is true. Otherwise, a STA sets the Short Preamble subfield to 0.

An AP sets the PBCC subfield to 1 in transmitted Beacon, Probe Response, Association Response, and Reassociation Response management frames to indicate that the packet binary convolutional code (PBCC) modulation option, as described in 17.4.6.7 and 19.6, is allowed within this BSS; a STA in an IBSS sets the PBCC subfield to 1 in transmitted Beacon frames when dot11PBCCOptionImplemented is true. Otherwise an AP or a STA in an IBSS sets the PBCC subfield to 0.

A non-AP STA sets the PBCC subfield to 1 in transmitted Probe Response, Association Request, Reassociation Request, DLS Request, and DLS Response frames when dot11PBCCOptionImplemented is true. Otherwise, a STA sets the PBCC subfield to 0.

The use of the ERP-PBCC option is deprecated, and this option may be removed in a later revision of the standard.

Bit 7 of the Capabilities Information field is used to indicate Channel Agility capability by the High Rate direct sequence spread spectrum (HR/DSSS) PHY or ERP. A STA sets the Channel Agility bit to 1 when Channel Agility is in use and sets it to 0 otherwise.

A STA sets the Spectrum Management subfield in the Capability Information field to 1 if dot11SpectrumManagementRequired is true; otherwise, it is set to 0.

A STA sets the QoS subfield to 1 within the Capability Information field when dot11QosOptionImplemented is true and sets it to 0 otherwise.

A STA sets the Short Slot Time subfield to 1 in transmitted Association Request, Reassociation Request, DLS Request, and DLS Response MMPDUs when dot11ShortSlotTimeOptionImplemented and dot11ShortSlotTimeOptionActivated are true. Otherwise, the STA sets the Short Slot Time subfield to 0 in transmitted Association Request and Reassociation Request MMPDUs.

An AP sets the Short Slot Time subfield in transmitted Beacon, Probe Response, Association Response, and Reassociation Response MMPDUs to indicate the currently used slot time value within this BSS. See 10.1.3.2.

See 9.3.2.12 for the operation of aSlotTime.

For IBSS and MBSS, the Short Slot Time subfield is set to 0.

An AP sets the APSD subfield to 1 within the Capability Information field when dot11APSDOptionImplemented is true and sets it to 0 otherwise. A non-AP STA always sets this subfield to 0.

An AP sets the DSSS-OFDM subfield to 1 in transmitted Beacon, Probe Response, Association Response, and Reassociation Response MMPDUs to indicate that the use of direct sequence spread spectrum with orthogonal frequency division multiplexing (DSSS-OFDM), as described in 19.7, is allowed within this BSS. To indicate that the use of DSSS-OFDM is not allowed, the DSSS-OFDM subfield is set to 0 in Beacon, Probe Response, Association Response, and Reassociation Response MMPDUs transmitted within the BSS.

A STA sets the DSSS-OFDM subfield to 1 in transmitted Association Request, Reassociation Request, DLS Request, and DLS Response MMPDUs when dot11DSSSOFDMOptionImplemented and dot11DSSSOFDMOptionActivated are true. Otherwise, a STA sets the DSSS-OFDM subfield to 0 in transmitted Association Request and Reassociation Request MMPDUs.

A STA in an IBSS sets the DSSS-OFDM subfield to 1 in transmitted Beacon and Probe Response MMPDUs when dot11DSSSOFDMOptionImplemented and dot11DSSSOFDMOptionActivated are true. Otherwise, a STA in an IBSS sets the DSSS-OFDM subfield to 0.

The use of the DSSS-OFDM option is deprecated, and this option may be removed in a later revision of the standard.

A STA sets the Delayed Block Ack subfield to 1 within the Capability Information field when dot11DelayedBlockAckOptionImplemented is true and sets it to 0 otherwise.

A STA sets the Immediate Block Ack subfield to 1 within the Capability Information field when dot11ImmediateBlockAckOptionImplemented is true and sets it to 0 otherwise.

A STA sets the Radio Measurement subfield in the Capability Information field to 1 when dot11RadioMeasurementActivated is true and sets it to 0 otherwise.

8.4.1.5 Current AP Address field

The Current AP Address field is the MAC address of the AP with which the STA is currently associated. The length of the Current AP Address field is 6 octets. The Current AP Address field is illustrated in Figure 8-39.

	Current AP Address
Octets:	6

Figure 8-39—Current AP Address field

8.4.1.6 Listen Interval field

The Listen Interval field is used to indicate to the AP how often a STA in power save mode wakes to listen to Beacon management frames. The value of this parameter is the Listen Interval parameter of the MLME-ASSOCIATE.request or MLME-REASSOCIATE.request primitive and is expressed in units of Beacon Interval. The length of the Listen Interval field is 2 octets. The Listen Interval field is illustrated in Figure 8-40.

NOTE—The value 0 might be used by a STA that never enters power save mode.

	Listen Interval
Octets:	2

Figure 8-40—Listen Interval field

An AP may use the Listen Interval information in determining the lifetime of frames that it buffers for a STA.

8.4.1.7 Reason Code field

This Reason Code field is used to indicate the reason that an unsolicited notification management frame of type Disassociation, Deauthentication, DELTS, DELBA, DLS Teardown, or Mesh Peering Close was generated. It is contained in the Mesh Channel Switch Parameters element to indicate the reason for the channel switch. It is contained in the PERR element to indicate the reason for the path error. The length of the Reason Code field is 2 octets. The Reason Code field is illustrated in Figure 8-41.

	Reason Code
Octets:	2

Figure 8-41—Reason Code field

The reason codes are defined in Table 8-36.

Table 8-36—Reason codes

Reason code	Name	Meaning
0		Reserved
1		Unspecified reason
2		Previous authentication no longer valid
3		Deauthenticated because sending STA is leaving (or has left) IBSS or ESS
4		Disassociated due to inactivity
5		Disassociated because AP is unable to handle all currently associated STAs

Table 8-36—Reason codes *(continued)*

Reason code	Name	Meaning
6		Class 2 frame received from nonauthenticated STA
7		Class 3 frame received from nonassociated STA
8		Disassociated because sending STA is leaving (or has left) BSS
9		STA requesting (re)association is not authenticated with responding STA
10		Disassociated because the information in the Power Capability element is unacceptable
11		Disassociated because the information in the Supported Channels element is unacceptable
12		Disassociated due to BSS Transition Management
13		Invalid element, i.e., an element defined in this standard for which the content does not meet the specifications in Clause 8
14		Message integrity code (MIC) failure
15		4-Way Handshake timeout
16		Group Key Handshake timeout
17		element in 4-Way Handshake different from (Re)Association Request/Probe Response/Beacon frame
18		Invalid group cipher
19		Invalid pairwise cipher
20		Invalid AKMP
21		Unsupported RSNE version
22		Invalid RSNE capabilities
23		IEEE 802.1X authentication failed
24		Cipher suite rejected because of the security policy
25		TDLS direct-link teardown due to TDLS peer STA unreachable via the TDLS direct link
26		TDLS direct-link teardown for unspecified reason
27		Disassociated because session terminated by SSP request
28		Disassociated because of lack of SSP roaming agreement
29		Requested service rejected because of SSP cipher suite or AKM requirement
30		Requested service not authorized in this location
31	SERVICE_CHANGE_ PRECLUDES_TS	TS deleted because QoS AP lacks sufficient bandwidth for this QoS STA due to a change in BSS service characteristics or operational mode (e.g., an HT BSS change from 40 MHz channel to 20 MHz channel)
32		Disassociated for unspecified, QoS-related reason
33		Disassociated because QoS AP lacks sufficient bandwidth for this QoS STA

Table 8-36—Reason codes *(continued)*

Reason code	Name	Meaning
34		Disassociated because excessive number of frames need to be acknowledged, but are not acknowledged due to AP transmissions and/or poor channel conditions
35		Disassociated because STA is transmitting outside the limits of its TXOPs
36	STA_LEAVING	Requested from peer STA as the STA is leaving the BSS (or resetting)

37	END_TS
	END_BA
	END_DLS
		Requested from peer STA as it does not want to use the mechanism

38	UNKNOWN_TS UNKNOWN_BA	Requested from peer STA as the STA received frames using the mechanism for which a setup is required
39	TIMEOUT	Requested from peer STA due to timeout
45	PEERKEY_MISMATCH	Peer STA does not support the requested cipher suite
46	PEER_INITIATED	In a DLS Teardown frame: The teardown was initiated by the DLS peer In a Disassociation frame: Disassociated because authorized access limit reached
47	AP_INITIATED	In a DLS Teardown frame: The teardown was initiated by the AP In a Disassociation frame: Disassociated due to external service requirements
48		Invalid FT Action frame count
49		Invalid pairwise master key identifier (PMKI)
50		Invalid MDE
51		Invalid FTE
52	MESH-PEERING-CANCELLED	SME cancels the mesh peering instance with the reason other than reaching the maximum number of peer mesh STAs
53	MESH-MAX-PEERS	The mesh STA has reached the supported maximum number of peer mesh STAs
54	MESH-CONFIGURATION-POLICY-VIOLATION	The received information violates the Mesh Configuration policy configured in the mesh STA profile
55	MESH-CLOSE-RCVD	The mesh STA has received a Mesh Peering Close message requesting to close the mesh peering.
56	MESH-MAX-RETRIES	The mesh STA has resent dot11MeshMaxRetries Mesh Peering Open messages, without receiving a Mesh Peering Confirm message.
57	MESH-CONFIRM-TIMEOUT	The confirmTimer for the mesh peering instance times out.
58	MESH-INVALID-GTK	The mesh STA fails to unwrap the GTK or the values in the wrapped contents do not match
59	MESH-INCONSISTENT-PARAMETERS	The mesh STA receives inconsistent information about the mesh parameters between Mesh Peering Management frames

Table 8-36—Reason codes *(continued)*

Reason code	Name	Meaning
60	MESH-INVALID-SECURITY-CAPABILITY	The mesh STA fails the authenticated mesh peering exchange because due to failure in selecting either the pairwise ciphersuite or group ciphersuite
61	MESH-PATH-ERROR-NO-PROXY-INFORMATION	The mesh STA does not have proxy information for this external destination.
62	MESH-PATH-ERROR-NO-FORWARDING-INFORMATION	The mesh STA does not have forwarding information for this destination.
63	MESH-PATH-ERROR-DESTINATION-UNREACHABLE	The mesh STA determines that the link to the next hop of an active path in its forwarding information is no longer usable.
64	MAC-ADDRESS-ALREADY-EXISTS-IN-MBSS	The Deauthentication frame was sent because the MAC address of the STA already exists in the mesh BSS. See 10.3.6.
65	MESH-CHANNEL-SWITCH-REGULATORY-REQUIREMENTS	The mesh STA performs channel switch to meet regulatory requirements.
66	MESH-CHANNEL-SWITCH-UNSPECIFIED	The mesh STA performs channel switch with unspecified reason.
67–65 535		Reserved

8.4.1.8 AID field

In infrastructure BSS operation, the AID field is a value assigned by an AP during association that represents the 16-bit ID of a STA. In mesh BSS operation, the AID field is a value that represents the 16-bit ID of a neighbor peer mesh STA. An AID value is assigned by a mesh STA that receives and accepts a Mesh Peering Open frame to the transmitter of the Mesh Peering Open frame during the mesh peering establishment process (see 13.3.1). The length of the AID field is 2 octets. The AID field is illustrated in Figure 8-42.

	Association ID (AID)
Octets:	2

Figure 8-42—AID field

The value assigned as the AID is in the range 1–2007 and is placed in the 14 LSBs of the AID field, with the two MSBs of the AID field set to 1 (see 8.2.4.2).

8.4.1.9 Status Code field

The Status Code field is used in a response management frame to indicate the success or failure of a requested operation. The length of the Status Code field is 2 octets. The Status Code field is illustrated in Figure 8-43.

	Status Code
Octets:	2

Figure 8-43—Status Code field

If an operation is successful, then the status code is set to 0. If an operation results in failure, the status code indicates a failure cause. The failure cause codes are defined in Table 8-37.

Table 8-37—Status codes

Status code	Name	Meaning
0	SUCCESS	Successful
1	REFUSED, REFUSED_REASON_UNSPECIFIED	Unspecified failure
2		TDLS wakeup schedule rejected but alternative schedule provided
3		TDLS wakeup schedule rejected
4		Reserved
5		Security disabled
6		Unacceptable lifetime
7		Not in same BSS
8–9		Reserved
10	REFUSED_CAPABILITIES_MISMATCH	Cannot support all requested capabilities in the Capability Information field
11		Reassociation denied due to inability to confirm that association exists
12		Association denied due to reason outside the scope of this standard
13		Responding STA does not support the specified authentication algorithm
14		Received an Authentication frame with authentication transaction sequence number out of expected sequence
15		Authentication rejected because of challenge failure
16		Authentication rejected due to timeout waiting for next frame in sequence
17		Association denied because AP is unable to handle additional associated STAs
18	REFUSED_BASIC_RATES_MISMATCH	Association denied due to requesting STA not supporting all of the data rates in the BSSBasicRateSet parameter
19		Association denied due to requesting STA not supporting the short preamble option
20		Association denied due to requesting STA not supporting the PBCC modulation option
21		Association denied due to requesting STA not supporting the Channel Agility option
22		Association request rejected because Spectrum Management capability is required
23		Association request rejected because the information in the Power Capability element is unacceptable
24		Association request rejected because the information in the Supported Channels element is unacceptable

Table 8-37—Status codes *(continued)*

Status code	Name	Meaning
25		Association denied due to requesting STA not supporting the Short Slot Time option
26		Association denied due to requesting STA not supporting the DSSS-OFDM option
27		Association denied because the requesting STA does not support HT features
28		R0KH unreachable
29		Association denied because the requesting STA does not support the phased coexistence operation (PCO) transition time required by the AP
30	REFUSED_TEMPORARILY	Association request rejected temporarily; try again later
31		Robust management frame policy violation
32		Unspecified, QoS-related failure
33		Association denied because QoS AP has insufficient bandwidth to handle another QoS STA
34		Association denied due to excessive frame loss rates and/or poor conditions on current operating channel
35		Association (with QoS BSS) denied because the requesting STA does not support the QoS facility
36		Reserved
37		The request has been declined
38	INVALID_PARAMETERS	The request has not been successful as one or more parameters have invalid values
39	REJECTED_WITH_SUGGESTED_CHANGES	The TS has not been created because the request cannot be honored; however, a suggested TSPEC is provided so that the initiating STA may attempt to set another TS with the suggested changes to the TSPEC
40		Invalid element, i.e., an element defined in this standard for which the content does not meet the specifications in Clause 8
41		Invalid group cipher
42		Invalid pairwise cipher
43		Invalid AKMP
44		Unsupported RSNE version
45		Invalid RSNE capabilities
46		Cipher suite rejected because of security policy
47	REJECTED_FOR_DELAY_PERIOD	The TS has not been created; however, the HC may be capable of creating a TS, in response to a request, after the time indicated in the TS Delay element
48	DLS_NOT_ALLOWED	Direct link is not allowed in the BSS by policy
49	NOT_PRESENT	The Destination STA is not present within this BSS
50	NOT_QOS_STA	The Destination STA is not a QoS STA

Table 8-37—Status codes *(continued)*

Status code	Name	Meaning
51		Association denied because the Listen Interval is too large
52		Invalid FT Action frame count
53		Invalid pairwise master key identifier (PMKID)
54		Invalid MDE
55		Invalid FTE
56		Requested TCLAS processing is not supported by the AP.
57		The AP has insufficient TCLAS processing resources to satisfy the request.
58		The TS has not been created because the request cannot be honored; however, the HC suggests the STA transitions to other BSSs to setup the TS.
59	GAS_ADVERTISEMENT_ PROTOCOL_NOT_SUPPORTED	GAS Advertisement Protocol not supported
60	NO_OUTSTANDING_GAS_ REQUEST	No outstanding GAS request
61	GAS_RESPONSE_NOT_ RECEIVED_FROM _SERVER	GAS Response not received from the Advertisement Server
62	GAS_QUERY_TIMEOUT	STA timed out waiting for GAS Query Response
63	GAS_QUERY_RESPONSE_ TOO_ LARGE	GAS Response is larger than query response length limit
64	REJECTED_HOME_WITH_ SUGGESTED_CHANGES	Request refused because home network does not support request
65	SERVER_UNREACHABLE	Advertisement Server in the network is not currently reachable
66		Reserved
67	REJECTED_FOR_SSP_ PERMISSIONS	Request refused due to permissions received via SSPN interface
68		Request refused because AP does not support unauthenticated access
69-71		Reserved
72		Invalid contents of RSNE
73		U-APSD Coexistence is not supported.
74		Requested U-APSD Coexistence mode is not supported.
75		Requested Interval/Duration value cannot be supported with U-APSD Coexistence.
76		Authentication is rejected because an Anti-Clogging Token is required.
77		Authentication is rejected because the offered finite cyclic group is not supported.

Table 8-37—Status codes *(continued)*

Status code	Name	Meaning
78	CANNOT_FIND_ALTERNATIVE_ TBTT	The TBTT adjustment request has not been successful because the STA could not find an alternative TBTT.
79	TRANSMISSION_FAILURE	Transmission failure
80	REQUESTED_TCLAS_NOT_ SUPPORTED	Requested TCLAS Not Supported.
81	TCLAS_RESOURCES_EXHAUSTED	TCLAS Resources Exhausted.
82	REJECTED_WITH_SUGGESTED_ BSS_TRANSITION	Rejected with Suggested BSS Transition.
83		Reserved
92	REFUSED_EXTERNAL_REASON	(Re)association refused for some external reason
93	REFUSED_AP_OUT_OF_MEMORY	(Re)association refused because of memory limits at the AP
94	REJECTED_EMERGENCY_ SERVICES_NOT_SUPPORTED	(Re)association refused because emergency services are not supported at the AP.
95	QUERY_RESPONSE_ OUTSTANDING	GAS query response not yet received.
96-99		Reserved
100	MCCAOP_RESERVATION_ CONFLICT	The request failed due to a reservation conflict
101	MAF_LIMIT_EXCEEDED	The request failed due to exceeded MAF limit
102	MCCA_TRACK_LIMIT_EXCEEDED	The request failed due to exceeded MCCA track limit
103–65 535		Reserved

8.4.1.10 Timestamp field

This field represents the value of the timing synchronization function (TSF) timer (see 10.1 and 10.21) of a frame's source. The length of the Timestamp field is 8 octets. The Timestamp field is illustrated in Figure 8-44.

	Timestamp
Octets:	8

Figure 8-44—Timestamp field

8.4.1.11 Action field

The Action field provides a mechanism for specifying extended management actions. The format of the Action field is shown in Figure 8-45.

	Category	Action Details
Octets:	1	variable

Figure 8-45—Action field

The Category field is set to one of the nonreserved values shown in Table 8-38. Action frames of a given category are referred to as *<category name> Action frames*. For example, frames in the QoS category are called *QoS Action frames*.

The Action Details field contains the details of the action. The details of the actions allowed in each category are described in the appropriate subclause referenced in Table 8-38.

Table 8-38—Category values

Code	Meaning	See subclause	Robust	Group addressed privacy
0	Spectrum management	8.5.2	Yes	No
1	QoS	8.5.3	Yes	No
2	DLS	8.5.4	Yes	No
3	Block Ack	8.5.5	Yes	No
4	Public	8.5.8	No	No
5	Radio measurement	8.5.7	Yes	No
6	Fast BSS Transition	8.5.9	Yes	No
7	HT	8.5.12	No	No
8	SA Query	8.5.10	Yes	No
9	Protected Dual of Public Action	8.5	Yes	No
10	WNM	8.5.14	Yes	No
11	Unprotected WNM	8.5.15	No	No
12	TDLS	8.5.13	— See NOTE	No
13	Mesh	8.5.17	Yes	Yes
14	Multihop	8.5.18	Yes	Yes
15	Self-protected	8.5.16	No	No
16	Reserved	—	—	—
17	Reserved (used by WFA)	—	—	—
18–125	Reserved	—	—	—
126	Vendor-specific Protected	8.5.6	Yes	No
127	Vendor-specific	8.5.6	No	No
128–255	Error	—	—	—
NOTE—TDLS Action fields are always transported encapsulated within a data frame (see 10.22.1), so the question of whether these frame are Robust is not applicable.				

8.4.1.12 Dialog Token field

The Dialog Token field is used for matching action responses with action requests when there are multiple, concurrent action requests. The length of the Dialog Token field is 1 octet. The Dialog Token field is illustrated in Figure 8-46. See 9.24.5.

	Dialog Token
Octets:	1

Figure 8-46—Dialog Token fixed field

8.4.1.13 DLS Timeout Value field

The DLS Timeout Value field is used in the DLS Request frame to indicate the timeout value for the direct link. The length of the DLS Timeout Value field is 2 octets. The DLS Timeout Value field is illustrated in Figure 8-47. See 10.7.2.4.

	DLS Timeout Value
Octets:	2

Figure 8-47—DLS Timeout Value fixed field

8.4.1.14 Block Ack Parameter Set field

The Block Ack Parameter Set field is used in ADDBA frames to signal the parameters for setting up a Block Ack. The length of the Block Ack Parameter Set field is 2 octets. The Block Ack Parameter Set field is illustrated in Figure 8-48.

	B0	B1	B2 B5	B6 B15
	A-MSDU Supported	Block Ack Policy	TID	Buffer Size
Bits:	1	1	4	10

Figure 8-48—Block Ack Parameter Set fixed field

The A-MSDU Supported subfield determines whether an A-MSDU may be carried in a QoS data MPDU sent under this Block Ack agreement. When equal to 1, use of A-MSDU is permitted. When equal to 0, use of A-MSDU is not permitted.

The Block Ack Policy subfield is set to 1 for immediate Block Ack and 0 for delayed Block Ack.

The TID subfield contains the value of the TC or TS for which the BlockAck is being requested.

The Buffer Size subfield indicates the number of buffers available for this particular TID.[21] When the A-MSDU Supported field is equal to 0 as indicated by the STA transmitting the Block Ack Parameter Set field, each buffer is capable of holding a number of octets equal to the maximum size of an MSDU. When the

[21] For buffer size, the recipient of data advertises a single scalar number that is the number of fragment buffers of the maximum MSDU or A-MSDU size (indicated by the A-MSDU Supported field) available for the Block Ack agreement that is being negotiated. Every buffered MPDU that is associated with this Block Ack agreement consumes one of these buffers regardless of whether the frame contains a whole MSDU (or a fragment thereof) or an A-MSDU. For example, ten maximum-size unfragmented MSDUs consumes the same amount of buffer space at the recipient as ten smaller fragments of a single MSDU of maximum size.

A-MSDU Supported field is equal to 1 as indicated by the STA, each buffer is capable of holding a number of octets equal to the maximum size of an A-MSDU that is supported by the STA.

In an ADDBA Request frame, the Buffer Size subfield is intended to provide guidance for the frame receiver to decide its reordering buffer size and is advisory only. If the Buffer Size subfield is equal to 0, it implies that the originator of the Block Ack has no information to specify its value.

In an ADDBA Response frame, when the Status Code field is equal to 0, the Buffer Size subfield is set to a value of at least 1.

8.4.1.15 Block Ack Timeout Value field

The Block Ack Timeout Value field is used in the ADDBA Request and Response frames to indicate the timeout value for Block Ack. The length of the Block Ack Timeout Value field is 2 octets. The Block Ack Timeout Value field is illustrated in Figure 8-49.

	Block Ack Timeout Value
Octets:	2

Figure 8-49—Block Ack Timeout Value fixed field

The Block Ack Timeout Value field contains the duration, in TUs, after which the Block Ack setup is terminated, if there are no frame exchanges (see 10.5.4) within this duration using this Block Ack agreement. A value of 0 disables the timeout.

8.4.1.16 DELBA Parameter Set field

The DELBA Parameter Set field is used in a DELBA frame to terminate an already setup Block Ack. The length of the DELBA Parameters field is 2 octets. The DELBA Parameters field is illustrated in Figure 8-50.

	B0 B10	B11	B12 B15
	Reserved	Initiator	TID
Bits:	11	1	4

Figure 8-50—DELBA Parameters fixed field

The Initiator subfield indicates if the originator or the recipient of the data is sending this frame. It is set to 1 to indicate the originator and is set to 0 to indicate the recipient. The TID subfield indicates the TSID or the UP for which the Block Ack has been originally set up.

8.4.1.17 QoS Info field

The QoS Info field is 1 octet in length and contains capability information bits. The contents of the field are dependent on whether the STA is contained within an AP.

The format of the QoS Info field, when sent by the AP, is defined in Figure 8-51.

	B0 B3	B4	B5	B6	B7
	EDCA Parameter Set Update Count	Q-Ack	Queue Request	TXOP Request	Reserved
Bits:	4	1	1	1	1

Figure 8-51—QoS Info field when sent by an AP

The EDCA Parameter Set Update Count subfield is described in 9.2.4.2.

APs set the Q-Ack subfield to 1 when dot11QAckOptionImplemented is true and set it to 0 otherwise.

APs set the Queue Request subfield to 1 if they can process a nonzero Queue Size subfield in the QoS Control field in QoS data frames and set it to 0 otherwise.

APs set the TXOP Request subfield to 1 if they can process a nonzero TXOP Duration Requested subfield in the QoS Control field in QoS data frames and set it to 0 otherwise.

The format of the QoS Info field, when sent by the non-AP STA, is defined in Figure 8-52.

	B0	B1	B2	B3	B4	B5 B6	B7
	AC_VO U-APSD Flag	AC_VI U-APSD Flag	AC_BK U-APSD Flag	AC_BE U-APSD Flag	Q-Ack	Max SP Length	More Data Ack
Bits:	1	1	1	1	1	1	1

Figure 8-52—QoS Info field when set by a non-AP STA

Each of the ACs U-APSD Flag subfields is 1 bit in length and set to 1 in (Re)Association Request frames to indicate that the corresponding AC (AC_BE, AC_BK, AC_VI, or AC_VO) is both trigger-enabled and delivery-enabled. It is set to 0 in (Re)Association Request frames to indicate that the corresponding AC is neither trigger-enabled nor delivery-enabled. A TSPEC as described in 10.2.1.5 is to be used to make a particular AC exclusively either trigger-enabled or delivery-enabled. These subfields are set to 0 when the APSD subfield in the Capability Information field is equal to 0.

Non-AP STAs set the Q-Ack subfield to 1 when dot11QAckOptionImplemented is true and set it to 0 otherwise.

The Max SP Length subfield is 2 bits in length and indicates the maximum number of total buffered MSDUs, A-MSDUs, and MMPDUs the AP may deliver to a STA during any SP triggered by the STA. This subfield is reserved when the APSD subfield in the Capability Information field is equal to 0. If the APSD subfield in the Capability Information field is equal to 1, the settings of the values in the Max SP Length subfield are defined in Table 8-39.

Table 8-39—Settings of the Max SP Length subfield

Bit 5	Bit 6	Usage
0	0	AP may deliver all buffered MSDUs, A-MSDUs, and MMPDUs.
1	0	AP may deliver a maximum of two MSDUs, A-MSDUs, and MMPDUs per SP.
0	1	AP may deliver a maximum of four MSDUs, A-MSDUs, and MMPDUs per SP.
1	1	AP may deliver a maximum of six MSDUs, A-MSDUs, and MMPDUs per SP.

Non-AP STAs set the More Data Ack subfield to 1 to indicate that they can process ACK frames with the More Data bit in the Frame Control field equal to 1 and remain in the Awake state. Non-AP STAs set the More Data Ack subfield to 0 otherwise. For APs, the More Data Ack subfield is reserved.

8.4.1.18 Measurement Pilot Interval field

The Measurement Pilot Interval field represents the number of time units (TUs) between target measurement pilot transmission times (TMPTTs). The length of the Measurement Pilot Interval field is 1 octet. The Measurement Pilot Interval field is illustrated in Figure 8-53.

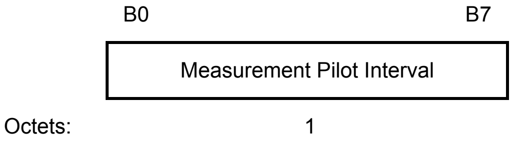

Figure 8-53—Measurement Pilot Interval fixed field

8.4.1.19 Max Transmit Power field

The Max Transmit Power field is a twos complement signed integer and is 1 octet in length, providing an upper limit, in units of dBm, on the transmit power as measured at the output of the antenna connector to be used by that AP on the current channel. See 10.11.13. The Max Transmit Power field is illustrated in Figure 8-54.

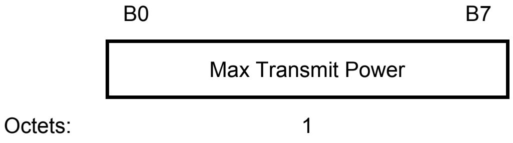

Figure 8-54—Max Transmit Power field

8.4.1.20 Transmit Power Used field

The Transmit Power Used field is a twos complement signed integer and is 1 octet in length. It is less than or equal to the Max Transmit Power and indicates the actual power used as measured at the output of the antenna connector, in units of dBm, by a STA when transmitting the frame containing the Transmit Power Used field. The Transmit Power Used value is determined anytime prior to sending the frame in which it is contained and has a tolerance of ±5 dB. The Transmit Power Used field is illustrated in Figure 8-55.

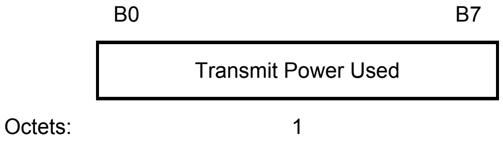

Figure 8-55—Transmit Power Used field

8.4.1.21 Channel Width field

The Channel Width field is used in a Notify Channel Width frame (see 8.5.12.2) to indicate the channel width on which the sending STA is able to receive. The length of the field is 1 octet. The Channel Width field is illustrated in Figure 8-56.

	Channel Width
Octets:	1

Figure 8-56—Channel Width fixed field

If a STA transmitting or receiving this field is operating in an operating class that includes a value of 13 or 14 in the behavior limits as specified in Annex E, then the values of the Channel Width field are defined in Table 8-40. If a STA transmitting or receiving this field is operating in an operating class that does not include a value of 13 or 14 in the behavior limits as specified in Annex E, then this field is reserved.

Table 8-40—Settings of the Channel Width field

Value	Meaning
0	20 MHz channel width
1	Any channel width in the STA's Supported Channel Width Set subfield
2–255	Reserved

8.4.1.22 SM Power Control field

The SM Power Control field is used in an SM Power Save frame (see 8.5.12.3) by a STA to communicate changes in its SM power-saving state. The field is 1 octet in length and is illustrated in Figure 8-57.

	B0	B1	B2 B7
	SM Power Save Enabled	SM Mode	Reserved
Bits:	1	1	6

Figure 8-57—SM Power Control fixed field

The SM Power Save Enabled subfield indicates whether SM power saving is enabled at the STA. A value of 1 indicates enabled, and a value of 0 indicates disabled.

The SM Mode subfield indicates the mode of operation. A value of 1 indicates dynamic SM power save mode, a value of 0 indicates static SM power save mode. The modes are described in 10.2.4.

8.4.1.23 PCO Phase Control field

The PCO Phase Control field is used in a Set PCO Phase frame (see 8.5.12.5) to indicate the phase of PCO operation (see 10.16). The length of the field is 1 octet. The PCO Phase Control field is illustrated in Figure 8-58.

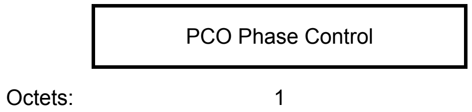

Figure 8-58—PCO Phase Control fixed field

The PCO Phase Control field indicates the current PCO phase. The values of the PCO Phase Control field are defined in Table 8-41.

Table 8-41—Settings of the PCO Phase Control field

Value	Meaning
0	20 MHz phase
1	40 MHz phase
2–255	Reserved

8.4.1.24 PSMP Parameter Set field

The PSMP Parameter Set field is used in a PSMP frame (see 8.5.12.4) to define the number of PSMP STA Info fields held in the PSMP frame, to indicate whether the PSMP sequence is to be followed by another PSMP sequence, and to indicate the duration of the PSMP sequence.

The PSMP Parameter Set field is 2 octets in length. The structure of the PSMP Parameter Set field is defined in Figure 8-59.

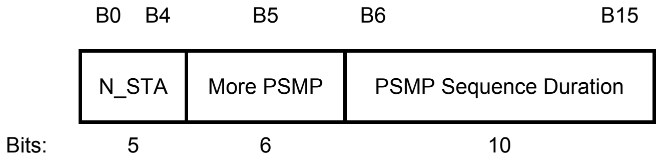

Figure 8-59—PSMP Parameter Set fixed field

The N_STA subfield indicates the number of STA Info fields present in the PSMP frame that contains the PSMP Parameter Set field.

The More PSMP subfield, when set to 1, indicates that the current PSMP sequence will be followed by another PSMP sequence. A value of 0 indicates that there will be no PSMP sequence following the current PSMP sequence.

The PSMP Sequence Duration subfield indicates the duration of the current PSMP sequence that is described by the PSMP frame, in units of 8 µs, relative to the end of the PSMP frame. Therefore, this field can describe a PSMP sequence with a duration of up to 8.184 ms. The next PSMP sequence within the current PSMP burst starts a SIFS interval after the indicated duration.

8.4.1.25 PSMP STA Info field

The PSMP STA Info field is used by the PSMP frame (see 8.5.12.4). The PSMP STA Info field defines the allocation of time to the downlink (PSMP-DTT) and/or uplink (PSMP-UTT) associated with a single RA.

There are two variants of the structure for the individually addressed and group addressed cases. The length of the PSMP STA Info field is 8 octets.

The structure of the STA Info field is defined in Figure 8-60 and Figure 8-61.

	B0 B1	B2 B12	B13 B20	B21 B63
	STA_INFO Type (=1)	PSMP-DTT Start Offset	PSMP-DTT Duration	PSMP Group Address ID
Bits:	2	11	8	43

Figure 8-60—PSMP STA Info fixed field (group addressed)

	B0 B1	B2 B12	B13 B20	B21 B36	B37 B47	B48 B57	B58 B63
	STA_INFO Type (=2)	PSMP-DTT Start Offset	PSMP-DTT Duration	STA_ID	PSMP-UTT Start Offset	PSMP-UTT Duration	Reserved
Bits:	2	11	8	16	11	10	6

Figure 8-61—PSMP STA Info fixed field (individually addressed)

The STA_INFO Type subfield indicates the format of the remainder of the structure. When the STA_INFO Type subfield is equal to 1, the PSMP STA Info field is structured as defined in Figure 8-60 and supports the transmission of group addressed data by the AP. When the STA_INFO Type subfield is equal to 2, the PSMP STA Info field is structured as defined in Figure 8-61 and supports the exchange of data with a single STA. STA_INFO Type subfield values 0 and 3 are reserved.

The PSMP-DTT Start Offset subfield indicates the start of the PSMP-DTT for the destination identified by the PSMP STA Info field, relative to the end of the PSMP frame, in units of 4 µs. This subfield locates the start of the first PPDU containing downlink data for this destination.

The PSMP-DTT Duration subfield indicates the duration of the PSMP-DTT for the destination identified by the PSMP STA Info field, in units of 16 µs. This subfield locates the end of the last PPDU containing downlink data for this destination relative to the PDMP-DTT start offset.

If no PSMP-DTT is scheduled for a STA, but a PSMP-UTT is scheduled for that STA, the PSMP-DTT Duration subfield is set to 0, and the PSMP-DTT Start Offset subfield is reserved.

The PSMP Group Address ID (B21 to B63) subfield contains the 43 least significant bits (LSBs) of a 48 bit MAC address. Use of this subfield is described in 9.26.1.8. B63 contains the LSB of the group address (considering the Individual/Group bit to be the most significant bit (MSB)).

The STA_ID subfield contains the AID of the STA to which the PSMP STA Info field is directed.

The PSMP-UTT Start Offset subfield indicates the start of the PSMP-UTT. The offset is specified relative to the end of the PSMP frame. It is specified in units of 4 µs. The first PSMP-UTT is scheduled to begin after a SIFS interval from the end of the last PSMP-DTT described in the PSMP.

The PSMP-UTT Duration subfield indicates the maximum length of a PSMP-UTT for a STA. PSMP-UTT duration is specified in units of 4 µs. All transmissions by the STA within the current PSMP sequence lie within the indicated PSMP-UTT.

If no PSMP-UTT is scheduled for a STA, but a PSMP-DTT is scheduled for that STA, the PSMP-UTT Start Offset and PSMP-UTT Duration subfields are both set to 0.

8.4.1.26 MIMO Control field

The MIMO Control field is used to manage the exchange of MIMO channel state or transmit beamforming feedback information. It is used in the CSI (see 8.5.12.6), Noncompressed Beamforming (see 8.5.12.7), and Compressed Beamforming (see 8.5.12.8) frames.

The MIMO Control field is 6 octets in length and is defined in Figure 8-62.

	B0B1	B2B3	B4	B5B6	B7B8	B9B10	B11B13	B14B15	B16B48
	Nc Index	Nr Index	MIMO Control Channel Width	Grouping (*Ng*)	Coefficient Size	Codebook Information	Remaining Matrix Segment	Reserved	Sounding Timestamp
Bits:	2	2	1	2	2	2	3	2	32

Figure 8-62—MIMO Control field

The subfields of the MIMO Control field are defined in Table 8-42.

Table 8-42—Subfields of the MIMO Control field

Subfield	Description
Nc Index	Indicates the number of columns in a matrix minus one: Set to 0 for *Nc* = 1 Set to 1 for *Nc* = 2 Set to 2 for *Nc* = 3 Set to 3 for *Nc* = 4
Nr Index	Indicates the number of rows in a matrix minus one: Set to 0 for *Nr* = 1 Set to 1 for *Nr* = 2 Set to 2 for *Nr* = 3 Set to 3 for *Nr* = 4
MIMO Control Channel Width	Indicates the width of the channel in which a measurement was made: Set to 0 for 20 MHz Set to 1 for 40 MHz
Grouping (*Ng*)	Number of carriers grouped into one: Set to 0 for *Ng* = 1 (No grouping) Set to 1 for *Ng* = 2 Set to 2 for *Ng* = 4 The value 3 is reserved

Table 8-42—Subfields of the MIMO Control field *(continued)*

Subfield	Description
Coefficient Size	Indicates the number of bits in the representation of the real and imaginary parts of each element in the matrix. For CSI feedback: Set to 0 for *Nb* = 4 Set to 1 for *Nb* = 5 Set to 2 for *Nb* = 6 Set to 3 for *Nb* = 8 For noncompressed beamforming feedback: Set 0 for *Nb* = 4 Set 1 for *Nb* = 2 Set 2 for *Nb* = 6 Set 3 for *Nb* = 8
Codebook Information	Indicates the size of codebook entries: Set to 0 for 1 bit for ψ , 3 bits for ϕ Set to 1 for 2 bits for ψ , 4 bits for ϕ Set to 2 for 3 bits for ψ , 5 bits for ϕ Set to 3 for 4 bits for ψ , 6 bits for ϕ
Remaining Matrix Segment	Contains the remaining segment number for the associated measurement report. Valid range: 0 to 7. Set to 0 for the last segment of a segmented report or the only segment of an unsegmented report.
Sounding Timestamp	Contains the lower 4 octets of the TSF timer value sampled at the instant that the MAC received the PHY-CCA.indication(IDLE) primitive that corresponds to the end of the reception of the sounding packet that was used to generate feedback information contained in the frame.

8.4.1.27 CSI Report field

The CSI Report field is used by the CSI frame (see 8.5.12.6) to carry explicit channel state information to a transmit beamformer, as described in 9.29.3.

The CSI Matrix subfields in the CSI Report field shown in Table 8-43 and Table 8-44 are matrices whose elements are taken from the CHAN_MAT parameter of RXVECTOR (see Table 20-1).

Table 8-43—CSI Report field (20 MHz)

Field	Size (bits)	Meaning
SNR in receive chain 1	8	Signal-to-noise ratio in the first receive chain of the STA sending the report.
...		
SNR in receive chain *Nr*	8	Signal-to-noise ratio in the *Nr*'th receive chain of the STA sending the report.
CSI Matrix for carrier –28	3+2× $Nb \times Nc \times Nr$	CSI matrix (see Figure 8-63)
...		

Table 8-43—CSI Report field (20 MHz) *(continued)*

Field	Size (bits)	Meaning
CSI Matrix for carrier –1	3+2× *Nb*×*Nc*×*Nr*	CSI matrix
CSI Matrix for carrier 1	3+2× *Nb*×*Nc*×*Nr*	CSI matrix
...		
CSI Matrix for carrier 28	3+2× *Nb*×*Nc*×*Nr*	CSI matrix

The structure of the field depends on the value of the MIMO Control Channel Width subfield. The CSI Report field for 20 MHz has the structure defined in Table 8-43 where

Nb is the number of bits determined by the Coefficients Size field of the MIMO Control field

Nc is the number of columns in a CSI matrix determined by the Nc Index field of the MIMO Control field

Nr is the number of rows in a CSI matrix determined by the Nr Index field of the MIMO Control field

The CSI Report field for 40 MHz has the structure defined in Table 8-44.

Table 8-44—CSI Report field (40 MHz)

Field	Size (bits)	Meaning
SNR in receive chain 1	8	Signal-to-noise ratio in the first receive chain of the STA sending the report.
...		
SNR in receive chain *Nr*	8	Signal-to-noise ratio in the *Nr*'th receive chain of the STA sending the report.
CSI Matrix for carrier –58	3+2× *Nb*×*Nc*×*Nr*	CSI matrix (see Figure 8-63)
...		
CSI Matrix for carrier –2	3+2× *Nb*×*Nc*×*Nr*	CSI matrix
CSI Matrix for carrier 2	3+2× *Nb*×*Nc*×*Nr*	CSI matrix
...		
CSI Matrix for carrier 58	3+2× *Nb*×*Nc*×*Nr*	CSI matrix

The signal-to-noise ratio (SNR) values in Table 8-43 and Table 8-44 are encoded as an 8-bit twos complement value of 4 × (SNR_average – 22), where SNR_average is the decibel representation of linearly averaged values over the tones represented. This encoding covers the SNR range from –10 dB to 53.75 dB in 0.25 dB steps.

Grouping is a method that reduces the size of the CSI Report field by reporting a single value for each group of *Ng* adjacent subcarriers. With grouping, the size of the CSI Report field is *Nr*×8+*Ns*×(3+2×*Nb*×*Nc*×*Nr)* bits, where the number of subcarriers sent, *Ns*, is a function of *Ng* and whether matrices for 40 MHz or 20 MHz are sent. The value of *Ns* and the specific carriers for which matrices are sent are shown in Table 8-45. If the size of the CSI Report field is not an integral multiple of 8 bits, up to 7 zeros are appended to the end of the report to make its size an integral multiple of 8 bits.

Table 8-45—Number of matrices and carrier grouping

BW	Grouping *Ng*	*Ns*	Carriers for which matrices are sent
20 MHz	1	56	All data and pilot carriers: –28, –27,…–2, –1, 1, 2,…27, 28
	2	30	–28,–26,–24,–22,–20,–18,–16,–14,–12,–10,–8,–6,–4,–2,–1, 1,3,5,7,9,11,13,15,17,19,21,23,25,27,28
	4	16	–28,–24,–20,–16,–12,–8,–4,–1,1,5,9,13,17,21,25,28
40 MHz	1	114	All data and pilot carriers: –58, –57, …, –3, –2, 2, 3,…, 57, 58
	2	58	–58,–56,–54,–52,–50,–48,–46,–44,–42,–40,–38,–36,–34,–32,–30, –28,–26,–24,–22,–20,–18,–16,–14,–12,–10,–8,–6,–4,–2, 2,4,6,8,10,12,14,16,18,20,22,24,26,28, 30,32,34,36,38,40,42,44,46,48,50,52,54,56,58
	4	30	–58,–54,–50,–46,–42,–38,–34,–30,–26,–22,–18,–14,–10,–6, –2, 2,6,10,14,18,22,26,30,34,38,42,46,50,54,58

The CSI matrix H_{eff} for a single carrier has the structure defined in Figure 8-63. The encoding rules for the elements of the H_{eff} matrix are given in 20.3.12.3.2.

```
For each subcarrier include
{
    Carrier Matrix Amplitude of 3 bits
    For each of Nr rows in each CSI matrix in order: (1, …, Nr)
    {
        Include Nc complex coefficients of CSI matrix $H_{eff}$ in order: (1, …, Nc );
        each element of $H_{eff}$ includes the real part of the element (Nb bits) and
        imaginary part of the element (Nb bits) in that order
    }

}
```

Figure 8-63—CSI matrix coding

When operating with a 40 MHz channel width, CSI feedback with a bandwidth of 20 MHz corresponds to the tones in the primary 20 MHz channel.

8.4.1.28 Noncompressed Beamforming Report field

The Noncompressed Beamforming Report field is used by the Noncompressed Beamforming frame to carry explicit feedback in the form of noncompressed beamforming feedback matrices *V* for use by a transmit beamformer to determine steering matrices Q, as described in 9.29.3 and 20.3.12.3.

The structure of the field is dependent on the value of the MIMO Control Channel Width subfield. The Noncompressed Beamforming Report field for 20 MHz has the structure defined in Table 8-46 where

Nb is the number of bits determined by the Coefficients Size field of the MIMO Control field

Nc is the number of columns in a beamforming feedback matrix determined by the Nc Index field of the MIMO Control field

Nr is the number of rows in a beamforming feedback matrix determined by the Nr Index field of the MIMO Control field

Table 8-46—Noncompressed Beamforming Report field (20 MHz)

Field	Size (bits)	Meaning
SNR for space-time stream 1	8	Average signal-to-noise ratio in the STA sending the report for space-time stream 1.
...		
SNR for space-time stream *Nc*	8	Average signal-to-noise ratio in the STA sending the report for space-time stream *Nc*.
Beamforming Feedback Matrix for carrier –28	2× *Nb*×*Nc*×*Nr*	Beamforming feedback matrix *V* (see Figure 8-64)
...		
Beamforming Feedback Matrix for carrier –1	2× *Nb*×*Nc*×*Nr*	Beamforming feedback matrix *V*
Beamforming Feedback Matrix for carrier 1	2× *Nb*×*Nc*×*Nr*	Beamforming feedback matrix *V*
...		
Beamforming Feedback Matrix for carrier 28	2× *Nb*×*Nc*×*Nr*	Beamforming feedback matrix *V*

The Noncompressed Beamforming Report field for 40 MHz has the structure defined in Table 8-47.

Table 8-47—Noncompressed Beamforming Report field (40 MHz)

Field	Size (bits)	Meaning
SNR for space-time stream 1	8	Average signal-to-noise ratio in the STA sending the report for space-time stream 1.
...		
SNR for space-time stream *Nc*	8	Average signal-to-noise ratio in the STA sending the report for space-time stream *Nc*.
Beamforming Feedback Matrix for carrier –58	2× *Nb*×*Nc*×*Nr*	Beamforming feedback matrix *V* (see Figure 8-64)
...		
Beamforming Feedback Matrix for carrier –2	2× *Nb*×*Nc*×*Nr*	Beamforming feedback matrix *V*
Beamforming Feedback Matrix for carrier 2	2× *Nb*×*Nc*×*Nr*	Beamforming feedback matrix *V*
...		
Beamforming Feedback Matrix for carrier 58	+2× *Nb*×*Nc*×*Nr*	Beamforming feedback matrix *V*

The SNR values in Table 8-46 and Table 8-47 are encoded as an 8-bit twos complement value of 4 × (SNR_average – 22), where SNR_average is the sum of the values of SNR per tone (in decibels) divided by the number of tones represented. This encoding covers the SNR range from –10 dB to 53.75 dB in 0.25 dB steps. The SNR in space-time stream *i* corresponds to the SNR associated with the column *i* of the beamforming feedback matrix *V*. Each SNR corresponds to the predicted SNR at beamformee when the beamformer applies the matrix *V*.

Grouping is a method that reduces the size of the Noncompressed Beamforming Report field by reporting a single value for each group of *Ng* adjacent subcarriers. With grouping, the size of the Noncompressed Beamforming Report field is $Nc\times 8+Ns\times(2\times Nb\times Nc\times Nr)$ bits. The number of subcarriers sent, *Ns*, is a function of *Ng* and whether matrices for 40 MHz or 20 MHz are sent. The value of *Ns* and the specific carriers for which matrices are sent is shown in Table 8-45. If the size of the Noncompressed Beamforming Report field is not an integral multiple of 8 bits, up to 7 zeros are appended to the end of the report to make its size an integral multiple of 8 bits.

A beamforming feedback matrix *V* for a single carrier has the structure defined in Figure 8-64.

```
For each subcarrier include
{
For each of Nr rows in the
        Noncompressed beamforming feedback matrix in order: (1, …, Nr)
    {
        Include Nc complex coefficients of the Noncompressed beamforming feedback
        matrix V in order: (1, …, Nc  );  each element of V includes the real
        part of the element (Nb bits) and imaginary part of the element (Nb bits)
        in that order
    }
}
```

Figure 8-64—*V* matrix coding (noncompressed beamforming)

Encoding rules for elements of the *V* matrix are given in 20.3.12.3.5.

When operating with a 40 MHz channel width, noncompressed feedback with a bandwidth of 20 MHz corresponds to the tones in the primary 20 MHz channel.

8.4.1.29 Compressed Beamforming Report field

The Compressed Beamforming Report field is used by the Compressed Beamforming frame (see 8.5.12.8) to carry explicit feedback information in the form of angles representing compressed beamforming feedback matrices *V* for use by a transmit beamformer to determine steering matrices Q, as described in 9.29.3 and 20.3.12.3.

The size of the Compressed Beamforming Report field depends on the values in the MIMO Control field.

The Compressed Beamforming Report field contains the channel matrix elements indexed, first, by matrix angles in the order shown in Table 8-48 and, second, by data subcarrier index from lowest frequency to highest frequency. The explanation on how these angles are generated from the beamforming feedback matrix *V* is given in 20.3.12.3.6.

Table 8-48—Order of angles in the Compressed Beamforming Report field

Size of *V* (*Nr* × *Nc*)	Number of angles (*Na*)	The order of angles in the Quantized Beamforming Feedback Matrices Information field
2×1	2	ϕ11, ψ21
2×2	2	ϕ11, ψ21
3×1	4	ϕ11, ϕ21, ψ21, ψ31

Table 8-48—Order of angles in the Compressed Beamforming Report field *(continued)*

Size of *V* (*Nr* × *Nc*)	Number of angles (*Na*)	The order of angles in the Quantized Beamforming Feedback Matrices Information field
3×2	6	ϕ11, ϕ21, ψ21, ψ31, ϕ22, ψ32
3×3	6	ϕ11, ϕ21, ψ21, ψ31, ϕ22, ψ32
4×1	6	ϕ11, ϕ21, ϕ31, ψ21, ψ31, ψ41
4×2	10	ϕ11, ϕ21, ϕ31, ψ21, ψ31, ψ41, ϕ22, ϕ32, ψ32, ψ42
4×3	12	ϕ11, ϕ21, ϕ31, ψ21, ψ31, ψ41, ϕ22, ϕ32, ψ32, ψ42, ϕ33, ψ43
4×4	12	ϕ11, ϕ21, ϕ31, ψ21, ψ31, ψ41, ϕ22, ϕ32, ψ32, ψ42, ϕ33, ψ43

The angles are quantized as defined in Table 8-49. All angles are transmitted LSB to MSB.

Table 8-49—Quantization of angles

Quantized ψ	Quantized ϕ
$\psi = \frac{k\pi}{2^{b_\psi + 1}} + \frac{\pi}{2^{b_\psi + 2}}$ radians where $k = 0, 1, \ldots, 2^{b_\psi} - 1$ b_ψ is the number of bits used to quantize ψ (defined by the Codebook Information field of the MIMO Control field; see 8.4.1.26);	$\phi = \frac{k\pi}{2^{b_\phi - 1}} + \frac{\pi}{2^{b_\phi}}$ radians where $k = 0, 1, \ldots, 2^{b_\phi} - 1$ b_ϕ is the number of bits used to quantize ϕ (defined by the Codebook Information field of the MIMO Control field; see 8.4.1.26)

The Compressed Beamforming Report field for 20 MHz has the structure defined in Table 8-50, where *Na* is the number of angles used for beamforming feedback matrix *V* (see Table 8-48).

Table 8-50—Compressed Beamforming Report field (20 MHz)

Field	Size (bits)	Meaning
SNR in space-time stream 1	8	Average signal-to-noise ratio in the STA sending the report for space-time stream 1
...		
SNR in space-time stream *Nc*	8	Average signal-to-noise ratio in the STA sending the report for space-time stream *Nc*
Beamforming Feedback Matrix *V* for carrier –28	$Na \times (b_\psi + b_\phi)/2$	Beamforming feedback matrix *V*
...		
Beamforming Feedback Matrix *V* for carrier –1	$Na \times (b_\psi + b_\phi)/2$	Beamforming feedback matrix *V*

Table 8-50—Compressed Beamforming Report field (20 MHz) *(continued)*

Field	Size (bits)	Meaning
Beamforming Feedback Matrix *V* for carrier 1	$Na\times(b_\psi+b_\phi)/2$	Beamforming feedback matrix *V*
...		
Beamforming Feedback Matrix *V* for carrier 28	$Na\times(b_\psi+b_\phi)/2$	Beamforming feedback matrix *V*

The Compressed Beamforming Report field for 40 MHz has the structure defined in Table 8-51, where *Na* is the number of angles used for beamforming feedback matrix *V* (see Table 8-48).

Table 8-51—Compressed Beamforming Report field (40 MHz)

Field	Size (bit)	Meaning
SNR in space-time stream 1	8	Average signal-to-noise ratio in the STA sending the report for space-time stream 1
...		
SNR in space-time stream *Nc*	8	Average signal-to-noise ratio in the STA sending the report for space-time stream *Nc*
Beamforming Feedback Matrix *V* for carrier –58	$Na\times(b_\psi+b_\phi)/2$	Beamforming feedback matrix *V*
Beamforming Feedback Matrix *V* for carrier –58 + *Ng*	$Na\times(b_\psi+b_\phi)/2$	Beamforming feedback matrix *V*
...		
Beamforming Feedback Matrix *V* for carrier –2	$Na\times(b_\psi+b_\phi)/2$	Beamforming feedback matrix *V*
Beamforming Feedback Matrix *V* for carrier 2	$Na\times(b_\psi+b_\phi)/2$	Beamforming feedback matrix *V*
Beamforming Feedback Matrix *V* for carrier 2 + *Ng*	$Na\times(b_\psi+b_\phi)/2$	Beamforming feedback matrix *V*
...		
Beamforming Feedback Matrix *V* for carrier 58	$Na\times(b_\psi+b_\phi)/2$	Beamforming feedback matrix *V*

The SNR values in Table 8-50 and Table 8-51 are encoded as an 8-bit twos complement value of 4 × (SNR_average – 22), where SNR_average is the sum of the values of SNR per tone (in decibels) divided by the number of tones represented. This encoding covers the SNR range from –10 dB to 53.75 dB in 0.25 dB steps. Each SNR value per tone in stream *i* (before being averaged) corresponds to the SNR associated with the column *i* of the beamforming feedback matrix *V* determined at the beamformee. Each SNR corresponds to the predicted SNR at the beamformee when the beamformer applies the matrix *V*.

Grouping is a method that reduces the size of the Compressed Beamforming Report field by reporting a single value for each group of *Ng* adjacent subcarriers. With grouping, the size of the Compressed Beamforming Report field is $Nc\times 8+Ns\times(Na\times(b_\psi+b_\phi)/2)$ bits, where the number of subcarriers sent, *Ns*, is a function of *Ng* and whether matrices for 40 MHz or 20 MHz are sent. The value of *Ns* and the specific carriers for which matrices are sent is defined in Table 8-45. If the size of the Compressed Beamforming Report field is not an integral multiple of 8 bits, up to 7 zeros are appended to the end of the report to make its size an integral multiple of 8 bits.

See Figure 8-65 and Figure 8-66 for examples of this encoding.

Bits	b1..b5	b6..b8	b9..b13	b14..b16	…	b441..b445	b446..b448
Data	$\phi_{11}(-28)$	$\psi_{21}(-28)$	$\phi_{11}(-27)$	$\psi_{21}(-27)$	…	$\phi_{11}(28)$	$\psi_{21}(28)$

Conditions:

- 2 x 2 V
- $b_\psi = 3$, $b_\phi = 5$
- No grouping
- 20 MHz width
- The matrix *V* is encoded using 8 bits per tone.

Figure 8-65—First example of Compressed Beamforming Report field encoding

Bits	b1..b4	b5..b8	…	b27..b28	b29..b30	b31..b34	…	b59..b60	…	b871..b874	…	b899..b900
Data	$\phi_{11}(-58)$	$\phi_{21}(-58)$	…	$\psi_{32}(-58)$	$\psi_{42}(-58)$	$\phi_{11}(-54)$	…	$\psi_{42}(-54)$	…	$\phi_{11}(58)$	…	$\psi_{42}(58)$

Conditions:

- 4 x 2 V
- $b_\psi = 2$, $b_\phi = 4$
- 4 tone grouping
- 40 MHz width
- The matrix *V* is encoded using 30 bits per tone.

Figure 8-66—Second example of Compressed Beamforming Report field encoding

When operating with a 40 MHz channel width, compressed feedback with a bandwidth of 20 MHz corresponds to the tones in the primary 20 MHz channel.

8.4.1.30 Antenna Selection Indices field

The Antenna Selection Indices field is used within the Antenna Selection Indices Feedback frame to carry ASEL feedback, as described in 9.30.

The Antenna Selection Indices field is 1 octet in length and illustrated in Figure 8-67.

	Antenna Selection Indices
Octets:	1

Figure 8-67—Antenna Selection Indices fixed field

Bits 0 to 7 in the Antenna Selection Indices field correspond to antennas with indices 0 to 7, respectively. A value of 1 in a bit indicates the corresponding antenna is selected, and the value of 0 indicates the corresponding antenna is not selected.

8.4.1.31 Organization Identifier field

The Organization Identifier field shall contain a public organizationally unique identifier assigned by the IEEE. The order of the Organization Identifier field is described in 8.2.2. The IEEE has assigned public organizationally unique identifiers both of 24-bit length (OUI) and longer length. In the latter case specific OUI values are shared over multiple organizations, e.g., using 36-bit length identifiers (OUI-36 and IAB) (see IEEE Registration Authority [B19]). The length of the Organization Identifier field (*j*) shall be the minimum number of octets required to contain the entire organizationally unique identifier (see Figure 8-68), and the first 3 octets shall contain the OUI portion of the identifier. Thus, the Organization Identifier field is 3 octets in length if the organizationally unique identifier is an OUI, or 5 octets in length if the organizationally unique identifier is 36 bits in length. The IEEE assigns 36-bit organizationally unique identifiers such that the OUI portion indicates that total length of the identifier is 36 bits.

	Organization Identifier
Octets:	j

Figure 8-68—Organization Identifier field

If the length of the organizationally unique identifier is not an integral number of octets, the least significant bits of the last octet are specified by the organization identified.

NOTE—For example, for the organizationally unique identifier 0x0050C24A4, the Organization Identifier field would contain 0x0050C24A4*y* where *y* represents the four least significant bits of the fifth octet of the field. The value of *y* is specified by the organization whose identifier is 0x0050C24A4.

8.4.1.32 Rate Identification field

The Rate Identification field is 4 octets in length and contains the rate identification information for a frame that is not the current frame transmitted or received by a STA. This information allows services to exchange frame rate information prior to use of the frames that use the rate specified by the Rate Identification field. The contents of the field is defined in Figure 8-69.

	Mask	MCS Index	Rate
Octets:	1	1	2

Figure 8-69—Identification field format

The Mask field specifies which other fields in the Rate Identification field are used by a STA. The format of the Mask field is shown in Figure 8-70.

	B0 B2	B3 B4	B5 B7
	MCS Selector	Rate Type	Reserved
Bits:	3	2	3

Figure 8-70—Mask field format

The MCS Selector field set to 0 indicates the MCS Index field is reserved. The MCS Selector field set to 1 indicates the MCS Index field specifies an index value that is taken from Table 20-30 through Table 20-33 and Table 20-39 through Table 20-41 in 20.6. The MCS Selector field set to 2 indicates the MCS Index field specifies an index value that is taken from Table 20-34 through Table 20-38 and Table 20-43 through Table 20-44 in 20.6. The MCS Selector field values 3 to 7 are reserved.

The Rate Type field set to 0 indicates the Rate field is reserved. The Rate Type field set to 1 indicates the Rate field specifies a data rate that is in the basic rate set. The Rate Type field set to 2 indicates the Rate field specifies a data rate that is not in the basic rate set.

The MCS Index field is a 1 octet unsigned integer that specifies the row index for one of the MCS parameter tables in 20.6.

The Rate field contains a 2-octet unsigned integer that specifies the PHY rate in 0.5 Mb/s units.

8.4.1.33 GAS Query Response Fragment ID field

A GAS Query Fragment Response ID field is used by the STA to indicate when a GAS Query Response spans multiple MMPDUs. STAs responding to GAS request use this field to inform the requesting STA of the GAS fragment number of the transmitted frames as well as identifying the last GAS fragment of the Query Response. Requesting STAs use this field to determine if any fragments of the Query Response are missing. The maximum value permitted in the GAS Query Response Fragment ID is 127. The More GAS Fragments field is set to 1 in GAS Query Response fragments of GAS Comeback Response frames that have another GAS fragment of the current query response to follow; otherwise, it is set to 0. The format of GAS Query Response Fragment ID is shown in Figure 8-71.

	B0 B6	B7
	GAS Query Response Fragment ID	More GAS Fragments
Bits:	7	1

Figure 8-71—GAS Query Response Fragment ID field

8.4.1.34 Venue Info field

The Venue Info field is a 2-octet field. It contains Venue Group and Venue Type subfields. The format of Venue Info subfield is shown in Figure 8-72.

	Venue Group	Venue Type
Octets:	1	1

Figure 8-72—Venue Info field format

The Venue Group and Venue Type subfields are both 1-octet values selected from Table 8-52 and Table 8-53, respectively. The entries in Table 8-52 and Table 8-53 are drawn from the International Building Code's Use and Occupancy Classifications [B43].

8.4.1.35 Target Channel

The Target Channel field specifies the channel number of the target channel. The length of the Target Channel field is 1 octet. The Target Channel Field is illustrated in Figure 8-73.

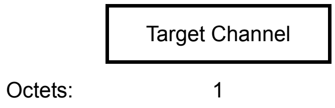

Figure 8-73—Target Channel field format

8.4.1.36 Operating Class

The Operating Class field specifies the operating class for the channel field included in the same frame. The length of the Operating Class field is 1 octet. Operating classes are defined in Annex E. The Operating Class field is illustrated in Figure 8-74.

	Operating Class
Octets:	1

Figure 8-74—Operating Channel field format

8.4.1.37 Send-Confirm field

The Send-Confirm field is used with SAE authentication as an anti-replay counter as specified in 11.3. See Figure 8-75.

	Send-Confirm
Octets:	2

Figure 8-75—Send-Confirm field

8.4.1.38 Anti-Clogging Token field

The Anti-Clogging Token field is used with SAE authentication for denial-of-service protection as specified in 11.3. See Figure 8-76.

	Anti-Clogging Token
Octets:	variable

Figure 8-76—Anti-Clogging Token field

8.4.1.39 Scalar field

The Scalar field is used with SAE authentication to communicate cryptographic material as specified in 11.3. See Figure 8-77.

	Scalar
Octets:	variable

Figure 8-77—Scalar field

8.4.1.40 Element field

The Element field is used with SAE authentication to communicate an element in a finite field as specified in 11.3. See Figure 8-78.

	Element
Octets:	variable

Figure 8-78—Element field

8.4.1.41 Confirm field

The Confirm field is used with SAE authentication to authenticate and prove possession of a cryptographic key as specified in 11.3. See Figure 8-79.

	Confirm
Octets:	variable

Figure 8-79—Confirm field

8.4.1.42 Finite Cyclic Group field

The Finite Cyclic Group is used in SAE to indicate which cryptographic group to use in the SAE exchange as specified in 11.3. See Figure 8-80.

	Finite Cyclic Group
Octets:	2

Figure 8-80—Finite Cyclic Group field

8.4.2 Information elements

8.4.2.1 General

Elements are defined to have a common general format consisting of a 1 octet Element ID field, a 1 octet Length field, and a variable-length element-specific Information field. Each element is assigned a unique Element ID as defined in this standard. The Length field specifies the number of octets in the Information field. See Figure 8-81.

	Element ID	Length	Information
Octets:	1	1	variable

Figure 8-81—Element format

The set of valid elements is defined in Table 8-54.

Table 8-54—Element IDs

Element	Element ID	Length of indicated element (in octets)	Extensible

Destination URI (see 8.4.2.92)	141	3 to 257	Yes

Table 8-54—Element IDs *(continued)*

Element	Element ID	Length of indicated element (in octets)	Extensible
U-APSD Coexistence (see 8.4.2.93)	142	14 to 257	Subelements
Reserved	143–173		
MCCAOP Advertisement Overview (see 8.4.2.110)	174	8	Yes
Reserved	175–220		
Vendor Specific (see 8.4.2.28)	221	3 to 257	
Reserved	222–255		

The frame body components specified for many management subtypes result in elements ordered by ascending Element ID, with the exception of the MIC Management element (8.4.2.57). If present, the MIC Management element appears at the end of the robust management frame body. See 9.24.6 on the parsing of elements.

A "Yes" in the Extensible column of an element listed in Table 8-54 indicates that the Length of the element might be extended in future revisions or amendments of this standard. See 9.24.8. When the Extensible column of an element is set to "Subelements," then the element might be extended in future revisions or amendments of this standard by defining additional subelements. See 9.24.9.

8.4.2.2 SSID element

The SSID element indicates the identity of an ESS or IBSS. See Figure 8-82.

	Element ID	Length	SSID
Octets:	1	1	0–32

Figure 8-82—SSID element format

The length of the SSID field is between 0 and 32 octets. A SSID field of length 0 is used within Probe Request management frames to indicate the wildcard SSID. The wildcard SSID is also used in Beacon and Probe Response frames transmitted by mesh STAs.

When the UTF-8 SSID subfield of the Extended Capabilities element is equal to 1 in the frame that includes the SSID element, the SSID is interpreted using UTF-8 encoding.

NOTE—This is true for Beacon and Probe Response frames when the MLME-START.request primitive was issued with the SSIDEncoding parameter equal to UTF8.

8.4.2.3 Supported Rates element

The Supported Rates element specifies up to eight rates in the OperationalRateSet parameter, as described in the MLME-JOIN.request and MLME-START.request primitives, and zero or more BSS membership selectors. The Information field is encoded as 1 to 8 octets, where each octet describes a single Supported Rate or BSS membership selector (see Figure 8-83).

	Element ID	Length	Supported Rates
Octets:	1	1	1–8

Figure 8-83—Supported rates element format

Within Beacon, Probe Response, Association Response, Reassociation Response, Mesh Peering Open, and Mesh Peering Confirm management frames, each Supported Rate contained in the BSSBasicRateSet parameter is encoded as an octet with the MSB (bit 7) set to 1, and bits 6 to 0 are set to the data rate, if necessary rounded up to the next 500kb/s, in units of 500 kb/s. For example, a 2.25 Mb/s rate contained in the BSSBasicRateSet parameter is encoded as X'85'. Rates not contained in the BSSBasicRateSet parameter are encoded with the MSB set to 0, and bits 6 to 0 are set to the appropriate value from the valid range column of the DATA_RATE row of the table in 6.5.5.2 (e.g., a 2 Mb/s rate not contained in the BSSBasicRateSet parameter is encoded as X'04'). The MSB of each Supported Rate octet in other management frame types is ignored by receiving STAs.

Within Beacon, Probe Response, Association Response, Reassociation Response, Mesh Peering Open, and Mesh Peering Confirm management frames, each BSS membership selector contained in the BSSMembershipSelectorSet parameter is encoded as an octet with the MSB (bit 7) set to 1, and bits 6 to 0 are set to the encoded value for the selector as found in Table 8-55 (e.g., an HT PHY BSS membership selector contained in the BSSMembershipSelectorSet parameter is encoded as X'FF'). A BSS membership selector that has the MSB (bit 7) set to 1 in the Supported Rates element is defined to be basic. The MSB of each Supported Rate octet in other management frame types is ignored by receiving STAs.

The valid values for BSS membership selectors and their associated features are shown in Table 8-55.

NOTE—Because the BSS membership selector and supported rates are carried in the same field, the BSS membership selector value cannot match the value corresponding to any valid supported rate. This allows any value in the supported rates set to be determined as either a supported rate or a BSS membership selector.

Table 8-55—BSS membership selector value encoding

Value	Feature	Interpretation
127	HT PHY	Support for the mandatory features of Clause 20 is required in order to join the BSS that was the source of the Supported Rates element or Extended Supported Rates element containing this value.

See 10.1.4.6.

8.4.2.4 FH Parameter Set element

The FH Parameter Set element contains the set of parameters necessary to allow synchronization for STAs using an FH PHY. The Information field contains Dwell Time, Hop Set, Hop Pattern, and Hop Index parameters. The total length of the Information field is 5 octets. See Figure 8-84.

	Element ID	Length	Dwell Time (TU)	Hop Set	Hop Pattern	Hop Index
Octets:	1	1	2	1	1	1

Figure 8-84—FH Parameter Set element format

The Dwell Time field is 2 octets in length and contains the dwell time (dot11CurrentDwellTime) in TU.

The Hop Set field identifies the current set (dot11CurrentSet) of hop patterns and is a single octet.

The Hop Pattern field identifies the current pattern (dot11CurrentPattern) within a set of hop patterns and is a single octet.

The Hop Index field selects the current index (dot11CurrentIndex) within a pattern and is a single octet.

The description of the attributes used in this subclause is in 14.9.2.

8.4.2.5 DSSS Parameter Set element

The DSSS Parameter Set element contains information to allow channel number identification for STAs. The Information field contains a single parameter containing the dot11CurrentChannel (see 16.4.6.3, 17.4.6.3, 18.3.8.4.2 and 20.3.15 for values). The length of the dot11CurrentChannel parameter is 1 octet. See Figure 8-85.

	Element ID	Length	Current Channel
Octets:	1	1	1

Figure 8-85—DSSS Parameter Set element format

8.4.2.6 CF Parameter Set element

The CF Parameter Set element contains the set of parameters necessary to support the PCF. The Information field contains the CFPCount, CFPPeriod, CFPMaxDuration, and CFPDurRemaining fields. The total length of the Information field is 6 octets. See Figure 8-86.

	Element ID	Length	CFP Count	CFP Period	CFP MaxDuration (TU)	CFP DurRemaining (TU)
Octets:	1	1	1	1	2	2

Figure 8-86—CF Parameter Set element format

CFPCount indicates how many delivery traffic indication maps (DTIMs) (including the current frame) appear before the next CFP start. A CFPCount of 0 indicates that the current DTIM marks the start of the CFP.

CFPPeriod indicates the number of DTIM intervals between the start of CFPs. The value is an integral number of DTIM intervals.

CFPMaxDuration indicates the maximum duration, in TU, of the CFP that may be generated by this PCF. This value is used by STAs to set their NAV at the TBTT of Beacon frames that begin CFPs.

CFPDurRemaining indicates the maximum time, in TU, remaining in the present CFP, and is set to 0 in CFP Parameter elements of Beacon frames transmitted during the CP. The value of CFPDurRemaining is referenced to the immediately previous TBTT. This value is used by all STAs to update their NAVs during CFPs.

8.4.2.7 TIM element

The TIM element contains four fields: DTIM Count, DTIM Period, Bitmap Control, and Partial Virtual Bitmap. See Figure 8-87.

	Element ID	Length	DTIM Count	DTIM Period	Bitmap Control	Partial Virtual Bitmap
Octets:	1	1	1	1	1	1–251

Figure 8-87—TIM element format

The Length field for this element indicates the length of the Information field, which is constrained as described below.

The DTIM Count field indicates how many Beacon frames (including the current frame) appear before the next DTIM. A DTIM Count of 0 indicates that the current TIM is a DTIM. The DTIM count field is a single octet.

The DTIM Period field indicates the number of beacon intervals between successive DTIMs. If all TIMs are DTIMs, the DTIM Period field has the value 1. The DTIM Period value 0 is reserved. The DTIM period field is a single octet.

The Bitmap Control field is a single octet. Bit 0 of the field contains the Traffic Indicator bit associated with AID 0. This bit is set to 1 in TIM elements with a value of 0 in the DTIM Count field when one or more group addressed MSDUs/MMPDUs are buffered at the AP or the mesh STA. The remaining 7 bits of the field form the Bitmap Offset.

The traffic-indication virtual bitmap, maintained by the AP or the mesh STA that generates a TIM, consists of 2008 bits, and is organized into 251 octets such that bit number N ($0 \leq N \leq 2007$) in the bitmap corresponds to bit number ($N \bmod 8$) in octet number $\lfloor N / 8 \rfloor$ where the low-order bit of each octet is bit number 0, and the high order bit is bit number 7. Each bit in the traffic-indication virtual bitmap corresponds to traffic buffered for a specific neighbor peer mesh STA within the MBSS that the mesh STA is prepared to deliver or STA within the BSS that the AP is prepared to deliver at the time the Beacon frame is transmitted. Bit number N is 0 if there are no individually addressed MSDUs/MMPDUs buffered for the STA whose AID is N. If any individually addressed MSDUs/MMPDUs for that STA are buffered and the AP or the mesh STA is prepared to deliver them, bit number N in the traffic-indication virtual bitmap is 1. A PC might decline to set bits in the TIM for CF-Pollable STAs it does not intend to poll (see 10.2.1.7).

When dot11MgmtOptionMultiBSSIDActivated is false, the Partial Virtual Bitmap field consists of octets numbered $N1$ to $N2$ of the traffic indication virtual bitmap, where $N1$ is the largest even number such that bits numbered 1 to $(N1 \times 8) - 1$ in the bitmap are all 0 and $N2$ is the smallest number such that bits numbered $(N2 + 1) \times 8$ to 2007 in the bitmap are all 0. In this case, the Bitmap Offset subfield value contains the number $N1/2$, and the Length field is set to $(N2 - N1) + 4$.

In the event that all bits other than bit 0 in the virtual bitmap are 0, the Partial Virtual Bitmap field is encoded as a single octet equal to 0, the Bitmap Offset subfield is 0, and the Length field is 4.

When dot11MgmtOptionMultiBSSIDActivated is true, the Partial Virtual Bitmap field of the TIM element is constructed as follows, where the maximum possible number of BSSIDs is an integer power of 2, n = log2 (maximum possible number of BSSIDs), k is the number of actually supported nontransmitted BSSIDs, and $k \leq (2^n - 1)$.

- The bits 1 to k of the bitmap are used to indicate that one or more group addressed frames are buffered for each AP corresponding to a nontransmitted BSSID. The AIDs from 1 to k are not allocated to a STA. The AIDs from $(k + 1)$ to $(2^n - 1)$ are reserved and set to 0. The remaining AIDs are shared by the BSSs corresponding to the transmitted BSSID and all nontransmitted BSSIDs.
- When the DTIM Count field is 0 for a BSS that has a nontransmitted BSSID, and one or more group addressed frames are buffered at the AP for this BSS, the corresponding bits from bit 1 to bit k is set to 1.

- Each bit starting from bit 2^n in the traffic-indication virtual bitmap corresponds to individually addressed traffic buffered for a specific STA within any BSS corresponding to a transmitted or nontransmitted BSSID at the time the Beacon frame is transmitted. The correspondence is based on the AID of the STA.
- Based upon its knowledge of the capability of associated stations to support the multiple BSSID capability, as indicated by the corresponding field in the Extended Capabilities element and the content of the traffic indication virtual bitmap, an AP shall encode the Partial Virtual Bitmap and the Bitmap Control field of the TIM element using one of the two following methods. Specifically, an AP uses Method B when it determines that the bit for each associated non-AP STA in the virtual bitmap that is reconstructed by each non-AP STA from the received TIM element encoded using Method B is set correctly. Otherwise, an AP uses Method A.

Method A and Method B are described as follows:

a) Method A: The Partial Virtual Bitmap field consists of octets numbered 0 to $N2$ of the traffic indication virtual bitmap, where $N2$ is the smallest number such that bits numbered $(N2 + 1) \times 8$ to 2007 in the bitmap are all 0. If such a value $N2$ does not exist, that is, when not all bits in the last octet of the traffic indication virtual bitmap are equal to 0, $N2 = 250$. When using this method, the Bitmap Offset subfield value always contains the number 0, and the Length field is $N2 + 4$.
b) Method B: The Partial Virtual Bitmap field consists of a concatenation of octets numbered 0 to $N0 - 1$ and octets numbered $N1$ to $N2$ of the traffic indication virtual bitmap, where $N0$ is the smallest positive integer such that $N0 \times 8 - 2^n < 8$. If $N0$ is an odd number, then $N1$ is the largest odd number such that $N0 < N1$and each of the bits $N0 \times 8$ to $(N1 \times 8 - 1)$ is equal to 0. When $N0$ is an even number, $N1$ is the largest even number such that $N0 < N1$ and each of the bits $N0 \times 8$ to $(N1 \times 8 - 1)$ is equal to 0. If such a value $N1 > N0$ does not exist, $N1 = N0$. Additionally, $N2$ is the smallest integer value for which the values for bit $(N2+1) \times 8$ to 2007 in the bitmap are all 0. If such a value $N2$ does not exist, that is, when not all bits in the last octet of the traffic indication virtual bitmap are equal to 0, $N2 = 250$. When using this method, the Bitmap Offset subfield contains the value of $(N1 - N0)/2$, and the Length field is $N0 + N2 - N1 + 4$.

NOTE—When $N1 = N0$, Method B reduces to Method A.

For both Method A and Method B, when there are no frames buffered for any BSS corresponding to a transmitted or nontransmitted BSSID supported, the Partial Virtual Bitmap field is encoded as a single octet equal to 0, the Bitmap Offset subfield is 0, and the Length field is 4. When there are no buffered individually addressed frames for any BSS corresponding to a transmitted or nontransmitted BSSID, but there are buffered group addressed frames for one or more of the BSSs, the Partial Virtual Bitmap field consists of the octets number 0 to $N0 - 1$ where $N0$ is the smallest positive integer such that $(N0 \times 8 - 2^n < 8)$. In this case, the Bitmap Offset subfield value contains the number 0, and the Length field is $N0$+3.

8.4.2.8 IBSS Parameter Set element

The IBSS Parameter Set element contains the set of parameters necessary to support an IBSS. The Information field contains the ATIM Window parameter. See Figure 8-88.

	Element ID	Length	ATIM Window
Octets:	1	1	2

Figure 8-88—IBSS Parameter Set element format

The ATIM Window field is 2 octets in length and contains the ATIM Window length in TU.

8.4.2.9 Challenge Text element

The Challenge Text element contains the challenge text within Authentication exchanges. The length of the Information field is dependent upon the authentication algorithm and the transaction sequence number as specified in 11.2.3.2. See Figure 8-89.

	Element ID	Length	Challenge Text
Octets:	1	1	1–253

Figure 8-89—Challenge Text element format

8.4.2.10 Country element

The Country element contains the information required to allow a STA to identify the regulatory domain in which the STA is located and to configure its PHY for operation in that regulatory domain. The format of this element is as shown in Figure 8-90.

These three fields are repeated, as determined by the Length field

	Element ID	Length	Country String	First Channel Number / Operating Extension Identifier	Number of Channels / Operating Class	Maximum Transmit Power Level / Coverage Class	Pad (if needed)
Octets:	1	1	3	1	1	1	0 or 1

Figure 8-90—Country element format

The element ID for this element is set to the value for Country, specified in Table 8-54. The length of the element is variable, as the element may contain more than one triplet comprising the First Channel Number, Number of Channels, and Maximum Transmit Power Level fields and referred to as subband triplets. Alternatively, where dot11OperatingClassesRequired is true and the First Channel Number/Operating Extension Identifier octet has a positive integer value of 201 or greater, then that triplet comprises the Operating Extension Identifier, Operating Class, and Coverage Class fields. Together they are referred to as an operating triplet. The minimum length of the element is 8 octets.

The Country String field of the element is 3 octets in length. The AP and mesh STA set this field to the value contained in the dot11CountryString attribute before transmission in a Beacon or Probe Response frame. Upon reception of this element, a STA sets the value of the dot11CountryString to the value contained in this field.

The First Channel Number/Operating Extension Identifier field is 1 octet in length. If the field has a positive integer value less than 201, then it contains a positive integer value that indicates the lowest channel number in the subband described in this element. The group of channels described by each pair of the First Channel Number and the Number of Channels fields do not have overlapping channel identifiers. [For example, the pairs (2,4) and (5,2) overlap and are not used together.] The First Channel Numbers are monotonically increasing where dot11OperatingClassesRequired is not true.

Where dot11OperatingClassesRequired is true, consecutive subband triplets following an operating triplet have monotonically increasing First Channel Number fields.

The Number of Channels field of the subelement is 1 octet in length.

The Maximum Transmit Power Level field is a signed number and is 1 octet in length. It indicates the maximum power, in dBm, allowed to be transmitted. As the method of measurement for maximum transmit power level differs by regulatory domain, the value in this field is interpreted according to the regulations applicable for the domain identified by the Country String.

An operating class is an index into a set of values for radio equipment sets of rules. The Operating Class field is 1 octet in length.

A coverage class is an index into a set of values for aAirPropagationTime. The Coverage Class field is 1 octet in length.

The Coverage Class field of the operating triplet specifies the aAirPropagationTime characteristic used in BSS operation, as shown in Table 8-56. The characteristic aAirPropagationTime describes variations in actual propagation time that are accounted for in a BSS and, together with maximum transmit power level, allow control of BSS diameter.

Table 8-56—Coverage Class field parameters

32–255	—

The Pad field is 0 or 1 octet in length. The length of the Country element is evenly divisible by 2. The Pad is used to add a single octet to the element if the length is not evenly divisible by 2. The value of the Pad field is 0.

8.4.2.11 Hopping Pattern Parameters element

The mechanisms described in this subclause are obsolete. Consequently, this subclause may be removed in a later revision of the standard.

The Hopping Pattern Parameters element contains the information necessary to allow a STA to calculate the code family using the hyperbolic congruence code (HCC) and extended HCC (EHCC) algorithms. See 9.18.3 for a description of the HCC and EHCC algorithms. The format of this element is as shown in Figure 8-91.

	Element ID	Length	Prime Radix	Number of Channels
Octets:	1	1	1	1

Figure 8-91—Hopping Pattern Parameters element

The Element ID of this element is 8. The length of this element is 4 octets.

The Prime Radix field of this element indicates the value to be used as the prime radix (*N*) in the HCC and EHCC algorithms. The value of this field is a positive integer. The size of this field is 1 octet.

The Number of Channels field of this element indicates the value to be used as the maximum for the family index (*a*) in the HCC and EHCC algorithms. The value of this field is a positive integer and is not less than the prime radix minus 3 (*N*–3). The size of this field is 1 octet.

8.4.2.12 Hopping Pattern Table element

The Hopping Pattern Table element contains the information necessary for an FH implementation to be able to create the hopping sequences necessary to operate in the regulatory domain in which the element was received. The format of the element is as shown in Figure 8-92.

	Element ID	Length	Flag	Number of Sets	Modulus	Offset	Random Table
Octets:	1	1	1	1	1	1	variable

Figure 8-92—Hopping Pattern Table element

The Element ID of this element is set to the value for Hopping Pattern Table, specified in Table 8-54. The element is variable in length. The length of the element is indicated by the Length field.

The Flag field indicates that a Random Table is present when the value is 1. When the flag value is 0, it indicates that a Random Table is not present and that the hop index method is to be used to determine the hopping sequence. The size of this field is 1 octet.

The Number of Sets field indicates the total number of sets within the hopping patterns. The size of this field is 1 octet.

The Modulus and Offset fields indicate the values to be used in the equations to create a hopping sequence from the Random Table information. The size of these fields are each 1 octet.

The Random Table field is a variable-length field. It is a vector of single octet values that indicate the random sequence to be followed during a hopping sequence. The size of the Random Table field is found by subtracting 4 from the value of the Length field of this element.

See 9.18.4.

8.4.2.13 Request element

This element is placed in a Probe Request frame to request that the responding STA include the requested information in the Probe Response frame. The format of the element is as shown in Figure 8-93.

	Element ID	Length	Requested Element IDs
Octets:	1	1	variable

Figure 8-93—Request element

The Element ID of this element is set to the value for Request, specified in Table 8-54. The element is variable in length. The length of the element is indicated in the Length field.

The Requested Element IDs are the list of elements that are requested to be included in the Probe Response frame. The Requested Element IDs are listed in order of increasing element ID.

See 10.1.4.3.2 for additional requirements.

8.4.2.14 ERP element

The ERP element contains information on the presence of Clause 16 or Clause 17 STAs in the BSS that are not capable of Clause 19 (ERP-OFDM) data rates. It also contains the requirement of the ERP element sender (AP in an infrastructure BSS, STA in an IBSS, or mesh STA in an MBSS) as to the use of protection mechanisms to optimize BSS performance and as to the use of long or short Barker preambles. See Figure 8-94 for a definition of the frame element.

The ERP element has the form shown in Figure 8-94. Note that the length of this element is flexible and may be expanded in the future.

	Element ID	Length (1)	ERP Parameters
Octets:	1	1	1

Figure 8-94—ERP element

The ERP Parameters field is defined in Figure 8-95.

	B0	B1	B2	B3 B7
	NonERP_Present	Use_Protection	Barker_Preamble_Mode	Reserved
Bits:	1	1	1	5

Figure 8-95—ERP Parameters field

Recommended behavior for setting the Use_Protection bit is contained in 9.23.

8.4.2.15 Extended Supported Rates element

The Extended Supported Rates element specifies the rates in the OperationalRateSet parameter, as described in the MLME_JOIN.request and MLME_START.request primitives, and zero or more BSS membership selector values that are not carried in the Supported Rates element. The Information field is encoded as 1 to 255 octets where each octet describes a single supported rate or BSS membership selector.

Within Beacon, Probe Response, Association Response, Reassociation Response, Mesh Peering Open, and Mesh Peering Confirm management frames, each supported rate contained in the BSSBasicRateSet parameter, as defined in 6.3.11.2, is encoded as an octet with the MSB (bit 7) set to 1 and bits 6 to 0 are set to the appropriate value from the valid range column of the DATA_RATE row of the table in 6.5.5.2 (e.g., a 1 Mb/s rate contained in the BSSBasicRateSet parameter is encoded as X'82'). Rates not contained in the BSSBasicRateSet parameter are encoded with the MSB set to 0, and bits 6 to 0 are set to the appropriate value from the valid range column of the DATA_RATE row of the table in 6.5.5.2 (e.g., a 2 Mb/s rate not contained in the BSSBasicRateSet parameter is encoded as X'04'). The MSB of each octet in the Extended Supported Rate element in other management frame types is ignored by receiving STAs.

Within Beacon, Probe Response, Association Response, Reassociation Response, Mesh Peering Open, and Mesh Peering Confirm management frames, each BSS membership selector contained in the BSSMembershipSelectorSet parameter is encoded as an octet with the MSB (bit 7) set to 1, and bits 6 to 0 are set to the encoded value for the selector as found in Table 8-55 (e.g., an HT PHY BSS membership selector contained in the BSSMembershipSelectorSet parameter is encoded as X'FF').

The Extended Supported Rates element has the format shown in Figure 8-96.

	Element ID	Length	Extended Supported Rates
Octets:	1	1	1–255

Figure 8-96—Extended Supported Rates element format

See 10.1.4.6

8.4.2.16 Power Constraint element

The Power Constraint element contains the information necessary to allow a STA to determine the local maximum transmit power in the current channel. The format of the Power Constraint element is shown in Figure 8-97.

	Element ID	Length	Local Power Constraint
Octets:	1	1	1

Figure 8-97—Power Constraint element format

The Length field is set to 1.

The field is coded as an unsigned integer in units of decibels. The local maximum transmit power for a channel is thus defined as the maximum transmit power level specified for the channel in the Country element minus the local power constraint specified for the channel (from the MIB) in the Power Constraint element.

The Power Constraint element is included in Beacon frames, as described in 8.3.3.2, and Probe Response frames, as described in 8.3.3.10. The use of Power Constraint elements is described in 10.8.4.

8.4.2.17 Power Capability element

The Power Capability element specifies the minimum and maximum transmit powers with which a STA is capable of transmitting in the current channel. The format of the Power Capability element is shown in Figure 8-98.

	Element ID	Length	Minimum Transmit Power Capability	Maximum Transmit Power Capability
Octets:	1	1	1	1

Figure 8-98—Power Capability element format

The Length field is set to 2.

The Minimum Transmit Power Capability field is set to the nominal minimum transmit power with which the STA is capable of transmitting in the current channel, with a tolerance ± 5 dB. The field is coded as a signed integer in units of decibels relative to 1 mW.

The Maximum Transmit Power Capability field is set to the nominal maximum transmit power with which the STA is capable of transmitting in the current channel, with a tolerance ± 5 dB. The field is coded as a signed integer in units of decibels relative to 1 mW.

The Power Capability element is included in Association Request frames, as described in 8.3.3.5; Reassociation Request frames, as described in 8.3.3.7; and Mesh Peering Open frame, as described in 8.5.16.2.2. The use of Power Capability elements is described in 10.8.2.

8.4.2.18 TPC Request element

The TPC Request element contains a request for a STA to report transmit power and link margin information using a TPC Report element. The format of the TPC Request element is shown in Figure 8-99.

	Element ID	Length
Octets:	1	1

Figure 8-99—TPC Request element format

The Length field is set to 0.

The TPC Request element is included in TPC Request frames, as described in 8.5.2.4. The use of TPC Request elements and frames is described in 10.8.6.

8.4.2.19 TPC Report element

The TPC Report element contains transmit power and link margin information sent in response to a TPC Request element or a Link Measurement Request frame. A TPC Report element is included in a Beacon frame or Probe Response frame without a corresponding request. The format of the TPC Report element is shown in Figure 8-100.

	Element ID	Length	Transmit Power	Link Margin
Octets:	1	1	1	1

Figure 8-100—TPC Report element format

The Length field is set to 2.

The Transmit Power field is set to the transmit power used to transmit the frame containing the TPC Report element. The field is coded as a twos complement signed integer in units of decibels relative to 1 mW. The maximum tolerance for the transmit power value reported in the TPC Response element is ± 5 dB. This tolerance is defined as the difference, in decibels, between the reported power value and the actual EIRP of the STA (when transmitting 1500 octet frames or maximum MPDU sized-frames, whichever is smaller).

The Link Margin field contains the link margin for the receive time and for the receive rate of the frame containing the TPC Request element or the Link Measurement Request frame. The field is coded as a twos complement signed integer in units of decibels. The Link Margin field is reserved when a TPC Report element is included in a Beacon frame or Probe Response frame. The measurement method of Link Margin is beyond the scope of this standard.

The TPC Report element is included in TPC Report frames, as described in 8.5.2.5; Link Measurement Report frames, as described in 8.5.7.5; Beacon frames, as described in 8.3.3.2; and Probe Response frames, as described in 8.3.3.10. The use of TPC Report elements and frames is described in 10.8.6.

8.4.2.20 Supported Channels element

The Supported Channels element contains a list of channel subbands (from those channels defined in 18.3.8.4.3) in which a STA is capable of operating. The format of the Supported Channels element is shown in Figure 8-101.

			One (first channel, number of channels) tuple for each subband	
	Element ID	Length	First Channel Number	Number of Channels
Octets:	1	1	1	1

Figure 8-101—Supported Channels element format

The Length field is variable and depends on the number of subbands, defined by a First Channel Number–Number of Channels pair, that are included in the element.

The First Channel Number field is set to the first channel (as defined in 18.3.8.4.3) in a subband of supported channels.

The Number of Channels field is set to the number of channels in a subband of supported channels.

The Supported Channels element is included in Association Request frames, as described in 8.3.3.5; Reassociation Request frames, as described in 8.3.3.7; and Mesh Peering Open frame, as described in 8.5.16.2.2. The use of the Supported Channels element is described in 10.9.2 and 10.9.8.

8.4.2.21 Channel Switch Announcement element

The Channel Switch Announcement element is used by an AP in a BSS, a STA in an IBSS, or a mesh STA in an MBSS to advertise when it is changing to a new channel and the channel number of the new channel. The format of the Channel Switch Announcement element is shown in Figure 8-102.

	Element ID	Length	Channel Switch Mode	New Channel Number	Channel Switch Count
Octets:	1	1	1	1	1

Figure 8-102—Channel Switch Announcement element format

The Length field is set to 3.

The Channel Switch Mode field indicates any restrictions on transmission until a channel switch. An AP in a BSS or a STA in an IBSS sets the Channel Switch Mode field to either 0 or 1 on transmission. In an MBSS, the Channel Switch Mode Field is reserved. See 10.9.9.

The New Channel Number field is set to the number of the channel to which the STA is moving (as defined in 18.3.8.4.3).

For nonmesh STAs, the Channel Switch Count field either is set to the number of TBTTs until the STA sending the Channel Switch Announcement element switches to the new channel or is set to 0. A value of 1 indicates that the switch occurs immediately before the next TBTT. A value of 0 indicates that the switch occurs at any time after the frame containing the element is transmitted.

For mesh STAs, the Channel Switch Count field is encoded as an octet with bits 6 to 0 set to the time, in units of 2 TU when the MSB (bit 7) is 0, or in units of 100 TU when the MSB (bit 7) is 1, until the mesh STA sending the Channel Switch Announcement element switches to the new channel. A value of 0 for bits 6 to 0 indicates that the switch occurs at any time after the frame containing the element is transmitted. For example, a 200 TU channel switch time is encoded as X'82' and a 10 TU channel switch time is encoded as X'05'.

The Channel Switch Announcement element is included in Channel Switch Announcement frames, as described in 8.5.2.6, and may be included in Beacon frames, as described in 8.3.3.2, and Probe Response frames, as described in 8.3.3.10. The use of Channel Switch Announcement elements and frames is described in 10.9.8.

8.4.2.22 Secondary Channel Offset element

The Secondary Channel Offset element is used by an AP in a BSS, a STA in an IBSS, or a mesh STA in an MBSS together with the Channel Switch Announcement element when changing to a new 40 MHz channel. The format of the Secondary Channel Offset element is shown in Figure 8-103.

The Secondary Channel Offset element is included in Channel Switch Announcement frames, as described in 8.5.2.6.

	Element ID	Length (=1)	Secondary Channel Offset
Octets:	1	1	1

Figure 8-103—Secondary Channel Offset element format

The Secondary Channel Offset field of the Secondary Channel Offset element represents the position of the secondary channel relative to the primary channel. The values of the Secondary Channel Offset field are defined in Table 8-57.

Table 8-57—Values of the Secondary Channel Offset field

Value	Name	Description
0	SCN - no secondary channel	Indicates that no secondary channel is present.
1	SCA - secondary channel above	Indicates that the secondary channel is above the primary channel.
2		Reserved.
3	SCB - secondary channel below	Indicates that the secondary channel is below the primary channel.
4–255		Reserved.

8.4.2.23 Measurement Request element

8.4.2.23.1 General

The Measurement Request element contains a request that the receiving STA undertake the specified measurement action. The Measurement Request element is included in Spectrum Management Measurement Request frames, as described in 8.5.2.2, or Radio Measurement Request frames, as described in 8.5.7.2. Measurement Types 0, 1, and 2 are defined for spectrum management and are included only in Spectrum Management Measurement Request frames. The use of Measurement Request elements for spectrum management is described in 10.9.7. Measurement Types 3 to 9 and 255 are defined for radio measurement and are included only in Radio Measurement Request frames. The use of Measurement Request elements for radio measurement is described in 10.11.

The format of the Measurement Request element is shown in Figure 8-104.

	Element ID	Length	Measurement Token	Measurement Request Mode (see Figure 8-105)	Measurement Type	Measurement Request
Octets:	1	1	1	1	1	variable

Figure 8-104—Measurement Request element format

	B0	B1	B2	B3	B4	B5 B7
	Parallel	Enable	Request	Report	Duration Mandatory	Reserved
Bits:	1	1	1	1	1	3

Figure 8-105—Measurement Request Mode field

The value of the Length field in octets is variable and depends on the length of the Measurement Request field. The minimum value of the Length field is 3 (based on a minimum length for the Measurement Request field of 0 octets).

The Measurement Token is set to a nonzero number that is unique among the Measurement Request elements in a particular Measurement Request frame.

The Measurement Request Mode field (shown in Figure 8-105) is a bit field with the following bits defined:

- The Parallel bit (bit 0) is used to request that more than one measurement is to be started in parallel. Parallel is set to 1 to request that the measurement is to start at the same time as the measurement described by the next Measurement Request element in the same Measurement Request frame. Parallel is set to 0 if the measurements are to be performed in sequence. The Parallel bit is reserved when Enable is 1, in the last or only measurement request element in the frame, or when the value of the Measurement Type field is 0, 1, or 2 (spectrum management measurements). See 10.11.6.
- The Enable bit (bit 1) is used to differentiate between a request to make a measurement and a request to control the measurement requests and triggered or autonomous reports generated by the destination STA. The Enable bit is further described in Table 8-58.
- Request bit (bit 2) is described in Table 8-58.
- Report bit (bit 3) is described in Table 8-58.
- The Duration Mandatory bit (bit 4) indicates whether the measurement duration contained within the Measurement Request is interpreted as mandatory by the STA receiving the request. A value of 0 indicates that the duration requested is a maximum duration, and the requesting STA accepts measurement results taken over any shorter duration. A value of 1 indicates that the duration requested is a mandatory duration. The Duration Mandatory bit is reserved when the Enable bit is 1, or when the value of the Measurement Type field is 0, 1, 2, 8, or 255. See 10.11.4.
- All other bits are reserved.

The use of the Enable, Request, and Report bits is summarized in Table 8-58. See 10.9.7 and 10.11.6 for the description of how a STA handles requests to enable or disable measurement requests and autonomous reports. See 10.11.8 for a description of the use of the Enable and Report bits in triggered reporting.

Table 8-58—Summary of use of Enable, Request, and Report bits

Bits			Meaning of bits
Enable	Request	Report	
0	Reserved	Reserved	The transmitting STA is requesting that the destination STA make a Measurement of type indicated in the Measurement Type field. When Enable bit is 0, Request and Report bits are reserved.
1	0	0	The transmitting STA is requesting that the destination STA not send any measurement requests or reports of the type indicated in the Measurement Type field.
1	1	0	The transmitting STA is indicating to the destination STA that it can accept measurement requests and is requesting the destination STA not send autonomous or triggered measurement reports of the type indicated in the Measurement Type field. NOTE—This setting corresponds to the default STA behavior.
1	0	1	The transmitting STA is requesting that the destination STA not send measurement requests and indicating it accepts autonomous or triggered measurement reports of the type indicated in the Measurement Type field.
1	1	1	The transmitting STA is indicating to the destination STA that it can accept measurement requests and can accept autonomous or triggered measurement reports of the type indicated in the Measurement Type field.

The Measurement Type field is set to a number that identifies a type of measurement request or measurement report. The Measurement Types that have been allocated for measurement requests are shown in Table 8-59 and measurement reports are shown in Table 8-81 (in 8.4.2.24).

Table 8-59—Measurement Type definitions for measurement requests

Name	Measurement Type	Measurement Use
Basic request	0	Spectrum Management
Clear channel assessment (CCA) request	1	
Receive power indication (RPI) histogram request	2	
Channel load request	3	Radio Measurement
Noise histogram request	4	
Beacon request	5	
Frame request	6	
STA statistics request	7	Radio Measurement and WNM
LCI request	8	Radio Measurement and WNM
Transmit stream/category measurement request	9	Radio Measurement
Multicast diagnostics request	10	WNM
Location Civic request	11	Radio Measurement and WNM
Location Identifier request	12	Radio Measurement and WNM
Reserved	13–254	N/A
Measurement pause request	255	Radio Measurement

When the Enable bit is 0, the Measurement Request field contains the specification of a single measurement request corresponding to the Measurement Type, as described in 8.4.2.23.2 to 8.4.2.23.12. When the Enable bit is 1, the Measurement Request field is present only when requesting a triggered measurement.

8.4.2.23.2 Basic request

A Measurement Type in the Measurement Request element may indicate a basic request. The Measurement Request field corresponding to a basic request is shown in Figure 8-106. See 10.9.7.

	Channel Number	Measurement Start Time	Measurement Duration
Octets:	1	8	2

Figure 8-106—Measurement Request field format for a basic request

The Channel Number field is set to the channel number for which the measurement request applies (as defined in 18.3.8.4.3).

The Measurement Start Time field is set to the TSF timer at the time (± 32 µs) at which the requested basic request measurement starts. A value of 0 indicates it starts immediately.

The Measurement Duration field is set to the duration of the requested measurement, expressed in TUs.

8.4.2.23.3 CCA request

A Measurement Type in the Measurement Request element may indicate a CCA request. A response to a CCA request is a CCA report. It is optional for a STA to generate a CCA report in response to a CCA Request. The Measurement Request field corresponding to a CCA request is shown in Figure 8-107.

	Channel Number	Measurement Start Time	Measurement Duration
Octets:	1	8	2

Figure 8-107—Measurement Request field format for a CCA request

The Channel Number field is set to the channel number for which the measurement request applies (as defined in 18.3.8.4.3).

The Measurement Start Time field is set to the TSF at the time (± 32 µs) at which the requested CCA request measurement starts. A value of 0 indicates it starts immediately.

The Measurement Duration field is set to the duration of the requested measurement, expressed in TUs.

8.4.2.23.4 RPI histogram request

A Measurement Type in the Measurement Request element may indicate an RPI histogram request. A response to an RPI histogram request is an RPI histogram report. It is optional for a STA to generate a RPI histogram report in response to a RPI histogram request. The Measurement Request field corresponding to an RPI histogram request is shown in Figure 8-108.

	Channel Number	Measurement Start Time	Measurement Duration
Octets:	1	8	2

Figure 8-108—Measurement Request field format for a RPI histogram request

The Channel Number field is set to the channel number for which the measurement request applies (as defined in 18.3.8.4.3).

The Measurement Start Time field is set to the TSF at the time (± 32 µs) at which the requested RPI histogram request measurement starts. A value of 0 indicates it starts immediately.

The Measurement Duration field is set to the duration of the requested measurement, expressed in TUs.

8.4.2.23.5 Channel Load Request

The Measurement Request field corresponding to a Channel Load Request is shown in Figure 8-109.

	Operating Class	Channel Number	Randomization Interval	Measurement Duration	Optional Subelements
Octets:	1	1	2	2	variable

Figure 8-109—Measurement Request field format for Channel Load Request

Operating Class indicates the channel set for which the measurement request applies. Country, Operating Class, and Channel Number together specify the channel frequency and spacing for which the measurement request applies. Valid values of Operating Class are shown in Annex E.

Channel Number indicates the channel number for which the measurement request applies. Channel Number is defined within an Operating Class as shown in Annex E.

Randomization Interval specifies the upper bound of the random delay to be used prior to making the measurement, expressed in units of TUs. See 10.11.3.

The Measurement Duration field is set to the preferred or mandatory duration of the requested measurement, expressed in units of TUs. See 10.11.4.

The Optional Subelements field format contains zero or more subelements, each consisting of a 1-octet Subelement ID field, a 1-octet Length field, and a variable-length Data field, as shown in Figure 8-402. Any optional subelements are ordered by nondecreasing subelement ID.

The Subelement ID field values for the defined optional subelements are shown in Table 8-60. A Yes in the Extensible column of a subelement listed in Table 8-60 indicates that the Length of the subelement might be extended in future revisions or amendments of this standard. When the Extensible column of an element is equal to Subelements, then the subelement might be extended in future revisions or amendments of this standard by defining additional subelements within the subelement. See 9.24.9.

Table 8-60—Optional subelement IDs for Channel Load Request

Subelement ID	Name	Length field (octets)	Extensible
0	Reserved		
1	Channel Load Reporting Information	2	Yes
2–220	Reserved		
221	Vendor Specific	1 to 244	
222–255	Reserved		

The Channel Load Reporting Information subelement indicates the condition for issuing a Channel Load Report. Channel Load Reporting Information subelement data field format is shown in Figure 8-110 and contains a 1-octet Reporting Condition subfield and a 1-octet Channel Load Reference Value subfield. The Reporting Condition is described in Table 8-61. The Channel Load Reference value is a Channel Load value as defined in 10.11.9.3 and is the reference value for the indicated Reporting Condition.

	Reporting Condition	Channel Load Reference Value
Octets:	1	1

Figure 8-110—Channel Load Reporting Information data field format

Table 8-61—Reporting Condition for Channel Load Report

Condition for report to be issued	Reporting Condition
Report to be issued after each measurement (default, used when Channel Load Reporting Information subelement is not included in Channel Load Request).	0
Report to be issued when measured Channel Load is equal to or greater than the reference value.	1
Report to be issued when measured Channel Load is equal to or less than the reference value.	2
Reserved	3–255

The Vendor Specific subelements have the same format as their corresponding elements (see 8.4.2.28). Multiple Vendor Specific subelements might be included in the list of optional subelements.

8.4.2.23.6 Noise Histogram Request

The Measurement Request field corresponding to a Noise Histogram Request is shown in Figure 8-111.

	Operating Class	Channel Number	Randomization Interval	Measurement Duration	Optional Subelements
Octets:	1	1	2	2	variable

Figure 8-111—Measurement Request field format for Noise Histogram Request

Operating Class indicates the channel set for which the measurement request applies. Country, Operating Class, and Channel Number together specify the channel frequency and spacing for which the measurement request applies. Valid values of Operating Class are shown in Annex E.

Channel Number indicates the channel number for which the measurement request applies. Channel Number is defined within an Operating Class as shown in Annex E.

Randomization Interval specifies the upper bound of the random delay to be used prior to making the measurement, expressed in units of TUs. See 10.11.3.

The Measurement Duration field is set to the preferred or mandatory duration of the requested measurement, expressed in units of TUs. See 10.11.4.

The Optional Subelements field format contains zero or more subelements, each consisting of a 1-octet Subelement ID field, a 1-octet Length field, and a variable-length Data field, as shown in Figure 8-402. Any optional subelements are ordered by nondecreasing subelement ID.

The Subelement ID field values for the defined optional subelements are shown in Table 8-62. A Yes in the Extensible column of a subelement listed in Table 8-62 indicates that the Length of the subelement might be extended in future revisions or amendments of this standard. When the Extensible column of an element is equal to Subelements, then the subelement might be extended in future revisions or amendments of this standard by defining additional subelements within the subelement. See 9.24.9.

Table 8-62—Optional subelement IDs for Noise Histogram Request

Subelement ID	Name	Length field (octets)	Extensible
0	Reserved		
1	Noise Histogram Reporting Information	2	Yes
2–220	Reserved		
221	Vendor Specific	1 to 244	
222–255	Reserved		

The Noise Histogram Reporting Information subelement indicates the condition for issuing a Noise Histogram Report. The Noise Histogram Reporting Information subelement data field format is shown in Figure 8-112 and contains a 1-octet Reporting Condition subfield and a 1-octet ANPI Reference Value subfield. The Reporting Condition is described in Table 8-63. The ANPI Reference Value is an ANPI value as defined in 10.11.9.4 and is the reference value for the indicated Reporting Condition.

	Reporting Condition	ANPI Reference Value
Octets:	1	1

Figure 8-112—Noise Histogram Reporting Information data field format

The Vendor Specific subelements have the same format as their corresponding elements (see 8.4.2.28). Multiple Vendor Specific subelements might be included in the list of optional subelements.

Table 8-63—Reporting Condition for Noise Histogram Report

Condition for report to be issued	Reporting Condition
Report to be issued after each measurement (default, used when Noise Histogram Reporting Information subelement is not included in Noise Histogram Request).	0
Noise Histogram Report to be issued when measured ANPI is equal to or greater than the reference value.	1
Noise Histogram Report to be issued when measured ANPI is equal to or less than the reference value.	2
Reserved	3–255

8.4.2.23.7 Beacon Request

The Measurement Request field corresponding to a Beacon Request is shown in Figure 8-113.

	Operating Class	Channel Number	Randomization Interval	Measurement Duration
Octets:	1	1	2	2

	Measurement Mode	BSSID	Optional Subelements
Octets:	1	6	variable

Figure 8-113—Measurement Request field format for Beacon Request

Operating Class indicates the channel set for which the measurement request applies. Country, Operating Class, and Channel Number together specify the channel frequency and spacing for which the measurement request applies. Valid values of Operating Class are shown in Annex E.

Channel Number indicates the channel number for which the measurement request applies. Channel Number is defined within an Operating Class as shown in Annex E. A Channel Number of 0 indicates a request to make iterative measurements for all supported channels in the Operating Class where the measurement is permitted on the channel and the channel is valid for the current regulatory domain. A Channel Number of 255 indicates a request to make iterative measurements for all supported channels in the current Operating Class listed in the latest AP Channel Report received from the serving AP. The procedures for iterative measurements on multiple channels are described in 10.11.9.1.

Randomization Interval specifies the upper bound of the random delay to be used prior to making the measurement, expressed in units of TUs. See 10.11.3.

The Measurement Duration field is set to the preferred or mandatory duration of the requested measurement, expressed in units of TUs. See 10.11.4.

Measurement Mode indicates the mode to be used for the measurement. The valid measurement modes are listed in Table 8-64. The procedures for each mode are described in 10.11.9.1.

Table 8-64—Measurement Mode definitions for Beacon Request element

Mode	Value
Passive	0
Active	1
Beacon Table	2
Reserved	3–255

The BSSID field indicates the BSSID of the BSS(s) for which a beacon report is requested. When requesting beacon reports for all BSSs on the channel, the BSSID field contains the wildcard BSSID; otherwise the BSSID field contains a specific BSSID for a single BSS.

The Optional Subelements field format contains zero or more subelements, each consisting of a 1-octet Subelement ID field, a 1-octet Length field, and a variable-length Data field, as shown in Figure 8-402. Any optional subelements are ordered by nondecreasing subelement ID.

The Subelement ID field values for the defined optional subelements are shown in Table 8-65. A Yes in the Extensible column of a subelement listed in Table 8-65 indicates that the Length of the subelement might be extended in future revisions or amendments of this standard. When the Extensible column of an element is equal to Subelements, then the subelement might be extended in future revisions or amendments of this standard by defining additional subelements within the subelement. See 9.24.9.

Table 8-65—Optional subelement IDs for Beacon Request

Subelement ID	Name	Length field (octets)	Extensible
0	SSID	0 to 32	
1	Beacon Reporting Information	2	Yes
2	Reporting Detail	1	Yes
3–9	Reserved		
10	Request	0 to 237	
11–50	Reserved		
51	AP Channel Report	1 to 237	
52–220	Reserved		
221	Vendor Specific	1 to 237	
222–255	Reserved		

The SSID subelement indicates the ESS(s) or IBSS(s) for which a beacon report is requested. When SSID is not included in a Beacon Request, the default “wildcard SSID” is used; otherwise the SSID is included in the Beacon Request and contains a specific SSID for a single ESS or IBSS. The wildcard SSID is used to represent all possible SSIDs. The SSID element is described in 8.4.2.2.

The Beacon Reporting Information subelement indicates the condition for issuing a Beacon Report. The Beacon Reporting Information subelement may be included in a Beacon Request only for repeated measurements. The Beacon Reporting Information subelement data field format is shown in Figure 8-114 and contains a 1-octet Reporting Condition subfield and a 1-octet Threshold/Offset Reference Value subfield. The Reporting Condition is described in Table 8-66. The Threshold/Offset Reference Value provides either the threshold value or the offset value to be used for conditional reporting. For Reporting Conditions 1 and 2, the threshold value is a logarithmic function of the received signal power, as defined in the RCPI measurement subclause for the associated PHY Type. For Reporting Conditions 3 and 4, the threshold value is a logarithmic function of the signal-to-noise ratio, as described in 8.4.2.43. For Reporting Conditions 5 to 10, the offset value is an 8-bit two’s complement integer in units of 0.5 dBm. The indicated Reporting Condition applies individually to each measured Beacon, Measurement Pilot, or Probe Response. Reporting Conditions are further described in 10.11.9.1.

	Reporting Condition	Threshold/Offset Reference Value
Octets:	1	1

Figure 8-114—Beacon Reporting Information data field format

Table 8-66—Reporting Condition for Beacon Report

Condition for report to be issued in Repeated Measurement	Reporting Condition
Report to be issued after each measurement (default, used when Beacon Reporting Information subelement is not included in Beacon Request).	0
The measured RCPI level is greater than the threshold indicated in the Threshold/ Offset Reference Value.	1
The measured RCPI level is less the threshold indicated in the Threshold/Offset Reference Value.	2
The measured RSNI level is greater than the threshold indicated in the Threshold/ Offset Reference Value.	3
The measured RSNI level is less than the threshold indicated in the Threshold/Offset Reference Value.	4
The measured RCPI level is greater than a threshold defined by an offset from the serving AP’s reference RCPI, where the offset is indicated in the Threshold/Offset Reference Value.	5
The measured RCPI level is less than a threshold defined by an offset from the serving AP’s reference RCPI, where the offset is indicated in the Threshold/Offset Reference Value.	6
The measured RSNI level is greater than a threshold defined by an offset from the serving AP’s reference RSNI, where the offset is indicated in the Threshold/Offset Reference Value.	7
The measured RSNI level is less than a threshold defined by an offset from the serving AP’s reference RSNI, where the offset is indicated in the Threshold/Offset Reference Value.	8
The measured RCPI level is in a range bound by the serving AP’s reference RCPI and an offset from the serving AP’s reference RCPI, where the offset is indicated in the Threshold/Offset Reference Value.	9
The measured RSNI level is in a range bound by the serving AP’s reference RSNI and an offset from the serving AP’s reference RSNI, where the offset is indicated in the Threshold/Offset Reference Value.	10
Reserved	11–255

The Reporting Detail subelement contains a 1-octet Reporting Detail data field that defines the level of detail per AP to be reported to the requesting STA. The Reporting Detail values are defined in Table 8-67.

Table 8-67—Reporting Detail values

Level of detail requested	Reporting Detail
No fixed-length fields or elements	0
All fixed-length fields and any requested elements in the Request element if present	1
All fixed-length fields and elements (default, used when Reporting Detail subelement is not included in Beacon Request)	2
Reserved	3–255

The indicated Reporting Detail applies individually to each measured Beacon, Measurement Pilot, or Probe Response. If the Reporting Detail equals 1, a Request element is optionally present in the optional subelements field. If included, the Request element lists the Element IDs of the elements requested to be reported in the Reported Frame Body of the Beacon Report.

The Request, AP Channel Report, and Vendor Specific subelements have the same format as their corresponding elements (see 8.4.2.13, 8.4.2.38, and 8.4.2.28, respectively). Multiple AP Channel Report and Vendor Specific subelements can be included in the list of optional subelements.

If one or more AP Channel Report elements are included, they indicate that iterative measurements are requested first on the channel(s) indicated by the Operating Class and Channel Number fields included in the Beacon Request, and second on the channel(s) indicated by the Operating Class and Channel List fields of each AP Channel Report element included in the Beacon Request. The procedures for iterative measurements on multiple channels are described in 10.11.9.1.

8.4.2.23.8 Frame request

The Measurement Request field corresponding to a frame request is shown Figure 8-115.

	Operating Class	Channel Number	Randomization Interval	Measurement Duration	Frame Request Type	MAC Address	Optional subelements
Octets:	1	1	2	2	1	6	variable

Figure 8-115—Measurement Request field format for frame request

Operating Class indicates the channel set for which the measurement request applies. Country, Operating Class, and Channel Number together specify the channel frequency and spacing for which the measurement request applies. Valid values of Operating Class are shown in Annex E.

Channel Number indicates the channel number for which the measurement request applies. Channel Number is defined within an Operating Class as shown in Annex E.

Randomization Interval specifies the upper bound of the random delay to be used prior to making the measurement, expressed in units of TUs. See 10.11.3.

The Measurement Duration field is set to the preferred or mandatory duration of the requested measurement, expressed in units of TUs. See 10.11.4.

The Frame Request Type indicates which subelements are requested in the Frame Report. The value of 1 signifies that a Frame Count Report is requested. The values 0 and 2 to 255 are reserved.

If the MAC Address field is the broadcast address, then all frames are counted towards the Frame Report generated in response to this frame request. For other MAC addresses, only frames matching this MAC address as the Transmitter Address are counted towards the Frame Report generated in response to this frame request.

The Optional Subelements field format contains zero or more subelements, each consisting of a 1-octet Subelement ID field, a 1-octet Length field, and a variable-length Data field, as shown in Figure 8-402. Any optional subelements are ordered by nondecreasing subelement ID.

The Subelement ID field values for the defined optional subelements are shown in Table 8-68. A Yes in the Extensible column of a subelement listed in Table 8-68 indicates that the Length of the subelement might be extended in future revisions or amendments of this standard. When the Extensible column of an element is equal to Subelements, then the subelement might be extended in future revisions or amendments of this standard by defining additional subelements within the subelement. See 9.24.9.

The Vendor Specific subelements have the same format as their corresponding elements (see 8.4.2.28). Multiple Vendor Specific subelements are optionally present in the list of optional subelements.

Table 8-68—Optional subelement IDs for frame request

Subelement ID	Name	Length field (octets)	Extensible
0–220	Reserved		
221	Vendor Specific	1 to 237	
222–255	Reserved		

8.4.2.23.9 STA Statistics Request

The Measurement Request field corresponding to a STA Statistics Request is shown in Figure 8-116.

	Peer MAC Address	Randomization Interval	Measurement Duration	Group Identity	Optional Subelements
Octets:	6	2	2	1	variable

Figure 8-116—Measurement Request field format for STA Statistics Request

The Peer MAC Address field is the RA or TA MAC address for the frame statistics of this measurement.

Randomization Interval specifies the upper bound of the random delay to be used prior to making the measurement, expressed in units of TUs. See 10.11.3.

The Measurement Duration field is set to the duration of the requested measurement in TUs except when triggered reporting is used. When triggered reporting is used, the measurement duration is 0.

Group Identity indicates the requested statistics group according to Table 8-69.

Table 8-69—Group Identity for a STA Statistics Request

Statistics Group Name	Group Identity
STA Counters from dot11CountersTable	0
STA Counters from dot11MacStatistics group	1
QoS STA Counters for UP0 from dot11QosCountersTable	2
QoS STA Counters for UP1 from dot11QosCountersTable	3
QoS STA Counters for UP2 from dot11QosCountersTable	4
QoS STA Counters for UP3 from dot11QosCountersTable	5
QoS STA Counters for UP4 from dot11QosCountersTable	6
QoS STA Counters for UP5 from dot11QosCountersTable	7
QoS STA Counters for UP6 from dot11QosCountersTable	8
QoS STA Counters for UP7 from dot11QosCountersTable	9
BSS Average Access Delays as described in 8.4.2.41 and 8.4.2.46	10
STA Counters from dot11CountersGroup3 (A-MSDU)	11
STA Counters from dot11CountersGroup3 (A-MPDU)	12
STA Counters from dot11CountersGroup3 (BlockAckReq, Channel Width, PSMP)	13
STA Counters from dot11CountersGroup3 (RD, dual CTS, L-SIG TXOP protection)	14
STA Counters from dot11CountersGroup3 (beamforming and STBC)	15
RSNA Counters	16
Reserved	17–255

The Optional Subelements field format contains zero or more subelements, each consisting of a 1-octet Subelement ID field, a 1-octet Length field, and a variable-length Data field, as shown in Figure 8-402. Any optional subelements are ordered by nondecreasing subelement ID.

The Subelement ID field values for the defined optional subelements are shown in Table 8-70. A Yes in the Extensible column of a subelement listed in Table 8-70 indicates that the Length of the subelement might be extended in future revisions or amendments of this standard. When the Extensible column of an element is equal to Subelements, then the subelement might be extended in future revisions or amendments of this standard by defining additional subelements within the subelement. See 9.24.9.

Table 8-70—Optional subelement IDs for STA Statistics Request

Subelement ID	Name	Length field (octets)	Extensible
0	Reserved		
1	Triggered Reporting	variable	
2–220	Reserved		
221	Vendor Specific	1 to 239	
222–255	Reserved		

The Triggered Reporting subelement is used to specify trigger conditions and thresholds for triggered STA Statistics measurements. It is present when setting up triggered reporting from STA Counters, QoS STA Counters, or RSNA Counters; see 10.11.9.5.

The format of the Triggered Reporting subelement for STA Counters is shown in Figure 8-117. The fields marked as optional are only present if the appropriate bit in the STA Counter Trigger Condition field is 1.

	Measurement Count	Trigger Timeout	STA Counter Trigger Condition	dot11FailedCount Threshold (optional)	dot11FCS ErrorCount Threshold (optional)
Octets:	4	2	2	0 or 4	0 or 4

	dot11Multiple RetryCount Threshold (optional)	dot11Frame DuplicateCount Threshold (optional)	dot11RTS FailureCount Threshold (optional)	dot11ACK FailureCount Threshold (optional)	dot11RetryCount Threshold (optional)
Octets:	0 or 4	0 or 4	0 or 4	0 or 4	0 or 4

Figure 8-117—Triggered Reporting subelement for STA Counters

The value in the Measurement Count field specifies the number of MSDUs or MPDUs transmitted and/or received by the STA that are to be used to determine if one or more of the trigger conditions have been met.

The Trigger Timeout field contains a value in units of 100 TUs during which a measuring STA does not generate further triggered STA Statistics Reports after a trigger condition has been met.

The STA Counter Trigger Condition field specifies trigger values used when requesting triggered STA Statistics reporting. The format of the STA Counter Trigger Condition field is shown in Figure 8-118.

	B0	B1	B2	B3
	dot11FailedCount	dot11FCSError Count	dot11Multiple RetryCount	dot11Frame DuplicateCount
Bits	1	1	1	1

	B4	B5	B6	B7 B15
	dot11RTS FailureCount	dot11ACK FailureCount	dot11RetryCount	Reserved
Bits	1	1	1	9

Figure 8-118—STA Counter Trigger Condition field

For each bit in the STA Counter Trigger Condition field that is 1, a corresponding threshold value exists (defined in Figure 8-117) in the Triggered Reporting subelement for STA Counters. With this, the STA Statistics Request indicates that a STA Statistics Report be generated when the corresponding STA counter defined in 8-154 and 8-155 (in 8.4.2.24.9) exceeds the value of the specified threshold, within the total number of MSDUs or MPDUs indicated in the Measurement Count field. See 10.11.9.5. One or more trigger conditions are set with specified thresholds. In the triggered STA Statistics request, the value of the Group Identity field is either 0 or 1. When the Group Identity field value of the triggered STA Statistics request is 0, B2–B6 in the STA Counter Trigger Condition field are set to 0. When the group identity of the triggered STA Statistics request is 1, B0 and B1 in the STA Counter Trigger Condition field are set to 0.

The format of the Triggered Reporting subelement for QoS STA Counters is shown in Figure 8-119. The fields marked as optional are only present if the appropriate bit in the QoS STA Counter Trigger Condition is 1.

	Measurement Count	Trigger Timeout	QoS STA Counter Trigger Condition	dot11QoSFailed Count Threshold (optional)	dot11QoSRetry Count Threshold (optional)
Octets:	4	2	2	0 or 4	0 or 4

	dot11QoSMultiple RetryCount Threshold (optional)	dot11QoSFrame DuplicateCount Threshold (optional)	dot11QoSRTSC ount Failure Threshold (optional)	dot11QoSACK FailureCount Threshold (optional)	dot11QoSDisca rdedCount Threshold (optional)
Octets:	0 or 4	0 or 4	0 or 4	0 or 4	0 or 4

Figure 8-119—Triggered Reporting subelement for QoS STA Counters

The UP of the QoS STA Counters for triggered QoS Statistics measurement is determined by the group identity of the measurement request field for a STA Statistics Request frame as defined in 8-69.

The value in the Measurement Count field specifies the number of MSDUs or MPDUs transmitted and/or received by the STAs that are to be used to determine if one or more of the trigger conditions have been met.

The Trigger Timeout field contains a value in units of 100 TUs during which a measuring STA does not generate further triggered STA Statistics Reports after a trigger condition has been met.

The QoS STA Counter Trigger Condition field specifies reporting triggers when requesting triggered STA Statistics reporting. The format of the QoS STA Counter Trigger Condition field is shown in Figure 8-120.

	B0	B1	B2	B3
	dot11QoS FailedCount	dot11QoS RetryCount	dot11QoSMultiple RetryCount	dot11QoSFrame DuplicateCount
Bits:	1	1	1	1

	B4	B5	B6	B7-B15
	dot11QoSRTS FailureCount	dot11QoSACK FailureCount	dot11QoS DiscardedCount	Reserved
Bits:	1	1	1	9

Figure 8-120—QoS STA Counter Trigger Condition field

For each bit in the QoS STA Counter Trigger Condition field that is 1, a corresponding threshold value exists (defined in Figure 8-119) in the Triggered Reporting subelement for QoS STA Counters. With this, the STA Statistics Request indicates that a STA Statistics Report be generated when the corresponding QoS STA counter defined in Figure 8-156 (in 8.4.2.24.9) exceeds the value of the specified threshold, within the total number of MSDUs or MPDUs indicated in the Measurement Count field. See 10.11.9.5. One or more trigger conditions are set with specified thresholds.

The format of the Triggered Reporting subelement for RSNA Counters is shown in Figure 8-121. The fields marked as optional are only present if the appropriate bit in the RSNA Trigger Condition is 1.

	Measurement Count	Trigger Timeout	RSNA Counter Trigger Condition	dot11RSNAStats CMACICVErrors Threshold (optional)	dot11RSNA StatsCMACReplays Threshold (optional)
Octets:	4	2	2	0 or 4	0 or 4

	dot11RSNA StatsRobustMgmt CCMPReplays Threshold (optional)	dot11RSNAStats TKIPICVErrors Threshold (optional)	dot11RSNAStats TKIPReplays Threshold (optional)	dot11RSNAStats CCMPDecryptErrors Threshold (optional)	dot11RSNAStats CCMPReplays Threshold (optional)
Octets:	0 or 4	0 or 4	0 or 4	0 or 4	0 or 4

Figure 8-121—Triggered Reporting subelement for RSNA Counters

The value in the Measurement Count field specifies the number of MPDUs transmitted and/or received by the STA that are to be used to determine if one or more of the trigger conditions have been met.

The Trigger Timeout field contains a value in units of 100 TUs during which a measuring STA does not generate further triggered STA Statistics Reports after a trigger condition has been met.

The RSNA Counter Trigger Condition field specifies reporting triggers when requesting triggered STA Statistics reporting. The format of the RSNA Trigger Condition field is shown in Figure 8-122.

	B0	B1	B2	B3
	dot11RSNAStats CMACICVErrors	dot11RSNA StatsCMACReplays	dot11RSNAStats RobustMgmt CCMPReplays	dot11RSNAStats TKIPICVErrors
Bits:	1	1	1	1

	B4	B5	B6	B7 B15
	dot11RSNAStats TKIPReplays	dot11RSNAStats CCMPDecryptErrors	dot11RSNAStats CCMPReplays	Reserved
Bits:	1	1	1	9

Figure 8-122—RSNA Trigger Condition field

For each bit in the RSNA Trigger Condition field that is 1, a corresponding threshold value exists (defined in Figure 8-121) in the Triggered Reporting subelement for RSNA Counters. With this, the STA Statistics Request indicates that a STA Statistics Report be generated when the corresponding RSNA counter defined in Figure 8-158 (in 8.4.2.24.9) exceeds the value of the specified threshold, within the total number of MPDUs indicated in the Measurement Count field. See 10.11.9.5. One or more trigger conditions are set with specified thresholds.

The Vendor Specific subelements have the same format as their corresponding elements (see 8.4.2.28). Multiple Vendor Specific subelements are optionally present in the list of optional subelements.

8.4.2.23.10 Location Configuration Information Request

The Measurement Request field corresponding to an LCI request is shown in Figure 8-123.

	Location Subject	Latitude Requested Resolution	Longitude Requested Resolution	Altitude Requested Resolution	Optional Subelements
Octets:	1	1	1	1	variable

Figure 8-123—Measurement Request field format for LCI Request

The Location Subject field of a LCI request is a single octet. See Table 8-71.

Table 8-71—Location subject definition

Value	Location Subject
0	Location Subject Local
1	Location Subject Remote
2	Location Subject Third Party
3–255	Reserved

The term Local refers to the location of the requesting STA, and Remote refers to the location of the reporting STA.

NOTE—Local Measurement Request is used by requesting STA to obtain its own location, asking “Where am I?” Remote Measurement Request is used by requesting STA to obtain the location of the reporting STA, asking “Where are you?”

Latitude Requested Resolution is the number of valid most significant bits requested for the fixed-point value of Latitude in degrees. Values above 34 (decimal), the specified maximum number of bits of Latitude, are reserved.

Longitude Requested Resolution is the number of valid most significant bits requested for the fixed-point value of Longitude in degrees. Values above 34 (decimal), the specified maximum number of bits of Longitude, are reserved.

Altitude Requested Resolution is the number of valid most significant bits requested for the Altitude, which has either of two types, as described in 8.4.2.24.10. Values above 30 (decimal), the specified maximum number of bits of Altitude, are reserved.

The Optional Subelements field format contains zero or more subelements, each consisting of a 1-octet Subelement ID field, a 1-octet Length field, and a variable-length Data field, as shown in Figure 8-402. Any optional subelements are ordered by nondecreasing subelement ID.

The Subelement ID field values for the defined optional subelements are shown in Table 8-72. A Yes in the Extensible column of a subelement listed in Table 8-72 indicates that the Length of the subelement might be extended in future revisions or amendments of this standard. When the Extensible column of an element is equal to Subelements, then the subelement might be extended in future revisions or amendments of this standard by defining additional subelements within the subelement. See 9.24.9.

Table 8-72—Optional subelement IDs for LCI Request

Subelement ID	Name	Length field (octets)	Extensible
0	Reserved		
1	Azimuth Request	1	Yes
2	Originator Requesting STA MAC Address	6	No
3	Target MAC Address	6	No
4–220	Reserved		
221	Vendor Specific	1 to 246	
222–255	Reserved		

The Azimuth Request subelement is present when requesting azimuth information. The Azimuth Request subelement is as shown in Figure 8-124.

	Subelement ID	Length	Azimuth Request
Octets:	1	1	1

Figure 8-124—Azimuth Request subelement format

The value of the subelement ID is equal to the Azimuth Request value in Table 8-72.

The Length field value is set to 1.

The Azimuth Request field of an Azimuth Request subelement is shown in Figure 8-125.

	B0 B3	B4	B5 B7
	Azimuth Resolution Requested	Azimuth Type	Reserved
Bits:	4	1	3

Figure 8-125—Azimuth Request field

Azimuth Resolution Requested is the number of valid most significant bits requested for the fixed-point value of Azimuth, reported in integer degrees. Values above 9 are reserved.

Azimuth Type (bit 4) is set to 1 to request a report of the Azimuth of radio reception and is set to 0 to request a report of the Azimuth of front surface of the reporting STA.

NOTE—A geographic feature is an abstraction of a real-world phenomenon; it is a geographic feature if it is associated with a location relative to the Earth. The designation of a horizontal plane is relative to the Earth. The designation of the “front surface” of a station is arbitrary, but refers to an orientable surface (possessing a centerline) of the station. It is common to use a direction cosine matrix to convert from one coordinate system to another, i.e., body-centered coordinates to earth-centered coordinates.

The Originator Requesting STA MAC Address subelement contains the MAC address of the STA requesting the Location Information and it is present whenever the location subject definition field is set to 2. The format of the Originator Requesting STA MAC Address subelement is shown in Figure 8-126.

	Subelement ID	Length	Originator Requesting STA MAC Address
Octets:	1	1	6

Figure 8-126—Originator Requesting STA MAC Address subelement format

The Target MAC Address subelement contains the MAC address of the STA whose Location Information is requested and it is present whenever the location subject definition field is set to 2. The format of the Target MAC address subelement is shown in Figure 8-127.

	Subelement ID	Length	Originator Requesting STA MAC Address
Octets:	1	1	6

Figure 8-127—Target MAC Address subelement format

The Vendor Specific subelement has the same format as the Vendor Specific element (see 8.4.2.28). Multiple Vendor Specific subelements are optionally present in the list of optional subelements.

8.4.2.23.11 Transmit Stream/Category Measurement Request

The Transmit Stream/Category Measurement applies to TIDs for Traffic Streams associated with TSPECs and also to TIDs for Traffic Categories for QoS traffic without TSPECs. The Measurement Request field corresponding to a Transmit Stream/Category Measurement Request is shown in Figure 8-128.

	Randomization Interval	Measurement Duration	Peer STA Address	Traffic Identifier	Bin 0 Range	Optional Subelements
Octets:	2	2	6	1	1	variable

Figure 8-128—Measurement Request field format for Transmit Stream/Category Measurement Request

Randomization Interval is set to the desired maximum random delay in the measurement start time, expressed in units of TUs. The use of Randomization Interval is described in 10.11.3. When requesting a triggered Transmit Stream/Category Measurement, Randomization Interval is not used and is set to 0. See 10.11.9.8.

The Measurement Duration is set to the duration of the requested measurement, expressed in units of TUs except when setting up a triggered QoS measurement, when it is not used and is set to 0.

The Peer STA Address contains a MAC address indicating the RA in the MSDUs to be measured.

The Traffic Identifier field contains the TID subfield as shown in Figure 8-129.

	B0 B3	B4 B7
	Reserved	TID
Bits:	4	4

Figure 8-129—Traffic Identifier field

The TID subfield indicates the TC or TS for which traffic is to be measured.

Bin 0 Range indicates the delay range of the first bin (Bin 0) of the Transmit Delay Histogram, expressed in units of TUs. The Bin 0 Range value is used to calculate the delay ranges of the other 5 bins making up the histogram. The delay range for each bin increases in a binary exponential fashion as described in 8.4.2.24.11.

The Optional Subelements field format contains zero or more subelements, each consisting of a 1-octet Subelement ID field, a 1-octet Length field, and a variable-length Data field, as shown in Figure 8-402. The optional subelements are ordered by nondecreasing subelement ID.

The Subelement ID field values for the defined optional subelements are shown in Table 8-73. A Yes in the Extensible column of a subelement listed in Table 8-73 indicates that the Length of the subelement might be extended in future revisions or amendments of this standard. When the Extensible column of an element is equal to Subelements, then the subelement might be extended in future revisions or amendments of this standard by defining additional subelements within the subelement. See 9.24.9.

Table 8-73—Optional subelement IDs for Transmit Stream/Category Measurement Request

Subelement ID	Name	Length field (octets)	Extensible
0	Reserved		
1	Triggered Reporting	6	Yes
2–220	Reserved		
221	Vendor Specific	1 to 238	
222–255	Reserved		

The Triggered Reporting subelement is used to specify measurement trigger thresholds. It is present only if requesting triggered transmit stream/category measurement reporting. The Triggered Reporting subelement field format is shown in Figure 8-130.

	Subelement ID	Length	Triggered Reporting
Octets:	1	1	6

Figure 8-130—Triggered Reporting subelement format

The value of the subelement ID is equal to the Triggered Reporting value in Table 8-73.

The value of the Length field in octets is equal to 6.

The Triggered Reporting field is as shown in Figure 8-131.

	Trigger Conditions	Average Error Threshold	Consecutive Error Threshold	Delay Threshold	Measurement Count	Trigger Time-out
Octets:	1	1	1	1	1	1

Figure 8-131—Triggered Reporting field

Trigger Conditions is a bit-field that specifies reporting triggers when requesting a triggered transmit stream/category measurement. The format of the Trigger Conditions bit-field is shown in Figure 8-132.

	B0	B1	B2	B3 B7
	Average	Consecutive	Delay	Reserved
Bits:	1	1	1	5

Figure 8-132—Trigger Conditions bit-field

- Average is set to 1 to request that a Transmit Stream/Category Measurement Report be generated when the number of MSDUs for the TC or TS given by the TID that are discarded out of the number of preceding MSDUs specified in Measurement Count is greater than or equal to the value given in Average Error Threshold. MSDUs discarded due to the number of transmit attempts exceeding dot11ShortRetryLimit or dot11LongRetryLimit, or due to the MSDU lifetime having been reached, are counted.
- Consecutive is set to 1 to request that a Transmit Stream/Category Measurement Report be generated when the number of MSDUs for the TC or TS given by the TID that are discarded in succession is greater than or equal to the value given in Consecutive Error Threshold. MSDUs discarded due to the number of transmit attempts exceeding dot11ShortRetryLimit or dot11LongRetryLimit, or due to the MSDU lifetime having been reached, are counted.
- Delay is set to 1 to request that a Transmit Stream/Category Measurement Report be generated when the number of consecutive MSDUs for the TC, or TS given by the TID that experience a transmit delay greater than or equal to the value specified in the Delay Threshold subfield, is greater than or equal to the value given in Delayed MSDU Count. Delay is measured from the time the MSDU is passed to the MAC until the point at which the entire MSDU has been successfully transmitted, including receipt of the final ACK from the peer STA if the QoSAck service class is being used.

The Average Error Threshold field contains a value representing the number of discarded MSDUs to be used as the threshold value for the Average trigger condition. The field is reserved if the Average Error Threshold subfield of the Trigger Conditions bit-field is 0.

The Consecutive Error Threshold field contains a value representing the number of discarded MSDUs to be used as the threshold value for the Consecutive trigger condition. The field is reserved if the Consecutive Error Threshold subfield of the Trigger Conditions bit-field is 0.

The Delay Threshold field contains two subfields as shown in Figure 8-133. The Delay Threshold field is reserved if the Delay Threshold subfield of the Trigger Conditions bit-field is 0.

	B0 B1	B2 B7
	Delayed MSDU Range	Delayed MSDU Count
Bits:	2	6

Figure 8-133—Delay Threshold subfield

Delayed MSDU Range contains a value representing the MSDU transmit delay at or above which an MSDU is counted towards the Delayed MSDU Count threshold. Delayed MSDU Range is encoded as a value representing the lower bound of a bin in the Transmit Delay Histogram as shown in Table 8-74. The Transmit Delay Histogram is defined in 8.4.2.24.11.

Table 8-74—Delayed MSDU Range Definitions

Delayed MSDU Range	Condition
0	Transmit Delay = Lower Bound of Bin 2
1	Transmit Delay = Lower Bound of Bin 3
2	Transmit Delay = Lower Bound of Bin 4
3	Transmit Delay = Lower Bound of Bin 5

Delayed MSDU Count contains a value representing the number of MSDUs to be used as the threshold value for the Delay trigger condition.

The Measurement Count field contains a number of MSDUs. This value is used to calculate an average discard count for the Average trigger condition. It is also used in place of measurement duration in determining the scope of the reported results when a report is triggered; see 10.11.9.8.

The Trigger Timeout field contains a value, expressed in units of 100 TU, during which a measuring STA does not generate further triggered transmit stream/category measurement reports after a trigger condition has been met. See 10.11.9.8.

The Vendor Specific subelement has the same format as the Vendor Specific element (see 8.4.2.28). Multiple Vendor Specific subelements are optionally present in the list of optional subelements.

8.4.2.23.12 Measurement pause request

The Measurement Request field corresponding to a measurement pause request is shown in Figure 8-134. The measurement pause request cannot be processed in parallel with any other Measurement Request. See 10.11.9.7.

	Pause Time	Optional Subelements
Octets:	2	variable

Figure 8-134—Measurement Request field format for measurement pause request

The Pause Time field contains a number between 1 and 65 535 representing the time period for which measurements are suspended or paused. The time unit for the Pause Time is 10 TUs. The Pause Time value 0 is reserved. Measurement pause requests are used to provide time delays between the execution times of measurement request elements in a Measurement Request frame.

The Optional Subelements field format contains zero or more subelements, each consisting of a 1-octet Subelement ID field, a 1-octet Length field, and a variable-length Data field, as shown in Figure 8-402. Any optional subelements are ordered by nondecreasing subelement ID.

The Subelement ID field values for the defined optional subelements are shown in Table 8-75. A Yes in the Extensible column of a subelement listed in Table 8-75 indicates that the Length of the subelement might be extended in future revisions or amendments of this standard. When the Extensible column of an element is equal to Subelements, then the subelement might be extended in future revisions or amendments of this standard by defining additional subelements within the subelement. See 9.24.9.

Table 8-75—Optional subelement IDs for measurement pause request

Subelement ID	Name	Length field (octets)	Extensible
0–220	Reserved		
221	Vendor Specific	1 to 248	
222–255	Reserved		

The Vendor Specific subelements have the same format as their corresponding elements (see 8.4.2.28). Multiple Vendor Specific subelements are optionally present in the list of optional subelements.

8.4.2.23.13 Multicast Diagnostics Request

The Measurement Request field corresponding to a Multicast Diagnostics Request is shown in Figure 8-135. The response to a Multicast Diagnostics Request is a Multicast Diagnostics Report.

	Randomization Interval	Measurement Duration	Group MAC Address	Multicast Triggered Reporting (optional)	Optional Subelements
Octets:	2	2	6	0 or 5	variable

Figure 8-135—Measurement Request field format for a Multicast Diagnostics Request

The Randomization Interval field is the desired upper limit of random delay before the measurement begins, expressed in TUs. The use of the Randomization Interval is described in 10.12.3. When requesting a triggered multicast diagnostic report, the Randomization Interval field is reserved.

The Measurement Duration field is the duration of the requested measurement, expressed in TUs. When requesting a triggered multicast diagnostic report, the Measurement Duration field is reserved.

A Group MAC Address field with the LSB of the first octet set to 1 contains the MAC address of the group addressed frames to which the measurement request relates. A Group MAC Address field with the LSB of the first octet set to 0 indicates that all group addressed frames, apart from the broadcast MAC address, are requested.

The Multicast Triggered Reporting field is used to specify trigger conditions and thresholds. It is only present when requesting triggered multicast diagnostic reporting. The format of Multicast Triggered Reporting subelement is as shown in Figure 8-136.

	Subelement ID	Length	Multicast Trigger Condition	Inactivity Timeout	Reactivation Delay
Octets:	1	1	1	1	1

Figure 8-136—Multicast Triggered Reporting subelement format

The Multicast Trigger Condition field specifies reporting triggers for triggered management diagnostic reporting. The format of the Multicast Trigger Condition field is shown in Figure 8-137.

	B0	B1 B7
	Inactivity Timeout Request	Reserved
Bits:	1	7

Figure 8-137—Multicast Trigger Condition field

The Inactivity Timeout Request field is 1 to request that a Multicast Triggered Report be generated when no group addressed frames with the monitored group address are received in a time equal to the value given in the Inactivity Timeout field. The Inactivity Timeout Request field is 0 when a multicast reception timeout is not requested.

The Inactivity Timeout field contains a time value in units of 100 TUs to be used as the threshold value for the Inactivity Timeout trigger condition.

The Reactivation Delay field contains a value in units of 100 TUs during which a measuring STA does not generate further Multicast Triggered Reports after a trigger condition has been met.

The Optional Subelements field format contains zero or more Subelements, each consisting of a 1-octet Subelement ID field, a 1-octet Length field and a variable-length Data field, as shown in Figure 8-402. The optional subelements are ordered by nondecreasing subelement ID.

The Subelement ID field values for the defined optional subelements are shown in Table 8-76. A Yes in the Extensible column of a subelement listed in Table 8-76 indicates that the length of the subelement might be extended in future revisions or amendments of this standard. When the Extensible column of an element is Subelements, then the subelement might be extended in future revisions or amendments of this standard by defining additional subelements within the subelement. See 9.24.9.

The use of Multicast Diagnostics Request is defined in 10.11.19.

Table 8-76—Optional subelement IDs for STA Multicast Diagnostics Request

Subelement ID	Name	Length field (octets)	Extensible
0	Reserved		
1	Multicast Triggered Reporting	5	
2–220	Reserved		
221	Vendor Specific	1 to 239	
222–255	Reserved		

8.4.2.23.14 Location Civic Request

The Measurement Request field corresponding to a Location Civic Request is shown in Figure 8-138. The response to a Location Civic Request is a Location Civic Report.

	Location Subject	Civic Location Type	Location Service Interval Units	Location Service Interval	Optional Subelements
Octets:	1	1	1	2	variable

Figure 8-138—Location Civic Request field format

The Location Subject field is a single octet and is defined in Table 8-71.

The Civic Location Type field contains the format of location information in the Location Civic Report, as indicated in Table 8-77.

Table 8-77—Civic Location Type

Civic Location Type value	Description
0	IETF RFC4776-2006; includes all subsequent RFCs that define additional civic address Types
1	Vendor Specific
2–255	Reserved

When the Civic Location Type value is Vendor Specific, a Vendor Specific subelement is included in the Optional Subelements field that identifies the Organization Identifier corresponding to the Civic Location Type.

The Location Service Interval Units field contains the units for the Location Service Interval field, as indicated in Table 8-78.

Table 8-78—Location Service Interval Units

Location Service Interval Units value	Description
0	Seconds
1	Minutes
2	Hours
3–255	Reserved

The Location Service Interval field is the time interval, expressed in the units indicated in the Location Service Interval Units field, at which the STA requests to receive Location Civic Reports. A Location Service Interval of 0 indicates that only a single Location Civic Report is requested.

The Optional Subelements field format contains zero or more subelements, each consisting of a 1-octet Subelement ID field, a 1-octet Length field and a variable-length Data field, as shown in Figure 8-402. The optional subelements are ordered by nondecreasing subelement ID.

The Subelement ID field values for the defined optional subelements are shown in Table 8-79. A Yes in the Extensible column of a subelement listed in Table 8-79 indicates that the length of the subelement might be extended in future revisions or amendments of this standard. When the Extensible column of an element is Subelement, then the subelement might be extended in future revisions or amendments of this standard by defining additional subelements within the subelement. See 9.24.9.

Table 8-79—Optional subelement IDs for Location Civic Request

Subelement ID	Name	Length field (octets)	Extensible
0	Reserved		
1	Originator Requesting STA MAC Address	6	No
2	Target MAC Address	6	No
3–220	Reserved		
221	Vendor Specific	1 to 237	
222–255	Reserved		

The Originator Requesting STA MAC Address subelement contains the MAC address of the STA requesting for the Location Information and it is present whenever the location subject definition field is set to 2. The format of the Originator Requesting STA MAC Address subelement is shown in Figure 8-126.

The Target MAC Address subelement contains the MAC address of the STA whose Location Information is requested and it is present whenever the location subject definition field is set to 2. The format of the Target MAC address subelement is shown in Figure 8-127.

8.4.2.23.15 Location Identifier Request

The Measurement Request field corresponding to a Location Identifier Request is shown in Figure 8-139. The response to a Location Identifier Request is a Location Identifier Report.

	Location Subject	Location Service Interval Units	Location Service Interval	Optional Subelements
Octets:	1	1	2	variable

Figure 8-139—Location Identifier Request field format

The Location Subject field is a single octet and is defined in Table 8-71.

The Location Service Interval Units field is defined in Table 8-78.

The Location Service Interval field is the time interval, expressed in the units indicated in the Location Service Interval Units field, at which the STA requests to receive Location Identifier Reports. A Location Service Interval of 0 indicates that only a single Location Identifier Report is requested.

The Optional Subelements field format contains zero or more subelements, each consisting of a 1-octet Subelement ID field, a 1-octet Length field and a variable-length Data field, as shown in Figure 8-402. Any optional subelements are ordered by nondecreasing subelement ID.

The Subelement ID field values for the defined optional subelements are shown in Table 8-80. A Yes in the Extensible column of a subelement listed in Table 8-80 indicates that the Length of the subelement might be extended in future revisions or amendments of this standard. When the Extensible column of an element is Subelement, then the subelement might be extended in future revisions or amendments of this standard by defining additional subelements within the subelement. See 9.24.9.

Table 8-80—Optional subelement IDs for Location Identifier Request

Subelement ID	Name	Length field (octets)	Extensible
0	Reserved		
1	Originator Requesting STA MAC Address	6	No
2	Target MAC Address	6	No
3–220	Reserved		
221	Vendor Specific	1 to 237	
222–255	Reserved		

The Originator Requesting STA MAC Address subelement contains the MAC address of the STA requesting the Location Information and it is present whenever the location subject definition field is set to 2. The format of the Originator Requesting STA MAC Address subelement is shown in Figure 8-126.

The Target MAC Address subelement contains the MAC address of the STA whose Location Information is requested and it is present whenever the location subject definition field is set to 2. The format of the Target MAC address subelement is shown in Figure 8-127.

8.4.2.24 Measurement Report element

8.4.2.24.1 General

The Measurement Report element contains a measurement report. The format of the Measurement Report element is shown in Figure 8-140. The Measurement Report element is included in Spectrum Management Measurement Report frames, as described in 8.5.2.3, or Radio Measurement Report frames, as described in 8.5.7.3. Measurement Types 0, 1, and 2 are used for spectrum management and are included only in Spectrum Management Measurement Report frames. All other Measurement Types are used for radio measurement and are included only in Radio Measurement Report frames. The use of Measurement Report elements and frames for spectrum management is described in 10.9.7. The use of Measurement Report elements and frames for radio measurement is described in 10.11.

	Element ID	Length	Measurement Token	Measurement Report Mode (see Figure 8-141)	Measurement Type	Measurement Report
Octets:	1	1	1	1	1	variable

Figure 8-140—Measurement Report element format

	B0	B1	B2	B3 B7
	Late	Incapable	Refused	Reserved
Bits:	1	1	1	5

Figure 8-141—Measurement Report Mode field

The value of the Length field in octets is variable and depends on the length of the Measurement Report field. The minimum value of the Length field is 3.

The Measurement Token field is set to the Measurement Token in the corresponding Measurement Request element. If the Measurement Report element is being sent autonomously, then the Measurement Token is set to 0. If the Measurement Report element is being sent in a Location Track Notification frame then the Measurement Token is set to the same value as the Location Configuration Request frame Dialog Token field that configured the STA to send the location track notification frames.

The Measurement Report Mode field (shown in Figure 8-141) is used to indicate the reason for a failed or rejected measurement request. The Measurement Report Mode is a bit field with the following bits defined:

- Late bit (bit 0) indicates whether this STA is unable to carry out a measurement request because it received the request after the requested measurement time. The Late bit is set to 1 to indicate the request was too late. The Late bit is set to 0 to indicate the request was received in time for the measurement to be executed. The Late bit only applies to spectrum management measurement and is set to 0 in all measurement report elements for radio measurement types (see Table 8-81).
- Incapable bit (bit 1) indicates whether this STA is incapable of generating a report of the type specified in the Measurement Type field that was previously requested by the destination STA of this Measurement Report element. The Incapable bit is set to 1 to indicate the STA is incapable. The Incapable bit is set to 0 to indicate the STA is capable or the report is autonomous.
- Refused bit (bit 2) indicates whether this STA is refusing to generate a report of the type specified in the Measurement Type field that was previously requested by the destination STA of this Measurement Report element. The Refused bit is set to 1 to indicate the STA is refusing. The Refused bit is set to 0 to indicate the STA is not refusing or the report is autonomous.

— All other bits are reserved.

Table 8-81—Measurement Type definitions for measurement reports

Name	Measurement Type	Measurement Use
Basic report	0	Spectrum Management
CCA report	1	
RPI histogram report	2	
Channel load report	3	Radio Measurement
Noise histogram report	4	
Beacon report	5	
Frame report	6	
STA statistics report	7	Radio Measurement and WNM
LCI report	8	Radio Measurement, Spectrum Management, and WNM
Transmit stream/category measurement report	9	Radio Measurement
Multicast diagnostics report	10	WNM
Location Civic report	11	Radio Measurement and WNM
Location Identifier report	12	Radio Measurement and WNM
Reserved	13–255	N/A

No more than one bit is set to 1 within a Measurement Report Mode field. All bits within the Measurement Mode field are set to 0 if the results of a successful measurement request or an autonomous measurement are being reported.

The Measurement Type field is set to a number that identifies the measurement report. The Measurement Types that have been allocated are shown in Table 8-81.

The Measurement Report field is not present when the Late bit is equal to 1, the Incapable bit is equal to 1, or the Refused bit is equal to 1. Otherwise, it contains a single measurement report, as described in 8.4.2.24.2 to 8.4.2.24.11.

8.4.2.24.2 Basic report

A Measurement Type in the Measurement Report element may indicate a basic report. The format of the Measurement Report field corresponding to a basic report is shown in Figure 8-142. It is mandatory for a STA to support the generation of this report.

	Channel Number	Measurement Start Time	Measurement Duration	Map (see Figure 8-143)
Octets:	1	8	2	1

Figure 8-142—Measurement Report field format for a basic report

	BSS	Orthogonal frequency division multiplexing (OFDM) Preamble	Unidentified Signal	Radar	Unmeasured	Reserved
Bit:	0	1	2	3	4	5-7

Figure 8-143—Map field format

The Channel Number field is set to the channel number to which the basic report applies (as defined in 18.3.8.4.3).

The Measurement Start Time field is set to the TSF at the time (± 32 µs) at which the basic report measurement started.

The Measurement Duration field is set to the duration over which the basic report was measured, expressed in TUs.

The Map field is coded as a bit field, as shown in Figure 8-143, and contains the following bits:

- BSS bit, which is set to 1 when at least one valid MPDU was received in the channel during the measurement period from another BSS. Otherwise, the BSS bit is set to 0.
- OFDM preamble bit, which is set to 1 when at least one sequence of short training symbols, as defined in 18.3.3, was detected in the channel during the measurement period without a subsequent valid SIGNAL field (see 18.3.4). This may indicate the presence of an OFDM preamble, such as high-performance RLAN/2 (HIPERLAN/2). Otherwise, the OFDM preamble bit is set to 0.
- Unidentified Signal bit, which may be set to 1 when, in the channel during the measurement period, there is significant power detected that is not characterized as radar, an OFDM preamble, or a valid MPDU. Otherwise, the Unidentified Signal bit is set to 0. The definition of significant power is implementation dependent.
- Radar bit, which is set to 1 when radar was detected operating in the channel during the measurement period. The radar detection algorithm that satisfies regulatory requirements is outside the scope of this standard. Otherwise, the Radar bit is set to 0.
- Unmeasured bit, which is set to 1 when this channel has not been measured. Otherwise, the Unmeasured bit is set to 0. When the Unmeasured field is equal to 1, all the other bit fields are set to 0.

8.4.2.24.3 CCA report

A Measurement Type in the Measurement Report element may indicate a CCA report. It is optional for a STA to support the generation of this report. The format of the Measurement Report field corresponding to a CCA report is shown in Figure 8-144.

	Channel Number	Measurement Start Time	Measurement Duration	CCA Busy Fraction
Octets:	1	8	2	1

Figure 8-144—Measurement Report field format for a CCA report

The Channel Number field contains the channel number to which the CCA report applies (as defined in 18.3.8.4.3).

The Measurement Start Time field is set to the TSF at the time (± 32 µs) at which the CCA report measurement started.

The Measurement Duration field is set to the duration over which the CCA report was measured, expressed in TUs.

The CCA Busy Fraction field contains the fractional duration over which CCA indicated the channel was busy during the measurement duration. The resolution of the CCA busy measurement is in microseconds. The CCA Busy Fraction value is defined as Ceiling (255 × [Duration CCA indicated channel was busy (µs)] / (1024 × [Measurement duration (TUs)])).

8.4.2.24.4 RPI histogram report

A Measurement Type in the Measurement Report element may indicate an RPI histogram report. It is optional for a STA to support the generation of this report. The format of the Measurement Report field corresponding to an RPI histogram report is shown in Figure 8-145.

	Channel Number	Measurement Start Time	Measurement Duration
Octets:	1	8	2

	RPI 0 density	RPI 1 density	RPI 2 density	RPI 3 density	RPI 4 density	RPI 5 density	RPI 6 density	RPI 7 density
Octets:	1	1	1	1	1	1	1	1

Figure 8-145—Measurement Report field format for an RPI histogram report

The Channel Number field is set to the channel number to which the RPI histogram report applies (as defined in 18.3.8.4.3).

The Measurement Start Time field is set to the TSF at the time (± 32 µs) at which the RPI histogram report measurement started.

The Measurement Duration field is set to the duration over which the RPI histogram report was measured, expressed in TUs.

The RPI histogram report contains the RPI densities observed in the channel for the eight RPI levels defined in Table 8-82. See 10.11.12.

Table 8-82—RPI definitions for an RPI histogram report

RPI	Power observed at the antenna (dBm)
0	Power ≤ –87
1	–87 < Power ≤ –82
2	–82 < Power ≤ –77
3	–77 < Power ≤ –72
4	–72 < Power ≤ –67
5	–67 < Power ≤ –62
6	–62 < Power ≤ –57
7	–57 < Power

The RPI histogram report provides an additional mechanism for a STA to gather information on the state of a channel from other STAs. The STA may use this information to assist in the choice of new channel, to help avoid false radar detections, and to assess the general level of interference present on a channel.

8.4.2.24.5 Channel Load Report

The format of the Measurement Report field corresponding to a Channel Load Report is shown in Figure 8-146.

	Operating Class	Channel Number	Actual Measurement Start Time	Measurement Duration	Channel Load	Optional Subelements
Octets:	1	1	8	2	1	variable

Figure 8-146—Measurement Report field format for Channel Load Report

Operating Class indicates the channel set for which the measurement request applies. Country, Operating Class, and Channel Number together specify the channel frequency and spacing for which the measurement request applies. Valid values of Operating Class are shown in Annex E.

Channel Number indicates the channel number for which the measurement report applies. Channel Number is defined within an Operating Class as shown in Annex E.

Actual Measurement Start Time is set to the value of the measuring STA’s TSF timer at the time the measurement started.

Measurement Duration is set to the duration over which the Channel Load Report was measured, expressed in units of TUs.

Channel Load contains the proportion of measurement duration for which the measuring STA determined the channel to be busy. Procedure for Channel Load measurement and definition of channel load values are found in 10.11.9.3.

The Optional Subelements field format contains zero or more subelements, each consisting of a 1-octet Subelement ID field, a 1-octet Length field, and a variable-length Data field, as shown in Figure 8-402. Any optional subelements are ordered by nondecreasing subelement ID.

The Subelement ID field values for the defined optional subelements are shown in Table 8-83. A Yes in the Extensible column of a subelement listed in Table 8-83 indicates that the Length of the subelement might be extended in future revisions or amendments of this standard. When the Extensible column of an element is equal to Subelements, then the subelement might be extended in future revisions or amendments of this standard by defining additional subelements within the subelement. See 9.24.9.

Table 8-83—Optional subelement IDs for Channel Load Report

Subelement ID	Name	Length field (octets)	Extensible
0–220	Reserved		
221	Vendor Specific	1 to 237	
222–255	Reserved		

The Vendor Specific subelements have the same format as their corresponding elements (see 8.4.2.28). Multiple Vendor Specific subelements are optionally present in the list of optional subelements.

8.4.2.24.6 Noise Histogram Report

The format of the Measurement Report field of a Noise Histogram Report is shown in Figure 8-147.

	Operating Class	Channel Number	Actual Measurement Start Time	Measurement Duration	Antenna ID	ANPI
Octets:	1	1	8	2	1	1

	IPI 0 Density	IPI 1 Density	IPI 2 Density	. . .	IPI 8 Density	IPI 9 Density	IPI 10 Density	Optional subelements
Octets:	1	1	1	5	1	1	1	variable

Figure 8-147—Measurement Report field format for Noise Histogram Report

Operating Class indicates the channel set for which the measurement request applies. Country, Operating Class, and Channel Number together specify the channel frequency and spacing for which the measurement request applies. Valid values of Operating Class are shown in Annex E.

Channel Number indicates the channel number for which the measurement report applies. Channel Number is defined within an Operating Class as shown in Annex E.

Actual Measurement Start Time is set to the value of the measuring STA’s TSF timer at the time the measurement started.

Measurement Duration is set to the duration over which the Noise Histogram Report was measured, expressed in units of TUs.

Antenna ID is set to the identifying number for the antenna(s) used for this measurement. Antenna ID is defined in 8.4.2.42.

ANPI is set to the average noise plus interference power value measured during the indicated Measurement Duration while the indicated channel is idle as described in 10.11.9.4.

The Noise Histogram Report contains the IPI densities, as defined in 10.11.9.4, observed in the channel for the eleven IPI levels defined in Table 8-84.

Table 8-84—IPI Definitions for a Noise Histogram Report

IPI Level	IPI Measured Power (dBm)
0	IPI ≤ – 92
1	–92 < IPI ≤ –89
2	–89 < IPI ≤ –86
3	–86 < IPI ≤ –83
4	–83 < IPI ≤ –80
5	–80 < IPI ≤ –75
6	–75 < IPI ≤ –70
7	–70 < IPI ≤ –65
8	–65 < IPI ≤ –60
9	–60 < IPI ≤ –55
10	–55 < IPI

The Optional Subelements field format contains zero or more subelements, each consisting of a 1-octet Subelement ID field, a 1-octet Length field, and a variable-length Data field, as shown in Figure 8-402. Any optional subelements are ordered by nondecreasing subelement ID.

The Subelement ID field values for the defined optional subelements are shown in Table 8-85. A Yes in the Extensible column of a subelement listed in Table 8-85 indicates that the Length of the subelement might be extended in future revisions or amendments of this standard. When the Extensible column of an element is equal to Subelements, then the subelement might be extended in future revisions or amendments of this standard by defining additional subelements within the subelement. See 9.24.9.

Table 8-85—Optional subelement IDs for Noise Histogram Report

Subelement ID	Name	Length field (octets)	Extensible
0–220	Reserved		
221	Vendor Specific	1 to 225	
222–255	Reserved		

The Vendor Specific subelements have the same format as their corresponding elements (see 8.4.2.28). Multiple Vendor Specific subelements are optionally present in the list of optional subelements.

8.4.2.24.7 Beacon Report

The format of the Measurement Report field corresponding to a Beacon Report is shown in Figure 8-148.

	Operating Class	Channel Number	Actual Measurement Start Time	Measurement Duration	Reported Frame Information
Octets:	1	1	8	2	1

	RCPI	RSNI	BSSID	Antenna ID	Parent TSF	Optional Subelements
Octets:	1	1	6	1	4	variable

Figure 8-148—Measurement Report field format for Beacon Report

Operating Class indicates the channel set for which the measurement request applies. Country, Operating Class, and Channel Number together specify the channel frequency and spacing for which the measurement request applies. Valid values of Operating Class are shown in Annex E.

Channel Number indicates the channel number for which the measurement report applies. Channel Number is defined within an Operating Class as shown in Annex E.

Actual Measurement Start Time is set to the value of the measuring STA's TSF timer at the time the measurement started.

Measurement Duration is set to the duration over which the Beacon Report was measured, expressed in units of TUs.

The Reported Frame Information field contains two subfields as shown in Figure 8-149.

	B0 B6	B7
	Condensed PHY Type	Reported Frame Type
Bits:	7	1

Figure 8-149—Reported Frame Information field

Condensed PHY Type indicates the physical medium type on which the Beacon, Measurement Pilot, or Probe Response frame being reported was received. It has an integer value between 0 and 127 coded according to the value of dot11PHYType.

Reported Frame Type indicates the type of frame reported. A value of 0 indicates a Beacon or Probe Response frame; a value of 1 indicates a Measurement Pilot frame.

RCPI indicates the received channel power of the Beacon, Measurement Pilot, or Probe Response frame, which is a logarithmic function of the received signal power, as defined in the RCPI measurement subclause for the indicated PHY Type.

RSNI indicates the received signal to noise indication for the Beacon, Measurement Pilot, or Probe Response frame, as described in 8.4.2.43.

The BSSID field contains the BSSID from the Beacon, Measurement Pilot, or Probe Response frame being reported.

The Antenna ID field contains the identifying number for the antenna(s) used for this measurement. Antenna ID is defined in 8.4.2.42.

The Parent TSF field contains the lower 4 octets of the measuring STA's TSF timer value at the start of reception of the first octet of the timestamp field of the reported Beacon, Measurement Pilot, or Probe Response frame at the time the Beacon, Measurement Pilot, or Probe Response frame being reported was received.

The Optional Subelements field format contains zero or more subelements, each consisting of a 1-octet Subelement ID field, a 1-octet Length field, and a variable-length Data field, as shown in Figure 8-402. Any optional subelements are ordered by nondecreasing subelement ID.

The Subelement ID field values for the defined optional subelements are shown in Table 8-86. A Yes in the Extensible column of a subelement listed in Table 8-86 indicates that the Length of the subelement might be extended in future revisions or amendments of this standard. When the Extensible column of an element is equal to Subelements, then the subelement might be extended in future revisions or amendments of this standard by defining additional subelements within the subelement. See 9.24.9.

Table 8-86—Optional subelement IDs for Beacon Report

Subelement ID	Name	Length field (octets)	Extensible
0	Reserved		
1	Reported Frame Body	0 to 224	
2–220	Reserved		
221	Vendor Specific	1 to 224	
222–255	Reserved		

The Reported Frame Body subelement contains the requested fields and elements of the frame body of the reported Beacon, Measurement Pilot, or Probe Response frame. If the Reporting Detail subelement of the corresponding Beacon Request equals 0, the Reported Frame Body subelement is not included in the Beacon Report. If the Reporting Detail subelement equals 1, all fixed fields and any elements whose Element IDs are present in the Request element in the corresponding Beacon Request are included in the Reported Frame Body subelement, in the order that they appeared in the reported frame. If the Reporting Detail field equals 2, all fixed fields and elements are included in the order they appeared in the reported frame. Reported TIM elements are truncated such that only the first 4 octets of the element are reported and the element Length field is modified to indicate the truncated length of 4. Reported IBSS dynamic frequency selection (DFS) elements shall be truncated so that only the lowest and highest channel number map are reported and the element Length field is modified to indicate the truncated length of 13. Reported RSNEs shall be truncated so that only the first 4 octets of the element are reported and the element Length field is modified to indicate the truncated length of 4. If the length of the Reported Frame Body subelement would cause the Measurement Report element to exceed the maximum element size, then the Reported Frame Body subelement is truncated so that the last element in the Reported Frame Body subelement is a complete element.

The Vendor Specific subelements have the same format as their corresponding elements (see 8.4.2.28). Multiple Vendor Specific subelements are optionally present in the list of optional subelements.

8.4.2.24.8 Frame Report

The format of the Measurement Report field corresponding to a Frame Report is shown in Figure 8-150.

	Operating Class	Channel Number	Actual Measurement Start Time	Measurement Duration	Optional Subelements
Octets:	1	1	8	2	variable

Figure 8-150—Measurement Report field format for Frame Report

Operating Class indicates the channel set for which the measurement request applies. Country, Operating Class, and Channel Number together specify the channel frequency and spacing for which the measurement request applies. Valid values of Operating Class are shown in Annex E.

Channel Number indicates the channel number for which the measurement report applies. Channel Number is defined within an Operating Class as shown in Annex E.

Actual Measurement Start Time is set to the value of the measuring STA's TSF timer at the time the measurement started.

Measurement Duration is set to the duration over which the Frame Report was measured, expressed in units of TUs.

The Optional Subelements field format contains zero or more subelements, each consisting of a 1-octet Subelement ID field, a 1-octet Length field, and a variable-length Data field, as shown in Figure 8-402. The optional subelements are ordered by nondecreasing subelement ID.

The Subelement ID field values for the defined optional subelements are shown in Table 8-87. A Yes in the Extensible column of a subelement listed in Table 8-87 indicates that the Length of the subelement might be extended in future revisions or amendments of this standard. When the Extensible column of an element is equal to Subelements, then the subelement might be extended in future revisions or amendments of this standard by defining additional subelements within the subelement. See 9.24.9.

Table 8-87—Optional subelement IDs for Frame Report

Subelement ID	Name	Length field (octets)	Extensible
0	Reserved		
1	Frame Count Report	0 to 228	
2–220	Reserved		
221	Vendor Specific	1 to 238	
222–255	Reserved		

The Frame Count Report subelement is used to report information about frames sent by a transmitter. The Frame Count Report subelement is as shown in Figure 8-151.

			Zero or more entries
	Subelement ID	Length	Frame Report Entry
Octets:	1	1	n x 19

Figure 8-151—Frame Count Report subelement format

The value of the subelement ID is equal to the Frame Count Report value in Table 8-87.

The Length field value is equal to 19 times the number of Frame Count Report Entries included.

The format of the Frame Report Entry is shown in Figure 8-152.

	Transmit Address	BSSID	PHY Type	Average RCPI	Last RSNI	Last RCPI	Antenna ID	Frame Count
Octets:	6	6	1	1	1	1	1	2

Figure 8-152—Frame Report Entry field format

The Transmit Address field contains the Transmitter Address (TA) from the frames being reported.

The BSSID field contains the BSSID from the frames being reported.

PHY Type indicates the physical medium type for the frame(s) being reported. Valid entries are coded according to the value of dot11PHYType.

Average RCPI indicates the average value for the received channel power of frames received and counted in this Frame Report Entry, as described in 10.11.9.2. Average RCPI is a logarithmic function of the received signal power, as defined in the RCPI measurement subclause for the PHY Type.

Last RSNI indicates the received signal to noise indication of the most recently measured frame counted in this Frame Report Entry, as described in 8.4.2.43.

Last RCPI indicates the received channel power of the most recently measured frame counted in this Frame Report entry. Last RCPI is a logarithmic function of the received signal power, as defined in the RCPI measurement subclause for the PHY Type.

The Antenna ID field contains the identifying number for the antenna(s) used to receive the most recently measured frame counted in this Frame Report entry. Antenna ID is defined in 8.4.2.42.

Frame Count is a count of the data and management frames received with the indicated Transmit Address and BSSID during the measurement duration. The value 65 535 indicates a count of 65 535 or more.

The Vendor Specific subelement has the same format as the Vendor Specific element (see 8.4.2.28). Multiple Vendor Specific subelements are optionally present in the list of optional subelements.

8.4.2.24.9 STA Statistics Report

The format of the Measurement Report field of a STA Statistics Report is shown in Figure 8-153.

	Measurement Duration	Group Identity	Statistics Group Data	Optional Subelements
Octets:	2	1	variable	variable

Figure 8-153—Measurement Report field format for STA Statistics Report

The STA Statistics Report reports the change in the requested Statistics Group Data values measured within the Measurement Duration. When the Measurement Duration is equal to 0 the current values of the requested Statistics Group Data is reported, rather than the change.

The Measurement Duration is set to the duration over which the change in Statistics Group Data was measured and reported, expressed in units of TUs. A Measurement Duration value of 0 indicates a report of the current values of the Statistics Group Data.

Group Identity indicates the requested statistics group describing the Statistics Group Data according to Table 8-88.

Statistics Group Data contains the requested statistics from the MIB in Annex C related to the interface on which the request was received according to Table 8-88. Units used for reporting a statistic or change in statistic are the units used to define the statistic in Annex C. When Measurement Duration value is nonzero, the reported data values for statistics that are not counters are the current values of the statistics data at the end of the Measurement Duration.

Table 8-88—Group Identity for a STA Statistics Report

Group Identity Requested	Statistics Group Data field length (octets)	Statistics Returned
0	28	dot11Counters Group for the Interface on which the STA Statistics Request was received (with the exception of WEPUndecryptableCount and those counters listed in Group Identity 1): dot11TransmittedFragmentCount (Counter32), dot11GroupTransmittedFrameCount (Counter32), dot11FailedCount (Counter32), dot11ReceivedFragmentCount (Counter32), dot11GroupReceivedFrameCount (Counter32), dot11FCSErrorCount (Counter32), dot11TransmittedFrameCount (Counter32)
1	24	dot11MACStatistics Group for the Interface on which the STA Statistics Request was received: dot11RetryCount (Counter32), dot11MultipleRetryCount (Counter32), dot11FrameDuplicateCount (Counter32), dot11RTSSuccessCount (Counter32), dot11RTSFailureCount (Counter32), dot11ACKFailureCount (Counter32)

The Optional Subelements field format contains zero or more subelements, each consisting of a 1-octet Subelement ID field, a 1-octet Length field, and a variable-length Data field, as shown in Figure 8-402. Any optional subelements are ordered by nondecreasing subelement ID.

The Subelement ID field values for the defined optional subelements are shown in Table 8-89. A Yes in the Extensible column of a subelement listed in Table 8-89 indicates that the Length of the subelement might be extended in future revisions or amendments of this standard. When the Extensible column of an element is equal to Subelements, then the subelement might be extended in future revisions or amendments of this standard by defining additional subelements within the subelement. See 9.24.9.

Table 8-89—Optional subelement IDs for STA Statistics Report

Subelement ID	Name	Length field (octets)	Extensible
0	Reserved		
1	Reporting Reason	Variable	
2–220	Reserved		
221	Vendor Specific	1 to 240	
222–255	Reserved		

The format of the Measurement Report field for RSNA Counters Group is shown in Figure 8-158.

Bits:	1	1	1	1

Figure 8-161—Reporting Reason subelement for RSNA Counters

In a nontriggered STA Statistics Report, all fields in the Reporting Reason subelement are set to 0.

The Vendor Specific subelements have the same format as their corresponding elements (see 8.4.2.28). Multiple Vendor Specific subelements are optionally present in the list of optional subelements.

8.4.2.24.10 Location Configuration Information Report

An LCI Report includes Latitude, Longitude, Altitude, and optional Azimuth information. The LCI report format is shown in Figure 8-162.

This structure and information fields are little-endian, per conventions defined in 8.2.2, and are based on the LCI format described in IETF RFC 3825.

The definition of elements within the LCI report are as defined in Section 2.1 of IETF RFC 3825 (July 2004) or as defined herein.

	B0 B7	B8 B15
	Element ID	Length
Bits	8	8

	B16 B21	B22 B46
	Latitude Resolution	Latitude Fraction
Bits	6	25

	B47 B55	B56 B61
	Latitude Integer	Longitude Resolution
Bits	9	6

	B62 B86	B87 B95
	Longitude Fraction	Longitude Integer
Bits	25	9

	B96 B99	B100 B105	B106 B113
	Altitude Type	Altitude Resolution	Altitude Fraction
Bits	4	6	8

	B114 B135	B136 B143
	Altitude Integer	Datum
Bits	22	8

	B144
	Optional Subelements
Bits	variable

Figure 8-162—Measurement Report field format for Location Configuration Information Report

NOTE—An example of fixed/fractional notation, using the longitude of the Sears Tower from p. 13 of IETF RFC 3825 (July 2004):

> Longitude 87.63602 degrees West (or –87.63602 degrees),
> Using twos complement, 34 bit fixed point, 25 bit fraction,
> Longitude = 0xf50ba5b97,
> Longitude = 1101010000101110100101101110010111 (big-endian)
> DSE registered location expression for a Longitude resolution of 34-bits:
> Bits 56–61 Longitude resolution = (bit 56) 0 1 0 0 0 1 (bit 61)
> Bits 62–86 Longitude fraction = (bit 62) 1 1 1 0 1 0 0 1 1 1 0 1 1 0 1 0 0 1 0 1 1 1 0 1 0 (bit 86)
> Bits 87–95 Longitude integer = (bit 87) 0 0 0 1 0 1 0 1 1 (bit 95)
>
> The octets in transmission order = E2 E5 96 2E D4.

The Optional Subelements field format contains zero or more subelements, each consisting of a 1-octet Subelement ID field, a 1-octet Length field, and a variable-length Data field, as shown in Figure 8-402. Any optional subelements are ordered by nondecreasing subelement ID.

The Subelement ID field values for the defined optional subelements are shown in Table 8-90. A Yes in the Extensible column of a subelement listed in Table 8-90 indicates that the Length of the subelement might be extended in future revisions or amendments of this standard. When the Extensible column of an element is equal to Subelements, then the subelement might be extended in future revisions or amendments of this standard by defining additional subelements within the subelement. See 9.24.9.

Table 8-90—Optional subelement IDs for Location Configuration Information Report

Subelement ID	Name	Length field (octets)	Extensible
0	Reserved		
1	Azimuth Report	2	Yes
2	Originator Requesting STA MAC Address	6	No
3	Target MAC Address	6	No
4–220	Reserved		
221	Vendor Specific	1 to 232	
222–255	Reserved		

The Azimuth Report subelement is used to report an azimuth. The Azimuth Report subelement is as shown in Figure 8-163.

	Subelement ID	Length	Azimuth Report
Octets:	1	1	2

Figure 8-163—Azimuth Report subelement format

The value of the subelement ID is equal to the Azimuth Report value in Table 8-90.

The value of the Length field in octets is equal to 1.

The Azimuth Report field of an Azimuth Report subelement contains three subfields as shown in Figure 8-164.

	B0 B1	B2	B3 B6	B7 B15
	Reserved	Azimuth Type	Azimuth Resolution	Azimuth
Bits:	2	1	4	9

Figure 8-164—Azimuth Report subfield

Azimuth Type is set to 1 to report the Azimuth of the bearing of the requestor with respect to the responder, and is set to 0 to report the Azimuth of front surface of the reporting STA.

Azimuth Resolution is 4 bits, indicating the number of valid most significant bits in the Azimuth.

Azimuth is a 9-bit unsigned integer value in degrees from true north, of the type defined by the Azimuth Type field.

The Originator Requesting STA MAC Address subelement contains the MAC address of the STA that requested the Location Information and it is present whenever the location subject definition field in the corresponding LCI Request was set to 2. The format of the Originator Requesting STA MAC Address subelement is shown in Figure 8-126.

The Target MAC Address subelement contains the MAC address of the STA whose Location Information was requested and it is present whenever the location subject definition field in the corresponding LCI Request was set to 2. The format of the Target MAC Address subelement is shown in Figure 8-127.

The Vendor Specific subelement has the same format as the Vendor Specific element (see 8.4.2.28). Multiple Vendor Specific subelements are optionally present in the list of optional subelements.

8.4.2.24.11 Transmit Stream/Category Measurement Report

The Transmit Stream/Category Measurement applies to TIDs for Traffic Streams associated with TSPECs and also to TIDs for Traffic Categories for QoS traffic without TSPECs. The format of the Measurement Report field corresponding to a Transmit Stream/Category Measurement Report is shown in Figure 8-165.

	Actual Measurement Start Time	Measurement Duration	Peer STA Address	Traffic Identifier	Reporting Reason	Transmitted MSDU Count
Octets:	8	2	6	1	1	4

	MSDU Discarded Count	MSDU Failed Count	MSDU Multiple Retry Count	QoS CF-Polls Lost Count	Average Queue Delay	Average Transmit Delay
Octets:	4	4	4	4	4	4

	Bin 0 Range	Bin 0	Bin 1	Bin 2	Bin 3	Bin 4	Bin 5	Optional Subelements
Octets:	1	4	4	4	4	4	4	variable

Figure 8-165—Measurement Report field format for Transmit Stream/ Category Measurement Report

Actual Measurement Start Time is set to the TSF at the time at which the measurement started, or for a triggered Transmit Stream/Category Measurement Report, the TSF value at the reporting QoS STA when the trigger condition was met.

Measurement Duration is set to the duration over which the Transmit Stream/Category Measurement Report was measured, expressed in units of TUs. For a triggered Transmit Stream/Category Measurement Report, metrics are reported over a number of transmitted MSDUs rather than a duration; hence Measurement Duration is set to 0; see 10.11.9.8.

The Peer STA Address contains a MAC address indicating the RA for the measured frames.

The Traffic Identifier field contains the TID subfield as shown in Figure 8-128. The TID subfield indicates the TC or TS for which traffic was measured.

The Reporting Reason field is a bit field indicating the reason that the measuring QoS STA sent the transmit stream/category measurement report. The Reporting Reason field is shown in Figure 8-166.

	B0	B1	B2	B3 B7
	Average Trigger	Consecutive Trigger	Delay Trigger	Reserved
Bits:	1	1	1	5

Figure 8-166—Reporting Reason field

- The Average Trigger bit set to 1 indicates that the Transmit Stream/Category Measurement Report was generated as a triggered report due to the Average Error trigger.
- The Consecutive Trigger bit set to 1 indicates that the Transmit Stream/Category Measurement Report was generated as a triggered report due to the Consecutive Error trigger.
- The Delay Trigger bit set to 1 indicates that the Transmit Stream/Category Measurement Report was generated as a triggered report due to the delay exceeding the Delay Threshold.

When a Transmit Stream/Category Measurement Report is sent as a direct response to a Transmit Stream/Category Measurement Request and not as a triggered Transmit Stream/Category Measurement Report, all bit fields in the Reporting Reason field are set to 0. This is termed a requested Transmit Stream/Category Measurement Report. Within a triggered Transmit Stream/Category Measurement Report, more than one bit field in the Reporting Reason field might be set to 1 if more than one trigger condition was met.

The Transmitted MSDU Count, MSDU Failed Count, MSDU Discarded Count, MSDU Multiple Retry Count, QoS CF-Polls Lost Count, Average Queue Delay, Average Transmit Delay, and delay histogram fields relate to transmissions to the QoS STA given in the Peer STA Address field. Metrics are reported over the Measurement Duration, or for triggered transmit stream/category measurements, over the Measurement Count. Any counter that increments to a value of 2^{32}–1 terminates the measurement.

The Transmitted MSDU Count field contains the number of MSDUs for the TC or the TS specified by the TID that were successfully transmitted.

The MSDU Discarded Count field contains the number of MSDUs for the TC or the TS specified by the TID that were discarded due either to the number of transmit attempts exceeding dot11ShortRetryLimit or dot11LongRetryLimit (as appropriate), or due to the MSDU lifetime having been reached.

The MSDU Failed Count field contains the number of MSDUs for the TC or the TS specified by the TID that were discarded due to the number of transmit attempts exceeding dot11ShortRetryLimit or dot11LongRetryLimit (as appropriate).

The MSDU Multiple Retry Count field contains the number of MSDUs for the TC or the TS specified by the TID that were successfully transmitted after more than one retransmission attempt.

The QoS CF-Polls Lost Count field contains the number of QoS (+)CF-Poll frames that were transmitted where there was no response from the QoS STA. QoS CF-Polls Lost Count are returned only if the reporting QoS STA is contained within an AP and the TID is for a TS. This field is set to 0 when QoS CF-Polls Lost Count is not returned.

Average Queue Delay is the average queuing delay of the frames (MSDUs) that are passed to the MAC for the indicated Peer STA Address and the indicated Traffic Identifier. Queue Delay is expressed in TUs and is measured from the time the MSDU is passed to the MAC until the point at which the first or only fragment begins transmission.

Average Transmit Delay is the average delay of the frames (MSDUs) that are successfully transmitted for the indicated Peer STA Address and TID. Average Transmit Delay is measured from the time the MSDU is passed to the MAC until the point at which the entire MSDU has been successfully transmitted, including receipt of the final ACK from the peer STA if the QoSAck service class is being used. Average Transmit delay is expressed in units of TUs.

Bin 0 Range field value indicates the delay range of the first bin (Bin 0) of the Transmit Delay Histogram, expressed in units of TUs. It is also used to calculate the delay ranges of the other five bins making up the histogram. The delay range for each bin increases in a binary exponential fashion as follows:

Bin 0 range: $0 \leq \text{Delay} < B_0 = \text{Bin 0 Range field value}$

Bin i range: $2^{i-1} \times B_0 \leq \text{Delay} < 2^i \times B_0$, for $1 \leq i \leq 4$

Bin 5 range: $16 \times B_0 \leq \text{Delay}$

For example, if Bin 0 Range field value is 10 TUs, the bin delay ranges are as defined in Table 8-91.

Table 8-91—Delay definitions for a Transmit Stream/Category Measurement Report for a Bin 0 Range field value of 10 TU

Bin	Measured MSDU Transmit Delay (TUs)
0	Delay < 10
1	10 ≤ Delay < 20
2	20 ≤ Delay < 40
3	40 ≤ Delay < 80
4	80 ≤ Delay < 160
5	160 ≤ Delay

To compute the value reported in Bin i (i.e., B_i for i = 0, 1...5 of the Transmit Delay Histogram), the STA initializes all bin values to 0. For each MSDU successfully transmitted, the measured MSDU Transmit Delay determines which bin is to be incremented. If the measured delay has a duration time t within Bin i, then Bin i is increased by one. MSDU Transmit Delay is measured from the time the MSDU is passed to the MAC until the point at which the entire MSDU has been successfully transmitted, including receipt of the final ACK from the peer STA if the QoSAck service class is being used. The sum of the values in all six bins is equal to the value reported in the Transmitted MSDU Count.

The Optional Subelements field format contains zero or more subelements, each consisting of a 1-octet Subelement ID field, a 1-octet Length field, and a variable-length Data field, as shown in Figure 8-402. Any optional subelements are ordered by nondecreasing subelement ID.

The Subelement ID field values for the defined optional subelements are shown in Table 8-92. A Yes in the Extensible column of a subelement listed in Table 8-92 indicates that the Length of the subelement might be extended in future revisions or amendments of this standard. When the Extensible column of an element is equal to Subelements, then the subelement might be extended in future revisions or amendments of this standard by defining additional subelements within the subelement. See 9.24.9.

Table 8-92—Optional subelement IDs for Transmit Stream/Category Measurement Report

Subelement ID	Name	Length field (octets)	Extensible
0–220	Reserved		
221	Vendor Specific	1 to 179	
222–255	Reserved		

The Vendor Specific subelements have the same format as their corresponding elements (see 8.4.2.28). Multiple Vendor Specific subelements are optionally present in the list of optional subelements.

8.4.2.24.12 Multicast Diagnostics Report

The format of the Measurement Report field of a Multicast Diagnostics report is shown in Figure 8-167.

	Measurement Time	Measurement Duration	Group MAC Address	Multicast Reporting Reason	Multicast Received MSDU Count
Octets:	8	2	6	1	4

	First Sequence Number	Last Sequence Number	Multicast Rate	Optional Subelements
Octets:	2	2	2	variable

Figure 8-167—Measurement Report field format for a Multicast Diagnostics Report

The Measurement Time field is the value of the STA TSF timer at the time the measurement started. For a triggered Multicast Diagnostics report, this is the TSF value at the reporting STA when the trigger condition was met. When the reason for sending the report is Performance Measurement and the Multicast Received MSDU Count is nonzero, the Measurement Time field is the value of the STA TSF timer at the time of the first group addressed MSDU received during the measurement interval.

The Measurement Duration field specifies the period over which the Multicast Diagnostic Report was generated, expressed in units of TUs.

The Group MAC Address field contains the value from the Group MAC Address field from the Multicast Diagnostics Request to which the report relates.

The Multicast Reporting Reason field indicates the reason why the measuring STA sent the Multicast Diagnostics report. The Multicast Reporting Reason field is shown in Figure 8-168.

	B0	B1	B2 B7
	Inactivity Timeout Trigger	Measurement Result	Reserved
Bits:	1	1	6

Figure 8-168—Multicast Reporting Reason field

The subfields of the Multicast Reporting Reason field are defined as follows:

- The Inactivity Timeout Trigger field set to 1 indicates that Multicast Diagnostics Report was generated as a triggered report due to the timeout of the multicast diagnostic timer.
- The Measurement Result field set to 1 indicates that the Multicast Diagnostic Report contains the result of completing a multicast diagnostic request that did not contain a Multicast Triggered Reporting subelement.

All the bits in the Multicast Reporting Reason field are independent.

The Multicast Received MSDU Count field contains the total number of group addressed MSDUs with the indicated Multicast MAC Address that were received during the Measurement Duration. For a triggered multicast diagnostics measurement, the Multicast Received MSDU Count field contains the total number of group addressed MSDUs with the indicated Multicast MAC Address that were received between the acceptance of the multicast diagnostics measurement request and the occurrence of the trigger condition.

When the LSB of the first octet of the Multicast MAC address field in the multicast diagnostic request is 1, the twelve LSBs of the First Sequence Number field contain the sequence number of the first frame received with destination address equal to the value in the Multicast MAC address field during the measurement period. When the LSB of the first octet of the Multicast MAC address field in the multicast diagnostic request is 0, the twelve LSBs of the First Sequence Number field contain the sequence number of the first group addressed frame, that does not have the broadcast MAC address as its destination, received during the measurement period. The four most significant bits of the First Sequence Number field are set to 0.

When the LSB of the first octet of the Multicast MAC address field in the multicast diagnostic request is 1, the twelve LSBs of the Last Sequence Number field contain the sequence number of the last frame received with destination address equal to the value in the Multicast MAC address field during the measurement period. When the LSB of the first octet of the Multicast MAC address field in the multicast diagnostic request is 0, the twelve LSBs of the Last Sequence Number field contain the sequence number of the last group addressed frame, that does not have the broadcast MAC address as its destination, received during the measurement period. The four most significant bits of the Last Sequence Number field are set to 0.

The First Sequence Number field and the Last Sequence Number field are set to 0 if the Multicast Received MSDU Count is 0.

The Multicast Rate field specifies the highest data rate, in 0.5 Mb/s units, at which the STA has received a group addressed frame with a valid FCS during the measurement period.The Multicast Rate field is encoded with the MSB set to 1 to indicate that the data rate is in the basic rate set, and set to 0 to indicate that the data rate is not in the basic rate set. The remaining 15 bit value is multiplied by 0.5 Mb/s to indicate the data rate. The Multicast Rate field is 0 by the STA to indicate that it has not received a group addressed frame with a valid FCS during the measurement period.

The Optional Subelements field format contains zero or more subelements, each consisting of a 1-octet Subelement ID field, a 1-octet Length field and a variable-length Data field, as shown in Figure 8-402. The optional subelements are ordered by nondecreasing subelement ID.

The Subelement ID field values for the defined optional subelements are shown in Table 8-93. A Yes in the Extensible column of a subelement listed in Table 8-93 indicates that the length of the subelement might be extended in future revisions or amendments of this standard. When the Extensible column of an element is Subelement, then the subelement might be extended in future revisions or amendments of this standard by defining additional subelements within the subelement. See 9.24.9.

Table 8-93—Optional subelement IDs for Multicast Diagnostics Report

Subelement ID	Name	Length field (octets)	Extensible
0–220	Reserved		
221	Vendor Specific	1 to 239	
222–255	Reserved		

The summary of fields used in the STA Multicast Diagnostics Report is shown in Table 8-94.

Table 8-94—Summary of fields used in the STA Multicast Diagnostics Report

Field	Measurement Result	Triggered Report
Measurement Time	Yes	Yes
Measurement Duration	Yes	Yes
Group MAC Address	Yes	Yes
Multicast Reporting Reason	Yes	Yes
Multicast Received MSDU Count	Yes	Yes
First Sequence Number	Yes	Yes
Last Sequence Number	Yes	Yes
Multicast Rate	Yes	Yes
Optional Subelements	Optional	Optional

The use of Multicast Diagnostics Report is defined in 10.11.19.

8.4.2.24.13 Location Civic Report

The Location Civic Report includes the location information defined in Civic format for the location subject provided in the Location Civic measurement request, as shown in Figure 8-169.

	Civic Location Type	Optional Subelements	Civic Location
Octets:	1	variable	variable

Figure 8-169—Location Civic Report field format

The Civic Location Type field contains the format of location information in the Civic Location field, as indicated in Table 8-77.

When the Civic Location Type is IETF RFC4776-2006, the Optional Subelements field may optionally include the Location Reference, Location Shape, Map Image, and Vendor Specific subelements as defined in Table 8-95.

When the Civic Location Type value is Vendor Specific, a Vendor Specific subelement is included in the Optional Subelements field that identifies the Organization Identifier corresponding to the Civic Location Type.

The Optional Subelements field format contains zero or more subelements, each consisting of a 1-octet Subelement ID field, a 1-octet Length field, and a variable-length Data field, as shown in Figure 8-402. The optional subelements are ordered by nondecreasing subelement ID.

The Subelement ID field values for the defined optional subelements are shown in Table 8-95. A Yes in the Extensible column of a subelement listed in Table 8-95 indicates that the length of the subelement might be extended in future revisions or amendments of this standard. When the Extensible column of an element is Subelement, then the subelement might be extended in future revisions or amendments of this standard by defining additional subelements within the subelement. See 9.24.9.

Table 8-95—Optional subelement IDs for Location Civic Report

Subelement ID	Name	Length field (octets)	Extensible
0	Reserved		
1	Originator Requesting STA MAC Address	6	No
2	Target MAC Address	6	No
3	Location Reference	Variable	
4	Location Shape	Variable	
5	Map Image	Variable	
6–220	Reserved		
221	Vendor Specific	1 to 237	
222–255	Reserved		

The Originator Requesting STA MAC Address subelement contains the MAC address of the STA that requested the Location Information and it is present whenever the location subject definition field in the corresponding Location Civic Request was set to 2. The format of the Originator Requesting STA MAC Address subelement is shown in Figure 8-126.

The Target MAC Address subelement contains the MAC address of the STA whose Location Information was requested and it is present whenever the location subject definition field in the corresponding Location Civic Request was set to 2. The format of the Target MAC Address subelement is shown in Figure 8-127.

The format of the Location Reference subelement is shown in Figure 8-170.

	Subelement ID	Length	Location Reference
Octets:	1	1	variable

Figure 8-170—Location Reference subelement format

The Location Reference is an ASCII string that defines a position on a floor from which the relative location contained in the Location Shape subelement is offset. A Location Reference value of 0 length indicates that the position of the Location Shape is top north west corner (i.e., 0,0) of the floor plan that on which the Location Shape is defined.

The format of the Location Shape subelement is shown in Figure 8-171.

	Subelement ID	Length	Location Shape ID	Location Shape Value
Octets:	1	1	1	variable

Figure 8-171—Location Shape subelement format

The Location Shape subelement defines the position in meters, including uncertainty, of the entity being located. A Shape is specified with respect to either a 2-Dimensional or 3-Dimensional Coordinate Reference System where each point in the shape defines the direction from the Location Reference starting point. A positive X-axis value corresponds to an easterly direction relative to the Location Reference; a negative X-axis value corresponds to a westerly direction relative to the Location Reference; a positive Y-axis value corresponds to a northerly direction relative to the Location Reference; a negative Y-axis value corresponds to a southerly direction relative to the Location Reference and the Z-axis value corresponds to the altitude above the horizontal plane at the Location Reference.

The Location Shape ID field contains a one-octet identifier that defines the shape contained in the subelement and is one of the values defined in Table 8-96.

Table 8-96—Location Shape IDs

Location Shape ID	Name	Length (octets)
0	Reserved	
1	2-Dimension Point	8
2	3-Dimension Point	12
3	Circle	12
4	Sphere	16
5	Polygon	Variable
6	Prism	Variable
7	Ellipse	18
8	Ellipsoid	26
9	Arcband	20
10–255	Reserved	

The Location Shape Value field contains the location shape value for each corresponding Location Shape ID. The formats of Location Shape Values are described in the following text.

All shape field value units that are 4-octet single precision floating point values are in meters and are represented by binary32 floating point values as defined in IEEE Std 754-2008, with the least significant bit of the fraction occurring in bit 0 of the field.

The format of the 2-Dimension Point Location Shape Value is defined in Figure 8-172.

	X-coordinate	Y-coordinate
Octets:	4	4

Figure 8-172—2-Dimension Point Location Shape Value format

The X-coordinate field contains a 4-octet single precision floating point value.

The Y-coordinate field contains a 4-octet single precision floating point value.

The format of the 3-Dimension Point Location Shape Value is defined in Figure 8-173.

	X-coordinate	Y-coordinate	Z-coordinate
Octets:	4	4	4

Figure 8-173—3-Dimension Point Location Shape Value format

The X-coordinate field contains a 4-octet single precision floating point value.

The Y-coordinate field contains a 4-octet single precision floating point value.

The Z-coordinate field contains a 4-octet single precision floating point value.

The format of the Circle Location Shape Value is defined in Figure 8-174.

	X-coordinate	Y-coordinate	Radius
Octets:	4	4	4

Figure 8-174—Circle Location Shape Value format

The X-coordinate field contains a 4-octet single precision floating point value.

The Y-coordinate field contains a 4-octet single precision floating point value.

The Radius field contains a 4-octet single precision floating point value.

The format of the Sphere Location Shape Value is defined in Figure 8-175.

	X-coordinate	Y-coordinate	Z-coordinate	Radius
Octets:	4	4	4	4

Figure 8-175—Sphere Location Shape Value format

The X-coordinate field contains a 4-octet single precision floating point value.

The Y-coordinate field contains a 4-octet single precision floating point value.

The Z-coordinate field contains a 4-octet single precision floating point value.

The Radius field contains a 4-octet single precision floating point value.

The format of the Polygon Location Shape Value is defined in Figure 8-176.

	Number of Points	List of 2-Dimension Points
Octets:	1	variable

Figure 8-176—Polygon Location Shape Value format

The Number of Points field is a 1 octet unsigned integer that specifies the number of points defined in the polygon. The value 0 is reserved.

The List of 2-Dimension Points is a sequence of 2D Point field values that define the closed polygon.

The format of the Prism Location Shape Value is defined in Figure 8-177.

	Number of Points	List of 3-Dimension Points
Octets:	1	variable

Figure 8-177—Prism Location Shape Value format

The Number of Points field is a 1 octet unsigned integer that specifies the number of points defined in the prism. The value 0 is reserved.

The List of 3-Dimension Points is a sequence of 3-Dimension Point field values that define the closed prism.

The format of the Ellipse Location Shape Value is defined in Figure 8-178.

	X-coordinate	Y-coordinate	Angle	Semi-Major Axis	Semi-Minor Axis
Octets:	4	4	2	4	4

Figure 8-178—Ellipse Location Shape Value format

The X-coordinate field contains a 4-octet single precision floating point value.

The Y-coordinate field contains a 4-octet single precision floating point value.

The Angle field contains a 2-octet unsigned integer between 0 and 359 degrees.

The Semi-Major Axis field contains a 4-octet single precision floating point value.

The Semi-Minor Axis field contains a 4-octet single precision floating point value.

The format of the Ellipsoid Location Shape Value is defined in Figure 8-179.

	X-coordinate	Y-coordinate	Z-coordinate	Angle	Semi-Major Axis	Semi-Minor Axis	Semi-Vertical Axis
Octets:	4	4	4	2	4	4	4

Figure 8-179—Ellipsoid Location Shape Value format

The X-coordinate field contains a 4-octet single precision floating point value.

The Y-coordinate field contains a 4-octet single precision floating point value.

The Angle field contains a 2-octet unsigned integer between 0 and 359 degrees.

The Semi-Major Axis field contains a 4-octet single precision floating point value.

The Semi-Minor Axis field contains a 4-octet single precision floating point value.

The Semi-Vertical Axis field contains a 4-octet single precision floating point value.

The format of the Arcband Location Shape Value is defined in Figure 8-180.

	X-coordinate	Y-coordinate	Inner Radius	Outer Radius	Start Angle	Opening Angle
Octets:	4	4	4	4	2	2

Figure 8-180—Arcband Location Shape Value format

The X-coordinate field contains a 4-octet single precision floating point value.

The Y-coordinate field contains a 4-octet single precision floating point value.

The Inner Radius field contains a 4-octet single precision floating point value.

The Outer Radius field contains a 4-octet single precision floating point value.

The Start Angle field contains a 2-octet unsigned integer between 0 and 359.

The Opening Angle field contains a 2-octet unsigned integer between 0 and 359.

The Map Image subelement contains a map reference that is used in combination with the Location Reference and Location Shape subelements. The format of the Map Image subelement is shown in Figure 8-181.

	Subelement ID	Length	Map Type	Map URL
Octets:	1	1	1	variable

Figure 8-181—Map Image subelement format

The Map Type field is a 1-octet unsigned integer that defines the type of map referred to by the Map URL field, as defined in Table 8-97.

Table 8-97—Map Types

Map Type Value	Name
0	URL Defined
1	Png
2	Gif
3	Jpeg
4	Svg
5	dxf
6	Dwg
7	Dwf
8	cad
9	Tiff
10	gml
11	Kml
12	Bmp
13	Pgm
14	ppm
15	Xbm
16	Xpm
17	ico
18–255	Reserved

The Map Type field value “URL Defined” indicates the Map URL field value has a file extension, defined as a mime type and is self-descriptive.

The Map URL field is a variable-length field formatted in accordance with IETF RFC 3986-2005 and provides the location of a floor map.

The Civic Location field of the Location Civic Report (see Figure 8-169) is a variable octet field and contains the location information in the format as indicated in the Civic Location Type field.

8.4.2.24.14 Location Identifier Report

The Location Identifier Report includes an indirect reference to the location information for the location subject provided in the Location Identifier measurement request, as shown in Figure 8-182.

	Expiration TSF	Optional Subelements	Public Identifier URI
Octets:	8	variable	variable

Figure 8-182—Location Identifier Report field format

The Expiration TSF field is the value of the TSF when the Public Identifier URI field value is no longer valid. The Expiration TSF field set to 0 indicates the Public Identifier URI does not expire.

The Optional Subelements field format contains zero or more subelements, each consisting of a 1-octet Subelement ID field, a 1-octet Length field and a variable-length Data field, as shown in Figure 8-402. Any optional subelements are ordered by nondecreasing subelement ID.

The Subelement ID field values for the defined optional subelements are shown in Table 8-98. A Yes in the Extensible column of a subelement listed in Table 8-98 indicates that the Length of the subelement might be extended in future revisions or amendments of this standard. When the Extensible column of an element is Subelement, then the subelement might be extended in future revisions or amendments of this standard by defining additional subelements within the subelement. See 9.24.9.

Table 8-98—Optional subelement IDs for Location Identifier Report

Subelement ID	Name	Length field (octets)	Extensible
0	Reserved		
1	Originator Requesting STA MAC Address	6	No
2	Target MAC Address	6	No
3–220	Reserved		
221	Vendor Specific	1 to 237	
222–255	Reserved		

The Originator Requesting STA MAC Address subelement contains the MAC address of the STA that requested the Location Information and it is present whenever the location subject definition field in the corresponding Location Identifier Request was set to 2. The format of the Originator Requesting STA MAC Address subelement is shown in Figure 8-126.

The Target MAC Address subelement contains the MAC address of the STA whose Location Information was requested and it is present whenever the location subject definition field in the corresponding Location Identifier Request was set to 2. The format of the Target MAC Address subelement is shown in Figure 8-127.

The Public Identifier URI field contains a value in URI format that points to a location object. It can be used to return the location value for the requesting STA. The format of the location value returned when the URI is dereferenced is dependent on the provider of the URI and is beyond the scope of this document. The Public Identifier URI confirms the validity of the location estimate to an external agent when a STA forwards a location estimate to that agent. The protocol used to query the infrastructure for a location report based on the Public Identifier URI is beyond the scope of this standard.

8.4.2.25 Quiet element

The Quiet element defines an interval during which no transmission occurs in the current channel. This interval may be used to assist in making channel measurements without interference from other STAs in the BSS. The format of the Quiet element is shown in Figure 8-183.

	Element ID	Length	Quiet Count	Quiet Period	Quiet Duration	Quiet Offset
Octets:	1	1	1	1	2	2

Figure 8-183—Quiet element format

The Length field is set to 6.

The Quiet Count field is set to the number of TBTTs until the beacon interval during which the next quiet interval starts. A value of 1 indicates the quiet interval starts during the beacon interval starting at the next TBTT. A value of 0 is reserved.

The Quiet Period field is set to the number of beacon intervals between the start of regularly scheduled quiet intervals defined by this Quiet element. A value of 0 indicates that no periodic quiet interval is defined.

The Quiet Duration field is set to the duration of the quiet interval, expressed in TUs.

The Quiet Offset field is set to the offset of the start of the quiet interval from the TBTT specified by the Quiet Count field, expressed in TUs. The value of the Quiet Offset field is less than one beacon interval.

The Quiet element may be included in Beacon frames, as described in 8.3.3.2, and Probe Response frames, as described in 8.3.3.10. The use of Quiet elements is described in 10.9.3.

8.4.2.26 IBSS DFS element

The IBSS DFS element contains information for DFS operation in an IBSS. The format of the IBSS DFS element is shown in Figure 8-184.

	Element ID	Length	DFS Owner	DFS Recovery Interval	Channel Map (see Figure 8-185)
Octets:	1	1	6	1	2×*n*

Figure 8-184—IBSS DFS element format

	Channel Number	Map
Octets:	1	1

n tuples, one for each supported channel

Figure 8-185—Channel Map field format

The Length field is variable.

The DFS Owner field is set to the individual IEEE MAC address of the STA that is the currently known DFS Owner in the IBSS.

The DFS Recovery Interval field indicates the time interval that is used for DFS owner recovery, expressed as an integral number of beacon intervals. The DFS Recovery Interval value is static throughout the lifetime of the IBSS and is determined by the STA that starts the IBSS.

The Channel Map field shown in Figure 8-185 contains a Channel Number field and a Map field (see 8.4.2.24.2) for each channel supported by the STA transmitting the IBSS DFS element. Note that *n* in

Figure 8-184 is the number of channels supported by the STA.

The IBSS DFS element may be included in Beacon frames, as described in 8.3.3.2, and Probe Response frames, as described in 8.3.3.10. The use of IBSS DFS elements is described in 10.9.8.3.

8.4.2.27 RSNE

8.4.2.27.1 General

The RSNE contains authentication and pairwise cipher suite selectors, a single group data cipher suite selector, an RSN Capabilities field, the PMK identifier (PMKID) count, a PMKID list, and a single group management cipher suite selector. See Figure 8-186. The size of the RSNE is limited by the size of an element, which is 255 octets. Therefore, the number of pairwise cipher suites, AKM suites, and PMKIDs is limited.

	Element ID	Length	Version	Group Data Cipher Suite	Pairwise Cipher Suite Count	Pairwise Cipher Suite List
Octets:	1	1	2	4	2	4 × *m*

	AKM Suite Count	AKM Suite List	RSN Capabilities	PMKIDCount	PMKID List	Group Management Cipher Suite
Octets:	2	4 × *n*	2	2	16 × *s*	4

Figure 8-186—RSNE format

In Figure 8-186, *m* denotes the pairwise cipher suite count, *n* the AKM suite count, and *s* is the PMKID count.

All fields use the bit convention from 8.2.2. The RSNE contains up to and including the Version field. All fields after the Version field are optional. If any nonzero length field is absent, then none of the subsequent fields is included.

Element ID is set to the value for RSN, specified in Table 8-54.

Length gives the number of octets in the Information field (field(s) following the Element ID and Length fields) of the element.

The Version field indicates the version number of the RSNA protocol. The range of Version field values a STA supports is contiguous. Values 0 and 2 or higher of the Version field are reserved. RSN Version 1 is defined in this standard.

NOTE—The following represent sample elements:

802.1X authentication, CCMP pairwise and group data cipher suites (WEP-40, WEP-104, and TKIP not allowed):

```
30, // element id, 48 expressed as Hex value
14, // length in octets, 20 expressed as Hex value
01 00, // Version 1
00 0F AC 04, // CCMP as group data cipher suite
01 00, // pairwise cipher suite count
00 0F AC 04, // CCMP as pairwise cipher suite
01 00, // authentication count
00 0F AC 01 // 802.1X authentication
00 00 // No capabilities
```

802.1X authentication, CCMP pairwise and group data cipher suites (WEP-40, WEP-104 and TKIP not allowed), preauthentication supported:

```
30, // element id, 48 expressed as Hex value
14, // length in octets, 20 expressed as Hex value
01 00, // Version 1
00 0F AC 04, // CCMP as group data cipher suite
01 00, // pairwise cipher suite count
00 0F AC 04, // CCMP as pairwise cipher suite
01 00, // authentication count
00 0F AC 01 // 802.1X authentication
01 00 // Preauthentication capabilities
```

802.1X authentication, Use GTK for pairwise cipher suite, WEP-40 group data cipher suites, optional RSN Capabilities field omitted:

```
30, // element id, 48 expressed as Hex value
12, // length in octets, 18 expressed as Hex value
01 00, // Version 1
00 0F AC 01, // WEP-40 as group data cipher suite
01 00, // pairwise cipher suite count
00 0F AC 00, // Use group key as pairwise cipher suite
01 00, // authentication count
00 0F AC 01 // 802.1X authentication
```

802.1X authentication, Use CCMP for pairwise cipher suite, CCMP group data cipher suites, preauthentication and a PMKID:

```
30, // element id, 48 expressed as Hex value
26 // length in octets, 38 expressed as Hex value
01 00, // Version 1
00 0F AC 04, // CCMP as group data cipher suite
01 00, // pairwise cipher suite count
00 0F AC 04, // CCMP as pairwise cipher suite
01 00, // authentication count
00 0F AC 01 // 802.1X authentication
01 00 // Preauthentication capabilities
01 00 // PMKID Count
01 02 03 04 05 06 07 08 09 0A 0B 0C 0D 0E 0F 10 // PMKID
```

802.1X authentication, CCMP pairwise and group data cipher suites (WEP-40, WEP-104, and TKIP are not allowed), and management frame protection with AES-128-CMAC as the group management suite selector.

```
30, // element id, 48 expressed as Hex value
1A, // length in octets, 26 expressed as Hex value
01 00, // Version 1
00 0F AC 04, // CCMP as group data cipher suite
01 00, // pairwise cipher suite count
00 0F AC 04, // CCMP as pairwise cipher suite
01 00, // authentication count
00 0F AC 01 // IEEE 802.1X authentication
80 00 // management frame protection is enabled but not required
00 00 // No PMKIDs
00 0F AC 06, // BIP as the broadcast/multicast management cipher suite
```

8.4.2.27.2 Cipher suites

The Group Data Cipher Suite field contains the cipher suite selector used by the BSS to protect group addressed frames.

The Pairwise Cipher Suite Count field indicates the number of pairwise cipher suite selectors that are contained in the Pairwise Cipher Suite List field.

The Pairwise Cipher Suite List field contains a series of cipher suite selectors that indicate the pairwise cipher suites contained in the RSNE.

The Group Management Cipher Suite field contains the cipher suite selector used by the BSS to protect group addressed robust management frames.

When management frame protection is negotiated, the negotiated pairwise cipher suite is used to protect individually addressed robust management frames, and the group management cipher suite is used to protect group addressed robust management frames. Use of AES-128-CMAC is not valid as a data cipher suite.

A suite selector has the format shown in Figure 8-187.

	OUI	Suite Type
Octets:	3	1

Figure 8-187—Suite selector format

The order of the OUI (organizationally unique identifier) field is described in 8.2.2.

Table 8-99 provides the cipher suite selectors defined by this standard.

Table 8-99—Cipher suite selectors

OUI	Suite type	Meaning
00-0F-AC	0	Use group cipher suite
00-0F-AC	1	WEP-40
00-0F-AC	2	TKIP
00-0F-AC	3	Reserved
00-0F-AC	4	CCMP – default pairwise cipher suite and default group cipher suite for data frames in an RSNA
00-0F-AC	5	WEP-104
00-0F-AC	6	BIP—default group management cipher suite in an RSNA with management frame protection enabled
00-0F-AC	7	Group addressed traffic not allowed
00-0F-AC	8–255	Reserved
Vendor OUI	Other	Vendor-specific
Other	Any	Reserved

The cipher suite selector 00-0F-AC:4 (CCMP) is the default cipher suite value.

The cipher suite selectors 00-0F-AC:1 (WEP-40) and 00-0F-AC:5 (WEP-104) are only valid as a group cipher suite in a transition security network (TSN) to allow pre-RSNA devices to join an IBSS or to associate with an infrastructure BSS.

Use of any group cipher suite other than TKIP, WEP-104, or WEP-40 with TKIP as the pairwise cipher suite is not supported.

The cipher suite selector 00-0F-AC:0 (Use group cipher suite) is only valid as the pairwise cipher suite. An AP may specify the selector 00-0F-AC:0 (Use group cipher suite) for a pairwise cipher suite if it does not support any pairwise cipher suites. If an AP specifies 00-0F-AC:0 (Use group cipher suite) as the pairwise cipher selection, this is the only pairwise cipher selection the AP advertises.

If any cipher suite other than TKIP, WEP-104, or WEP-40 is enabled, then the AP supports pairwise keys, and thus the suite selector 00-0F-AC:0 (Use group cipher suite) is not a valid option.

Table 8-100 indicates the circumstances under which each cipher suite is used.

Table 8-100—Cipher suite usage

Cipher suite selector	GTK	PTK	IGTK
Use group key	No	Yes	No
WEP-40	Yes	No	No
WEP-104	Yes	No	No
TKIP	Yes	Yes	No
CCMP	Yes	Yes	No
BIP	No	No	Yes

8.4.2.27.3 AKM suites

The AKM Suite Count field indicates the number of AKM suite selectors that are contained in the AKM Suite List field.

The AKM Suite List field contains a series of AKM suite selectors contained in the RSNE. In an IBSS only a single AKM suite selector may be specified because STAs in an IBSS use the same AKM suite and because there is no mechanism to negotiate the AKMP in an IBSS (see 11.5.5).

Each AKM suite selector specifies an AKMP. Table 8-101 gives the AKM suite selectors defined by this standard. An AKM suite selector has the format shown in Figure 8-187.

Table 8-101—AKM suite selectors

OUI	Suite type	Meaning		
		Authentication type	Key management type	Key derivation type
00-0F-AC	0	Reserved	Reserved	Reserved
00-0F-AC	1	Authentication negotiated over IEEE 802.1X or using PMKSA caching as defined in 11.5.9.3 – RSNA default	RSNA key management as defined in 11.6 or using PMKSA caching as defined in 11.5.9.3 – RSNA default	Defined in 11.6.1.2
00-0F-AC	2	PSK	RSNA key management as defined in 11.6, using PSK	Defined in 11.6.1.2
00-0F-AC	3	FT authentication negotiated over IEEE 802.1X	FT key management as defined in 11.6.1.7	Defined in 11.6.1.7.2
00-0F-AC	4	FT authentication using PSK	FT key management as defined in 11.6.1.7	Defined in 11.6.1.7.2

Table 8-101—AKM suite selectors *(continued)*

OUI	Suite type	Meaning		
		Authentication type	Key management type	Key derivation type
00-0F-AC	5	Authentication negotiated over IEEE 802.1X or using PMKSA caching as defined in 11.5.9.3 with SHA256 Key Derivation	RSNA Key Management as defined in 8.5 or using PMKSA caching as defined in 11.5.9.3, with SHA256 Key Derivation	Defined in 11.6.1.7.2
00-0F-AC	6	PSK with SHA256 Key Derivation	RSNA Key Management as defined in 11.6 using PSK with SHA256 Key Derivation	Defined in 11.6.1.7.2
00-0F-AC	7	TDLS	TPK Handshake	Defined in 11.6.1.7.2
00-0F-AC	8	SAE Authentication with SHA-256 or using PMKSA caching as defined in 11.5.9.3 with SHA-256 key derivation	RSNA key management as defined in 11.6, PMKSA caching as defined in 11.5.9.3 with SHA256 key derivation or authenticated mesh peering exchange as defined in 13.5	Defined in 11.6.1.7.2
00-0F-AC	9	FT authentication over SAE with SHA-256	FT key management defined in 11.6.1.7	Defined in 11.6.1.7.2
00-0F-AC	10–255	Reserved	Reserved	Reserved
Vendor OUI	Any	Vendor-specific	Vendor-specific	Vendor-specific
Other	Any	Reserved	Reserved	Reserved

The AKM suite selector value 00-0F-AC:1 (i.e., Authentication negotiated over IEEE 802.1X with RSNA key management as defined in 11.6 or using PMKSA caching as defined in 11.5.9.3) is the assumed default when the AKM suite selector field is not supplied.

NOTE—The selector value 00-0F-AC:1 specifies only that IEEE Std 802.1X-2004 is used as the authentication transport. IEEE Std 802.1X-2004 selects the authentication mechanism.

The AKM suite selector value 00-0F-AC:8 (i.e., SAE Authentication with SHA-256 or using PMKSA caching as defined in 11.5.9.3 with SHA-256 key derivation) is used when either a password or PSK is used with RSNA key management.

NOTE—Selector values 00-0F-AC:1 and 00-0F-AC:8 can simultaneously be enabled by an Authenticator.

The AKM suite selector value 00-0F-AC:2 (PSK) is used when an alternate form of PSK is used with RSNA key management.

NOTE—Selector values 00-0F-AC:1 and 00-0F-AC:2 can simultaneously be enabled by an Authenticator.

8.4.2.27.4 RSN capabilities

The RSN Capabilities field indicates requested or advertised capabilities. If the RSN Capabilities field is not present, the default value of 0 is used for all the capability subfields.

The length of the RSN Capabilities field is 2 octets. The format of the RSN Capabilities field is as illustrated in Figure 8-188 and described after the figure.

	B0	B1	B2 B3	B4 B5	B6	B7
	Preauthentication	No Pairwise	PTKSA Replay Counter	GTKSA Replay Counter	Management Frame Protection Required (MFPR)	Management Frame Protection Capable (MFPC)
Bits:	1	1	2	2	1	1

	B8	B9	B10	B11	B12	B13	B14 B15
	Reserved	Peerkey Enabled	SPP A-MSDU Capable	SPP A-MSDU Required	PBAC	Extended Key ID for Individually Addressed Frames	Reserved
Bits:	1	1	1	1	1	1	2

Figure 8-188—RSN Capabilities field format

— Bit 0: Preauthentication. An AP sets the Preauthentication subfield of the RSN Capabilities field to 1 to signal it supports preauthentication (see 11.5.9.2) and sets the subfield to 0 when it does not support preauthentication. A non-AP STA sets the Preauthentication subfield to 0.

— Bit 1: No Pairwise. If a STA supports WEP default key 0 simultaneously with a pairwise key (see 11.6.1), then the STA sets the No Pairwise subfield of the RSN Capabilities field to 0.

If a STA does not support WEP default key 0 simultaneously with a pairwise key (see 11.6.1), then the STA sets the No Pairwise subfield of the RSN Capabilities field to 1.

The No Pairwise subfield describes a capability of a non-AP STA. STAs in an IBSS and APs set the No Pairwise subfield to 0.

The No Pairwise subfield is set to 1 only in a TSN and when the pairwise cipher suite selected by the STA is TKIP.

— Bits 2–3: PTKSA Replay Counter. A STA sets the PTKSA Replay Counter subfield of the RSN Capabilities field to the value contained in dot11RSNAConfigNumberofPTKSAReplayCounters. The least significant bit (LSB) of dot11RSNAConfigNumberofPTKSAReplayCounters is put in bit 2. See 11.4.2.6 and 11.4.3.4.4. The meaning of the value in the PTKSA/GTKSA/STKSA Replay Counter subfield is defined in Table 8-102. The number of replay counters per STKSA is the same as the number of replay counters per PTKSA.

Table 8-102—PTKSA/GTKSA/STKSA replay counters usage

Replay counter value	Meaning
0	1 replay counter per PTKSA/GTKSA/STKSA
1	2 replay counters per PTKSA/GTKSA/STKSA
2	4 replay counters per PTKSA/GTKSA/STKSA
3	16 replay counters per PTKSA/GTKSA/STKSA

— Bits 4–5: GTKSA Replay Counter. A STA sets the GTKSA Replay Counter subfield of the RSN Capabilities field to the value contained in dot11RSNAConfigNumberofPTKSAReplayCounters. The LSB of dot11RSNAConfigNumberofGTKSAReplayCounters is put in bit 4. See 11.4.2.6 and 11.4.3.4.4. The meaning of the value in the GTKSA Replay Counter subfield is defined in Table 8-102.

— Bit 6: Management Frame Protection Required (MFPR). A STA sets this bit to 1 to advertise that protection of robust management frames is mandatory. A STA sets this bit to 1 when dot11RSNAProtectedManagementFramesActivated is true and dot11RSNAUnprotectedManagementFramesAllowed is false; otherwise it sets this bit to 0. If a STA sets this bit to 1, then that STA only allows RSNAs with STAs that provide Management Frame Protection.

— Bit 7: Management Frame Protection Capable (MFPC). A STA sets this bit to 1 when dot11RSNAProtectedManagementFramesActivated is true to advertise that protection of robust management frames is enabled.

— Bits 9: PeerKey Enabled. An AP STA sets the PeerKey Enabled subfield of the RSN Capabilities field to 1 to signal it supports PeerKey Handshake (see 11.6.8). This field is used by AP STA to describe its ability to support PeerKey Handshake.

— Bit 10: SPP A-MSDU Capable. A STA sets the SPP A-MSDU Capable subfield of the RSN Capabilities field to 1 to signal that it supports signaling and payload protected A-MSDUs (SPP A-MSDUs) (see 10.18). Otherwise, this subfield is set to 0.

— Bit 11: SPP A-MSDU Required. A STA sets the SPP A-MSDU Required subfield of the RSN Capabilities field to 1 when it allows only SPP A-MSDUs (i.e., does not send or receive payload protected A-MSDUs (PP A-MSDUs) (see 10.18). Otherwise, this subfield is set to 0.

— Bit 12: PBAC (protected block ack agreement capable). A STA sets the PBAC subfield of RSN Capabilities field to 1 to indicate it supports PBAC. Otherwise, this subfield is set to 0.

— Bit 13: Extended Key ID for Individually Addressed Frames. This subfield is set to 1 to indicate that the STA supports Key ID values in the range 0 to 1 for a PTKSA and STKSA when the cipher suite is CCMP. A value of 0 indicates that the STA only supports Key ID 0 for a PTKSA and STKSA.

— Bits 8 and 14–15: Reserved. The remaining subfields of the RSN Capabilities field are reserved.

8.4.2.27.5 PMKID

The PMKID Count and List fields are used only in the RSNE in the (Re)Association Request frame to an AP and in FT authentication sequence frames. The PMKID Count specifies the number of PMKIDs in the PMKID List field. The PMKID list contains 0 or more PMKIDs that the STA believes to be valid for the destination AP. The PMKID can refer to

a) A cached PMKSA that has been obtained through preauthentication with the target AP

b) A cached PMKSA from an EAP or SAE authentication

c) A PMKSA derived from a PSK for the target AP

d) A PMK-R0 security association derived as part of an FT initial mobility domain association

e) A PMK-R1 security association derived as part of an FT initial mobility domain association or as part of a fast BSS transition.

See 11.6.1.3 for the construction of the PMKID, 12.8 for the population of PMKID for fast BSS transitions, and 11.6.1.7 for the construction of PMKR0Name and PMKR1Name.

NOTE—A STA need not insert a PMKID in the PMKID List field if the STA will not be using that PMKSA.

8.4.2.28 Vendor Specific element

The Vendor Specific element is used to carry information not defined in this standard within a single defined format, so that reserved element IDs are not usurped for nonstandard purposes and so that interoperability is more easily achieved in the presence of nonstandard information. The element is in the format shown in Figure 8-189 and requires that the first 3 or more octets of the Information field identify the entity that has defined the content of the particular Vendor Specific element. The length of the Organization Identifier field (see 8.4.1.31) is *j* octets, and the order of this field is described in 8.2.2. The length of the Information field (*n*) is constrained by $j \le n \le 255$. The length of the vendor-specific content is *n–j* octets.

	Element ID	Length	Organization Identifier (see 8.4.1.31)	Vendor-specific content
Octets:	1	1	*j*	*n–j*

Figure 8-189—Vendor Specific element format

Multiple Vendor Specific elements are optionally present in a single frame. Each Vendor Specific element might have a different Organization Identifier value. The number of Vendor Specific elements that may appear in a frame is limited only by the maximum frame size.

8.4.2.29 Extended Capabilities element

The Extended Capabilities element carries information about the capabilities of an IEEE 802.11 STA that augment the Capability Information field (CIF). The format of this element is shown in Figure 8-190.

	Element ID	Length	Capabilities
Octets:	1	1	n

Figure 8-190—Extended Capabilities element format

The Element ID field is set to the value for Extended Capabilities, specified in Table 8-54.

The value of the Length field is equal to the number of octets in the Capabilities field.

The Capabilities field is a bit field indicating the capabilities being advertised by the STA transmitting the element. The length of the Capabilities field is a variable *n*. The Capabilities field is shown in Table 8-103.

Table 8-103—Capabilities field

Bit	Information	Notes
0	20/40 BSS Coexistence Management Support	The 20/40 BSS Coexistence Management Support field indicates support for the 20/40 BSS Coexistence Management frame and its use. The 20/40 BSS Coexistence Management Support field is set to 1 to indicate support for the communication of STA information through the transmission and reception of the 20/40 BSS Coexistence Management frame. The 20/40 BSS Coexistence Management Support field is set to 0 to indicate a lack of support for the communication of STA information through the transmission and reception of the 20/40 BSS Coexistence Management frame.
1	Reserved	

Table 8-103—Capabilities field *(continued)*

Bit	Information	Notes
2	Extended Channel Switching	The Extended Channel Switching field is 1 to indicate support for the communication of channel switching information through the transmission and reception of the Extended Channel Switch Announcement element and management frame, as described in 8.5.8.7. The Extended Channel Switching field is 0 to indicate a lack of support for extended channel switching.
3	Reserved	
4	PSMP Capability	This bit in the Extended Capabilities element is set to 1 if the STA supports PSMP operation described in 9.26. In Beacon and Probe Response frames transmitted by an AP: Set to 0 if the AP does not support PSMP operation Set to 1 if the AP supports PSMP operation In Beacon frames transmitted by a non-AP STA: Set to 0 Otherwise: Set to 0 if the STA does not support PSMP operation Set to 1 if the STA supports PSMP operation
5	Reserved	
6	S-PSMP Support	Indicates support for scheduled PSMP. When PSMP Support is equal to 0, S-PSMP support is set to 0. When PSMP Support is equal to 1, the S-PSMP Support field is defined as follows: Set to 0 if STA does not support S-PSMP Set to 1 if STA supports S-PSMP
7	Event	The STA sets the Event field to 1 when dot11MgmtOptionEventsActivated is true, and sets it to 0 otherwise. See 10.23.2.
8	Diagnostics	The STA sets the Diagnostics field to 1 when dot11MgmtOptionDiagnosticsActivated is true, and sets it to 0 otherwise. See 10.23.3.
9	Multicast Diagnostics	The STA sets the Multicast Diagnostics field to 1 when dot11MgmtOptionMulticastDiagnosticsActivated is true, and sets it to 0 otherwise. See 10.23.3.
10	Location Tracking	The STA sets the Location Tracking field to 1 when dot11MgmtOptionLocationTrackingActivated is true, and sets it to 0 otherwise. See 10.23.4.
11	FMS	The STA sets the FMS field to 1 when dot11MgmtOptionFMSActivated is true, and sets it to 0 otherwise. See 10.2.1.16 and 10.23.7.
12	Proxy ARP Service	The AP sets the Proxy ARP Service field to 1 when dot11MgmtOptionProxyARPActivated is true, and sets it to 0 otherwise. See 10.23.13. A non-AP STA sets the Proxy ARP Service field to 0.
13	Collocated Interference Reporting	The STA sets the Collocated Interference Reporting field to 1 when dot11MgmtOptionCoLocIntfReportingActivated is true, and sets it to 0 otherwise. See 10.23.9.

Table 8-103—Capabilities field *(continued)*

Bit	Information	Notes
14	Civic Location	The STA sets the Civic Location field to 1 when dot11RMCivicMeasurementActivated is true, and sets it to 0 otherwise. See 10.11.9.9.
15	Geospatial Location	The STA sets the Geospatial Location field to 1 when dot11RMLCIMeasurementActivated is true, and sets it to 0 otherwise. See 10.11.9.6.
16	TFS	The STA sets the TFS field to 1 when dot11MgmtOptionTFSActivated is true, and sets it to 0 otherwise. See 10.23.11.
17	WNM-Sleep Mode	The STA sets the WNM-Sleep Mode field to 1 when dot11MgmtOptionWNMSleepModeActivated is true, and sets it to 0 otherwise. See 10.2.1.18.
18	TIM Broadcast	The STA sets the TIM Broadcast field to 1 when dot11MgmtOptionTIMBroadcastActivated is true, and sets it to 0 otherwise. See 10.2.1.17.
19	BSS Transition	The STA sets the BSS Transition field to 1 when dot11MgmtOptionBSSTransitionActivated is true, and sets it to 0 otherwise. See 10.23.6.
20	QoS Traffic Capability	The STA sets the QoS Traffic Capability field to 1 when dot11MgmtOptionQoSTrafficCapabilityActivated is true, and sets it to 0 otherwise. See 10.23.9.
21	AC Station Count	The STA sets the AC Station Count field to 1 when dot11MgmtOptionACStationCountActivated is true, and sets it to 0 otherwise. See 10.23.10.
22	Multiple BSSID	The STA sets the Multiple BSSID field to 1 when dot11MgmtOptionMultiBSSIDActivated is true, and sets it to 0 otherwise. See 10.11.14 and 10.1.3.6.
23	Timing Measurement	The STA sets the Timing Measurement field to 1 when dot11MgmtOptionTimingMsmtActivated is true, and sets it to 0 otherwise. See 10.23.5.
24	Channel Usage	The STA sets the Channel Usage field to 1 when dot11MgmtOptionChannelUsageActivated is true and sets it to 0 otherwise. See 10.23.14.
25	SSID List	The STA sets the SSID List field to 1 when dot11MgmtOptionSSIDListActivated is true, and sets it to 0 otherwise. See 10.1.4.
26	DMS	The STA sets the DMS field to 1 when dot11MgmtOptionDMSActivated is true and sets it to 0 otherwise. See 10.23.15.
27	UTC TSF Offset	The STA sets the UTC TSF Offset field to 1 when dot11MgmtOptionUTCTSFOffsetActivated is true and sets it to 0 otherwise. See 10.21.3.
28	TDLS Peer U-APSD Buffer STA Support	The TDLS Peer U-APSD Buffer STA Support subfield indicates support for the TDLS Peer U-APSD Buffer STA function, as defined in 10.2.1.15. When dot11TDLSPeerUAPSDBufferSTAActivated is true, and to indicate support for TDLS Peer U-APSD on this link, the TDLS Peer U-APSD Buffer STA Support subfield is set to 1. Otherwise, the TDLS Peer U-APSD Buffer STA Support subfield is set to 0 to indicate that this capability is not supported on this link.

Table 8-103—Capabilities field *(continued)*

Bit	Information	Notes
29	TDLS Peer PSM Support	The TDLS Peer PSM Support subfield indicates support for TDLS Peer PSM, as defined in 10.2.1.14. When dot11TDLSPeerPSMActivated is true, and to indicate support for TDLS Peer PSM on this link, the TDLS Peer PSM Support subfield is set to 1. Otherwise, the TDLS Peer PSM Support subfield is set to 0 to indicate that this capability is not supported on this link.
30	TDLS channel switching	When dot11TDLSChannelSwitchingActivated is true, and to indicate that the STA supports TDLS with TDLS Channel Switching on this link as described in 10.22, the TDLS Channel Switching capability subfield is set to 1. Otherwise, the TDLS Channel Switching subfield is set to 0 to indicate that this capability is not supported on this link.
31	Interworking	When dot11InterworkingServiceActivated is true, the Interworking field is set to 1 to indicate the STA supports interworking service as described in 10.24. When dot11InterworkingServiceActivated is false, the Interworking field is set to 0 to indicate the STA does not support this capability.
32	QoS Map	When dot11QosMapActivated is true, the QoS Map field is set to 1 to indicate the STA supports QoS Map service as described in 10.24.9. When dot11QosMapActivated is false, the QoS Map field is set to 0 to indicate the STA does not support this capability.
33	EBR	When dot11EBRActivated is true, the EBR field is set to 1 to indicate the STA supports EBR operation as described in 10.4. When dot11EBRActivated is false, the EBR field is set to 0 to indicate the STA does not support this capability.
34	SSPN Interface	When dot11SSPNInterfaceActivated is true, the SSPN Interface field is set to 1 to indicate the AP supports SSPN Interface service as described in 10.24.5. When dot11SSPNInterfaceActivated is false, the SSPN Interface is set to 0 to indicate the AP does not support this capability. Non-AP STAs set this field to 0.
35	Reserved	
36	MSGCF Capability	When dot11MSGCFActivated is true, the MSGCF Capability field is set to 1 to indicate the non-AP STA supports the MSGCF in 6.4. When dot11MSGCFActivated is false, the MSGCF Capability is set to 0 to indicate the non-AP STA does not support this capability. APs set this field to 0.
37	TDLS Support	The TDLS Support subfield indicates support for TDLS, as defined in 10.22. When dot11TunneledDirectLinkSetupImplemented is true, this field is set to 1 to indicate support for TDLS. The field is set to 0 otherwise, to indicate that TDLS is not supported.
38	TDLS Prohibited	The TDLS Prohibited subfield indicates whether the use of TDLS is prohibited. The field is set to 1 to indicate that TDLS is prohibited and to 0 to indicate that TDLS is allowed.
39	TDLS Channel Switching Prohibited	The TDLS Channel Switching Prohibited subfield indicates whether the use of TDLS Channel Switching is prohibited. The field is set to 1 to indicate that TDLS Channel Switching is prohibited and to 0 to indicate that TDLS Channel Switching is allowed.
40	Reject Unadmitted Frame	When dot11RejectUnadmittedTraffic is true, the Reject Unadmitted Frame bit is set to 1 to indicate that the STA rejects MA-UNITDATA.request primitives for frames belonging to an un-admitted TS. When dot11RejectUnadmittedTraffic is false, the Reject Unadmitted Frame bit is set to 0 to indicate that the STA is not required to reject MA-UNITDATA.request primitives for frames belonging to an un-admitted TS. When dot11RejectUnadmittedTraffic is not present, the Reject Unadmitted frame bit is set to 0.

Table 8-103—Capabilities field *(continued)*

Bit	Information	Notes
41-43	Service Interval Granularity	Duration of the shortest service interval (SI). Used for scheduled PSMP only. This field is defined when the S-PSMP Support field is set to 1; otherwise, it is reserved. See 10.4.6. Set to 0 for 5 ms Set to 1 for 10 ms Set to 2 for 15 ms Set to 3 for 20 ms Set to 4 for 25 ms Set to 5 for 30 ms Set to 6 for 35 ms Set to 7 for 40 ms
44	Identifier Location	The STA sets the Identifier Location field to 1 when dot11RMIdentifierMeasurementActivated is true, and sets it to 0 otherwise. See 10.11.9.10.
45	U-APSD Coexistence	The STA sets the U-APSD Coexistence field to 1 when dot11MgmtOptionUAPSDCoexistenceActivated is true and sets it to 0 otherwise. See 10.2.1.5.2.
46	WNM-Notification	The STA sets the WNM-Notification field to 1 when dot11MgmtOptionWNMNotificationActivated is true and sets it to 0 otherwise. See 10.23.16.
47	Reserved	
48	UTF-8 SSID	The SSID in this BSS is interpreted using UTF-8 encoding
49–*n*	Reserved	

If a STA does not support any of capabilities defined in the Extended Capabilities element, then the STA is not required to transmit the Extended Capabilities element.

NOTE—The fields of the Extended Capabilities element are not dynamic. They are determined by the parameters of the MLME-START.request or MLME-JOIN.request primitive that caused the STA to start or join its current BSS, and they remain unchanged until the next MLME-START.request or MLME-JOIN.request primitive.

8.4.2.30 BSS Load element

The BSS Load element contains information on the current STA population and traffic levels in the BSS. The element information format is defined in Figure 8-191. This element may be used by the STA for vendor-specific AP selection algorithm when roaming.

	Element ID	Length (5)	Station Count	Channel Utilization	Available Admission Capacity
Octets:	1	1	2	1	2

Figure 8-191—BSS Load element format

The STA Count field is interpreted as an unsigned integer that indicates the total number of STAs currently associated with this BSS.

The Channel Utilization field is defined as the percentage of time, linearly scaled with 255 representing 100%, that the AP sensed the medium was busy, as indicated by either the physical or virtual carrier sense (CS) mechanism. When more than one channel is in use for the BSS, the Channel Utilization field value is calculated only for the primary channel. This percentage is computed using the formula,

$$\text{Channel Utilization} = \text{Integer}((\text{channel busy time}/(\text{dot11ChannelUtilizationBeaconIntervals} \times \text{dot11BeaconPeriod} \times 1024)) \times 255),$$

where

channel busy time is defined to be the number of microseconds during which the CS mechanism, as defined in 9.3.2.1, has indicated a channel busy indication,

dot11ChannelUtilizationBeaconIntervals represents the number of consecutive beacon intervals during which the channel busy time is measured. The default value of dot11ChannelUtilizationBeaconIntervals is defined in Annex C.

The Available Admission Capacity field is 2 octets long and contains an unsigned integer that specifies the remaining amount of medium time available via explicit admission control, in units of 32 µs/s. The field is helpful for roaming STAs to select an AP that is likely to accept future admission control requests, but it does not represent an assurance that the HC admits these requests.

8.4.2.31 EDCA Parameter Set element

The EDCA Parameter Set element provides information needed by STAs for proper operation of the QoS facility during the CP. The format of the EDCA Parameter Set element is defined in Figure 8-192.

	Element ID	Length (18)	QoS Info	Reserve d	AC_BE Parameter Record	AC_BK Parameter Record	AC_VI Parameter Record	AC_VO Parameter Record
Octets:	1	1	1	1	4	4	4	4

Figure 8-192—EDCA Parameter Set element

For an infrastructure BSS, the EDCA Parameter Set element is used by the AP to establish policy (by changing default MIB attribute values), to change policies when accepting new STAs or new traffic, or to adapt to changes in offered load. The most recent EDCA parameter set element received by a STA is used to update the appropriate MIB values.

The format of the QoS Info field is defined in 8.4.1.17. The QoS Info field contains the EDCA Parameter Set Update Count subfield, which is initially set to 0 and is incremented each time any of the AC parameters changes. This subfield is used by non-AP STAs to determine whether the EDCA parameter set has changed and requires updating the appropriate MIB attributes.

The formats of AC_BE, AC_BK, AC_VI, and AC_VO Parameter Record fields are identical and are illustrated in Figure 8-193.

	ACI / AIFSN	ECWmin / ECWmax	TXOP Limit
Octets:	1	1	2

Figure 8-193—AC_BE, AC_BK, AC_VI, and AC_VO Parameter Record field format

The format of the ACI/AIFSN field is illustrated in Figure 8-194.

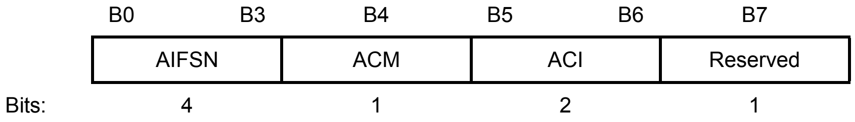

Figure 8-194—ACI/AIFSN field

The value of the AC index (ACI) references the AC to which all parameters in this record correspond. The mapping between ACI and AC is defined in Table 8-104. The ACM (admission control mandatory) subfield indicates that admission control is required for the AC. If the ACM subfield is equal to 0, then there is no admission control for the corresponding AC. If the ACM subfield is set to 1, admission control has to be used prior to transmission using the access parameters specified for this AC. The AIFSN subfield indicates the number of slots after a SIFS duration a STA should defer before either invoking a backoff or starting a transmission. The minimum value for the AIFSN subfield is 2.

Table 8-104—ACI-to-AC coding

ACI	AC	Description
00	AC_BE	Best effort
01	AC_BK	Background
10	AC_VI	Video
11	AC_VO	Voice

The ECWmin and ECWmax fields are illustrated in Figure 8-195.

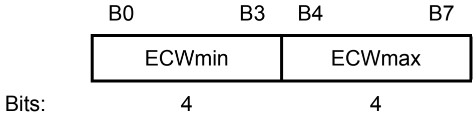

Figure 8-195—ECWmin and ECWmax fields

The ECWmin and ECWmax fields encode the values of CWmin and CWmax, respectively, in an exponent form. The ECWmin and ECWmax values are defined so that

$$\mathrm{CWmin} = 2^{\mathrm{ECWmin}} - 1$$

$$\mathrm{CWmax} = 2^{\mathrm{ECWmax}} - 1$$

Hence the minimum encoded value of CWmin and CWmax is 0, and the maximum value is 32 767.

The value of the TXOP Limit field is specified as an unsigned integer, with the least significant octet transmitted first, in units of 32 µs. A TXOP Limit field value of 0 has a special meaning (see 9.19.2.2).

Table 8-105 defines the default EDCA parameter values used by a non-AP STA if dot11OCBActivated is false.[22]

Table 8-105—Default EDCA Parameter Set element parameter values if dot11OCBActivated is false

AC	CWmin	CWmax	AIFSN	TXOP limit		
				For PHYs defined in Clause 16 and Clause 17	For PHYs defined in Clause 18, Clause 19, and Clause 20	Other PHYs
AC_BK	aCWmin	aCWmax	7	0	0	0
AC_BE	aCWmin	aCWmax	3	0	0	0
AC_VI	(aCWmin+1)/2 – 1	aCWmin	2	6.016 ms	3.008 ms	0
AC_VO	(aCWmin+1)/4 – 1	(aCWmin+1)/2 – 1	2	3.264 ms	1.504 ms	0

If dot11OCBActivated is true, the default EDCA parameter set for STAs transmitting QoS frames is given in Table 8-106.

Table 8-106—Default EDCA parameter set for STA operation if dot11OCBActivated is true

AC	CWmin	CWmax	AIFSN	TXOP Limit OFDM/CCK-OFDM PHY
AC_BK	aCWmin	aCWmax	9	0
AC_BE	aCWmin	aCWmax	6	0
AC_VI	(aCWmin+1)/2–1	aCWmin	3	0
AC_VO	(aCWmin+1)/4–1	(aCWmin+1)/2–1	2	0

8.4.2.32 TSPEC element

The TSPEC element contains the set of parameters that define the characteristics and QoS expectations of a traffic flow, in the context of a particular STA, for use by the HC and STA(s) in support of QoS traffic transfer using the procedures defined in 10.4. The element information format comprises the items as defined in this subclause, and the structure is defined in Figure 8-196.

	Element ID	Length (55)	TS Info	Nominal MSDU Size	Maximum MSDU Size	Minimum Service Interval	Maximum Service Interval	Inactivity Interval	Suspension Interval
Octets:	1	1	3	2	2	4	4	4	4

	Service Start Time	Minimum Data Rate	Mean Data Rate	Peak Data Rate	Burst Size	Delay Bound	Minimum PHY Rate	Surplus Bandwidth Allowance	Medium Time
Octets:	4	4	4	4	4	4	4	2	2

Figure 8-196—TSPEC element format

[22] The default values for TXOP limit are expressed in milliseconds and are multiples of 32 µs.

The TSPEC allows a set of parameters more extensive than may be needed, or may be available, for any particular instance of parameterized QoS traffic. Unless indicated otherwise, fields that follow the TS Info field are set to 0 for any unspecified parameter values. STAs set the value of any parameters to unspecified if they have no information for setting that parameter. The HC may change the value of parameters that have been set unspecified by the STA to any value that it deems appropriate, including leaving them unspecified.

The structure of the TS Info field is defined in Figure 8-197.

	B0	B1 B4	B5 B6	B7 B8	B9	B10	B11 B13	B14 B15	B16	B17 B23
	Traffic Type	TSID	Direction	Access Policy	Aggregation	APSD	User Priority	TSInfo Ack Policy	Schedule	Reserved
Bits:	1	4	2	2	1	1	3	2	1	7

Figure 8-197—TS Info field

The subfields of the TS Info field are defined as follows:

- The Traffic Type subfield is a single bit and is set to 1 for a periodic traffic pattern (e.g., isochronous TS of MSDUs or A-MSDUs, with constant or variable sizes, that are originated at fixed rate) or set to 0 for an aperiodic, or unspecified, traffic pattern (e.g., asynchronous TS of low-duty cycles).
- The TSID subfield is 4 bits in length and contains a value that is a TSID. Note that the MSB (bit 4 in TS Info field) of the TSID subfield is always set to 1.
- The Direction subfield specifies the direction of data carried by the TS as defined in Table 8-107.

Table 8-107—Direction subfield encoding

Bit 5	Bit 6	Usage
0	0	Uplink (MSDUs or A-MSDUs are sent from the non-AP STA to HC)
1	0	Downlink (MSDUs or A-MSDUs are sent from the HC to the non-AP STA)
0	1	Direct link (MSDUs or A-MSDUs are sent from the non-AP STA to another non-AP STA)
1	1	Bidirectional link (equivalent to a downlink request plus an uplink request, each direction having the same parameters). The fields in the TSPEC element specify resources for a single direction. Double the specified resources are required to support both streams.

- The Access Policy subfield is 2 bits in length, specifies the access method to be used for the TS, and is defined in Table 8-108.

Table 8-108—Access Policy subfield

Bit 7	Bit 8	Usage
0	0	Reserved
1	0	Contention-based channel access (EDCA)
0	1	Controlled channel access (HCCA)
1	1	HCCA, EDCA mixed mode (HEMM)

- The Aggregation subfield is 1 bit in length. The Aggregation subfield is valid only when access method is HCCA or when the access method is EDCA and the Schedule subfield is equal to 1. It is set to 1 by a non-AP STA to indicate that an aggregate schedule is required. It is set to 1 by the AP if an aggregate schedule is being provided to the STA. It is set to 0 otherwise. In all other cases, the Aggregation subfield is reserved.

— The APSD subfield is a single bit and is set to 1 to indicate that automatic PS delivery is to be used for the traffic associated with the TSPEC and set to 0 otherwise.

— The UP subfield is 3 bits and indicates the actual value of the UP to be used for the transport of MSDUs or A-MSDUs belonging to this TS in cases where relative prioritization is required. When the TCLAS element is present in the request, the UP subfield in TS Info field of the TSPEC element is reserved.

— The TS Info Ack Policy subfield is 2 bits in length and indicates whether MAC acknowledgments are required for MPDUs or A-MSDUs belonging to this TID and the desired form of those acknowledgments. The encoding of the TS Info Ack Policy subfield is shown in Table 8-109.

Table 8-109—TS Info Ack Policy subfield encoding

Bit 14	Bit 15	Usage
0	0	Normal IEEE 802.11 acknowledgment The addressed recipient returns an ACK or QoS +CF-Ack frame after a SIFS period, according to the procedures defined in 9.3.2.8, 9.4.4, and 9.19.3.5.
1	0	No Ack: The recipient(s) do not acknowledge the transmission.
0	1	Reserved
1	1	Block Ack: A separate Block Ack setup mechanism described in 9.21 is used.

— The Schedule subfield is 1 bit in length and specifies the requested type of schedule. The setting of the subfield when the access policy is EDCA is shown in Table 8-110. When the Access Policy subfield is equal to any value other than EDCA, the Schedule subfield is reserved. When the Schedule and APSD subfields are equal to 1, the AP sets the aggregation bit to 1, indicating that an aggregate schedule is being provided to the STA.

Table 8-110—Setting of Schedule subfield

APSD	Schedule	Usage
0	0	No Schedule
1	0	Unscheduled APSD
0	1	Scheduled PSMP
1	1	Scheduled APSD

The Nominal MSDU Size field is 2 octets long, contains an unsigned integer that specifies the nominal size, in octets, of MSDUs or A-MSDUs belonging to the TS under this TSPEC, and is defined in Figure 8-198. If the Fixed subfield is equal to 1, then the size of the MSDU or A-MSDU is fixed and is indicated by the Size subfield. If the Fixed subfield is equal to 0, then the size of the MSDU or A-MSDU might not be fixed and the Size subfield indicates the nominal MSDU size. If both the Fixed and Size subfields are equal to 0, then the nominal MSDU size is unspecified.

	B0 B15	B15
	Size	Fixed
Bits:	15	1

Figure 8-198—Nominal MSDU Size field

The Maximum MSDU Size field is 2 octets long and contains an unsigned integer that specifies the maximum size, in octets, of MSDUs or A-MSDUs belonging to the TS under this TSPEC.

The Minimum Service Interval field is 4 octets long and contains an unsigned integer that specifies the minimum interval, in microseconds, between the start of two successive SPs.

The Maximum Service Interval field is 4 octets long and contains an unsigned integer that specifies the maximum interval, in microseconds, between the start of two successive SPs.

The Inactivity Interval field is 4 octets long and contains an unsigned integer that specifies the minimum amount of time, in microseconds, that may elapse without arrival or transfer of an MPDU belonging to the TS before this TS is deleted by the MAC entity at the HC.

The Suspension Interval field is 4 octets long and contains an unsigned integer that specifies the minimum amount of time, in microseconds, that may elapse without arrival or transfer of an MSDU belonging to the TS before the generation of successive QoS(+)CF-Poll is stopped for this TS. A value of 4 294 967 295 (= $2^{32} – 1$) disables the suspension interval, indicating that polling for the TS is not to be interrupted based on inactivity. The value of the suspension interval is always less than or equal to the inactivity interval.

The Service Start Time field is 4 octets and contains an unsigned integer that specifies the time, expressed in microseconds, when the first scheduled SP starts. The service start time indicates to the AP the time when a STA first expects to be ready to send frames and a power-saving STA needs to be awake to receive frames. This may help the AP to schedule service so that the MSDUs encounter small delays in the MAC and help the power-saving STAs to reduce power consumption. The field represents the four lower order octets of the TSF timer at the start of the SP. If APSD subfield is 0, this field is also set to 0 (unspecified).

The Minimum Data Rate field is 4 octets long and contains an unsigned integer that specifies the lowest data rate specified at the MAC_SAP, in bits per second, for transport of MSDUs or A-MSDUs belonging to this TS within the bounds of this TSPEC. The minimum data rate does not include the MAC and PHY overheads incurred in transferring the MSDUs or A-MSDUs.

The Mean Data Rate[23] field is 4 octets long and contains an unsigned integer that specifies the average data rate specified at the MAC_SAP, in bits per second, for transport of MSDUs or A-MSDUs belonging to this TS within the bounds of this TSPEC. The mean data rate does not include the MAC and PHY overheads incurred in transferring the MSDUs or A-MSDUs.

The Peak Data Rate field is 4 octets long and contains an unsigned integer that specifies the maximum allowable data rate, in bits per second, for transfer of MSDUs or A-MSDUs belonging to this TS within the bounds of this TSPEC. If p is the peak rate in bits per second, then the maximum amount of data, belonging to this TS, arriving in any time interval [$t1$,$t2$], where $t1 < t2$ and $t2 – t1 > 1$ TU, does not exceed $p \times (t2 – t1)$ bits.

[23] The mean data rate, the peak data rate, and the burst size are the parameters of the token bucket model, which provides standard terminology for describing the behavior of a traffic source. The token bucket model is described in IETF RFC 2212-1997 [B27], IETF RFC 2215-1997 [B28], and IETF RFC 3290-2002 [B33].

The Burst Size field is 4 octets long and contains an unsigned integer that specifies the maximum burst, in octets, of the MSDUs or A-MSDUs belonging to this TS that arrive at the MAC_SAP at the peak data rate. A value of 0 indicates that there are no bursts.

The Delay Bound field is 4 octets long and contains an unsigned integer that specifies the maximum amount of time, in microseconds, allowed to transport an MSDU or A-MSDU belonging to the TS in this TSPEC, measured between the time marking the arrival of the MSDU, or the first MSDU of the MSDUs constituting an A-MSDU, at the local MAC sublayer from the local MAC_SAP and the time of completion of the successful transmission or retransmission of the MSDU or A-MSDU to the destination. The completion of the MSDU or A-MSDU transmission includes the relevant acknowledgment frame transmission time, if present.

The Minimum PHY Rate field is 4 octets long and contains an unsigned integer that specifies the desired minimum PHY rate to use for this TS, in bits per second, that is required for transport of the MSDUs or A-MSDUs belonging to the TS in this TSPEC.[24] See 10.4.2 for constraints on the selection of this field.

The Surplus Bandwidth Allowance field is 2 octets long and specifies the excess allocation of time (and bandwidth) over and above the stated application rates required to transport an MSDU or A-MSDU belonging to the TS in this TSPEC. This field is represented as an unsigned binary number and, when specified, is greater than 0. The 13 least significant bits (LSBs) indicate the decimal part while the three MSBs indicate the integer part of the number. This field takes into account the retransmissions, as the rate information does not include retransmissions. It represents the ratio of over-the-air bandwidth (i.e., time that the scheduler allocates for the transmission of MSDUs or A-MSDUs at the required rates) to bandwidth of the transported MSDUs or A-MSDUs required for successful transmission (i.e., time that would be necessary at the minimum PHY rate if there were no errors on the channel) to meet throughput and delay bounds under this TSPEC, when specified. As such, it should be greater than unity. A value of 1 indicates that no additional allocation of time is requested.

The Medium Time field is a 16-bit unsigned integer and contains the amount of time admitted to access the medium, in units of 32 µs/s. This field is reserved in the ADDTS Request frame and is set by the HC in the ADDTS Response frame. The derivation of this field is described in N.2.2. This field is not used for controlled channel access.

The UP, Minimum Data Rate, Mean Data Rate, Peak Data Rate, Burst Size, Minimum PHY Rate, and Delay Bound fields in a TSPEC element express the QoS expectations requested by a STA, if this TSPEC was issued by that STA, or provided by the HC, if this TSPEC was issued by the HC, when these fields are specified with nonzero values. Unspecified parameters in these fields as indicated by a value of 0 indicate that the STA does not have specific requirements for these parameters if the TSPEC was issued by that STA or that the HC does not provide any specific values for these parameters if the TSPEC was issued by the HC.

8.4.2.33 TCLAS element

The TCLAS element specifies an element that contains a set of parameters necessary to identify incoming MSDUs (from a higher layer in all STAs or from the DS in an AP) that belong to a particular TS. The TCLAS element is also used when the traffic does not belong to a TS, for example, by the FMS, DMS, and TFS services. If required, the TCLAS element is provided in ADDTS Request and ADDTS Response frames only for the downlink or bidirectional links. TCLAS element need not be provided for the uplink or direct- link transmissions. The structure of this element is shown in Figure 8-199.

[24] This rate information is intended to confirm that the TSPEC parameter values resulting from an admission control negotiation are sufficient to provide the required throughput for the TS. In a typical implementation, a TS is admitted only if the defined traffic volume can be accommodated at the specified rate within an amount of WM occupancy time that the admissions control entity is willing to allocate to this TS.

	Element ID	Length (L+1)	User Priority	Frame Classifier
Octets:	1	1	1	variable

Figure 8-199—TCLAS element format

The UP field contains the value of the UP of the associated MSDUs.

The Frame Classifier field is 3–255 octets in length and is defined in Figure 8-200.

	Classifier Type	Classifier Mask	Classifier Parameters
Octets:	1	1	1–252

Figure 8-200—Frame Classifier field

The Frame Classifier field comprises the following subfields: Classifier Type, Classifier Mask, and Classifier Parameters. The Classifier Type subfield is 1 octet in length and specifies the type of classifier parameters in this TCLAS as defined in Table 8-111.

Table 8-111—Frame classifier type

Classifier type	Classifier parameters
0	Ethernet parameters
1	TCP/UDP IP parameters
2	IEEE 802.1Q parameters
3	Filter Offset parameters
4	IP and higher layer parameters
5	IEEE 802.1D/Q parameters
6–255	Reserved

The Classifier Mask subfield specifies a bitmap in which bits that have the value 1 identify a subset of the classifier parameters whose values need to match those of the corresponding parameters in a given MSDU for that MSDU to be classified to the TS of the affiliated TSPEC. The bitmap is ordered from the LSB to the MSB, with each bit pointing to one of the classifier parameters of the same relative position as shown in this subclause based on classifier type. An incoming MSDU that failed to be classified to a particular TS may be classified to another active TS based on the frame classifier for that TS. If, however, all the frame classifiers for the active TS have been exhausted, the MSDU does not belong to any active TS and is classified to be a best-effort MSDU. In cases where there are more bits in the bitmap than classifier parameters that follow, the MSBs that do not point to any classifier parameters are reserved.

For Classifier Type 0, the classifier parameters are the following parameters contained in an Ethernet packet header: Source Address, Destination Address, and Type (“Ethernet” [B12]). The endianness of the Type field is as defined in Ethernet [B12]. The Frame Classifier field for Classifier Type 0 is defined in Figure 8-201. It has a length of 16 octets.

	Classifier Type (0)	Classifier Mask	Source Address	Destination Address	Type
Octets:	1	1	6	6	2

Figure 8-201—Frame Classifier field of Classifier Type 0

For Classifier Type 1, frame classifier is defined for both IPv4 and IPv6, shown in Figure 8-202 and Figure 8-203, and distinguished by the Version field. Use of Classifier Type 1 for IPv6 is deprecated and replaced by Classifier Type 4. The subfields in the classifier parameters are represented and transmitted in the big-endian format. The classifier parameters are the following parameters:

- In a TCP or UDP header: Source Address, Destination Address, Source Port, Destination Port, and Version, plus
- One of the following:
  - In an IPv4 header: Differentiated Services Code Point (DSCP) (IETF RFC 2474-1998 [B29]) and Protocol, or
  - In an IPv6 header: Flow Label.

	Classifier Type (1)	Classifier Mask	Version	Source IP Address	Destination IP Address	Source Port	Destination Port	DSCP	Protocol	Reserved
Octets:	1	1	1	4	4	2	2	1	1	1

Figure 8-202—Frame Classifier field of Classifier Type 1 for traffic over IPv4

	Classifier Type (1)	Classifier Mask	Version	Source IP Address	Destination IP Address	Source Port	Destination Port	Flow Label
Octets:	1	1	1	16	16	2	2	3

Figure 8-203—Frame Classifier field of Classifier Type 1 for traffic over IPv6

The DSCP field contains the value in the 6 LSBs, and the 2 MSBs are set to 0. The 2 MSBs of the DSCP field are ignored for frame classification.

The value in the Version subfield is the value specified in IETF RFC 791-1981 or IETF RFC 2460-1998.

For Classifier Type 2, the Classifier Parameter is the IEEE 802.1Q-2003 [B22] VLAN Tag TCI. The endianness of the 802.1Q VLAN TCI field is as defined IEEE 802.1Q-2003 [B22] for the VLAN Tag TCI. The Frame Classifier field for Classifier Type 2 is defined in Figure 8-204.

	Classifier Type (2)	Classifier Mask	802.1Q VLAN TCI
Octets:	1	1	2

Figure 8-204—Frame Classifier field of Classifier Type 2

For Classifier Type 3, the classifier parameters are defined by a Filter Offset subfield, a Filter Value subfield and a Filter Mask subfield. The Frame Classifier subfield of Classifier Type 3 is defined in Figure 8-205. It has a variable length.

	Classifier Type (3)	Classifier Mask	Filter Offset	Filter Value	Filter Mask
Octets:	1	1	2	variable	variable

Figure 8-205—Frame Classifier field of Classifier Type 3

The Classifier Mask subfield is reserved.

The value of the Filter Offset subfield is the number of octets from the beginning of the MSDU or MMPDU at which the Filter Value is compared. A value of 0 for the Filter Offset indicates that the Filter Value subfield is to be compared to the first octet of the payload prior to encryption following the MAC header.

The length of the Filter Value and Filter Mask subfields is (*Length* – 5)/2, where *Length* is the value in the Length field of the TCLAS element.

The Filter Value subfield is an octet string that is compared to the MSDU or MMDPU content, beginning at the octet indicated by the Filter Offset.

The Filter Mask subfield is an octet string that is used to indicate which bits in the Filter Value subfield are compared. The length of the Filter Mask subfield is equal to the length of the Filter Value subfield. A bit in the Filter Value subfield is only compared if the matching bit in the Filter Mask subfield is 1.

For Classifier Type 4, frame classifier is defined for both IPv4 and IPv6, shown in Figure 8-206 (with the Classifier Type subfield set to 4) and Figure 8-207, and distinguished by the Version subfield. The classifier parameters represent corresponding values in a received IPv4 or IPv6 frame and are defined in Table 8-112. The subfields in the classifier parameters are represented and transmitted in big-endian format.

Table 8-112—Classifier Parameters for Classifier Type 4

Subfield	Included in IPv4	IPv4 field length (octets)	Included in IPv6	IPv6 field length (octets)
Version	Yes	1	Yes	1
Source IP Address	Yes	4	Yes	16
Destination IP Address	Yes	4	Yes	16
Source Port	Yes	2	Yes	2
Destination Port	Yes	2	Yes	2
DSCP	Yes	1	Yes	1
Protocol	Yes	1	No	n/a
Next Header	No	n/a	Yes	1
Flow Label	No	n/a	Yes	3

The Frame Classifier subfield of Classifier Type 4 for traffic over IPv4 is shown in Figure 8-206.

	Classifier Type (4)	Classifier Mask	Version(4)	Source IP Address	Destination IP Address
Octets:	1	1	1	4	4

	Source Port	Destination Port	DSCP	Protocol	Reserved
Octets:	2	2	1	1	1

Figure 8-206—Frame Classifier subfield of Classifier Type 4 for traffic over IPv4

The Frame Classifier subfield of Classifier Type 4 for traffic over IPv6 is shown in Figure 8-207.

	Classifier Type (4)	Classifier Mask	Version(6)	Source IP Address	Destination IP Address
Octets:	1	1	1	16	16

	Source Port	Destination Port	DSCP	Next Header	Flow Label
Octets:	2	2	1	1	3

Figure 8-207—Frame Classifier subfield of Classifier Type 4 for traffic over IPv6

NOTE—Frame classification when extension headers are used is supported only if the TCLAS does not classify on ports (Classifier Mask has the Source and Destination Port bits set to 0).

The value in the Version subfield is the value specified in IETF RFC 791-1981 or IETF RFC 2460-1998.

The DSCP subfield contains the value as described in IETF RFC 2474-1998 in the 6 least significant bits. The 2 most significant bits are reserved.

The Next Header subfield contains the next encapsulated protocol and is compatible with the values specified for the IPv4 Protocol subfield. In the presence of options in the IPv6 header, the Next Header subfield specifies the presence of one or more out of six extension headers as defined in IETF RFC 2460-1998.

The Flow Label subfield contains the value in the 20 least significant bits. The 4 most significant bits are reserved.

NOTE—For example, the flow label 0x12345 is represented as the octet sequence 0x01, 0x23, 0x45.

A TCLAS element is valid when the Classifier Mask Version bit is 1.

For Classifier Type 5, the classifier parameters are the following parameters in an IEEE 802.1Q-2003 [B22] tag header: Priority Code Point (PCP; equivalent to IEEE 802.1D-2004 [B20] User Priority), Canonical Format Indicator (CFI), and VLAN ID (VID).

The Frame Classifier field for Classifier Type 5 is defined in Figure 8-208.

	Classifier Type (4)	Classifier Mask	802.1Q PCP	802.1Q CFI	802.1Q VID
Octets:	1	1	1	1	2

Figure 8-208—Frame Classifier field of Classifier Type 5

The subfields in the classifier parameters are represented and transmitted in big-endian format.

The PCP subfield contains the value in the 4 LSBs; the 4 MSBs are reserved.

The CFI subfield contains the value in the LSB; the 7 MSBs are reserved.

The VID subfield contains the value in the 12 LSBs; the 4 MSBs are reserved.

8.4.2.34 TS Delay element

The TS Delay element is used in the ADDTS Response frame transmitted by the HC and indicates the time after which the ADDTS may be retried. The TS Delay element is defined in Figure 8-209.

	Element ID	Length (4)	Delay
Octets:	1	1	4

Figure 8-209—TS Delay element

The Delay field is 4 octets long and specifies the amount of time, in TUs, a STA should wait before it reinitiates setup of a TS.

The Delay field is set to 0 when an AP does not expect to serve any TSPECs for an indeterminate time and does not know this time a priori.

8.4.2.35 TCLAS Processing element

The TCLAS Processing element is present in the ADDTS Request, ADDTS Response, FMS Request, DMS Request, and TFS Request frames if there are multiple TCLASs associated with the request. It indicates how an MSDU received from higher layers should be processed by the classifier. The TCLAS Processing element is defined in Figure 8-210.

	Element ID	Length (1)	Processing
Octets:	1	1	1

Figure 8-210—TCLAS Processing element

The Processing subfield is 1 octet long. The encoding of the Processing subfield is shown in Table 8-113.

Table 8-113—Encoding of Processing subfield

Processing subfield value	Meaning
0	Incoming MSDU's higher layer parameters have to match to the parameters in all the associated TCLAS elements.
1	Incoming MSDU's higher layer parameters have to match to at least one of the associated TCLAS elements.
2	Incoming MSDUs that do not belong to any other TS are classified to the TS for which this TCLAS Processing element is used. In this case, there are not any associated TCLAS elements.
3–255	Reserved

8.4.2.36 Schedule element

The Schedule element is transmitted by the HC to a STA to announce the schedule that the HC/AP follows for admitted streams originating from or destined to that STA in the future. The information in this element may be used by the STA for power management, internal scheduling, or any other purpose. The element information format is shown in Figure 8-211.

	Element ID	Length (12)	Schedule Info	Service Start Time	Service Interval	Specification Interval
Octets:	1	1	2	4	4	2

Figure 8-211—Schedule element

The Schedule Info field is shown in Figure 8-212.

	B0	B1 B4	B5 B6	B7 B15
	Aggregation	TSID	Direction	Reserved
Bits:	1	4	2	9

Figure 8-212—Schedule Info field

The Aggregation subfield is set to 1 if the schedule is an aggregate schedule for all TSIDs associated with the STA to which the frame is directed. It is set to 0 otherwise. The TSID subfield is as defined in 8.2.4.5.2 and indicates the TSID for which this schedule applies. The Direction subfield is as defined in 8.4.2.32 and defines the direction of the TSPEC associated with the schedule. The TSID and Direction subfields are valid only when the Aggregation subfield is 0. If the Aggregation subfield is 1, the TSID and Direction subfields are reserved.

The Service Start Time field is 4 octets and indicates the anticipated time, expressed in microseconds, when service starts and represents the lower order 4 octets of the TSF timer value at the start of the first SP. The AP uses this field to confirm or modify the service start time indicated in the TSPEC request.

The Service Interval field is 4 octets and indicates the time, expressed in microseconds, between two successive SPs and represents the measured time from the start of one SP to the start of the next SP.

The Specification Interval field is 2 octets long and contains an unsigned integer that specifies the time interval, in TUs, to verify schedule conformance.

The HC may set the Service Start Time field and the Service Interval field to 0 (unspecified) for nonpowersaving STAs.

8.4.2.37 QoS Capability element

The QoS Capability element contains a number of subfields that are used to advertise optional QoS capabilities at a QoS STA. The QoS Capability element is present in Beacon frames that do not contain the EDCA Parameter Set element and in (Re)Association Request frames. The QoS Capability element is defined in Figure 8-213.

	Element ID	Length (1)	QoS Info
Octets:	1	1	1

Figure 8-213—QoS Capability element format

The QoS Info field is 1 octet in length and is defined in 8.4.1.17.

8.4.2.38 AP Channel Report element

The AP Channel Report element contains a list of channels where a STA is likely to find an AP. The format of the AP Channel Report element is shown in Figure 8-214. See 10.11.6 for details.

	Element ID	Length	Operating Class	Channel List
Octets:	1	1	1	variable

Figure 8-214—AP Channel Report element format

The Element ID field is equal to the AP Channel Report value in Table 8-54.

The Length field in octets is variable and depends on the number of channels reported in the Channel List. The minimum value of the Length field is 1 (based on a minimum length for the channel list field of 0 octets).

Operating Class contains an enumerated value from Annex E, specifying the operating class in which the Channel List is valid. An AP Channel Report only reports channels for a single operating class. Multiple AP Channel Report elements are present when reporting channels in more than one operating class.

The Channel List contains a variable number of octets, where each octet describes a single channel number. Channel numbering is dependent on Operating Class according to Annex E.

8.4.2.39 Neighbor Report element

The format of the Neighbor Report element is shown in Figure 8-215.

	Element ID	Length	BSSID	BSSID Information	Operating Class	Channel Number	PHY Type	Optional Subelements
Octets:	1	1	6	4	1	1	1	variable

Figure 8-215—Neighbor Report element format

The Element ID field is equal to the Neighbor Report value in Table 8-54.

The Length field in octets is variable and depends on the number and length of optional subelements. Each Report element describes an AP and consists of BSSID, BSSID Information, Channel Number, Operating Class, PHY Type, and optionally includes optional subelements. The minimum value of the Length field is 13 (i.e., with no optional subelements in the Neighbor Report element).

The BSSID is the BSSID of the BSS being reported. The subsequent fields in the Neighbor Report element pertain to this BSS.

The BSSID Information field can be used to help determine neighbor service set transition candidates. It is 4 octets in length and contains the subfields as shown in Figure 8-216.

	B0 B1	B2	B3	B4 B9	B10	B11	B12 B31
	AP Reachability	Security	Key Scope	Capabilities	Mobility Domain	High Throughput	Reserved
Bits:	2	1	1	6	1	1	20

Figure 8-216—BSSID Information field

The AP Reachability field indicates whether the AP identified by this BSSID is reachable by the STA that requested the neighbor report. For example, the AP identified by this BSSID is reachable for the exchange of preauthentication frames as described in 11.5.9.2. The values are shown in Table 8-114.

Table 8-114—Reachability field

Value	Reachability	Usage
0	Reserved	Not used.
1	Not Reachable	A station sending a preauthentication frame to the BSSID will not receive a response even if the AP indicated by the BSSID is capable of preauthentication.
2	Unknown	The AP is unable to determine if the value Reachable or Not Reachable is to be returned.
3	Reachable	The station sending a preauthentication frame to the BSSID can receive a response from an AP that is capable of preauthentication.

The Security bit, if 1, indicates that the AP identified by this BSSID supports the same security provisioning as used by the STA in its current association. If the bit is 0, it indicates either that the AP does not support the same security provisioning or that the security information is not available at this time.

The Key Scope bit, when set, indicates the AP indicated by this BSSID has the same authenticator as the AP sending the report. If this bit is 0, it indicates a distinct authenticator or the information is not available.

The Capabilities Subfield contains selected capability information for the AP indicated by this BSSID. The bit fields within this subfield have the same meaning and are set to the equivalent bits within the Capability Information field (see 8.4.1.4) being sent in the beacons by the AP being reported. The format of the Capabilities subfield is as in Figure 8-217.

	B4	B5	B6	B7	B8	B9
	Spectrum Management	QoS	APSD	Radio Measurement	Delayed Block Ack	Immediate Block Ack
Bits:	1	1	1	1	1	1

Figure 8-217—Capabilities subfield

The Mobility Domain bit is set to 1 to indicate that the AP represented by this BSSID is including an MDE in its Beacon frames and that the contents of that MDE are identical to the MDE advertised by the AP sending the report.

The High Throughput bit is set to 1 to indicate that the AP represented by this BSSID is an HT AP including the HT Capabilities element in its Beacons, and that the contents of that HT Capabilities element are identical to the HT Capabilities element advertised by the AP sending the report.

Bits 12–31 are reserved.

Operating Class indicates the channel set of the AP indicated by this BSSID. Country, Operating Class, and Channel Number together specify the channel frequency and spacing for the AP indicated by this BSSID. Valid values of Operating Class are shown in Annex E.

Channel Number indicates the last known operating channel of the AP indicated by this BSSID. Channel Number is defined within an Operating Class as shown in Annex E.

The PHY Type field indicates the PHY type of the AP indicated by this BSSID. It is an integer value coded according to the value of the dot11PHYType.

The Optional Subelements field format contains zero or more subelements, each consisting of a 1-octet Subelement ID field, a 1-octet Length field, and a variable-length Data field, as shown in Figure 8-402. Any optional subelements are ordered by nondecreasing subelement ID.

The Subelement ID field values for the defined optional subelements are shown in Table 8-115. A Yes in the Extensible column of a subelement listed in Table 8-115 indicates that the Length of the subelement might be extended in future revisions or amendments of this standard. When the Extensible column of an element is equal to Subelements, then the subelement might be extended in future revisions or amendments of this standard by defining additional subelements within the subelement. See 9.24.9.

Table 8-115—Optional subelement IDs for neighbor report

Subelement ID	Name	Length field (octets)	Extensible
0	Reserved		
1	TSF Information	4	Yes
2	Condensed Country String	2	Yes
3	BSS Transition Candidate Preference	1	
4	BSS Termination Duration	12	
5	Bearing	8	
6–44	Reserved		
45	HT Capabilities subelement	26	Yes
46–60	Reserved		
61	HT Operation subelement	22	Yes
62	Secondary Channel Offset subelement	1	
63–65	Reserved		
66	Measurement Pilot Transmission	1 to 238	Subelements
67–69	Reserved		
70	RM Enabled Capabilities	5	Yes
71	Multiple BSSID	1 to 238	Subelements
72–220	Reserved		
221	Vendor Specific	1 to 238	
222–255	Reserved		

The TSF Information subelement contains TSF Offset and Beacon Interval subfields as shown in Figure 8-218.

	Subelement ID	Length	TSF Offset	Beacon Interval
Octets:	1	1	2	2

Figure 8-218—TSF Information subelement format

The value of the TSF Information subelement Length field in octets is 4.

The TSF Offset subfield is 2 octets long and contains the neighbor AP’s TSF timer offset. This is the time difference, in TU units, between the serving AP and a neighbor AP. This offset is given modulo the neighbor AP’s Beacon Interval and rounded to the nearest TU boundary.

The Beacon Interval field is the beacon interval of the Neighbor AP indicated by this BSSID. This field is defined in 8.4.1.3 and illustrated in Figure 8-37.

The Condensed Country String subelement is set to the first two octets of the value contained in dot11CountryString. This subelement is present only if the country of the neighbor AP indicated by the BSSID differs from the country of the AP that sent this neighbor report.

The Measurement Pilot Transmission subelement has the same format as the Measurement Pilot Transmission element (see 8.4.2.44). The Measurement Pilot Interval subelement is not included if the reported AP is not transmitting Measurement Pilot frames or if the Measurement Pilot Interval of the reported AP is unknown.

The HT Capabilities subelement is the same as the HT Capabilities element as defined in 8.4.2.58.

The HT Operation subelement is the same as the HT Operation element as defined in 8.4.2.59.

The Secondary Channel Offset subelement is the same as the Secondary Channel Offset element as defined in 8.4.2.22.

The RM Enabled Capabilities subelement has the same format as the RM Enabled Capabilities element (see 8.4.2.47).

The Multiple BSSID subelement has the same format as the Multiple BSSID element (see 8.4.2.48). The reference BSSID for the Multiple BSSID subelement is the BSSID field in the Neighbor Report element. This subelement is not present if the neighbor AP is not a member of a Multiple BSSID Set with two or more members or its membership is unknown. (see 10.11.14).

The format of the BSS Transition Candidate Preference subelement field is shown in Figure 8-219.

	Subelement ID	Length	Preference
Octets:	1	1	1

Figure 8-219— BSS Transition Candidate Preference subelement field format

The value of the Length field in the BSS Transition Candidate Information subelement is 1.

The Preference field indicates the network preference for BSS transition to the BSS listed in this BSS Transition Candidate List Entries field in the BSS Transition Management Request frame, BSS Transition Management Query frame, and BSS Transition Management Response frame. The Preference field value is a number ranging from 0 to 255, as defined in Table 8-116, indicating an ordering of preferences for the BSS transition candidates for this STA. Additional details describing use of the Preference field are provided in 10.23.6.

Table 8-116—Preference field values

Preference field value	Description
0	Excluded BSS; reserved when present in the BSS Transition Management Query or BSS Transition Management Response frames.
1–255	Relative values used to indicate the preferred ordering of BSSs, with 255 indicating the most preferred candidate and 1 indicating the least preferred candidate.

The BSS Termination TSF field contained in the BSS Termination Duration subelement is the TSF time of the BSS transmitting the neighbor report that corresponds to the time when termination of the neighbor BSS occurs. How the BSS determines the neighbor BSS termination time is out of scope of the standard. The format of the BSS Termination Duration subelement field is shown in Figure 8-220.

	Subelement ID	Length	BSS Termination TSF	Duration
Octets:	1	1	8	2

Figure 8-220—BSS Termination Duration subelement field format

The value of the Length field in the BSS Termination Duration Information subelement is 10.

The BSS Termination TSF field indicates the value of the TSF counter when BSS termination will occur in the future. A BSS Termination TSF field value of 0 indicates that termination of the BSS will occur imminently. Prior to termination of the BSS, all associated STAs are disassociated by the AP.

The Duration field is an unsigned 2-octet integer that indicates the number of minutes for which the BSS is not present. The Duration field value of 0 is reserved. The Duration field value is 65 535 when the BSS is terminated for a period longer than or equal to 65 535 minutes.

The format of the Bearing subelement field is shown in Figure 8-221.

	Subelement ID	Length	Bearing	Distance	Relative Height
Octets:	1	1	2	4	2

Figure 8-221—Bearing subelement field format

The value of the Bearing Information subelement length field is 4.

The Bearing field specifies the direction that the neighbor, specified by the BSSID field in the Neighbor Report element, is positioned, relative to the reporting BSS and defined in relation to true north, increasing clockwise, measured in degrees from 0 degree to 359 degrees. If the Bearing value is unknown, the subelement is not included.

The Distance field specifies the distance that the neighbor, specified by the BSSID field in the Neighbor Report element, is positioned relative to the reporting BSS as a 4-octet single precision floating point value represented by a binary32 floating point value as defined in IEEE Std 754-2008, with the least significant bit of the fraction occurring in bit 0 of the field, in meters. If the Distance field value is unknown the field is set to 0.

The Relative Height field, defined by a 2-octet signed integer, specifies the relative height in meters that the neighbor is positioned, relative to the reporting BSS. If the Relative height is unknown or at the same height as the reporting BSS, the field is 0.

The Vendor Specific subelement has the same format as the Vendor Specific element (see 8.4.2.28). Multiple Vendor Specific subelements are optionally present in the list of optional subelements.

8.4.2.40 RCPI element

The RCPI element indicates the received frame power level at the receiving STA as shown in Figure 8-222.

	Element ID	Length	RCPI
Octets:	1	1	1

Figure 8-222—RCPI element format

The Element ID field is equal to the RCPI value in Table 8-54.

The Length field in octets is set to 1.

The RCPI field contains an RCPI value as specified for certain PHYs in Clause 16, Clause 18, Clause 17, Clause 19, and Clause 20.

8.4.2.41 BSS Average Access Delay element

The BSS Average Access Delay element contains the AP Average Access Delay, which is a measure of load in the BSS and is available in both QoS APs and non-QoS APs. The format of the BSS Average Access Delay element is defined in Figure 8-223.

	Element ID	Length	AP Average Access Delay
Octets:	1	1	1

Figure 8-223—BSS Average Access Delay element format

The Element ID field is equal to the BSS Average Access Delay value in Table 8-54.

The Length field in octets is set to 1.

The AP Average Access Delay is a scalar indication of the relative level of loading at an AP. A low value indicates more available capacity than a higher value. If the AP is not currently transmitting any DCF or EDCAF traffic, the AP Average Access Delay is set to 255. The values between 1 and 252 are a scaled representation of the average medium access delay for DCF or EDCAF transmitted frames measured from the time the DCF or EDCAF MPDU is ready for transmission (i.e., begins CSMA/CA access) until the actual frame transmission start time. Non-QoS APs average the access delays for all DCF transmitted frames. QoS APs average the access delays for all EDCA transmitted frames of all ACs. The AP Average Access Delay values are scaled as follows:

0:	Access Delay < 8 µs
1:	8 µs ≤ Access Delay < 16 µs
$2 \leq n \leq 14$:	$n \times 8$ µs ≤ Access Delay < $(n + 1) \times 8$ µs
15:	120 µs ≤ Access Delay < 128 µs
16:	128 µs ≤ Access Delay < 144 µs
$17 \leq n \leq 106$:	$(n \times 16) - 128$ µs ≤ Access Delay < $((n + 1) \times 16) - 128$ µs
107:	1584 µs ≤ Access Delay < 1600 µs
108:	1600 µs ≤ Access Delay < 1632 µs
$109 \leq n \leq 246$:	$(n \times 32) - 1856$ µs ≤ Access Delay < $((n + 1) \times 32) - 1856$ µs

247:	6048 µs ≤ Access Delay < 6080 µs
248:	6080 µs ≤ Access Delay < 8192 µs
249:	8192 µs ≤ Access Delay < 12288 µs
250:	12 288 µs ≤ Access Delay < 16384 µs
251:	16 384 µs ≤ Access Delay < 20480 µs
252:	20 480 µs ≤ Access Delay < 24576 µs
253:	24 576 µs ≤ Access Delay
254:	Service unable to access channel
255:	Measurement not available

The values 0–253 indicate Average Access Delay when one or more frames were transmitted during the measurement window. The value 254 indicates that DCF or EDCAF services are currently unable to access the channel due to continuous carrier sense mechanism deferral and that no frames were transmitted during the measurement window. The AP measures and averages the medium access delay for all transmit frames using the DCF or EDCAF over a continuous 30 s measurement window. See 10.11.16 for accuracy requirements.

8.4.2.42 Antenna element

The Antenna element contains the Antenna ID field as shown in Figure 8-224.

	Element ID	Length	Antenna ID
Octets:	1	1	1

Figure 8-224—Antenna element format

The Element ID field is equal to the Antenna value in Table 8-54.

The Length field in octets is set to 1.

The Antenna ID field contains the identifying number for the relevant antenna(s). When included in a Beacon, Probe Response, or Location Track Notification frame, the Antenna ID identifies the antenna(s) used to transmit the Beacon, Probe Response, or Location Track Notification frame. When included in a measurement report, or Location Track Notification frame, the Antenna ID identifies the antenna(s) used for the reported measurement or transmission of the Location Track Notification frame. The valid range for the Antenna ID is 1 to 254. The value 0 indicates that the antenna identifier is unknown. The value 255 indicates that this measurement was made with multiple antennas, i.e., antennas were switched during the measurement duration. In a Beacon Report or Frame Report, the Antenna ID always identifies the antenna used to receive the reported beacon or frame. If during frame reception, different antennas are used to receive the preamble and body, the antenna ID identifies the antenna that receives the frame body. In these cases, the value 255 is not used. The value 1 is the only value used for a STA with only one antenna. STAs with more than one antenna assign Antenna IDs to each antenna and each antenna configuration as consecutive, positive integers starting with 1. Each Antenna ID number represents a unique antenna or unique configuration of multiple antennas characterized by a fixed relative position, a fixed relative direction, and a fixed peak gain for that position and direction.

8.4.2.43 RSNI element

The RSNI element contains an RSNI value, as shown in Figure 8-225.

	Element ID	Length	RSNI
Octets:	1	1	1

Figure 8-225—RSNI element format

The Element ID field is equal to the RSNI value in Table 8-54.

The Length field in octets is set to 1.

RSNI is in steps of 0.5 dB. RSNI is calculated by the ratio of the received signal power (RCPI-ANPI) to the noise plus interference power (ANPI) using the expression:

$$\text{RSNI} = (10 \times \log10((\text{RCPI}_{\text{power}} - \text{ANPI}_{\text{power}}) / \text{ANPI}_{\text{power}})+10) \times 2$$

where $\text{RCPI}_{\text{power}}$ and $\text{ANPI}_{\text{power}}$ indicate power domain values for RCPI and ANPI and not dB domain values. RSNI in dB is scaled in steps of 0.5 dB to obtain 8-bit RSNI values, which cover the range from –10 dB to +117 dB. The value 255 indicates that RSNI is not available. See 10.11.9.4 for details and procedures for measuring ANPI.

8.4.2.44 Measurement Pilot Transmission element

The Measurement Pilot Transmission element contains a Measurement Pilot Transmission field as shown in Figure 8-226.

	Element ID	Length	Measurement Pilot Transmission	Optional Subelements
Octets:	1	1	1	variable

Figure 8-226—Measurement Pilot Transmission element format

The Element ID field is equal to the Measurement Pilot Transmission value in Table 8-54.

The Length field in octets is variable and depends on the number and length of optional subelements.

The Measurement Pilot Transmission field contains the Measurement Pilot Interval as specified in 8.4.1.18.

The Optional Subelements field format contains zero or more subelements, each consisting of a 1-octet Subelement ID field, a 1-octet Length field, and a variable-length Data field, as shown in Figure 8-402. Any optional subelements are ordered by nondecreasing subelement ID.

The Subelement ID field values for the defined optional subelements are shown in Table 8-117. A Yes in the Extensible column of a subelement listed in Table 8-117 indicates that the Length of the subelement might be extended in future revisions or amendments of this standard. When the Extensible column of an element is equal to Subelements, then the subelement might be extended in future revisions or amendments of this standard by defining additional subelements within the subelement. See 9.24.9.

Table 8-117—Optional subelement IDs for Measurement Pilot Transmission

Subelement ID	Name	Length field (octets)	Extensible
0–220	Reserved		
221	Vendor Specific	1 to 255	
222–255	Reserved		

The Vendor Specific subelements have the same format as their corresponding elements (see 8.4.2.28). Multiple Vendor Specific subelements are optionally present in the list of optional subelements.

8.4.2.45 BSS Available Admission Capacity element

The BSS Available Admission Capacity element contains a list of Available Admission Capacity fields at different User Priorities and Access Categories as shown in Figure 8-227.

NOTE—The BSS Available Admission Capacity element is helpful for roaming QoS STAs to select a QoS AP that is likely to accept future admission control requests, but it does not provide an assurance that the HC will admit these requests.

	Element ID	Length	Available Admission Capacity Bitmask	Available Admission Capacity List
Octets:	1	1	2	2 x (total number of nonzero bits in Available Admission Capacity Bitmask)

Figure 8-227—BSS Available Admission Capacity element format

The Element ID field is equal to the BSS Available Admission Capacity value in Table 8-54.

The Length field has units of octets and is set to $2 + 2N_{nz}$, where N_{nz} equals the total number of nonzero bits in Available Admission Capacity Bitmask.

The Available Admission Capacity Bitmask field indicates the UP values that have an Available Admission Capacity specified in the Available Admission Capacity List field. The format of the Available Admission Capacity Bitmask is defined in Table 8-118.

Table 8-118—Available Admission Capacity Bitmask definition

Bit	Available Admission Capacity Reported
0	UP 0
1	UP 1
2	UP 2
3	UP 3
4	UP 4
5	UP 5

Table 8-118—Available Admission Capacity Bitmask definition *(continued)*

Bit	Available Admission Capacity Reported
6	UP 6
7	UP 7
8	AC 0
9	AC 1
10	AC 2
11	AC 3
12–15	Reserved

Each bit in the Available Admission Capacity Bitmask is set to 1 to indicate that the Available Admission Capacity for the corresponding traffic type is present in the Available Admission Capacity List field. The bit is set to 0 to indicate that the Available Admission Capacity for the corresponding traffic type is not present in the Available Admission Capacity List field.

The Available Admission Capacity List comprises a sequence of Available Admission Capacity fields corresponding respectively to the nonzero bits in the Available Admission Capacity Bitmask field.

The Available Admission Capacity field is 2 octets long and contains an unsigned integer that specifies the amount of medium time available using explicit admission control for the corresponding UP or AC traffic, in units of 32 µs per 1 s. See 10.11.17 for furthers details.

8.4.2.46 BSS AC Access Delay element

The BSS AC Access Delay element contains an Access Category Access Delay field, as shown in Figure 8-228.

	Element ID	Length	Access Category Access Delay
Octets:	1	1	4

Figure 8-228—BSS AC Access Delay element format

The Element ID field is equal to the BSS AC Access Delay value in Table 8-54.

The Length field in octets is set to 4.

The AC Access Delay field is formatted as four subfields as shown in Figure 8-229. The AC Access Delay is a scalar indication of the average access delay at a QoS AP for services for each of the indicated Access Categories. If the QoS AP is not currently transmitting any traffic using the indicated AC, the Average Access Delay for that AC is set to 255. The values between 1 and 252 are a scaled representation of the average medium access delay for transmitted frames in the indicated AC measured from the time the EDCA MPDU is ready for transmission (i.e., begins CSMA/CA access) until the actual frame transmission start time. The AC Access Delay values are scaled as follows:

0:	$\text{Access Delay} < 8\ \mu\text{s}$
1:	$8\ \mu\text{s} \le \text{Access Delay} < 16\ \mu\text{s}$
$2 \le n \le 14$:	$n \times 8\ \mu\text{s} \le \text{Access Delay} < (n + 1) \times 8\ \mu\text{s}$
15:	$120\ \mu\text{s} \le \text{Access Delay} < 128\ \mu\text{s}$
16:	$128\ \mu\text{s} \le \text{Access Delay} < 144\ \mu\text{s}$
$17 \le n \le 106$:	$(n \times 16) - 128\ \mu\text{s} \le \text{Access Delay} < ((n + 1) \times 16) - 128\ \mu\text{s}$
107:	$1584\ \mu\text{s} \le \text{Access Delay} < 1600\ \mu\text{s}$
108:	$1600\ \mu\text{s} \le \text{Access Delay} < 1632\ \mu\text{s}$
$109 \le n \le 246$:	$(n \times 32) - 1856\ \mu\text{s} \le \text{Access Delay} < ((n + 1) \times 32) - 1856\ \mu\text{s}$
247:	$6048\ \mu\text{s} \le \text{Access Delay} < 6080\ \mu\text{s}$
248:	$6080\ \mu\text{s} \le \text{Access Delay} < 8192\ \mu\text{s}$
249:	$8192\ \mu\text{s} \le \text{Access Delay} < 12\,288\ \mu\text{s}$
250:	$12\,288\ \mu\text{s} \le \text{Access Delay} < 16\,384\ \mu\text{s}$
251:	$16\,384\ \mu\text{s} \le \text{Access Delay} < 20\,480\ \mu\text{s}$
252:	$20\,480\ \mu\text{s} \le \text{Access Delay} < 24\,576\ \mu\text{s}$
253:	$24\,576\ \mu\text{s} \le \text{Access Delay}$
254:	Service unable to access channel
255:	Measurement not available

The values 0–253 indicate Average Access Delay when one or more frames were transmitted during the measurement window. The value 254 indicates that EDCA services are currently unable to access the channel due to continuous carrier sense mechanism deferral to higher priority AC transmissions and that no frames were transmitted during the measurement window. The QoS AP measures and averages the medium access delay for all transmit frames of the indicated AC using EDCA mechanism over a continuous 30 s measurement window. See 10.11.16 for accuracy requirements.

	Average Access Delay for Best Effort (AC_BE)	Average Access Delay for Background (AC_BK)	Average Access Delay for Video (AC_VI)	Average Access Delay for Voice (AC_VO)
Octets:	1	1	1	1

Figure 8-229—Access Category Access Delay subfields

8.4.2.47 RM Enabled Capabilities element

The RM Enabled Capabilities element signals support for radio measurements in a device. The element is shown in Figure 8-230.

	Element ID	Length	RM Enabled Capabilities
Octets:	1	1	5

Figure 8-230—RM Enabled Capabilities element format

The Element ID field is equal to the RM Enabled Capabilities value in Table 8-54.

The Length field in octets is set to 5.

The RM Enabled Capabilities field is an octet string. Each subfield of this field indicates whether the corresponding capability listed in Table 8-119 is enabled.

Table 8-119—RM Enabled Capabilities definition

Bit position in the RM Enabled Capabilities field	Field name	Notes
0	Link Measurement capability enabled	A STA sets Link Measurement capability enabled bit to 1 when dot11RMLinkMeasurementActivated is true, and is set to 0 otherwise.
1	Neighbor Report capability enabled	A STA sets Neighbor Report capability enabled bit to 1 when dot11RMNeighborReportActivated is true, and sets it to 0 otherwise.
2	Parallel Measurements capability enabled	A STA sets Parallel Measurements capability enabled bit to 1 when dot11RMParallelMeasurementsActivated is true, and sets it to 0 otherwise.
3	Repeated Measurements capability enabled	A STA sets Repeated Measurements capability enabled bit to 1 when dot11RMRepeatedMeasurementsActivated is true, and sets it to 0 otherwise.
4	Beacon Passive Measurement capability enabled	A STA sets Beacon Passive Measurement capability enabled bit to 1 when dot11RMBeaconPassiveMeasurementActivated is true, and sets it to 0 otherwise.
5	Beacon Active Measurement capability enabled	A STA sets Beacon Active Measurement capability enabled bit to 1 when dot11RMBeaconActiveMeasurementActivated is true, and sets it to 0 otherwise.
6	Beacon Table Measurement capability enabled	A STA sets Beacon Table Measurement capability enabled bit to 1 when dot11RMBeaconTableMeasurementActivated is true, and sets it to 0 otherwise.
7	Beacon Measurement Reporting Conditions capability enabled	A STA sets Beacon Measurement Reporting Conditions capability enabled bit to 1 when dot11RMBeaconMeasurementReportingConditionsActivated is true, and sets it to 0 otherwise.
8	Frame Measurement capability enabled	A STA sets Frame Measurement capability enabled bit to 1 when dot11RMFrameMeasurementActivated is true, and sets it to 0 otherwise.

Table 8-119—RM Enabled Capabilities definition *(continued)*

Bit position in the RM Enabled Capabilities field	Field name	Notes
9	Channel Load Measurement capability enabled	A STA sets Channel Load Measurement capability enabled bit to 1 when dot11RMChannelLoadMeasurementActivated is true, and sets it to 0 otherwise.
10	Noise Histogram Measurement capability enabled	A STA sets Noise Histogram Measurement capability enabled bit to 1 when dot11RMNoiseHistogramMeasurementActivated is true, and sets it to 0 otherwise.
11	Statistics Measurement capability enabled	A STA sets Statistics Measurement capability enabled bit to 1 when dot11RMStatisticsMeasurementActivated is true, and sets it to 0 otherwise.
12	LCI Measurement capability enabled	A STA sets LCI Measurement capability enabled bit to 1 when dot11RMLCIMeasurementActivated is true, and sets it to 0 otherwise.
13	LCI Azimuth capability enabled	A STA sets LCI Azimuth capability enabled bit to 1 when dot11RMLCIAzimuthActivated is true, and sets it to 0 otherwise.
14	Transmit Stream/ Category Measurement capability enabled	A STA sets Transmit Stream/Category Measurement capability enabled bit to 1 when dot11RMTransmitStreamCategoryMeasurementActivated is true, and sets it to 0 otherwise.
15	Triggered Transmit Stream/Category Measurement capability enabled	A STA sets Triggered Transmit Stream/Category Measurement capability enabled bit to 1 when dot11RMTriggeredTransmitStreamCategoryMeasurementActivated is true, and sets it to 0 otherwise.
16	AP Channel Report capability enabled	A STA sets AP Channel Report capability enabled bit to 1 when dot11RMAPChannelReportActivated is true, and sets it to 0 otherwise.
17	RM MIB capability enabled	A STA sets RM MIB capability enabled bit to 1 when dot11RMMIBActivated is true, and sets it to 0 otherwise.
18–20	Operating Channel Max Measurement Duration	A STA sets Operating Channel Max Measurement Duration to equal the value of dot11RMMaxMeasurementDuration. See 10.11.4.
21–23	Nonoperating Channel Max Measurement Duration	A STA sets Nonoperating Channel Max Measurement Duration to equal the value of dot11RMNonOperatingChannelMaxMeasurementDuration. See 10.11.4.
24–26	Measurement Pilot capability	A STA sets Measurement Pilot capability to equal the value of dot11RMMeasurementPilotActivated. See Table 10-7 in 10.11.15.
27	Measurement Pilot Transmission Information capability enabled	A STA sets Measurement Pilot Transmission capability enabled bit to 1 when dot11RMMeasurementPilotTransmissionInformationActivated is true, and sets it to 0 otherwise.
28	Neighbor Report TSF Offset capability enabled	A STA sets Neighbor Report TSF Offset capability enabled bit to 1 when dot11RMNeighborReportTSFOffsetActivated is true, and sets it to 0 otherwise.
29	RCPI Measurement capability enabled	A STA sets RCPI Measurement capability enabled bit to 1 when dot11RMRCPIMeasurementActivated is true, and sets it to 0 otherwise.

Table 8-119—RM Enabled Capabilities definition *(continued)*

Bit position in the RM Enabled Capabilities field	Field name	Notes
30	RSNI Measurement capability enabled	A STA sets RSNI Measurement capability enabled bit to 1 when dot11RMRSNIMeasurementActivated is true, and sets it to 0 otherwise.
31	BSS Average Access Delay capability enabled	A STA sets BSS Average Access Delay capability enabled bit to 1 when dot11RMBSSAverageAccessDelayActivated is true, and sets it to 0 otherwise (see NOTE).
32	BSS Available Admission Capacity capability enabled	A STA sets BSS Available Admission Capacity capability enabled bit to 1 when dot11RMBSSAvailableAdmissionCapacityActivated is true, and sets it to 0 otherwise.
33	Antenna capability enabled	A STA sets Antenna capability enabled bit to 1 when dot11RMAntennaInformationActivated is true, and sets it to 0 otherwise.
34–39	Reserved	
NOTE—At a QoS AP dot11RMBSSAverageAccessDelayActivated is true indicates that the AP BSS AC Access Delay capability is also enabled.		

8.4.2.48 Multiple BSSID element

The format of the Multiple BSSID element is shown in Figure 8-231.

	Element ID	Length	MaxBSSID Indicator	Optional Subelements
Octets:	1	1	1	variable

Figure 8-231—Multiple BSSID element format

The Element ID field is equal to the Multiple BSSID value in Table 8-54.

The value of the Length field is 1 plus the length of the extensions in units of octets.

The Max BSSID Indicator field contains a value assigned to *n*, where 2^n is the maximum number of BSSIDs in the multiple BSSID set, including the reference BSSID (see 10.11.14). The actual number of BSSIDs in the multiple BSSID set is not explicitly signalled. The BSSID(i) value corresponding to the i^{th} BSSID in the multiple BSSID set is derived from a reference BSSID (REF_BSSID) as follows:

BSSID(i) = BSSID_A | BSSID_B

where

BSSID_A is a BSSID with (48–n) MSBs equal to the (48–n) MSBs of the REF_BSSID and n LSBs equal to 0

BSSID_B is a BSSID with (48–n) MSBs equal to 0 and n LSBs equal to [(n LSBs of REF_BSSID) +i] mod 2^n

| indicates the OR operation

When the Multiple BSSID element is transmitted in a Beacon or Probe Response frame, the reference BSSID is the BSSID of the frame. More than one Multiple BSSID element may be included in a Beacon frame. The AP determines the number of Multiple BSSID elements. The AP does not fragment a nontransmitted BSSID profile subelement for a single BSSID across two Multiple BSSID elements unless the length of the nontransmitted BSSID profile subelement exceeds 255 octets. When the Multiple BSSID element is transmitted as a subelement in a Neighbor Report element, the reference BSSID is the BSSID field in the Neighbor Report element.

The Optional Subelements field format contains zero or more subelements, each consisting of a 1-octet Subelement ID field, a 1-octet Length field, and a variable-length Data field, as shown in Figure 8-402. Any optional subelements are ordered by nondecreasing subelement ID.

The Subelement ID field values for the defined optional subelements are shown in Table 8-120. A Yes in the Extensible column of a subelement listed in Table 8-120 indicates that the Length of the subelement might be extended in future revisions or amendments of this standard. When the Extensible column of an element is equal to Subelements, then the subelement might be extended in future revisions or amendments of this standard by defining additional subelements within the subelement. See 9.24.9.

Table 8-120—Optional subelement IDs for Multiple BSSID

Subelement ID	Name	Length field (octets)	Extensible
0	Nontransmitted BSSID Profile	Variable	
1–220	Reserved		
221	Vendor Specific	1 to 255	
222–255	Reserved		

The Nontransmitted BSSID Profile subelement contains a list of elements for one or more APs that have nontransmitted BSSIDs, and is defined as follows:

- For each nontransmitted BSSID, the Nontransmitted BSSID Capability element (see 8.4.2.74) is the first element included, followed by a variable number of elements, in the order defined in 8-20.
- The SSID and multiple BSSID-index subelements are included in the Nontransmitted BSSID Profile subelement.
- The FMS Descriptor element is included in the Nontransmitted BSSID Profile subelement if the Multiple BSSID element is included in a Beacon frame and if the TIM field indicates there are buffered group addressed frames for this nontransmitted BSSID.
- The Timestamp and Beacon Interval fields, DSSS Parameter Set, FH Parameter Set, IBSS Parameter Set, Country, FH Parameters, FH Pattern Table, Channel Switch Assignment, Extended Channel Switch Announcement, Supported Operating Classes, IBSS DFS, ERP Information, HT Capabilities and HT Operation elements are not included in the Nontransmitted BSSID Profile field; the values of these elements for each nontransmitted BSSID are always the same as the corresponding transmitted BSSID element values.

The Vendor Specific subelements have the same format as their corresponding elements (see 8.4.2.28). Multiple Vendor Specific subelements are optionally present in the list of optional subelements.

The Multiple BSSID element is included in Beacon frames, as described in 8.3.3.2, and Probe Response frames, as described in 8.3.3.10. The use of the Multiple BSSID element is described 10.11.14. Nontransmitted BSSID Advertisement procedures are described in 10.1.3.6.

8.4.2.49 Mobility Domain element (MDE)

The MDE contains the Mobility Domain Identifier (MDID) and the FT Capability and Policy field. The AP uses the MDE to advertise that it is included in the group of APs that constitute a mobility domain, to advertise its support for FT capability, and to advertise its FT policy information. The format for this element is given in Figure 8-232.

	Element ID	Length	MDID	FT Capability and Policy
Octets:	1	1	2	1

Figure 8-232—MDE format

The Length field is set to 3.

The MDID field is a 2-octet value that follows the ordering conventions defined in 8.2.2.

The FT Capability and Policy field is 1 octet. The FT Capability and Policy field is defined in Figure 8-233.

	B0	B1	B2 B7
	Fast BSS Transition over DS	Resource Request Protocol Capability	Reserved
Bits:	1	1	6

Figure 8-233—FT Capability and Policy field

Bits 0–1 of the FT Capability and Policy field control the behavior of STAs performing fast BSS transitions (see 12.3). The STA might use information from the MDE to determine the transition methods recommended by the AP and protocols supported by the AP. The choice of executing any specific transition method is outside the scope of this standard.

If Resource Request Protocol Capability subfield is 1, then the STA may perform the FT Resource Request Protocol of 12.6.

When sent by a STA to a target AP, the FT Capability and Policy field matches the value advertised by that target AP. See 12.8.

8.4.2.50 Fast BSS Transition element (FTE)

The FTE includes information needed to perform the FT authentication sequence during a fast BSS transition in an RSN. This element is shown in Figure 8-234.

	Element ID	Length	MIC Control	MIC	ANonce	SNonce	Optional Parameter(s)
Octets:	1	1	2	16	32	32	variable

Figure 8-234—FTE format

The Length field for this element indicates the length of the Information field.

The MIC Control field is two octets and is defined in Figure 8-235.

	B0 B7	B8 B15
	Reserved	Element Count
Bits:	8	8

Figure 8-235—MIC Control field

The Element Count subfield of the MIC Control field contains the number of elements that are included in the message integrity code (MIC) calculation. A value of 0 indicates no MIC is present.

The MIC field contains a MIC that is calculated using the algorithm specified in 12.8.4 and 12.8.5.

The ANonce field contains a value chosen by the R1KH. It is encoded following the conventions in 8.2.2.

The SNonce field contains a value chosen by the S1KH. It is encoded following the conventions in 8.2.2.

The format of the Optional Parameter(s) field is shown in Figure 8-236.

	Subelement ID	Length	Data
Octets:	1	1	variable

Figure 8-236—Optional Parameter(s) field

The Subelement ID field contains one of the values from Table 8-121:

Table 8-121—Subelement IDs

Value	Contents of Data field	Length (in octets)
0	Reserved	
1	PMK-R1 key holder identifier (R1KH-ID)	6
2	GTK subelement	35–51
3	PMK-R0 key holder identifier (R0KH-ID)	1–48
4	IGTK	Variable
5–255	Reserved	

R1KH-ID indicates the identity of the R1KH, which is used by the S0KH and the R0KH for deriving the PMK-R1s. It is encoded following the conventions in 8.2.2.

The GTK subelement contains the group temporal key, which is encrypted (see procedures in 12.8.5) and is defined in Figure 8-237.

	Subelement ID	Length	Key Info	Key Length	RSC	Wrapped Key
Octets:	1	1	2	1	8	24–40

Figure 8-237—GTK subelement format

The GTK subelement Key Info subfield is defined in Figure 8-238.

	B0 B1	B2 B15
	Key ID	Reserved
Bits:	2	14

Figure 8-238—GTK subelement's Key Info subfield

Key Length field is the length of the Key field in octets, not including any padding (see 12.8.5).

RSC field contains the receive sequence counter (RSC) for the GTK being installed. Delivery of the RSC field value allows a STA to identify replayed MPDUs. If the RSC field value is less than 8 octets in length, the remaining octets are set to 0. The least significant octet of the transmit sequence counter (TSC) or packet number (PN) is in the first octet of the RSC field. See Table 11-5.

For WEP, the RSC value is set to 0 on transmit and is not used at the receiver.

The Wrapped Key field contains the encrypted GTK as described in 12.8.5.

When sent by a non-AP STA, the R0KH-ID indicates the R0KH with which the S0KH negotiated the PMK-R0 it is using for this transition. When sent by an AP, the R0KH-ID indicates the R0KH that the S0KH will be using to generate a PMK-R0 security association. It is encoded following the conventions from 8.2.2.

The IGTK field contains the Integrity GTK, used for protecting robust management frames. The IGTK subelement format is shown in Figure 8-239.

	Subelement ID	Length	KeyID	IPN	Key Length	Wrapped Key
Octets:	1	1	2	6	1	24

Figure 8-239—IGTK subelement format

The KeyID field indicates the value of the BIP key ID.

The IPN field indicates the receive sequence counter for the IGTK being installed. The PN field gives the current message number for the IGTK, to allow a STA to identify replayed MPDUs.

The Key Length field is the length of IGTK in octets, not including any padding (see 12.8.5).

The Wrapped Key field contains the wrapped IGTK being distributed. The length of the resulting AES-Key-wrapped IGTK in the Wrapped Key field is Key Length + 8 octets.

8.4.2.51 Timeout Interval element (TIE)

The TIE specifies time intervals and timeouts. Figure 8-240 shows this element.

	Element ID	Length	Timeout Interval Type	Timeout Interval Value
Octets:	1	1	1	4

Figure 8-240—TIE format

The Length field is set to 5.

The Timeout Interval Type field contains one of the values from Table 8-122.

Table 8-122—Timeout Interval Type field value

Timeout Interval Type	Meaning	Units
0	Reserved	
1	Reassociation deadline interval	Time units (TUs)
2	Key lifetime interval	Seconds
3	Association Comeback time	Time units (TUs)
4–255	Reserved	

The Timeout Interval Value field contains an unsigned 32-bit integer. It is encoded according to the conventions in 8.2.2.

A reassociation deadline interval value of 0 indicates no deadline exists. A key lifetime interval value of 0 is reserved.

8.4.2.52 RIC Data element (RDE)

The RIC refers to a collection of elements that are used to express a resource request and to convey responses to the corresponding requests.

A RIC is a sequence of one or more Resource Requests, or a sequence of one or more Resource Responses. Each Resource Request or Response consists of an RDE, followed by one or more elements that describe that resource. See 12.11 for examples and procedures.

The RDE format is shown in Figure 8-241.

	Element ID	Length	RDE Identifier	Resource Descriptor Count	Status Code
Octets:	1	1	1	1	2

Figure 8-241—RDE format

The Length field is set to 4.

The RDE Identifier field has an arbitrary 8-bit value, chosen by the resource requestor to uniquely identify the RDE within the RIC.

The Resource Descriptor Count field indicates the number of alternative Resource Descriptors that follow this RDE.

The Status Code field is used in Resource Responses to indicate the result of the request. Valid values for the Status Code field are given in 8.4.1.9. When an RDE is included in a Resource Request, the Status Code field is reserved.

8.4.2.53 RIC Descriptor element

The RIC Descriptor element is used with an RDE during a fast BSS transition to negotiate resources that are not otherwise described by elements. See 12.11 for procedures for including this element in a RIC.

Figure 8-242 shows the format of this element.

	Element ID	Length	Resource Type	Variable parameters
Octets:	1	1	1	variable

Figure 8-242—RIC Descriptor element format

The Length field is set to the number of octets in this element (variable).

The Resource Type field contains one of the values given in Table 8-123.

Table 8-123—Resource type code in RIC Descriptor element

Resource type value	Meaning	Variable parameters
1	Block Ack	Block Ack parameter set as defined in 8.4.1.14, Block Ack timeout value as defined in 8.4.1.15, and Block Ack starting sequence control as defined in 8.3.1.8.
0, 2–255	Reserved	

Variable parameters contain any additional data based on the resource type.

8.4.2.54 DSE Registered Location element

A DSE Registered Location element includes DSE location configuration information (LCI), which contains latitude, longitude, and altitude information. The DSE Registered Location element format is shown in Figure 8-243.

	Element ID	Length	DSE Registered Location element body fields
Octets:	1	1	20

Figure 8-243—DSE Registered Location element format

The Length field is set to 20.

The structure and information fields are little endian, per conventions defined in 8.2.2, and are based on the LCI format described in IETF RFC 3825.

The DSE Registered Location element body fields are shown in Figure 8-244.

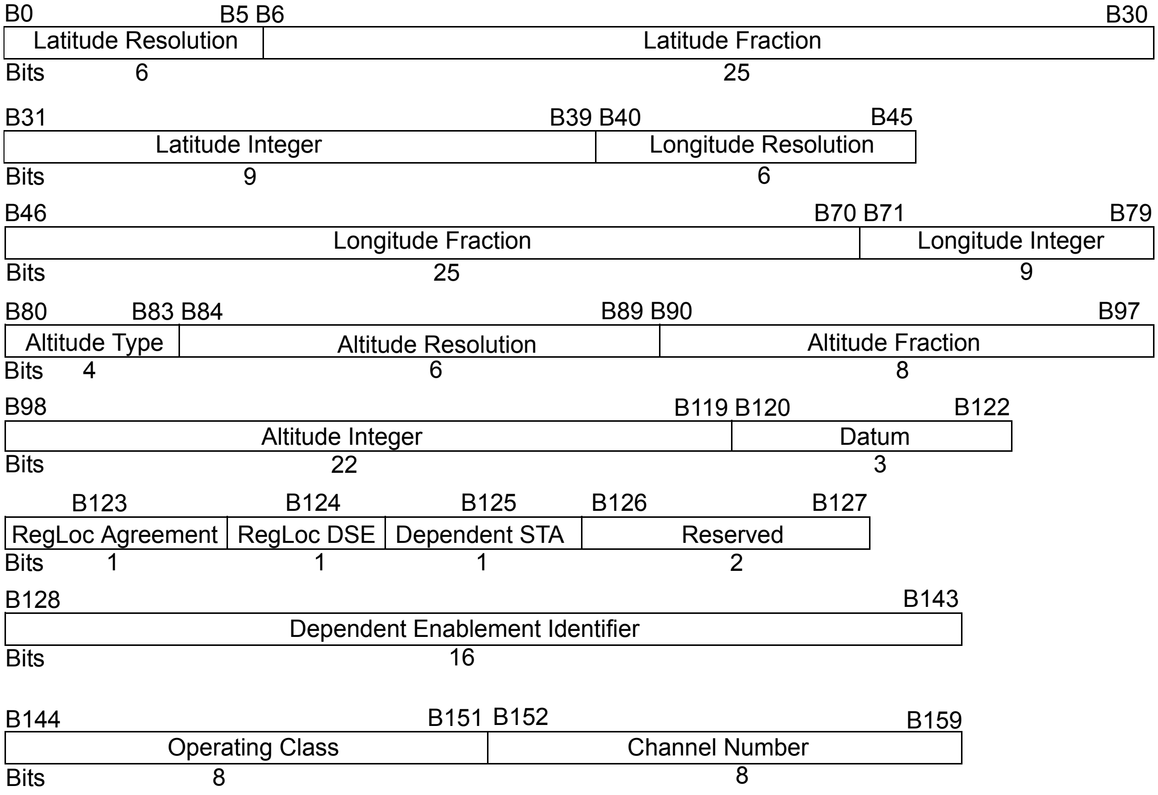

Figure 8-244—DSE registered location element body fields format

The definition of fields within the DSE Registered Location element body is as defined in Section 2.1 of IETF RFC 3825 (July 2004) except as defined in this standard.

With an Altitude Type field value of 3 (i.e., height above ground is in meters), the altitude is defined to be in meters and is formatted in twos-complement, fixed-point, 22-bit integer part with 8-bit fraction.

The Datum field is a 3-bit field, rather than the 8-bit field defined in IETF RFC 3825, and the codes used are as defined in IETF RFC 3825.

The RegLoc Agreement bit field is set to 1 to report that the STA is operating within a national policy area or an international agreement area near a national border (see 10.12.3); otherwise, it is 0.

The RegLoc DSE bit field is set to 1 to report that the enabling STA is enabling the operation of STAs with DSE; otherwise, it is 0.

The Dependent STA bit field is set to 1 to report that the STA is operating with the enablement of the enabling STA whose LCI is being reported; otherwise, it is 0.

The Dependent Enablement Identifier field is a 16-bit field with a value set by the enabling STA via the DSE Enablement frame; otherwise, it is set to 0.

The Operating Class field indicates the channel set for which the enablement request, report, or announcement applies. The Operating Class and Channel Number fields together specify the channel frequency and channel bandwidth for which the report applies. Valid values for the Operating Class field are shown in Annex E.

The Channel Number field indicates the channel number for which the enablement request, report, or announcement applies. The channel number is defined within an operating class as shown in Annex E.

NOTE—An example of fixed/fractional notation, using the longitude of the Sears Tower from p. 13 of IETF RFC 3825 (July 2004) is shown below:

Longitude 87.63602 degrees West (or –87.63602 degrees),

Using twos-complement, 34-bit fixed point, 25-bit fraction,

Longitude = 0xf50ba5b97,

Longitude = 1101010000101110100101101110010111 (big endian)

DSE registered location expression for a Longitude resolution of 34 bits:

Bits 40–45 Longitude resolution = (bit 40) 0 1 0 0 0 1 (bit 45)

Bits 46–70 Longitude fraction = (bit 46) 1 1 1 0 1 0 0 1 1 1 0 1 1 0 1 0 0 1 0 1 1 1 0 1 0 (bit 70)

Bits 71–79 Longitude integer = (bit 71) 0 0 0 1 0 1 0 1 1 (bit 79)

The octets in transmission order = E2 E5 96 2E D4.

8.4.2.55 Extended Channel Switch Announcement element

The Extended Channel Switch Announcement element is used by an AP in an infrastructure BSS, a STA in an IBSS, or a mesh STA in an MBSS to advertise when the BSS is changing to a new channel or a new channel in a new operating class. The announcement includes both the operating class and the channel number of the new channel. The element is present only when an extended channel switch is pending. The format of the Extended Channel Switch Announcement element is shown in Figure 8-245.

	Element ID	Length	Channel Switch Mode	New Operating Class	New Channel Number	Channel Switch Count
Octets:	1	1	1	1	1	1

Figure 8-245—Extended Channel Switch Announcement element format

The Length field is set to 4.

The Channel Switch Mode field indicates any restrictions on transmission until a channel switch. An AP in an infrastructure BSS or a STA in an IBSS sets the Channel Switch Mode field to either 0 or 1 on transmission as specified in 10.9.8.2 and 10.9.8.3. The Channel Switch Mode field is reserved in an MBSS.

The New Operating Class field is set to the number of the operating class after the channel switch, as defined in Annex E.

The New Channel Number field is set to the number of the channel after the channel switch. The channel number is a channel from the STA's new operating class as defined in Annex E.

For nonmesh STAs, the Channel Switch Count field indicates either the number of target beacon transmission times (TBTTs) until the STA sending the Extended Channel Switch Announcement element switches to the new channel or a value of 0. A value of 1 indicates that the switch occurs immediately before the next TBTT. A value of 0 indicates that the switch occurs anytime after the frame containing the element is transmitted.

For mesh STAs, the Channel Switch Count field is encoded as an octet with bits 6 to 0 set to the time, in units of 2TU when the MSB (bit 7) is 0, or in units of 100TU when the MSB (bit 7) is 1, until the mesh STA sending the Channel Switch Announcement element switches to the new channel. A value of 0 for bits 6 to 0 indicates that the switch occurs at any time after the frame containing the element is transmitted. For example, a 200 TU channel switch time is encoded as X'82' and a 10TU channel switch time is encoded as X'05'.

8.4.2.56 Supported Operating Classes element

The Supported Operating Classes element is used by a STA to advertise the operating classes that it is capable of operating with in this country. The format of the Supported Operating Classes element is shown in Figure 8-246.

	Element ID	Length	Current Operating Class	Operating Classes
Octets:	1	1	1	Length–1

Figure 8-246—Supported Operating Classes element format

The value of the Length field of the Supported Operating Classes element is between 2 and 253. The Current Operating Class octet indicates the operating class in use for transmission and reception. The Operating Classes field lists in ascending order all operating classes that the STA is capable of operating with in this country. The use of this element is described in 10.10.1 and 10.11.9.1.

8.4.2.57 Management MIC element

The Management MIC element (MME) provides message integrity and protects group addressed robust management frames from forgery and replay. Figure 8-247 shows the MME format.

	Element ID	Length	KeyID	IPN	MIC
Octets:	1	1	2	6	8

Figure 8-247—Management MIC element format

The value of the Element ID field is 76 decimal (4c hex).

The Length field is set to 16.

The Key ID field identifies the IGTK used to compute the MIC. Bits 0–11 define a value in the range 0–4095. Bits 12–15 are reserved. The IGTK Key ID is either 4 or 5. The remaining Key IDs are reserved.

The IPN field contains a 6 octet value, interpreted as a 48-bit unsigned integer and used to detect replay of protected group addressed robust management frames.

The MIC field contains a message integrity code calculated over the robust management frame as specified in 11.4.4.5 and 11.4.4.6.

8.4.2.58 HT Capabilities element

8.4.2.58.1 HT Capabilities element structure

An HT STA declares that it is an HT STA by transmitting the HT Capabilities element.

The HT Capabilities element contains a number of fields that are used to advertise optional HT capabilities of an HT STA. The HT Capabilities element is present in Beacon, Association Request, Association Response, Reassociation Request, Reassociation Response, Probe Request, Probe Response, Mesh Peering Open, and Mesh Peering Close frames. The HT Capabilities element is defined in Figure 8-248.

	Element ID	Length	HT Capabilities Info	A-MPDU Parameters	Supported MCS Set	HT Extended Capabilities	Transmit Beamforming Capabilities	ASEL Capabilities
Octets:	1	1	2	1	16	2	4	1

Figure 8-248—HT Capabilities element format

The Element ID field is set to the value for HT Capabilities element defined in Table 8-54.

The Length field of the HT Capabilities element is set to 26.

8.4.2.58.2 HT Capabilities Info field

The HT Capabilities Info field of the HT Capabilities element is 2 octets in length, and contains capability information bits. The structure of this field is defined in Figure 8-249.

	B0	B1	B2 B3	B4	B5	B6	B7	B8 B9
	LDPC Coding Capability	Supported Channel Width Set	SM Power Save	HT-Greenfield	Short GI for 20 MHz	Short GI for 40 MHz	Tx STBC	Rx STBC
Bits:	1	1	2	1	1	1	1	2

B10	B11	B12	B13	B14	B15
HT-Delayed Block Ack	Maximum A-MSDU Length	DSSS/CCK Mode in 40 MHz	Reserved	Forty MHz Intolerant	L-SIG TXOP Protection Support
1	1	1	1	1	1

Figure 8-249—HT Capabilities Info field

The subfields of the HT Capabilities Info field are defined in Table 8-124.

Table 8-124—Subfields of the HT Capabilities Info field

Subfield	Definition	Encoding
LDPC Coding Capability	Indicates support for receiving LDPC coded packets	Set to 0 if not supported Set to 1 if supported
Supported Channel Width Set	Indicates the channel widths supported by the STA. See 10.15.	Set to 0 if only 20 MHz operation is supported Set to 1 if both 20 MHz and 40 MHz operation is supported This field is reserved when the transmitting or receiving STA is operating in an operating class that does not include a value of 13 or 14 in the behavior limits as specified in Annex E.
SM Power Save	Indicates the spatial multiplexing power save mode. See 10.2.4.	Set to 0 for static SM power save mode Set to 1 for dynamic SM power save mode Set to 3 for SM Power Save disabled The value 2 is reserved
HT-Greenfield	Indicates support for the reception of PPDUs with HT-greenfield format. See 20.1.4.	Set to 0 if not supported Set to 1 if supported
Short GI for 20 MHz	Indicates short GI support for the reception of packets transmitted with TXVECTOR parameter CH_BANDWIDTH equal to HT_CBW20	Set to 0 if not supported Set to 1 if supported
Short GI for 40 MHz	Indicates short GI support for the reception of packets transmitted with TXVECTOR parameter CH_BANDWIDTH equal to HT_CBW40	Set to 0 if not supported Set to 1 if supported
Tx STBC	Indicates support for the transmission of PPDUs using STBC	Set to 0 if not supported Set to 1 if supported
Rx STBC	Indicates support for the reception of PPDUs using STBC	Set to 0 for no support Set to 1 for support of one spatial stream Set to 2 for support of one and two spatial streams Set to 3 for support of one, two and three spatial streams
HT-Delayed Block Ack	Indicates support for HT-delayed Block Ack operation. See 9.21.8.	Set to 0 if not supported Set to 1 if supported Support indicates that the STA is able to accept an ADDBA request for HT-delayed Block Ack
Maximum A-MSDU Length	Indicates maximum A-MSDU length. See 9.11.	Set to 0 for 3839 octets Set to 1 for 7935 octets

Table 8-124—Subfields of the HT Capabilities Info field *(continued)*

Subfield	Definition	Encoding
DSSS/CCK Mode in 40 MHz	Indicates use of DSSS/CCK mode in a 20/40 MHz BSS. See 10.15.	In Beacon and Probe Response frames: Set to 0 if the BSS does not allow use of DSSS/CCK in 40 MHz Set to 1 if the BSS does allow use of DSSS/CCK in 40 MHz Otherwise: Set to 0 if the STA does not use DSSS/CCK in 40 MHz Set to 1 if the STA uses DSSS/CCK in 40 MHz See 10.15.8 for operating rules
Forty MHz Intolerant	Indicates whether APs receiving this information or reports of this information are required to prohibit 40 MHz transmissions (see 10.15.12).	Set to 1 by an HT STA to prohibit a receiving AP from operating that AP's BSS as a 20/40 MHz BSS; otherwise, set to 0.
L-SIG TXOP Protection Support	Indicates support for the L-SIG TXOP protection mechanism (see 9.23.5)	Set to 0 if not supported Set to 1 if supported

The following subfields are reserved for a mesh STA: Tx STBC, Rx STBC, PSMP Support.

8.4.2.58.3 A-MPDU Parameters field

The structure of the A-MPDU Parameters field of the HT Capabilities element is shown in Figure 8-250.

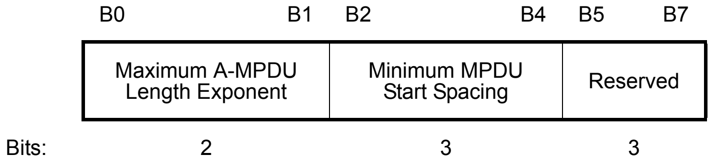

Figure 8-250—A-MPDU Parameters field

The subfields of the A-MPDU Parameters field are defined in Table 8-125.

Table 8-125—Subfields of the A-MPDU Parameters field

Subfield	Definition	Encoding
Maximum A-MPDU Length Exponent	Indicates the maximum length of A-MPDU that the STA can receive.	This field is an integer in the range 0 to 3. The length defined by this field is equal to $2^{(13 + \text{Maximum A-MPDU Length Exponent})} - 1$ octets.
Minimum MPDU Start Spacing	Determines the minimum time between the start of adjacent MPDUs within an A-MPDU that the STA can receive, measured at the PHY-SAP. See 9.12.3.	Set to 0 for no restriction Set to 1 for 1/4 µs Set to 2 for 1/2 µs Set to 3 for 1 µs Set to 4 for 2 µs Set to 5 for 4 µs Set to 6 for 8 µs Set to 7 for 16 µs

8.4.2.58.4 Supported MCS Set field

The Supported MCS Set field of the HT Capabilities element indicates which MCSs a STA supports.

An MCS is identified by an MCS index, which is represented by an integer in the range 0 to 76. The interpretation of the MCS index (i.e., the mapping from MCS to data rate) is PHY dependent. For the HT PHY, see 20.6.

The structure of the MCS Set field is defined in Figure 8-251.

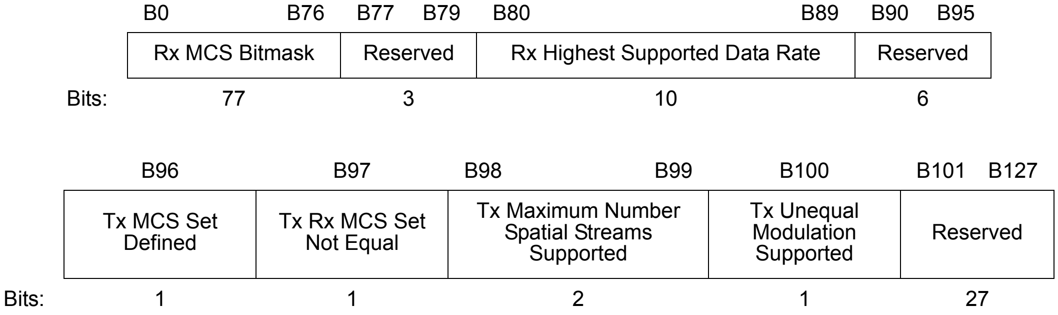

Figure 8-251—Supported MCS Set field

The Rx MCS Bitmask subfield of the Supported MCS Set field defines a set of MCS index values, where bit B0 corresponds to MCS 0 and bit B76 corresponds to MCS 76.

NOTE—An HT STA includes the mandatory MCS values defined in 20.1 in the Rx MCS Bitmask subfield.

The Rx Highest Supported Data Rate subfield of the Supported MCS Set field defines the highest data rate that the STA is able to receive, in units of 1 Mb/s, where 1 represents 1 Mb/s, and incrementing by 1 Mb/s steps to the value 1023, which represents 1023 Mb/s. If the maximum data rate expressed in Mb/s is not an integer, then the value is rounded up to the next integer. The value 0 indicates that this subfield does not specify the highest data rate that the STA is able to receive; see 9.7.6.5.3.

The Tx MCS Set Defined, Tx Rx MCS Set Not Equal, Tx Maximum Number Spatial Streams Supported, and Tx Unequal Modulation Supported subfields of the Supported MCS Set field indicate the transmit-supported MCS set, as defined in Table 8-126.

Table 8-126—Transmit MCS Set

Condition	Tx MCS Set Defined	Tx Rx MCS Set Not Equal	Tx Maximum Number Spatial Streams Supported	Tx Unequal Modulation Supported
No Tx MCS set is defined	0	0	0	0
The Tx MCS set is defined to be equal to the Rx MCS set	1	0	0	0
The Tx MCS set may differ from the Rx MCS set	1	1	Indicates the maximum number of spatial streams supported when transmitting: Set to 0 for 1 spatial stream Set to 1 for 2 spatial streams Set to 2 for 3 spatial streams Set to 3 for 4 spatial streams	Indicates whether transmit unequal modulation (UEQM) is supported: Set to 0 for UEQM not supported Set to 1 for UEQM supported

8.4.2.58.5 HT Extended Capabilities field

The structure of the HT Extended Capabilities field of the HT Capabilities element is defined in Figure 8-252.

	B0	B1 B2	B3 B7	B8 B9	B10	B11	B12 B15
	PCO	PCO Transition Time	Reserved	MCS Feedback	+HTC Support	RD Responder	Reserved
Bits:	1	2	5	2	1	1	4

Figure 8-252—HT Extended Capabilities field

The subfields of the HT Extended Capabilities field are defined in Table 8-127.

Table 8-127—Subfields of the HT Extended Capabilities field

Subfield	Definition	Encoding
PCO	Indicates support for PCO. When transmitted by an AP: indicates whether the AP can operate its BSS as a PCO BSS. When transmitted by a non-AP STA: indicates whether the STA can operate as a PCO active STA when the Transition Time subfield in its HT Extended Capabilities field meets the intended transition time of the PCO capable AP.	Set to 0 if not supported Set to 1 if supported
PCO Transition Time	When transmitted by a non-AP STA: indicates that the STA can switch between 20 MHz channel width and 40 MHz channel width within the specified time. When transmitted by an AP: indicates the PCO Transition Time to be used during PCO operation. The value contained in this field is dynamic when transmitted by an AP, i.e., the value of this field may change at any time during the lifetime of the association of a STA with the AP. See 10.16.3.	If the PCO subfield is equal to 0, this field is reserved. Otherwise: Set to 1 for 400 µs Set to 2 for 1.5 ms Set to 3 for 5 ms Set to 0 for no transition. In this case, the PCO active STA does not change its operating channel width and is able to receive 40 MHz PPDUs during the 20 MHz phase (see 10.16).
MCS Feedback	Indicates whether the STA can provide MFB	Set to 0 (No Feedback) if the STA does not provide MFB Set to 2 (Unsolicited) if the STA provides only unsolicited MFB Set to 3 (Both) if the STA can provide MFB in response to MRQ (either Delayed or Immediate, see 9.28.1) as well as unsolicited MFB The value 1 is reserved
+HTC Support	Indicates support of the HT Control field. See 9.9	Set to 0 if not supported Set to 1 if supported
RD Responder	Indicates support for acting as a reverse direction responder, i.e., the STA may use an offered RDG to transmit data to an RD initiator using the Reverse Direction Protocol described in 9.25.	Set to 0 if not supported Set to 1 if supported

The following subfield is reserved for a mesh STA: PCO.

8.4.2.58.6 Transmit Beamforming Capabilities

The structure of the Transmit Beamforming Capabilities field is defined in Figure 8-253.

B0	B1	B2	B3	B4	B5	B6 B7	B8
Implicit Transmit Beamforming Receiving Capable	Receive Staggered Sounding Capable	Transmit Staggered Sounding Capable	Receive NDP Capable	Transmit NDP Capable	Implicit Transmit Beamforming Capable	Calibration	Explicit CSI Transmit Beamforming Capable
Bits: 1	1	1	1	1	1	2	1

B9	B10	B11 B12	B13 B14	B15 B16	B17 B18	B19 B20
Explicit Noncompressed Steering Capable	Explicit Compressed Steering Capable	Explicit Transmit Beamforming CSI Feedback	Explicit Noncompressed Beamforming Feedback Capable	Explicit Compressed Beamforming Feedback Capable	Minimal Grouping	CSI Number of Beamformer Antennas Supported
1	1	2	2	2	2	2

B21 B22	B23 B24	B25 B26	B27 B28	B29 B31
Noncompressed Steering Number of Beamformer Antennas Supported	Compressed Steering Number of Beamformer Antennas Supported	CSI Max Number of Rows Beamformer Supported	Channel Estimation Capability	Reserved
2	2	2	2	3

Figure 8-253—Transmit Beamforming Capabilities field

The subfields of the Transmit Beamforming Capabilities field are defined in Table 8-128.

Table 8-128—Subfields of the Transmit Beamforming Capabilities field

Subfield	Definition	Encoding
Implicit Transmit Beamforming Receiving Capable	Indicates whether this STA can receive Transmit Beamforming steered frames using implicit feedback	Set to 0 if not supported Set to 1 if supported
Receive Staggered Sounding Capable	Indicates whether this STA can receive staggered sounding frames.	Set to 0 if not supported Set to 1 if supported
Transmit Staggered Sounding Capable	Indicates whether this STA can transmit staggered sounding frames.	Set to 0 if not supported Set to 1 if supported
Receive NDP Capable	Indicates whether this receiver can interpret null data packets as sounding frames.	Set to 0 if not supported Set to 1 if supported
Transmit NDP Capable	Indicates whether this STA can transmit null data packets as sounding frames.	Set to 0 if not supported Set to 1 if supported
Implicit Transmit Beamforming Capable	Indicates whether this STA can apply implicit transmit beamforming.	Set to 0 if not supported Set to 1 if supported

Table 8-128—Subfields of the Transmit Beamforming Capabilities field *(continued)*

Subfield	Definition	Encoding
Calibration	Indicates whether the STA can participate in a calibration procedure initiated by another STA that is capable of generating an immediate response sounding PPDU and can provide a CSI report in response to the receipt of a sounding PPDU.	Set to 0 if not supported Set to 1 if the STA can respond to a calibration request using the CSI report, but cannot initiate calibration The value 2 is reserved Set to 3 if the STA can both initiate and respond to a calibration request
Explicit CSI Transmit Beamforming Capable	Indicates whether this STA can apply transmit beamforming using CSI explicit feedback in its transmission	Set to 0 if not supported Set to 1 if supported
Explicit Noncompressed Steering Capable	Indicates whether this STA can apply transmit beamforming using noncompressed beamforming feedback matrix explicit feedback in its transmission	Set to 0 if not supported Set to 1 if supported
Explicit Compressed Steering Capable	Indicates whether this STA can apply transmit beamforming using compressed beamforming feedback matrix explicit feedback in its transmission	Set to 0 if not supported Set to 1 if supported
Explicit Transmit Beamforming CSI Feedback	Indicates whether this receiver can return CSI explicit feedback.	Set to 0 if not supported Set to 1 for delayed feedback Set to 2 for immediate feedback Set to 3 for delayed and immediate feedback
Explicit Noncompressed Beamforming Feedback Capable	Indicates whether this receiver can return noncompressed beamforming feedback matrix explicit feedback.	Set to 0 if not supported Set to 1 for delayed feedback Set to 2 for immediate feedback Set to 3 for delayed and immediate feedback
Explicit Compressed Beamforming Feedback Capable	Indicates whether this receiver can return compressed beamforming feedback matrix explicit feedback.	Set to 0 if not supported Set to 1 for delayed feedback Set to 2 for immediate feedback Set to 3 for delayed and immediate feedback
Minimal Grouping	Indicates the minimal grouping used for explicit feedback reports	Set to 0 if the STA supports groups of 1 (no grouping) Set to 1 indicates groups of 1, 2 Set to 2 indicates groups of 1, 4 Set to 3 indicates groups of 1, 2, 4
CSI Number of Beamformer Antennas Supported	Indicates the maximum number of beamformer antennas the beamformee can support when CSI feedback is required	Set to 0 for single Tx antenna sounding Set to 1 for 2 Tx antenna sounding Set to 2 for 3 Tx antenna sounding Set to 3 for 4 Tx antenna sounding
Noncompressed Steering Number of Beamformer Antennas Supported	Indicates the maximum number of beamformer antennas the beamformee can support when noncompressed beamforming feedback matrix is required	Set to 0 for single Tx antenna sounding Set to 1 for 2 Tx antenna sounding Set to 2 for 3 Tx antenna sounding Set to 3 for 4 Tx antenna sounding

Table 8-128—Subfields of the Transmit Beamforming Capabilities field *(continued)*

Subfield	Definition	Encoding
Compressed Steering Number of Beamformer Antennas Supported	Indicates the maximum number of beamformer antennas the beamformee can support when compressed beamforming feedback matrix is required	Set to 0 for single Tx antenna sounding Set to 1 for 2 Tx antenna sounding Set to 2 for 3 Tx antenna sounding Set to 3 for 4 Tx antenna sounding
CSI Max Number of Rows Beamformer Supported	Indicates the maximum number of rows of CSI explicit feedback from the beamformee or calibration responder or transmit ASEL responder that a beamformer or calibration initiator or transmit ASEL initiator can support when CSI feedback is required.	Set to 0 for a single row of CSI Set to 1 for 2 rows of CSI Set to 2 for 3 rows of CSI Set to 3 for 4 rows of CSI
Channel Estimation Capability	Indicates the maximum number of space-time streams (columns of the MIMO channel matrix) for which channel dimensions can be simultaneously estimated when receiving an NDP sounding PPDU or the extension portion of the HT Long Training fields (HT-LTFs) in a staggered sounding PPDU. See NOTE.	Set 0 for 1 space-time stream Set 1 for 2 space-time streams Set 2 for 3 space-time streams Set 3 for 4 space-time streams
NOTE—The maximum number of space-time streams for which channel coefficients can be simultaneously estimated using the HT-LTFs corresponding to the data portion of the packet is limited by the Rx MCS Bitmask subfield of the Supported MCS Set field and by the Rx STBC subfield of the HT Capabilities Info field. Both fields are part of the HT Capabilities element.		

8.4.2.58.7 ASEL Capability field

The structure of the ASEL Capability field of the HT Capabilities element is defined in Figure 8-254.

	B0	B1	B2	B3	B4	B5	B6	B7
	Antenna Selection Capable	Explicit CSI Feedback Based Transmit ASEL Capable	Antenna Indices Feedback Based Transmit ASEL Capable	Explicit CSI Feed-back Capable	Antenna Indices Feedback Capable	Receive ASEL Capable	Transmit Sounding PPDUs Capable	Reserved
Bits:	1	1	1	1	1	1	1	1

Figure 8-254—ASEL Capability field

The subfields of the ASEL Capability field are defined in Table 8-129.

Table 8-129—ASEL Capability field subfields

Subfield	Definition	Encoding
Antenna Selection Capable	Indicates whether this STA supports ASEL	Set to 0 if not supported Set to 1 if supported
Explicit CSI Feedback Based Transmit ASEL Capable	Indicates whether this STA supports transmit ASEL based on explicit CSI feedback	Set to 0 if not supported Set to 1 if supported
Antenna Indices Feedback Based Transmit ASEL Capable	Indicates whether this STA supports transmit ASEL based on antenna indices feedback	Set to 0 if not supported Set to 1 if supported
Explicit CSI Feedback Capable	Indicates whether this STA can compute CSI and provide CSI feedback in support of ASEL	Set to 0 if not supported Set to 1 if supported
Antenna Indices Feedback Capable	Indicates whether this STA can compute an antenna indices selection and return an antenna indices selection in support of ASEL	Set to 0 if not supported Set to 1 if supported
Receive ASEL Capable	Indicates whether this STA supports receive ASEL	Set to 0 if not supported Set to 1 if supported
Transmit Sounding PPDUs Capable	Indicates whether this STA can transmit sounding PPDUs for ASEL training on request	Set to 0 if not supported Set to 1 if supported

8.4.2.59 HT Operation element

The operation of HT STAs in the BSS is controlled by the HT Operation element. The structure of this element is defined in Figure 8-255.

	Element ID	Length	Primary Channel	HT Operation Information	Basic MCS Set
Octets:	1	1	1	5	16

Figure 8-255—HT Operation element format

The Element ID field is set to the value for HT Operation element defined in Table 8-54.

The structure of the HT Operation Information field is shown in Figure 8-256.

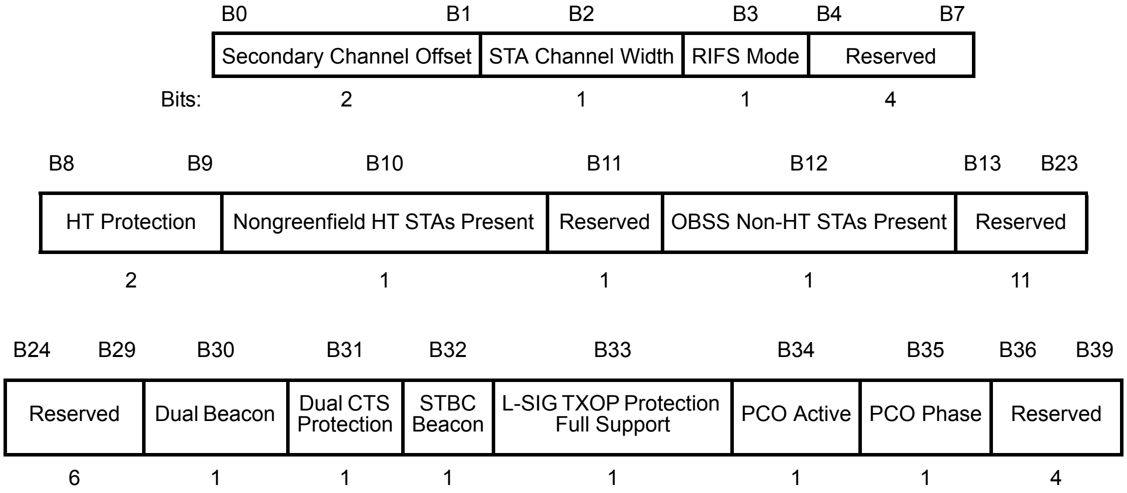

Figure 8-256—HT Operation Information field

The Primary Channel field, subfields of the HT Operation Information field, and the Basic MCS Set field are defined in Table 8-130. The "Reserved in IBSS?" column indicates whether each field is reserved (Y) or not reserved (N) when this element is present in a frame transmitted within an IBSS. The "Reserved in MBSS?" column indicates whether each field is reserved (Y) or not reserved (N) when this element is present in a frame transmitted within an MBSS.

Table 8-130—HT Operation element fields and subfields

Field	Definition	Encoding	Reserved in IBSS?	Reserved in MBSS?
Primary Channel	Indicates the channel number of the primary channel. See 10.15.2.	Channel number of the primary channel	N	N
Secondary Channel Offset	Indicates the offset of the secondary channel relative to the primary channel.	Set to 1 (SCA) if the secondary channel is above the primary channel Set to 3 (SCB) if the secondary channel is below the primary channel Set to 0 (SCN) if no secondary channel is present The value 2 is reserved	N	N
STA Channel Width	Defines the channel widths that may be used to transmit to the STA. See 10.15.12	Set to 0 for a 20 MHz channel width Set to 1 allows use of any channel width in the Supported channel width set This field is reserved when the transmitting or receiving STA is operating in an operating class that does not include a value of 13 or 14 in the behavior limits as specified in Annex E. See NOTE 1.	N	N

Table 8-130—HT Operation element fields and subfields *(continued)*

Field	Definition	Encoding	Reserved in IBSS?	Reserved in MBSS?
RIFS Mode	Indicates whether the use of reduced interframe space is permitted within the BSS. See 9.3.2.3.2 and 9.23.3.3	Set to 0 if use of RIFS is prohibited Set to 1 if use of RIFS is permitted	Y	Y
HT Protection	Indicates protection requirements of HT transmissions. See 9.23.3.	Set to 0 for no protection mode Set to 1 for nonmember protection mode Set to 2 for 20 MHz protection mode Set to 3 for non-HT mixed mode	Y	N
Nongreenfield HT STAs Present	AP indicates if any HT STAs that are not HT-greenfield capable have associated. Mesh STA indicates if it establishes a mesh peering with an HT STA that is not HT-greenfield capable. Determines when a non-AP STA should use HT-greenfield protection. Present in Beacon and Probe response frames transmitted by an AP or mesh STA. Otherwise reserved. See 9.23.3.1.	Set to 0 if all HT STAs that are associated are HT-greenfield capable or all HT peer mesh STAs are HT-greenfield capable Set to 1 if one or more HT STAs that are not HT-greenfield capable are associated or one or more HT peer mesh STAs are not HT-greenfield capable	Y	N
OBSS Non-HT STAs Present	Indicates if the use of protection for non-HT STAs by overlapping BSSs is determined to be desirable. If the BSS is operating in an operating class for which the behavior limits set listed in Annex E includes the value 16, this field indicates if there exist any non-HT OBSSs and whether HT-greenfield transmissions are allowed. Present in Beacon and Probe response frames transmitted by an AP. Otherwise reserved. See 9.23.3.4 and 10.9.8.5.	If not operating in an operating class for which the behavior limits set listed in Annex E includes the value 16: Set to 1 if the use of protection for non-HT STAs by OBSSs is determined to be desirable. See NOTE 2. Set to 0 otherwise. If operating in an operating class for which the behavior limits set listed in Annex E includes the value 16: Set to 1 if there exists one or more non-HT OBSSs. Indicates that HT-greenfield transmissions are disallowed in the BSS. Set to 0 otherwise.	Y	Y
Dual Beacon	Indicates whether the AP transmits an STBC beacon.	Set to 0 if no STBC beacon is transmitted Set to 1 if an STBC beacon is transmitted by the AP	Y	Y

Table 8-130—HT Operation element fields and subfields *(continued)*

Field	Definition	Encoding	Reserved in IBSS?	Reserved in MBSS?
Dual CTS Protection	Dual CTS protection is used by the AP to set a NAV at STAs that do not support STBC and at STAs that can associate solely through the STBC beacon. See 9.3.2.7.	Set to 0 if dual CTS protection is not required Set to 1 if dual CTS protection is required	Y	Y
STBC Beacon	Indicates whether the beacon containing this element is a primary or an STBC beacon. The STBC beacon has half a beacon period shift relative to the primary beacon. Defined only in a Beacon transmitted by an AP. Otherwise reserved. See 10.1.3.2.	Set to 0 in a primary beacon Set to 1 in an STBC beacon	Y	Y
L-SIG TXOP Protection Full Support	Indicates whether all HT STA in the BSS support L-SIG TXOP protection. See 9.23.5.	Set to 0 if one or more HT STA in the BSS do not support L-SIG TXOP protection Set to 1 if all HT STA in the BSS support L-SIG TXOP protection	Y	Y
PCO Active	Indicates whether PCO is active in the BSS Present in Beacon/Probe Response frames transmitted by an AP. Otherwise reserved. Non-PCO STAs regard the BSS as a 20/40 MHz BSS and may associate with the BSS without regard to this field. See 10.16.	Set to 0 if PCO is not active in the BSS Set to 1 if PCO is active in the BSS	Y	Y
PCO Phase	Indicates the PCO phase of operation Defined only in a Beacon and Probe Response frames when PCO Active is 1. Otherwise reserved. See 10.16.	Set to 0 indicates switch to or continue 20 MHz phase Set to 1 indicates switch to or continue 40 MHz phase	Y	Y

Table 8-130—HT Operation element fields and subfields *(continued)*

Field	Definition	Encoding	Reserved in IBSS?	Reserved in MBSS?
Basic MCS Set	Indicates the MCS values that are supported by all HT STAs in the BSS. Present in Beacon, Probe Response, Mesh Peering Open and Mesh Peering Confirm frames. Otherwise reserved.	The Basic MCS Set is a bitmap of size 128 bits. Bit 0 corresponds to MCS 0. A bit is set to 1 to indicate support for that MCS and 0 otherwise. MCS values are defined in 8.4.2.58.4.	N	N

NOTE 1—Any change of STA Channel Width field value does not impact the value of the HT Protection field.

NOTE 2—Examples of when this bit may be set to 1 include, but are not limited to, the following situations:

- One or more non-HT STAs are associated
- A non-HT BSS is overlapping (a non-HT BSS may be detected by the reception of a Beacon where the supported rates contain only Clause 16, Clause 18, Clause 17, or Clause 19 rates)
- A management frame (excluding a Probe Request) is received where the supported rate set includes only Clause 16, Clause 18, Clause 17, and Clause 19 rates

8.4.2.60 20/40 BSS Intolerant Channel Report element

The 20/40 BSS Intolerant Channel Report element contains a list of channels on which a STA has found conditions that disallow the use of a 20/40 MHz BSS. The format of the 20/40 BSS Intolerant Channel Report element is shown in Figure 8-257.

	Element ID	Length	Operating Class	Channel List
Octets:	1	1	1	Variable

Figure 8-257—20/40 BSS Intolerant Channel Report element format

The Element ID field is set to the value of 20/40 BSS Intolerant Channel Report element defined in Table 8-54.

The Length field of the 20/40 BSS Intolerant Channel Report element is variable and depends on the number of channels reported in the Channel List field. The minimum value of the Length field is 1 (based on a minimum length for the Channel List field of 0 octets).

Operating Class field of the 20/40 MHz BSS Intolerant Channel Report element contains an enumerated value from Annex E, encoded as an unsigned integer, specifying the operating class in which the channel list is valid. A 20/40 BSS Intolerant Channel Report only reports channels for a single operating class. Multiple 20/40 BSS Intolerant Channel Report elements are used to report channels in more than one operating class.

The Channel List field of the 20/40 MHz BSS Intolerant Channel Report element a variable number of octets, where each octet describes a single channel number. Channel numbering shall be dependent on operating class according to Annex E.

A 20/40 BSS Intolerant Channel Report element includes only channels that are valid for the regulatory domain in which the STA transmitting the element is operating and that are consistent with the Country element transmitted by the AP of the BSS of which it is a member.

8.4.2.61 Overlapping BSS Scan Parameters element

The Overlapping BSS Scan Parameters element is used by an AP in a BSS to indicate the values to be used by BSS members when performing OBSS scan operations. The format of the Overlapping BSS Scan Parameters element is shown in Figure 8-258.

	Element ID	Length	OBSS Scan Passive Dwell	OBSS Scan Active Dwell	BSS Channel Width Trigger Scan Interval	OBSS Scan Passive Total Per Channel	OBSS Scan Active Total Per Channel	BSS Width Channel Transition Delay Factor	OBSS Scan Activity Threshold
Octets:	1	1	2	2	2	2	2	2	2

Figure 8-258—Overlapping BSS Scan Parameters element format

The Element ID field value is equal to the Overlapping BSS Scan Parameters element value in Table 8-54.

The Length field is set to 14.

The OBSS Scan Passive Dwell field contains a value in TUs, encoded as an unsigned integer, that a receiving STA uses to set dot11OBSSScanPassiveDwell as described in 10.15.5.

The OBSS Scan Active Dwell field contains a value in TUs, encoded as an unsigned integer, that a receiving STA uses to set dot11OBSSScanActiveDwell as described in 10.15.5.

The BSS Channel Width Trigger Scan Interval field contains a value in seconds, encoded as an unsigned integer, that a receiving STA uses to set dot11BSSWidthTriggerScanInterval as described in 10.15.5.

The OBSS Scan Passive Total Per Channel field contains a value in TUs, encoded as an unsigned integer, that a receiving STA uses to set dot11OBSSScanPassiveTotalPerChannel as described in 10.15.5.

The OBSS Scan Active Total Per Channel field contains a value in TUs, encoded as an unsigned integer, that a receiving STA uses to set dot11OBSSScanActiveTotalPerChannel as described in 10.15.5.

The BSS Width Channel Transition Delay Factor field contains an integer value that a receiving STA uses to set dot11BSSWidthChannelTransitionDelayFactor as described in 10.15.5.

The OBSS Scan Activity Threshold field contains a value in hundredths of percent, encoded as an unsigned integer, that a receiving STA uses to set dot11OBSSScanActivityThreshold as described in 10.15.5.

The use of each of these parameters is described in 10.15.5.

8.4.2.62 20/40 BSS Coexistence element

The 20/40 BSS Coexistence element is used by STAs to exchange information that affects 20/40 BSS coexistence.

The 20/40 BSS Coexistence element is formatted as shown in Figure 8-259.

	Element ID	Length	20/40 BSS Coexistence Information field
Octets:	1	1	1

Figure 8-259—20/40 BSS Coexistence element format

The Element ID field is set to the value for 20/40 BSS Coexistence element defined in Table 8-54.

The structure of the 20/40 BSS Coexistence Information field is shown in Figure 8-260.

	B0	B1	B2	B3	B4	B5 B7
	Informatio n Request	Forty MHz Intolerant	20 MHz BSS Width Request	OBSS Scanning Exemption Request	OBSS Scanning Exemption Grant	Reserved
Bits:	1	1	1	1	1	3

Figure 8-260—20/40 BSS Coexistence Information field

The Information Request field is used to indicate that a transmitting STA is requesting the recipient to transmit a 20/40 BSS Coexistence Management frame with the transmitting STA as the recipient.

The Forty MHz Intolerant field is set to 1 to prohibit an AP that receives this information or reports of this information from operating a 20/40 MHz BSS. When equal to 0, it does not prohibit a receiving AP from operating a 20/40 MHz BSS. This field is used for inter-BSS communication. The definition of this field is the same as the definition of the Forty MHz Intolerant field in the HT Capabilities element (see 8.4.2.58), and its operation is described in 10.15.11.

The 20 MHz BSS Width Request field is set to 1 to prohibit a receiving AP from operating its BSS as a 20/40 MHz BSS. Otherwise, it is set to 0. This field is used for intra-BSS communication. The operation of this field is described in 10.15.12.

The OBSS Scanning Exemption Request field is set to 1 to indicate that the transmitting non-AP STA is requesting the BSS to allow the STA to be exempt from OBSS scanning. Otherwise, it is set to 0. The OBSS Scanning Exemption Request field is reserved when transmitted by an AP. The OBSS Scanning Exemption Request field is reserved when a 20/40 BSS Coexistence element is included in a group addressed frame.

The OBSS Scanning Exemption Grant field is set to 1 by an AP to indicate that the receiving STA is exempted from performing OBSS Scanning. Otherwise, it is set to 0. The OBSS Scanning Exemption Grant field is reserved when transmitted by a non-AP STA. The OBSS Scanning Exemption Grant field is reserved when a 20/40 BSS Coexistence element is included in a group addressed frame.

8.4.2.63 Time Advertisement element

The Time Advertisement element, shown in Figure 8-261, specifies fields describing the source of time corresponding to a time standard, an external clock (external time source), an estimate of the offset between that time standard and the TSF timer, and an estimate of the standard deviation of the error in the offset estimate. This information is used by a receiving STA to align its own estimate of the time standard based on that of another STA.

	Element ID	Length	Timing Capabilities	Time Value (optional)	Time Error (optional)	Time Update Counter (optional)
Octets:	1	1	1	0 or 10	0 or 5	0 or 1

Figure 8-261—Time Advertisement element format

The Timing Capabilities field specifies the STA's source and encoding of the Time Value field. The encoding of the Timing Capabilities field is specified in Table 8-131.

Table 8-131—Encoding of the Timing Capabilities field

Value	Usage
0	No standardized external time source
1	Timestamp offset based on UTC [see ITU-R Recommendation TF.460-4(2002) [B48]]. The Timestamp offset value in nanoseconds is defined to be 0 at the beginning of the first nanosecond of the first day of the year 1958.
2	UTC time at which the TSF timer is 0.
3–255	Reserved

When the value of the Timing Capabilities field is 0, only the Element ID, Length, and Timing Capabilities fields are included in the Time Advertisement element.

When the value of the Timing Capabilities is 1, the following additional fields are included in the Time Advertisement element:

— Time Value field, a two's complement integer in nanoseconds that, when added to the Timestamp present in the same transmitted frame, gives the receiving STA an estimate of the time standard at the time the frame was transmitted. The Timestamp is derived from the TSF Timer as defined in 10.21.

— Time Error field, which is set to an unsigned integer in nanoseconds that defines the standard deviation of the error in the Time Value estimate. The value of all 1s is used to indicate that the error is unknown.

When the Timing Capabilities field is 2, the following fields are included in the Time Advertisement element:

— The Time Value field is the UTC time at which the TSF Timer is 0, given that the TSF Timer units are 1 microsecond units as defined in 10.1.3. The format, including all subfields is shown in Table 8-132. For any subfield not known in the Time Value field, the subfield value is 0.

— The Time Error field is an unsigned integer in milliseconds that defines the standard deviation of the error in the Time Value estimate.

— The Time Update Counter field is a modulo 256 counter that increments each time the AP updates the Time Value UTC at which the TSF Timer is 0.

Table 8-132—Time Value field format when Timing Capabilities is 2

Octet	Description
0–1	Year (0–65 534)
2	Month (0–12)
3	Day of month (0–31)
4	Hours (0–23)
5	Minutes (0–59)
6	Seconds (0–59)
7–8	Milliseconds (0–999)
9	Reserved

8.4.2.64 Link Identifier element

The Link Identifier element contains information that identifies a TDLS direct link. The element information format is defined in Figure 8-262.

	Element ID	Length	BSSID	TDLS initiator STA Address	TDLS responder STA Address
Octets:	1	1	6	6	6

Figure 8-262—Link Identifier element format

The Element ID field is defined in Table 8-54.

The Length field is set to 18.

The BSSID field is set to the BSSID of the BSS to which the TDLS initiator STA is associated.

The TDLS initiator STA Address field is set to the TDLS initiator STA’s MAC address.

The TDLS responder STA Address field is set to the TDLS responder STA’s MAC address.

8.4.2.65 Wakeup Schedule element

The Wakeup Schedule element contains information regarding the periodic wakeup schedule for TDLS Peer Power Save Mode. The element format is defined in Figure 8-263.

	Element ID	Length	Offset	Interval	Awake Window Slots	Maximum Awake Window Duration	Idle Count
Octets:	1	1	4	4	4	4	2

Figure 8-263—Wakeup Schedule element format

The Element ID field is defined in Table 8-54.

The Length field is set to 18.

The Offset field is the time in microseconds between TSF 0 and the start of a first Awake Window. See 10.2.1.14.

The Interval field is set to the time in microseconds between the start of two successive Awake Windows. See 10.2.1.14.

The Awake Window Slots field is set to the duration of the Awake Window in units of backoff slots (see 9.19.2.3). See 10.2.1.14.

The Maximum Awake Window Duration field is set to the maximum duration of the Awake Window, in units of microseconds. See 10.2.1.14.

The Idle Count field is set to the number of consecutive Awake Windows during which no individually addressed frame is received from the TDLS peer STA before a TDLS peer STA deletes the wakeup schedule. See 10.2.1.14.

8.4.2.66 Channel Switch Timing element

The Channel Switch Timing element contains information regarding the channel switch timing. The element is defined in Figure 8-264.

	Element ID	Length	SwitchTime	Switch Timeout
Octets:	1	1	2	2

Figure 8-264—Channel Switch Timing element format

The Element ID field is defined in Table 8-54

The Length field is set to 4.

The Switch Time field is set to the time it takes for a STA sending the Channel Switch Timing element to switch channels, in units of microseconds.

The Switch Timeout field is set to a time in units of microseconds. The STA sending the Channel Switch Timing element waits for the first data frame exchange on the off-channel for Switch Timeout microseconds before switching back to base channel. The time is measured from the end of the last symbol of the ACK frame that is transmitted in response to TDLS Channel Switch Response frame, as seen at the air interface.

8.4.2.67 PTI Control element

The PTI Control element contains information regarding the traffic buffered at the TPU buffer STA for the TPU sleep STA at the time a TDLS Peer Traffic Indication frame is transmitted by the TPU buffer STA. The element is optionally included in the TDLS Peer Traffic Indication frame. The element is defined in Figure 8-265.

	Element ID	Length	TID	Sequence Control
Octets:	1	1	1	2

Figure 8-265—PTI Control element format

The Element ID field is defined in Table 8-54.

The Length field is set to 3.

The TID field contained in the PTI Control element is set to the TID of the latest MPDU that has been transmitted over the TDLS direct link to the TPU sleep STA that is the destination of the TDLS Peer Traffic Indication frame that contains the PTI Control element. See 10.2.1.15.

The Sequence Control field is defined in 8.2.4.4. The Sequence Control field contained in the PTI Control element is set to the sequence number of the latest MPDU that has been transmitted over the TDLS direct link to the TPU sleep STA that is the destination of the TDLS Peer Traffic Indication frame that contains the PTI Control element. See 10.2.1.15.

8.4.2.68 TPU Buffer Status element

The TPU Buffer Status element contains information regarding the traffic buffered at the TPU buffer STA for the TPU sleep STA at the time a TDLS Peer Traffic Indication frame is transmitted by the TPU buffer STA. The element is included in the TDLS Peer Traffic Indication frame. The element is defined in Figure 8-266.

			B0	B1	B2	B3	B4 B7
	Element ID	Length	AC_BK traffic available	AC_BE traffic available	AC_VI traffic available	AC_VO traffic available	Reserved
Octets:	1	1	1				

Figure 8-266—TPU Buffer Status element format

The Element ID field is defined in Table 8-54.

The Length field is set to 1.

The AC_BK traffic available field is one bit in size and is set to 1 if AC_BK contains traffic buffered for the TPU sleep STA to which the TPU Buffer Status element will be transmitted, and is set to 0 otherwise.

The AC_BE traffic available field is one bit in size and is set to 1 if AC_BE contains traffic buffered for the TPU sleep STA to which the TPU Buffer Status element will be transmitted, and is set to 0 otherwise.

The AC_VI traffic available field is one bit in size and is set to 1 if AC_VI contains traffic buffered for the TPU sleep STA to which the TPU Buffer Status element will be transmitted, and is set to 0 otherwise.

The AC_VO traffic available field is one bit in size and is set to 1 if AC_VO contains traffic buffered for the TPU sleep STA to which the TPU Buffer Status element will be transmitted, and is set to 0 otherwise.

8.4.2.69 Event Request element

8.4.2.69.1 Event Request definition

The Event Request element contains a request to the receiving STA to perform the specified event action. The format of the Event Request element is shown in Figure 8-267.

	Element ID	Length	Event Token	Event Type	Event Response Limit	Event Request
Octets:	1	1	1	1	1	variable

Figure 8-267—Event Request element format

The Element ID field is equal to the Event Request value in Table 8-54.

The value of the Length field is 3 plus the length of the Event Request field.

The Event Token field is a nonzero number that is unique among the Event Request elements sent to each destination MAC address for which a corresponding Event Report element has not been received.

The Event Type field is a number that identifies the type of event request. The Event Types are shown in Table 8-133.

Table 8-133—Event Type definitions for event requests and reports

Name	Event Type
Transition	0
RSNA	1
Peer-to-Peer Link	2
WNM Log	3
Reserved	4–220
Vendor Specific	221
Reserved	222–255

The Event Response Limit field contains the maximum number of requested Event Reports to be included in the Event Report element. A value of 0 indicates that no limit is set on the number of Event Reports to be included in the Event Report element.

The Event Request field contains the event request corresponding to the Event Type, as described in 8.4.2.69.2 through 8.4.2.69.4. The Event Request field is not present when requesting a WNM Log report.

The Event Request element is included in an Event Request frame, as described in 8.5.14.2. The use of the Event Request element and Event Request frame is described in 10.23.2.

8.4.2.69.2 Transition event request

The Event Request field corresponding to the Transition event request contains zero or more Transition Event Request subelements. A transition event is a STA movement or attempted movement from one BSS (the source BSS) in one ESS to another BSS (the target BSS) within the same ESS.

The Transition Event subelements specify the conditions in which a Transition Event Report is sent by a STA. The set of valid Transition Event Request subelements is defined in Table 8-134.

Table 8-134—Transition Event Request subelement

Order	Transition Event Request subelement	Subelement ID
1	Transition Target BSSID	0
2	Transition Source BSSID	1
3	Transition Time Threshold	2
4	Transition Result	3
5	Frequent Transition	4
—	Reserved	5–255

The Transition Target BSSID subelement is used to request that a Transition Event Report includes the transition event entry when the target BSSID is equal to the specific BSSID in the Target BSSID field. Excluding this subelement from the Event Request element indicates a request for transition events for all target BSSIDs. The format of the Transition Target BSSID subelement is shown in Figure 8-268.

	Subelement ID	Length	Target BSSID
Octets:	1	1	6

Figure 8-268—Transition Target BSSID subelement format

The Subelement ID field is equal to the Transition Target BSSID value in Table 8-134.

The value of the Length field is 6.

The Target BSSID field contains a 6-octet BSSID.

The Transition Source BSSID subelement is used to request that a Transition Event Report includes the transition event entry when the source BSSID is equal to the BSSID specified in the Source BSSID field. Excluding this subelement from the Event Request element indicates a request for transition events for all source BSSIDs. The format of the Transition Source BSSID subelement is shown in Figure 8-269.

	Subelement ID	Length	Source BSSID
Octets:	1	1	6

Figure 8-269—Transition Source BSSID subelement format

The Subelement ID field is equal to the Transition Source BSSID value in Table 8-134.

The value of the Length field is 6.

The Source BSSID field contains a 6-octet BSSID.

The Transition Time Threshold subelement is used to request that a Transition Event Report includes the transition event entry when the Transition Time is greater than or equal to the Transition Time Threshold value. The format of the Transition Time subelement is shown in Figure 8-270.

	Subelement ID	Length	Transition Time Threshold
Octets:	1	1	2

Figure 8-270—Transition Time Threshold subelement format

The Subelement ID field is equal to the Transition Time Threshold value in Table 8-134.

The value of the Length field is 2.

The Transition Time Threshold field contains a value representing the Transition Time to be used as the threshold value for the Transition Time condition in TUs. The Transition Time is defined in 10.23.2.2.

The Transition Result subelement is used to request that a Transition Event Report includes the transition event entry that matches the transition result defined by this subelement. The format of Transition Result subelement is shown in Figure 8-271.

	Subelement ID	Length	Match Value
Octets:	1	1	1

Figure 8-271—Transition Result subelement format

The Subelement ID field is equal to the Transition Result value in Table 8-134.

The value of the Length field is 1.

The Match Value field is set with each bit as defined in Figure 8-272 to request that the specified transition results that match the bit descriptions are included in the Transition Event Report.

	B0	B1	B2-B7
	Include Successful Transitions	Include Failed Transitions	Reserved
Bits	1	1	6

Figure 8-272—Match Value field definitions

The Frequent Transition subelement is used to request that an alerting Transition Event report be generated when the total transition count during the specified time period is equal to or greater than the value given in Frequent Transition Count Threshold field. The format of the Frequent Transition subelement is shown in Figure 8-273.

	Subelement ID	Length	Frequent Transition Count Threshold	Time Interval
Octets:	1	1	1	2

Figure 8-273—Frequent Transition subelement format

The Subelement ID field is equal to the Frequent Transition value in Table 8-134.

The value of the Length field is 3.

The Frequent Transition Count Threshold field is a 1-octet field containing the number of transitions in the measurement duration after which a Transition Event Report is generated.

The Time Interval field is the time interval in TUs during which the STA determines if the Frequent Transition Count Threshold is exceeded.

8.4.2.69.3 RSNA event request

The Event Request field corresponding to an RSNA event request contains zero or more RSNA Event Request subelements.

The RSNA Event Request subelements are defined to have a common format consisting of a 1 octet Subelement ID field, a 1 octet Length field, and a variable-length subelement specific information field. See Figure 8-402. The set of valid RSNA Event Request subelements is defined in Table 8-135.

Table 8-135—RSNA Event Request subelement

Order	RSNA Event Request subelement	Subelement ID
1	RSNA Target BSSID	0
2	Authentication Type	1
3	EAP Method	2
4	RSNA Result	3
—	Reserved	4–255

The RSNA subelements specify reporting conditions for RSNA Event Reports.

The RSNA Target BSSID subelement identifies the BSS at which an RSNA Event establishment was attempted. Excluding this subelement from the Event Request element indicates a request for transition events for all source BSSIDs. The format of the RSNA Target BSSID subelement is shown in Figure 8-274.

	Subelement ID	Length	Target BSSID
Octets:	1	1	6

Figure 8-274—RSNA Target BSSID subelement format

The Subelement ID field is equal to the RSNA Target BSSID value in Table 8-135.

The value of the Length field is 6.

The Target BSSID field contains a 6-octet BSSID.

The Authentication Type subelement is used to request that an RSNA Event Report includes the RSNA event entry when the Authentication Type is equal to the authentication type specified in the Authentication Type field. The format of the Authentication Type subelement is shown in Figure 8-275.

	Subelement ID	Length	Authentication Type
Octets:	1	1	4

Figure 8-275—Authentication Type subelement format

The Subelement ID field is equal to the Authentication Type value in Table 8-135.

The value of the Length field is 4.

The Authentication Type field contains one of the AKM suite selectors defined in Table 8-101 in 8.4.2.27.3.

The EAP Method subelement is used to request that an RSNA Event Report includes the RSNA event entry when the EAP Method is equal to the EAP method specified in the EAP Method field. The format of the EAP Method subelement is shown in Figure 8-276.

	Subelement ID	Length	EAP Type	EAP Vendor ID (optional)	EAP Vendor Type (optional)
Octets:	1	1	1	0 or 3	0 or 4

Figure 8-276—EAP Method subelement format

The Subelement ID field is equal to the EAP Method value in Table 8-135.

The value of the Length field is 1 or 8.

The EAP Type field contains a value that identifies a single EAP method and is any valid IANA assigned EAP type.

The EAP Vendor ID field contains a value that identifies the EAP Vendor. The EAP Vendor ID field is included when EAP Type field is 254, and is excluded otherwise.

The EAP Vendor Type field contains a value that identifies the EAP Type as defined by the vendor. The EAP Vendor Type field is included when EAP Type field is 254, and is excluded otherwise.

The RSNA Result subelement is used to request that an RSNA Event Report includes the RSNA event entry that matches the transition result defined by this subelement. The format of RSNA Result subelement is shown in Figure 8-277.

	Subelement ID	Length	Match Value
Octets:	1	1	1

Figure 8-277—RSNA Result subelement format

The Subelement ID field is equal to the RSNA Result value in Table 8-135.

The value of the Length field is 1.

The Match Value field bits are set as defined in Figure 8-278 to request that the specified RSNA results that match that bit descriptions are included in the RSNA Event Report.

	B0	B1	B2-B7
	Include Successful RSNA	Include Failed RSNA	Reserved
Bits	1	1	6

Figure 8-278—Match Value field definitions

8.4.2.69.4 Peer-to-Peer Link event request

The Event Request field corresponding to Peer-to-Peer Link event request contains zero or more Peer-to-Peer Link Event Request subelements.

The Peer-to-Peer Link Event Request subelements are defined to have a common format consisting of a 1 octet Subelement ID field, a 1 octet Length field, and a variable-length subelement specific information field. The set of valid Peer-to-Peer Link Event Request subelements is defined in Table 8-136.

Table 8-136—Peer-to-Peer Link Event Request subelement

Order	Peer-to-Peer Link Event Request subelement	Subelement ID
1	Peer Address	0
2	Channel Number	1
—	Reserved	2–255

The Peer-to-Peer Link subelements specify reporting conditions for Peer-to-Peer Link Event Reporting.

The Peer Address subelement identifies the peer STA, BSS, or IBSS of the Peer-to-Peer links to be reported. Excluding this subelement from the Event Request element indicates a request for Peer-to-Peer Link events for any peer STA, any BSS, and any IBSS. The format of the Peer Address subelement is shown in Figure 8-279.

	Subelement ID	Length	Peer STA/ BSSID Address
Octets:	1	1	6

Figure 8-279—Peer Address subelement format

The Subelement ID field is equal to the Peer Address value in Table 8-136.

The value of the Length field is 6.

The Peer STA/BSSID Address field contains a 6-octet MAC address of a peer STA or a BSSID for Peer-to-Peer links in an IBSS. If the indicated address matches the Address 1 field of the MAC Header contents (see Table 8-19), then the address is a peer STA address for a TDLS or IBSS. If the indicated address matches the Address 3 field of the MAC Header contents, then the address is a BSSID for the Direct Link in an infrastructure BSS or for the IBSS.

The Channel Number subelement identifies the channel for the Peer-to-Peer links to be reported. Excluding this subelement from the Event Request element indicates a request for Peer-to-Peer Link events for any channel. The format of the Channel Number subelement is shown in Figure 8-280.

	Subelement ID	Length	Operating Class	Channel Number
Octets:	1	1	1	1

Figure 8-280—Channel Number subelement format

The Subelement ID field is equal to the Channel Number value in Table 8-136.

The value of the Length field is 2.

The Operating Class field indicates the channel set of the Peer-to-Peer link to be used for the Peer-to-Peer Link event report. Operating Classes are defined in Annex E.

The Channel Number field indicates the channel number of the Peer-to-Peer Link events requested and included in the Peer-to-Peer Link event report. A Channel Number of 0 indicates a request to report any Peer-to-Peer Link event for any supported channel in the specified filtering Operating Class.

8.4.2.69.5 Vendor Specific event request

The Event Request field corresponding to Vendor Specific event request contains zero or more Vendor Specific subelements. The Vendor Specific subelement has the same format as the Vendor Specific element (see 8.4.2.28).

8.4.2.70 Event Report element

8.4.2.70.1 Event Report Definition

The Event Report element is used by a STA to report an event. The format of the Event Report element is shown in Figure 8-281.

	Element ID	Length	Event Token	Event Type	Event Report Status
Octets:	1	1	1	1	1

	Event TSF (optional)	UTC Offset (optional)	Event Time Error (optional)	Event Report (optional)
Octets:	0 or 8	0 or 10	0 or 5	variable

Figure 8-281—Event Report element format

The Element ID field is equal to the Event Report value in Table 8-54.

The value of the Length field is 3 or 26 plus the length of the Event Report field.

The Event Token field is the Event Token in the corresponding Event Request element. If the Event Report element is being sent autonomously then the Event Token is 0.

The Event Type field is a number that identifies the type of event report. The Event Types are shown in Table 8-133.

The Event Report Status field is a value in Table 8-137, indicating the STA's response to the Event Request.

Table 8-137—Event Report Status

Event Report Status	Description
0	Successful
1	Request failed
2	Request refused
3	Request incapable
4	Detected frequent transition
5–255	Reserved

The Event TSF, UTC Offset, Event Time Error, and Event Report fields are present only when the Event Report Status field is 0.

The Event TSF field is TSF value when the STA logged the event.

The UTC Offset field is the UTC value that corresponds to the UTC time when the TSF timer is equal to 0. If the UTC Offset is unknown, the field is 0.

The Event Time Error field is the UTC standard deviation, as described in 8.4.2.63, that corresponds to the TSF value logged for the event. If the Event Time Error is unknown, the field is 0.

The Event Report field contains the specification of a single event report, as described in 8.4.2.70.2 through 8.4.2.70.5.

The Event Report element is included in an Event Report frame, as described in 8.5.14.3. The use of the Event Report element and frame is described in 10.23.2.

8.4.2.70.2 Transition event report

The format of the Event Report field corresponding to a Transition event report is shown in Figure 8-282.

	Source BSSID	Target BSSID	Transition Time	Transition Reason	Transition Result
Octets:	6	6	2	1	2

	Source RCPI	Source RSNI	Target RCPI	Target RSNI
Octets:	1	1	1	1

Figure 8-282—Event Report format for Transition event

The Source BSSID field contains the 6-octet BSSID address of the associated AP prior to the attempted transition.

The Target BSSID field contains the 6-octet BSSID address of the AP that is the target of the attempted Transition.

The Transition Time field contains the transition time in TUs. The transition time is defined in 10.23.2.2.

The Transition Reason field indicates the reason why a transition attempt occurred and contains one of the values in Table 8-138.

Table 8-138—Transition and Transition Query reasons

Transition Reason value	Description
0	Unspecified
1	Excessive frame loss rates and/or poor conditions
2	Excessive delay for current traffic streams
3	Insufficient QoS capacity for current traffic streams (TSPEC rejected)
4	First association to ESS (the association initiated by an Association Request message instead of a Reassociation Request message)
5	Load balancing
6	Better AP found
7	Deauthenticated or Disassociated from the previous AP
8	AP failed IEEE 802.1X EAP Authentication
9	AP failed 4-Way Handshake

Table 8-138—Transition and Transition Query reasons *(continued)*

Transition Reason value	Description
10	Received too many replay counter failures
11	Received too many data MIC failures
12	Exceeded maximum number of retransmissions
13	Received too many broadcast disassociations
14	Received too many broadcast deauthentications
15	Previous transition failed
16	Low RSSI
17	Roam from a non-IEEE 802.11 system
18	Transition due to received BSS Transition Request frame
19	Preferred BSS transition candidate list included
20	Leaving ESS
21–255	Reserved

The Transition Result field contains the result of the attempted transition and is one of the status codes specified in Table 8-37 in 8.4.1.9.

The Source RCPI field indicates the received channel power of the most recently measured frame from the Source BSSID before the STA reassociates to the Target BSSID. The Source RCPI is a logarithmic function of the received signal power, as defined in the RCPI measurement subclause for the PHY Type.

The Source RSNI field indicates the received signal-to-noise indication of the most recently measured frame from the Source BSSID before the STA reassociates to the Target BSSID. The Source RSNI is a logarithmic function of the signal-to-noise ratio, as defined in 8.4.2.43.

The Source BSSID, Source RCPI, and Source RSNI fields are set to 0 if the transition is initiated by an Association Request frame.

The Target RCPI field indicates the received channel power of the first measured frame just after the STA reassociates to the Target BSSID. If association with the Target BSSID failed, the Target RCPI field indicates the received channel power of the most recently measured frame from the Target BSSID. The Target RCPI is a logarithmic function of the received signal power, as defined in the RCPI measurement subclause for the PHY Type.

The Target RSNI field indicates the received signal-to-noise indication of the first measured frame just after the STA reassociates to the Target BSSID. If association with the Target BSSID failed, the Target RCPI field indicates the received signal-to-noise indication of the most recently measured frame from the Target BSSID. The Target RSNI is a logarithmic function of the signal-to-noise ratio, as defined in 8.4.2.43.

8.4.2.70.3 RSNA event report

The format of the Event Report field corresponding to an RSNA event report is shown in Figure 8-283.

	Target BSSID	Authentication Type	EAP Method	RSNA Result	RSNE
Octets:	6	4	1 or 8	2	variable

Figure 8-283—Event Report format for RSNA event

The Target BSSID field contains the 6-octet BSSID address of the AP accepting the authentication attempt.

The Authentication Type field contains the Authentication type in use at the time of the authentication attempt and is one of the AKM suite selectors defined in Table 8-101 in 8.4.2.27.3.

When the Authentication Type field is the value of either 00-0F-AC:1 (Authentication negotiated over IEEE 802.1X or using PMKSA caching as defined in 11.5.9.3) or 00-0F-AC:3 (AKM suite selector for Fast BSS Transition as defined in 11.5.3), the EAP Method field contains the IANA assigned EAP type. The EAP type contains either the legacy type (1 octet) or the expanded type (1 octet type = 254, 3-octet Vendor ID, 4-octet Vendor-Type). The EAP Method field is 0 otherwise. The EAP Method field is a single octet set to 0 otherwise.

The RSNA Result field contains the result of the RSNA establishment attempt and is one of the status codes specified in Table 8-37 in 8.4.1.9.

The RSNE field contains the entire contents of the negotiated RSNE at the time of the authentication attempt. The maximum length of the RSNE field is less than the maximum length of an RSNE, as defined in 8.4.2.27. If the length of the RSNE included here exceeds the maximum length of the RSNE field, the RSNE shall be truncated to the maximum length allowed for the RSNE field.

8.4.2.70.4 Peer-to-Peer Link event report

The format of the Event Report field corresponding to a Peer-to-Peer Link event report is shown in Figure 8-284.

	Peer STA/ BSSID Address	Operating Class	Channel Number	STA Tx Power	Connection Time	Peer Status
Octets:	6	1	1	1	3	1

Figure 8-284—Event Report format for Peer-to-Peer Link event

A Peer-to-Peer link is defined to be either a Direct Link within a QoS BSS, a TDLS, or a STA-to-STA communication in an IBSS.

The Peer STA/BSSID Address field contains a 6-octet MAC address. If this event is for a Peer-to-Peer link in an infrastructure BSS, this field contains the MAC address of the peer STA. If this event is for a Peer-to-Peer link in an IBSS, this field contains the BSSID of the IBSS.

The Operating Class field indicates the channel set of the Peer-to-Peer link. Valid values of the Operating Class are shown in Annex E.

The Channel Number field indicates the Peer-to-Peer channel number of the Peer-to-Peer link. The Channel Number is defined within a Operating Class as shown in Annex E.

The STA Tx Power field indicates the target transmit power at the antenna in dBm with a tolerance of ± 5 dB of the lowest basic rate of the reporting STA.

The Connection Time field contains the connection time in seconds. If the Peer Status is 0, this field indicates the duration of the Direct Link. If the Peer Status is 1, this field indicates the time difference from the time the Direct Link was established to the time at which the reporting STA generated the event report. If the Peer Status is 2, this field indicates the duration of the IBSS membership. If the Peer Status is 3, this field indicates the time difference from the time the STA joined the IBSS to the time at which the reporting STA generated the event report. See 10.23.2.4.

The Peer Status field indicates the Peer link connection status as indicated in Table 8-139.

Table 8-139—Peer Status definitions

Peer Status	Description
0	Direct Link terminated
1	Direct Link active
2	IBSS membership terminated
3	IBSS membership active
4–255	Reserved

8.4.2.70.5 WNM Log event report

The format of the Event Report field corresponding to a WNM Log event report is shown in Figure 8-285.

	WNM Log Msg
Octets:	variable

Figure 8-285—Event Report format for WNM Log event

The WNM Log Msg field contains the entire syslog message, consisting of the PRI, HEADER, and MSG portion of a WNM Log message as described in IETF RFC 3164-2001. The TAG field of the MSG portion of the message is a 17 octet string containing the ASCII representation of the STA MAC address using hexadecimal notation with colons between octets. The octet containing the individual/group bit occurs last, and that bit is in the least significant position within that octet. See 10.23.2.5.

8.4.2.70.6 Vendor Specific event report

The Event Report field corresponding to Vendor Specific event report contains zero or more Vendor Specific subelements. The Vendor Specific subelement has the same format as the Vendor Specific element (see 8.4.2.28).

8.4.2.71 Diagnostic Request element

8.4.2.71.1 Diagnostic Request definition

The Diagnostic Request element contains a request that the receiving STA undertake the specified diagnostic action. The format of the Diagnostic Request element is shown in Figure 8-286.

	Element ID	Length	Diagnostic Token	Diagnostic Request Type	Diagnostic Timeout	Diagnostic Information Subelements (optional)
Octets:	1	1	1	1	2	variable

Figure 8-286—Diagnostic Request element format

The Element ID field is equal to the Diagnostic Request value in Table 8-54.

The value of the Length field is 4 plus the length of the Diagnostic Information Subelements field. The minimum value of the Length field is 4 (based on a minimum length for the Diagnostic Information Subelements field of 0 octets).

The Diagnostic Token field is a number that is unique among the Diagnostic Request elements sent to each destination MAC address for which a corresponding Diagnostic Report element has not been received.

The Diagnostic Request Type field is a number that identifies a type of diagnostic request. The values of Diagnostic Request Types are shown in Table 8-140.

Table 8-140—Diagnostic Request/Report Type definitions

Name	Diagnostic Type values
Cancel Diagnostic Request	0
Manufacturer Information STA Report	1
Configuration Profile	2
Association Diagnostic	3
IEEE 802.1X Authentication Diagnostic	4
Reserved	5–220
Vendor Specific	221
Reserved	222–255

The Diagnostic Timeout field contains the time, in seconds, after which no response is returned.

The Diagnostic Information Subelements field contains zero or more diagnostic information subelements depending on the specific Diagnostic Request Type, as defined in 8.4.2.71.2 through 8.4.2.71.4.

The Cancel Diagnostic Request, Manufacturer Information STA Report, and Configuration Profile Diagnostic Request elements carry no Diagnostic Information subelements.

The Diagnostic Request element is included in a Diagnostic Request frame, as described in 8.5.14.4. The use of Diagnostic Request element and frames is described in 10.23.3.

8.4.2.71.2 Association Diagnostic request

The Diagnostic Information Subelements field corresponding to an Association Diagnostic request type is shown in Table 8-141. The corresponding Diagnostic Information subelements are defined in 8.4.2.71.5.

Table 8-141—Association Diagnostic request contents

Order	Information subelement
1	AP Descriptor
2	Profile ID

8.4.2.71.3 IEEE 802.1X Authentication Diagnostic request

The Diagnostic Information Subelements field corresponding to an IEEE 802.1X Authentication Diagnostic request type is shown in Table 8-142. The corresponding Diagnostic Information subelements are defined in 8.4.2.71.5.

Table 8-142—IEEE 802.1X Authentication Diagnostic request contents

Order	Information subelement
1	AP Descriptor
2	EAP Method
3	Credential Type
4	Profile ID

8.4.2.71.4 Vendor Specific diagnostic request

The Diagnostic Information Subelements field corresponding to a Diagnostic Request element of type Vendor Specific diagnostic request contains zero or more Vendor Specific subelements. The Vendor Specific subelements have the same format as their corresponding elements (see 8.4.2.28).

8.4.2.71.5 Diagnostic Information subelement descriptions

The following text describes the various subelements that may be included in Diagnostic Information Subelements field of a Diagnostic Request element (8.4.2.71) or a Diagnostic Report element (8.4.2.72). The format of a Diagnostic Information subelement is shown in Figure 8-287.

	Diagnostic Information Subelement ID	Length	Diagnostic Information Subelement Contents
Octets:	1	1	variable

Figure 8-287—Diagnostic Information subelement format

The Diagnostic Information Subelement ID field indicates the Diagnostic Information subelement ID and is any allocated value in Figure 8-143.

Table 8-143—Diagnostic Information subelement ID values

Identifier	Subelement name	Length (in octets)
0	Credential Type	3
1	AKM Suite	6
2	AP Descriptor	10
3	Antenna Type	4 to 251
4	Cipher Suite	6
5	Collocated Radio Type	3
6	Device Type	3
7	EAP Method	3 to 10
8	Firmware Version	3 to 251
9	MAC Address	8
10	Manufacturer ID String	3 to 251
11	Manufacturer Model String	3 to 251
12	Manufacturer OI	5 or 7
13	Manufacturer Serial Number String	3 to 251
14	Power Save Mode	6
15	Profile ID	3
16	Supported Operating Classes	3 to 251
17	Status Code	4
18	SSID	4 to 36
19	Tx Power Capability	3 to 251
20	Certificate ID	3 to 251
21–220	Reserved	
221	Vendor Specific	3 to 251
221–255	Reserved	

The Length field is the length in octets of the Diagnostic Information Subelement Contents field.

The values of the Diagnostic Information Subelement Contents field are described in the following paragraphs.

The format for the Credential Type subelement is shown in Figure 8-288.

	Subelement ID	Length	Credential Values
Octets:	1	1	variable

Figure 8-288—Credential Type subelement format

The Credentials Values field indicates one or more types of credential. Each value is chosen from those shown in Table 8-144.

Table 8-144—Credentials values

Value	Description
0	None
1	Preshared key
2	Username and password
3	X.509 certificate
4	Other certificate
5	One time password
6	Token
7–255	Reserved

The format for the AKM Suite subelement is shown in Figure 8-289.

	Subelement ID	Length	OUI	AKM Suite
Octets:	1	1	3	1

Figure 8-289—AKM Suite subelement format

The OUI and AKM Suite fields identify the authentication method, and the AKM suite selector is one of the values in Table 8-101 in 8.4.2.27.3.

The format of the AP descriptor subelement is described in Figure 8-290.

	Subelement ID	Length	BSSID	Operating Class	Channel Number
Octets:	1	1	6	1	1

Figure 8-290—AP Descriptor subelement format

The BSSID field is a 6-octet field, as described in 8.2.4.3.4, that identifies the BSS indicated in the AP Descriptor subelement.

The Operating Class field contains an enumerated value from Annex E specifying the frequency band in which the Channel Number is valid.

The Channel Number field indicates the current operating channel of the AP identified by the BSSID in the AP Descriptor.

The format for the Antenna Type subelement is shown in Figure 8-291.

	Subelement ID	Length	Antenna Count	Antenna Gain	Antenna Type
Octets:	1	1	1	1	variable

Figure 8-291—Antenna Type subelement format

The Antenna Count field contains a 1-octet field indicating the number of antennas of the indicated Antenna Type and Antenna Gain pair. The Antenna Count field value 0 is reserved.

The Antenna Gain field contains the peak gain, in dBi, of the antenna.

The Antenna Type field contains an ASCII string (truncated to 251 octets if required) describing the manufacturer's type information (i.e., a series of letters/numbers) of the antenna(s) connected to the wireless adapter. The Antenna Type field does not change based on different modes of operation of the antenna(s), as may be identified by the Antenna ID field (see 8.4.2.42). This string is not null terminated.

NOTE—Beamforming antennas might have several Antenna IDs, depending on antenna bearing.

The format for the Cipher Suite subelement is shown in Figure 8-292.

	Subelement ID	Length	OUI	Suite Type
Octets:	1	1	3	1

Figure 8-292—Cipher Suite subelement format

The OUI and Suite Type fields identify the cipher suite, and the cipher suite selector is one of the values in Table 8-99.

The format for the Collocated Radio Type subelement is shown in Figure 8-293.

	Subelement ID	Length	Collocated Radio Type
Octets:	1	1	1

Figure 8-293—Collocated Radio Type subelement format

The Collocated Radio Type subelement contains a 1-octet field indicating the type of collocated radio, and is one of the values in Table 8-145. The method that a STA uses to obtain the information on the Collocated Radio is out of the scope of this standard.

Table 8-145—Collocated Radio Type

Collocated Radio Type	Value
Reserved	0
Cellular	1
Cordless	2
GPS	3
IEEE 802.11	4
IEEE 802.15	5
IEEE 802.16	6
IEEE 802.20	7
IEEE 802.22	8
Digital Audio Broadcasting	9
Digital Video Broadcasting	10
Reserved	11–255

The Device Type subelement reports the type of device in which the IEEE 802.11 STA resides. The format of the Device Type subelement is shown in Figure 8-294.

	Subelement ID	Length	Device Type
Octets:	1	1	1

Figure 8-294—Device Type subelement format

The Device Type field is a 1-octet field indicating the category of device.[25] The numerical assignment to each device type category is defined in Table 8-146.

Table 8-146—Device Type definitions

Device Type	Value
Reserved	0
Reference Design	1
Access Point or Wireless Router for Home or Small Office	2
Enterprise Access Point	3
Cable, DSL or Other Broadband Gateway	4

[25] The category of device is based on the Wi-Fi Alliance® category definitions found at http://www.wi-fi.org/knowledge_center/insist-on-wifi-certified.

Table 8-146—Device Type definitions *(continued)*

Device Type	Value

Reserved	222–255

The format for the EAP Method subelement is shown in Figure 8-295.

	Subelement ID	Length	EAP Type	EAP Vendor ID (optional)	EAP Vendor Type (optional)
Octets:	1	1	1	0 or 3	0 or 4

Figure 8-295—EAP Method subelement format

The EAP Type field contains a value that identifies a single EAP method and is any valid IANA assigned EAP type.

The EAP Vendor ID field contains a value that identifies the EAP Vendor. The EAP Vendor ID field is included when EAP Type field is 254, and is excluded otherwise.

The EAP Vendor Type field contains a value that identifies the EAP Type as defined by the vendor. The EAP Vendor Type field is included when EAP Type field is 254, and is excluded otherwise.

The format for the Firmware Version subelement is shown in Figure 8-296.

	Subelement ID	Length	Firmware Version
Octets:	1	1	variable

Figure 8-296—Firmware Version subelement format

This Firmware Version field contains an ASCII string identifying the version of firmware currently installed on the wireless network adaptor. This string is not null terminated.

The format for the MAC Address subelement is shown in Figure 8-297.

	Subelement ID	Length	MAC Address
Octets:	1	1	6

Figure 8-297—MAC Address subelement format

This MAC Address field contains the 6-octet IEEE 802 MAC address of the STA.

The format for the Manufacturer ID String subelement is shown in Figure 8-298.

	Subelement ID	Length	ID
Octets:	1	1	variable

Figure 8-298—Manufacturer ID String subelement format

The ID field contains an ASCII string indicating the manufacturer identifier of the wireless network adaptor. This string is not null terminated.

The format for the Manufacturer Model String subelement is shown in Figure 8-299.

	Subelement ID	Length	Model
Octets:	1	1	variable

Figure 8-299—Manufacturer Model String subelement format

The Model field contains an ASCII string indicating the model of the wireless network adaptor. This string is not null terminated.

The format for the Manufacturer OI subelement is shown in Figure 8-300.

	Subelement ID	Length	OI
Octets:	1	1	3 or 5

Figure 8-300—Manufacturer OI subelement format

The OI field contains an organizationally unique identifier, as defined in 8.4.1.31.

The format for the Manufacturer Serial Number String subelement is shown in Figure 8-301.

	Subelement ID	Length	Serial Number
Octets:	1	1	variable

Figure 8-301—Manufacturer Serial Number String subelement format

The Serial Number field contains an ASCII string indicating the serial number of the wireless network adaptor. This string is not null terminated.

The format for the Power Save Mode subelement is shown in Figure 8-302.

	Subelement ID	Length	Power Save Mode
Octets:	1	1	4

Figure 8-302—Power Save Mode subelement format

The Power Save Mode field is a bitmap field that indicates the power save mode(s) in use by the STA, as defined in Table 8-147.

Table 8-147—Power Save Mode definition

Power Save Mode	Bit
Unknown	0
None	1
PS mode (ReceiveDTIMs=1, see 10.2.1)	2
PS mode (ReceiveDTIMs=0, see 10.2.1)	3

TIM Broadcast (see 10.2.1.17)	11
TFS (see 10.23.11)	12
TDLS Peer U-APSD (see 10.2.1.15)	13
TDLS Peer PSM (see 10.2.1.14)	14
Reserved	15–31

The format for the Profile ID subelement is shown in Figure 8-303.

	Subelement ID	Length	Profile ID
Octets:	1	1	1

Figure 8-303— Profile ID subelement format

The Profile ID field contains a unique identifier for referencing a configuration profile available on a device. The value of the identifier is uniquely associated to a single configuration profile on the device sending the identifier.

The format for the Supported Operating Classes subelement is shown in Figure 8-304.

	Subelement ID	Length	Supported Operating Classes Element
Octets:	1	1	variable

Figure 8-304—Supported Operating Classes subelement format

The Supported Operating Classes Element field contains the Supported Operating Classes element, as defined in 8.4.2.56.

The format for the Status Code subelement is shown in Figure 8-305.

	Subelement ID	Length	Status Code
Octets:	1	1	2

Figure 8-305—Status Code subelement format

The Status Code field contains the final IEEE 802.11 Status code, as defined in Table 8-37 in 8.4.1.9, received at the end of the applicable operation.

The format for the SSID subelement is shown in Figure 8-306.

	Subelement ID	Length	SSID
Octets:	1	1	0 to 32

Figure 8-306—SSID subelement format

The SSID field contains a Service Set Identifier with a maximum length of 32 octets, as defined in 8.4.2.2.

The format for the Tx Power Capability subelement is shown in Figure 8-307.

	Subelement ID	Length	Tx Power Mode	Tx Power
Octets:	1	1	1	variable

Figure 8-307—Tx Power Capability subelement format

The Tx Power Mode field identifies the transmit power mode of the non-AP STA and is one of the values in Table 8-148.

Table 8-148—Tx Power Modes

Tx Power Mode	Value
Discrete	0
Range	1
Reserved	2–255

The Tx Power field indicates the target transmit power level(s) at the antenna(s), where the actual power is within ±5 dB to the target. Each transmit power level is encoded in a single octet as a twos complement value in dBm, rounded to the nearest integer. If the Tx Power Mode field is 0 then the Tx Power field contains one or more transmit power levels in increasing numerical order. If the Tx Power Mode field is 1, the Tx Power field contains the STA's minimum and nonzero maximum transmit power levels, in that order.

The format for the Certificate ID subelement is shown in Figure 8-308.

	Subelement ID	Length	Certificate ID
Octets:	1	1	variable

Figure 8-308—Certificate ID subelement format

The Certificate ID field contains an UTF-8 string indicating the assigned identifier for the STA. This string is not null terminated. The Certificate ID typically takes the form of "WFA3991" and might be used by a receiving STA to look up the certificate assigned to that ID using a web lookup url such as http://certifications.wi-fi.org/pdf_certificate.php?cid= WFA3991.

The Vendor Specific subelements have the same format as their corresponding elements (see 8.4.2.28).

8.4.2.72 Diagnostic Report element

8.4.2.72.1 Diagnostic Report definition

The Diagnostic Report element contains a Diagnostic report. The format of the Diagnostic Report element is shown in Figure 8-309.

	Element ID	Length	Diagnostic Token	Diagnostic Report Type	Diagnostic Status	Diagnostic Information Subelements
Octets:	1	1	1	1	1	variable

Figure 8-309—Diagnostic Report element format

The Element ID field is equal to the Diagnostic Report value in Table 8-54.

The value of the Length field is 3 plus the length of the Diagnostic Information Subelements field. The minimum value of the Length field is 3.

The Diagnostic Token field is the Diagnostic Token in the corresponding Diagnostic Request element.

The Diagnostic Report Type field is a number that identifies the Diagnostic report. The Diagnostic Report Types are defined in Table 8-140.

The Diagnostic Status field is a value in Table 8-137 (see 8.4.2.70), indicating the STA's response to the Diagnostic Request indicated by the Diagnostic Token.

The Diagnostic Information Subelements field contains the results of the diagnostic request.

The Diagnostic Information Subelements field contains the diagnostic subelement values, defined in 8.4.2.71.5 corresponding to the Diagnostic Report Type field value.

The Diagnostic Report element is included in a Diagnostic Report frame, as described in 8.5.14.5. The use of Diagnostic Report element and frames is described in 10.23.3.

8.4.2.72.2 Manufacturer Information STA Report

The contents of the Diagnostic Information Subelements field of a Diagnostic Report element of type Manufacturer Information STA Report is shown in Table 8-149. The corresponding Diagnostic Information subelements are defined in 8.4.2.71.5.

Table 8-149—Manufacturer Information STA Report contents

Order	Information subelement
1	Manufacturer OI
2	Manufacturer ID string
3	Manufacturer model string
4	Manufacturer serial number string
6	Firmware Version

Table 8-149—Manufacturer Information STA Report contents *(continued)*

Order	Information subelement
7	Antenna Type
8	Collocated Radio Type
9	Device Type
10	Certificate ID

8.4.2.72.3 Configuration Profile report

The contents of the Diagnostic Information Subelements field of a Diagnostic Report element of type Configuration Profile is shown in Table 8-150. The corresponding Diagnostic Information subelements are defined in 8.4.2.71.5.

Table 8-150—Configuration Profile report contents

Order	Information subelement
1	Profile ID
2	Supported Operating Classes
3	Tx Power
4	Cipher Suite
5	AKM Suite
6	EAP Method
7	Credential Type
8	SSID
9	Power Save Mode

8.4.2.72.4 Association Diagnostic report

The contents of the Diagnostic Information Subelements field of a Diagnostic Report element of type Association Diagnostic is shown in Table 8-151. The corresponding Diagnostic Information subelements are defined in 8.4.2.71.5.

Table 8-151—Association Diagnostic report contents

Order	Information subelement
1	AP Descriptor
2	Status Code

8.4.2.72.5 IEEE 802.1X Authentication Diagnostic report

The contents of the Diagnostic Information Subelements field of a Diagnostic Report element of type IEEE 802.1X Authentication Diagnostic is shown in Table 8-152. The corresponding Diagnostic Information subelements are defined in 8.4.2.71.5.

Table 8-152—IEEE 802.1X Authentication Diagnostic report contents

Order	Information subelement
1	AP Descriptor
2	EAP Method
3	Credential Type
4	Status Code

8.4.2.72.6 Vendor Specific diagnostic report

The contents of the Diagnostic Information subelements field of a Diagnostic Report element of type Vendor Specific contains zero or more Vendor Specific subelements that have the same formats as Vendor Specific elements in 8.4.2.28.

8.4.2.73 Location Parameters element

8.4.2.73.1 Location Parameters definition

The Location Parameters element is used for location services. The format of this element is shown in Figure 8-310.

	Element ID	Length	Location Subelements
Octets:	1	1	variable

Figure 8-310—Location Parameters element format

The Element ID field is equal to the Location Parameters value in Table 8-54.

The value of the Length field is the length of the Location Subelements field.

The Location Subelements field contains one or more Location subelements described in Table 8-153.

Table 8-153—Location subelements

Identifier	Subelement name	Length (in octets)
1	Location Indication Parameters (see 8.4.2.73.2)	18
2	Location Indication Channels (see 8.4.2.73.3)	4–254
3	Location Status (see 8.4.2.73.4)	4

Table 8-153—Location subelements *(continued)*

Identifier	Subelement name	Length (in octets)
4	Radio Information (see 8.4.2.73.5)	7
5	Motion (see 8.4.2.73.6)	10
6	Location Indication Broadcast Data Rate (see 8.4.2.73.7)	4
7	Time of Departure (see 8.4.2.73.8)	9
8	Location Indication Options (see 8.4.2.73.9)	4
9–220	Reserved	
221	Vendor Specific (see 8.4.2.28)	5–254
222–255	Reserved	

The Location Parameters element is included in Location Configuration Request frames, as described in 8.5.14.6; Location Configuration Response frames, as described in 8.5.14.7; and Location Track Notification frames, as described in 8.5.8.17. The use of the Location Parameters element is described in 10.23.4.

The Vendor Specific subelements have the same format as their corresponding elements (see 8.4.2.28). Multiple Vendor Specific subelements are optionally present in the list of Optional subelements.

8.4.2.73.2 Location Indication Parameters subelement

The Location Indication Parameters subelement contains STA location reporting characteristics. The format of the Location Indication Parameters subelement is shown in Figure 8-311.

	Subelement ID	Length	Indication Multicast Address	Report Interval Units	Normal Report Interval	Normal Number of Frames per Channel
Octets:	1	1	6	1	2	1

	In-Motion Report Interval	In-Motion Number of Frames per Channel	Burst Inter-frame Interval	Tracking Duration	ESS Detection Interval
Octets:	2	1	1	1	1

Figure 8-311—Location Indication Parameters subelement

The Subelement ID field contains the value for Location Indication Parameters as defined in Table 8-153.

The Length field is 16.

The Indication Multicast Address field specifies the destination address to which the Location Track Notification frames are sent to in a non-IBSS network. The value of this field is a locally administered group address formed according to the procedure defined in 10.23.4.1. The field is reserved when Location Track Notifications are transmitted in an IBSS.

The Report Interval Units field contains the units used for the Normal Report Interval field and In-Motion Report Interval field, as indicated in Table 8-154.

Table 8-154—Report Interval Units field

Report Interval Units	Description
0	Hours
1	Minutes
2	Seconds
3	Milliseconds
4–255	Reserved

The Normal Report Interval is the time interval, expressed in the units indicated in the Report Interval Units field, at which the reporting STA is expected to transmit one or more Location Track Notification frames if either dot11MgmtOptionMotionDetectionActivated is false or the STA is stationary. The STA does not transmit Location Track Notification frames when the Normal Report Interval is 0.

The Normal Number of Frames per Channel is the number of Location Track Notification frames per channel sent or expected to be sent by the STA at each Normal Report Interval.

Motion is the act or process of moving, or a particular action or movement relative to the point at which the STA is configured to send Location Track Notification frames. Motion might be detected using one of the following criteria:

- Detection of speed that is greater or equal to 0.5 m/sec.
- Detection of movement or vibration, for example by a ball-in-tube sensor or accelerometer or other means.

The exact criteria and mechanism to detect motion is out of scope for this standard.

The In-Motion Report Interval is the time interval, expressed in the units indicated in the Report Interval Units field, at which the STA reports its location by sending a Location Track Notification frame when the reporting STA is in motion. If dot11MgmtOptionMotionDetectionActivated is false, this field is 0.

The In-Motion Number of Frames per Channel is the number of Location Track Notification frames per channel sent or expected to be sent by the STA at each In-Motion Report Interval. If dot11MgmtOptionMotionDetectionActivated is false, this field is 0.

The Burst Inter-frame Interval is the target time interval, expressed in milliseconds, between the transmissions of each of the Normal or In-Motion frames on the same channel. The Burst Inter-frame interval value is 0 to indicate that frames are transmitted with no target inter-frame delay.

The Tracking Duration is the amount of time, in minutes, that a STA sends the Location Track Notification frames. The duration starts as soon as the STA sends a Location Configuration Response frame with a Location Status value of Success. If the Tracking Duration value is a nonzero value the STA sends Location Track Notification Frames, based on the Normal and In-Motion Report Interval field values, until the duration ends. If the Tracking Duration is 0 the STA continuously sends Location Track Notification frames as defined by Normal and In-Motion Report Interval field values until transmission is terminated based on the procedures detailed in 10.23.4.2.

The ESS Detection Interval is the periodicity, in minutes, that a STA checks for beacons transmitted by one or more APs belonging to the same ESS that configured the STA. If no beacons from the ESS are received for this period, the STA terminates transmission of Location Track Notification frames, as described in the procedures detailed in 10.23.4.2. The ESS Detection Interval field is not used when the ESS Detection Interval field value is 0.

8.4.2.73.3 Location Indication Channels subelement

The Location Indication Channels subelement contains location reporting channel information. The format of the Location Indication Channels subelement format is shown in Figure 8-312.

			one or more entries
	Subelement ID	Length	Channel Entry
Octets:	1	1	2xn

Figure 8-312—Location Indication Channels subelement

The Subelement ID field contains the value for Location Indication Channels as defined in Table 8-153.

The Length field is 2*n*, where *n* indicates the total number of Channel Entry subelements contained in the element.

The Channel Entry field includes one or more Operating Class and Channel pair. The format Channel Entry field is shown in Figure 8-313.

	Operating Class	Channel
Octets:	1	1

Figure 8-313—Channel Entry field format

The Operating Class field each indicates the frequency band on which a STA transmits Location Track Notification frames. All Operating Class field values are for the country specified in the Beacon frame. Valid values of the Operating Class field are defined in Annex E.

The Channel field includes the channel numbers on which a STA sends or an ESS expects to receive Location Track Notification frames. Valid values of the Channel field are defined in Annex E.

8.4.2.73.4 Location Status subelement

The Location Status subelement provides the result of a Location Request or Location Configuration Request frame. The format of the Location Status subelement is shown in Figure 8-314.

	Subelement ID	Length	Config Subelement ID	Status
Octets:	1	1	1	1

Figure 8-314—Location Status subelement

The Subelement ID field contains the value for Location Status as defined in Table 8-153.

The Length field is 2.

The Config Subelement ID field is a specific Location Parameters subelement ID transmitted in a Location Configuration Request frame as defined in Table 8-153.

A Location Status subelement is included for each configuration subelement in the Location Configuration Request frame, except when all status values are the same. When all status values are the same, one Location Status subelement is included with the Config subelement ID set to 0 in the Location Configuration Response frame.

The Status field identifies the result of the Location Request frame and is one of the values in Table 8-137.

8.4.2.73.5 Radio Information subelement

The Radio Information subelement contains radio information. The format of the Radio Information subelement is shown in Figure 8-315.

	Subelement ID	Length	Transmit Power	Antenna ID	Antenna Gain	RSNI	RCPI
Octets:	1	1	1	1	1	1	1

Figure 8-315—Radio Information subelement

The Subelement ID field contains the value for Radio Information as defined in Table 8-153.

The Length field is 5.

The Transmit Power field is the transmit power used to transmit the current Location Track Notification frame containing the Location Parameters element with the Radio Information subelement and is a signed integer, 1 octet in length, reported in dBm. A value of –128 indicates that the transmit power is unknown. The tolerance for the transmit power value reported in the Radio Information subelement is ± 5 dB. This tolerance is defined as the maximum possible difference, in decibels, between the reported power value and the total transmitted power across all antennas of the STA, which are measured when transmitting Location Request frames.

The Antenna ID field is the identifying number for the antenna used to transmit the Location Request frame. The Antenna ID is defined in 8.4.2.42.

The Antenna Gain field is the antenna gain of the antenna (or group of antennas) over which the Location Track Notification frame is transmitted and is a signed integer, 1 octet in length, reported in dB. A value of –128 indicates that the antenna gain is unknown.

The RSNI field contains the RSNI value measured against the most recently received Location Configuration Request frame requesting that a Radio Information subelement be included in the Location

Track Notification frame. The RSNI value is defined in 8.4.2.43. A value of 255 indicates that the RSNI value is unknown or is not used.

The RCPI field contains the RCPI value measured against the most recently received Location Configuration Request frame requesting that a Radio Information subelement be included in the Location Track Notification frame. The RCPI value is defined in 8.4.2.40. A value of 255 indicates that the RCPI value is unknown or is not used.

8.4.2.73.6 Motion subelement

The Motion subelement contains motion information. The format of the Motion subelement is shown in Figure 8-316.

	Subelement ID	Length	Motion Indicator	Bearing	Speed Units	Horizontal Speed	Vertical Speed
Octets:	1	1	1	2	1	2	2

Figure 8-316—Motion subelement

The Subelement ID field contains the value for Motion as defined in Table 8-153.

The Length field is 8.

The Motion Indicator field is defined in Table 8-155. The mechanism that a STA uses to determine the value or transitions from one value to another of the Motion Indicator field is beyond the scope of the standard.

Table 8-155—Motion Indicator field

Motion Indicator value	Description
0	Stationary: the device is stationary and not in motion.
1	Start of motion: the device was stationary and is now in motion.
2	In motion: the device is and has been in motion.
3	End of motion: the device was in motion and is now stationary.
4	Unknown: information related to motion is unknown.
5–255	Reserved

The Bearing field, defined by a 2-octet unsigned integer, specifies the direction that the STA is traveling with relation to true north, increasing clockwise, measured in degrees from 0 degree to 359 degrees. If the Bearing value is unknown, the field is 65 535.

The Speed Units field contains the units for both Horizontal and Vertical Speed field, as defined in Table 8-156.

Table 8-156—Speed Units

Speed Units Value	Description
0	Centimeters per second
1	Meters per second
2–255	Reserved

The Horizontal Speed field contains the horizontal speed of the STA expressed in the units indicated in the Speed Units field. If the Horizontal Speed value is unknown, the field is 65 535.

The Vertical Speed field is a twos complement signed integer indicating the vertical speed of the STA expressed in the units indicated in the Speed Units field. If the Vertical Speed value is unknown or greater than 32 766, the field is 32 767. If the Vertical Speed value is less than –32 767, the field is –32 768.

The Motion subelement field values are valid at the time of transmission of the Location Track Notification frame containing the subelement.

8.4.2.73.7 Location Indication Broadcast Data Rate subelement

The Location Indication Broadcast Data Rate subelement contains location reporting transmission rate information. The format of the Location Indication Broadcast Data Rate subelement format is shown in Figure 8-317.

	Subelement ID	Length	Broadcast Target Data Rate
Octets:	1	1	4

Figure 8-317—Location Indication Broadcast Data Rate subelement

The Subelement ID field contains the value for Location Indication Broadcast Data Rate as defined in Table 8-153.

The value of the Length field is 4.

The Broadcast Target Data Rate field specifies the target data rate at which the STA transmits Location Track Notification frames. The Broadcast Target Data Rate field format is specified by the Rate Identification field defined in 8.4.1.32. A value of 0 indicates the STA transmits Location Track Notification frames at a rate chosen by the STA transmitting the Location Track Notification frames.

8.4.2.73.8 Time of Departure subelement

The Time of Departure subelement contains time of departure information for the Location Track Notification frame including the subelement. The format of the Time of Departure subelement is shown in Figure 8-318.

	Subelement ID	Length	TOD Timestamp	TOD RMS	TOD Clock Rate
Octets:	1	1	4	2	2

Figure 8-318—Time of Departure subelement

The Subelement ID field contains the value for Time of Departure as defined in Table 8-153.

The value of the Length field is 8.

The TOD Timestamp field carried within a frame specifies when the first frame energy is sent by the transmitting port in units equal to 1/TOD Clock Rate, where the TOD Clock Rate is specified in the TOD Clock Rate field. The reported TOD timestamp value is determined from the TIME_OF_DEPARTURE parameter within the PHY-TXSTART.confirm primitive.

The TOD RMS field specifies the RMS time of departure error in units equal to 1/TOD Clock Rate, where the TOD Clock Rate is specified in the TOD Clock Rate field, where the time of departure error equals the difference between the TOD Timestamp field and the time of departure measured by a reference entity using a clock synchronized to the start time and mean frequency of the local PHY entity's clock. TOD RMS field is determined from aTxPmdTxStartRMS in units equal to 1/TOD Clock Rate, where the TOD Clock Rate is specified in the TOD Clock Rate field.

The TOD Clock Rate field contains the clock rate used to generate the TOD timestamp value reported in the TOD Timestamp field, and it is specified in units of MHz.

8.4.2.73.9 Location Indication Options subelement

The Location Indication Options subelement contains the options for the STA when transmitting the Location Track Notification frame. The format of the Location Indication Options subelement is shown in Figure 8-319.

	Subelement ID	Length	Options Used	Indication Parameters
Octets:	1	1	1	variable

Figure 8-319—Location Indication Options subelement

The Subelement ID field contains the value for Location Indication Options as defined in Table 8-153.

The Length field is 1 plus the length of each Indication Parameter included.

The Options Used field specifies which Indication Parameter fields in the Location Indication Options subelement are used. The format of the Options Used field is shown in Figure 8-320.

	B0	B1 B7
	Beacon Measurement Mode Used	Reserved
Bits:	1	7

Figure 8-320—Options Used field format

The Indication Parameters field defines a sequence of optional fields that are included in the Location Indication Options subelement based on the Options Used field value. The value of the Indication Parameters field is defined in Table 8-157.

Table 8-157—Indication Parameter values

Order	Field length	Field	Description
1	1	Beacon Measurement Mode	The Beacon Measurement Mode field is the mode of beacon measurement, as defined in Table 8-64. The results of the beacon measurement are included in the Location Track Notification frame, as described in 8.5.8.17 and 10.23.4.2.
2–8		Reserved	

8.4.2.74 Nontransmitted BSSID Capability element

The format of the Nontransmitted BSSID Capability element is shown in Figure 8-321.

	Element ID	Length	Nontransmitted BSSID Capability
Octets:	1	1	2

Figure 8-321—Nontransmitted BSSID Capability element format

The Element ID field is equal to the Nontransmitted BSSID Capability value in Table 8-54.

The value of the Length field is 2.

The Nontransmitted BSSID Capability field contains the Capability information field of the BSS.

The Nontransmitted BSSID Capability element is included in the Nontransmitted BSSID profile subelement of the Multiple BSSID element defined in 8.4.2.48. The use of the Multiple BSSID element is described in 10.11.14 and Nontransmitted BSSID Advertisement procedures are described in 10.1.3.6.

8.4.2.75 SSID List element

The format of the SSID List element is shown in Figure 8-322.

	Element ID	Length	SSID List
Octets:	1	1	variable

Figure 8-322—SSID List element format

The Element ID field is equal to the SSID List value in Table 8-54.

The value of the Length field is the length of the SSID list (variable) in octets.

The SSID List field is a list of SSID elements, each including the element ID, length field and SSID information field (see 8.4.2.2) for which the STA is requesting information.

The SSID List element is included in Probe Request frames, as described in 8.3.3.9. The use of the SSID List element and frames is described in 10.1.4.

8.4.2.76 Multiple BSSID-Index element

The format of the Multiple BSSID-Index element is shown in Figure 8-323.

	Element ID	Length	BSSID Index	DTIM Period (optional)	DTIM Count (optional)
Octets:	1	1	1	0 or 1	0 or 1

Figure 8-323—Multiple BSSID-Index element format

The Element ID field is equal to the Multiple BSSID-Index value in Table 8-54.

The value of the Length field is 1 octet when the Multiple BSSID-Index element is included in the Probe Response frame and otherwise is three octets.

The BSSID Index field is a value between 1 and $2^n – 1$ that identifies the nontransmitted BSSID, where *n* is a nonzero, positive integer value.

The DTIM Period field is the DTIM period field for the BSSID. This field is not present when the Multiple BSSID-Index element is included in the Probe Response frame.

The DTIM Count field is the DTIM count field for the BSSID. This field is not present when the Multiple BSSID-Index element is included in the Probe Response frame.

The Multiple BSSID-index element is included in the nontransmitted BSSID profile element, as described in 10.1.3.6. The use of the Multiple BSSID element and frames is described in 10.11.14.

8.4.2.77 FMS Descriptor element

The FMS Descriptor element defines information about group addressed BUs buffered at the AP. It is present in the Beacon frames when dot11MgmtOptionFMSActivated is true. The format of the FMS Descriptor element is shown in Figure 8-324.

				zero or more FMS Counters	zero or more FMSIDs
	Element ID	Length	Number of FMS Counters	FMS Counters	FMSIDs
Octets:	1	1	1	n	m

Figure 8-324—FMS Descriptor element format

The Element ID field is equal to the FMS Descriptor value in Table 8-54.

The Length field is 1 if no FMS streams are accepted at the AP or is 1 + *n* + *m*, where *n* is the number of FMS Counters present and *m* indicates the number of 1-octet FMSIDs present in the element.

The Number of FMS Counters field defines the number of FMS Counters fields that are contained in the FMS Descriptor element.

The FMS Counters field contains zero or more FMS Counters. The format of the FMS Counter is shown in Figure 8-325. When one or more FMS streams are accepted at the AP, at least one FMS counter is present in the FMS Descriptor element. A maximum of eight FMS counters are permitted. The FMS counters are used by the non-AP STA to identify the DTIM beacon after which group addressed BUs assigned to a particular delivery interval are transmitted. A single FMS Counter is shared by all FMS streams that use the same delivery interval.

	B0 B2	B3 B7
	FMS Counter ID	Current Count
Bits:	3	5

Figure 8-325—FMS Counter format

The FMS Counter ID field is a 3- bit value that represents the counter ID assigned by the AP for a particular FMS stream.

The Current Count field indicates how many DTIM Beacon frames (including the current one) appear before the next DTIM Beacon frame after which the group addressed BUs assigned to a particular delivery interval are scheduled to be transmitted. The Current Count field is 0 on transmission and ignored upon reception when the FMS Counter field is included in the FMS Status subelement.

The FMSIDs field contains zero or more FMSIDs. Each FMSID is a 1-octet identifier assigned by the AP.

Inclusion of an FMSID indicates the AP has buffered BUs for the corresponding group addressed stream that is scheduled for transmission immediately after the DTIM Beacon frame.

The FMS Descriptor element is included in Beacon frames, as described in 8.3.3.2. The use of the FMS Descriptor element and frames is described in 10.2.1.16.

8.4.2.78 FMS Request element

The FMS Request element defines information about the group addressed frames being requested by the non-AP STA. The format of FMS Request element is shown in Figure 8-326.

				One or more Request subelements
	Element ID	Length	FMS Token	Request subelements
Octets:	1	1	1	variable

Figure 8-326—FMS Request element format

The Element ID field is the FMS Request value in Table 8-54.

The value of the Length field is 1 + *n*, where *n* indicates the total length of all FMS subelements contained in the element.

The FMS Token field contains a unique identifier for the FMS Stream Set that is the set of FMS subelements specified in the request. If this is a new request, then the FMS Token value is 0. Otherwise, the FMS Token value is the value assigned by the AP in the FMS Response element. The FMS Token is fixed for the lifetime of the FMS Stream Set.

The Request Subelements field contains one or more Request subelements described in Table 8-158.

Table 8-158—Request subelements

Identifier	Subelement name	Length (in octets)
0	Reserved	
1	FMS subelement	6 to 254
2–220	Reserved	
221	Vendor Specific subelement	5 to 254
222–255	Reserved	

The format of the FMS subelement is shown in Figure 8-327.

					One or more TCLAS Elements	
	Subelement ID	Length	Delivery Interval	Max Delivery Interval	Rate Identification	TCLAS Elements	TCLAS Processing Element (optional)
Octets:	1	1	1	1	4	variable	0 or 3

Figure 8-327—FMS Subelement format

The Subelement ID field is 1 to uniquely identify this subelement as the FMS subelement.

The value of the Length field is the sum of the lengths of the TCLAS element(s) plus 6 and the optional TCLAS Processing element, if present.

The Delivery Interval field defines the periodicity of stream transmission in units of DTIMs. The default value is 1. The value set to 0 indicates that requesting non-AP STA does not use the FMS stream identified by the TCLAS elements anymore.

The Max Delivery Interval field defines the maximum delivery interval the non-AP STA supports for the requested stream in units of DTIMs. The value set to 0 indicates that the non-AP STA is willing to accept any maximum delivery interval supported by the AP.

The Rate Identification field specifies the data rate as described in 8.4.1.32, at which the STA requests to receive group addressed frames. If the STA does not request a particular multicast rate, the Rate Identification field is 0.

The TCLAS Elements field contains one or more TCLAS elements to specify the traffic filter as defined in 8.4.2.33. The number of TCLAS elements is limited and the total size of the FMS Request element is less than or equal to 255 octets.

The TCLAS Processing Element field is optionally present and defines how multiple TCLAS elements are processed as defined in 8.4.2.35.

The FMS Request element is included in FMS Request frames, as described in 8.5.14.11. The use of the FMS Request element and frames is described in 10.2.1.16.

The Vendor Specific subelements have the same format as their corresponding elements (see 8.4.2.28).

8.4.2.79 FMS Response element

The FMS Response element provides information about the delivery of group addressed frames. The format of the FMS Response element is shown in Figure 8-328.

				One or more Status Subelements
	Element ID	Length	FMS Token	Status Subelements
Octets:	1	1	1	variable

Figure 8-328—FMS Response element format

The Element ID field is the FMS Response value in Table 8-54.

The Length field is 1 + *n*, where *n* indicates the total length of all FMS Status subelements contained in the element.

The FMS Token field is assigned by the AP for the set of FMS streams that share the counter identified by the FMS Counter ID maintained in the AP.

The Status Subelements field contains one or more Status subelements described in Table 8-159.

Table 8-159—Status subelements

Identifier	Subelement name	Length (in octets)
0	Reserved	
1	FMS Status subelement	15 to 254
2	TCLAS Status subelement	6 to 254
3–220	Reserved	
221	Vendor Specific subelement	5 to 254
222–255	Reserved	

The FMS Status Subelements field contains one or more FMS Status subelements. The format of the FMS Status subelement is shown in Figure 8-329.

	Subelement ID	Length	Element Status	Delivery Interval	Max Delivery Interval	FMS ID	FMS Counter	Rate Identification	Multicast Address
Octets:	1	1	1	1	1	1	1	4	6

Figure 8-329—FMS Status Subelement format

The Subelement ID field is 1 to uniquely identify this subelement as the FMS Status subelement.

The value of the Length field is 15.

The Element Status field indicates the status of STA's requested delivery interval, as indicated in Table 8-160, provided by the AP.

Table 8-160—FMS Element Status and TFS Response Status definition

Value	Description
0	Accept
1	Deny, due to request format error or ambiguous classifier.
2	Deny, due to lack of resources on AP.
3	Deny, due to requested classifier(s) matching 2 or more existing streams on different intervals.
4	Deny, by policy, requested stream or filter is not permitted to participate in the service.
5	Deny, reason unspecified.
6	Alternate Preferred, due to existing stream with different delivery interval.
7	Alternate Preferred, due to policy limits on AP.
8	Alternate Preferred, due to AP changed the delivery interval.
9	Alternate Preferred, due to AP multicast rate policy.
10	Terminate, due to AP policy change.
11	Terminate, due to lack of resources of AP.
12	Terminate, due to other FMS stream with higher priority.
13	Alternate Preferred, due to AP changed the maximum delivery interval.
14	Alternate Preferred, due to AP unable to provide requested TCLAS-based classifiers.
15–255	Reserved

The Delivery Interval field defines the minimum integer of DTIM periods between successive transmissions of frames for the stream corresponding to that FMSID.

The Max Delivery Interval field defines the maximum delivery interval the AP uses for the stream corresponding to FMSID. The value set to 0 indicates that the AP has no maximum delivery interval for the stream identified by FMSID.

The FMSID field is assigned by the AP and provides a unique identifier for this stream within the BSS.

The format of the FMS Counter field is shown in Figure 8-325.

The Rate Identification field specifies the data rate as described in 8.4.1.32 to be used for the multicast service. If the value of the Rate Identification field is 0 then the data rate is undefined.

The Multicast MAC Address field contains the MAC address of the multicast traffic to which this FMS response relates.

The format of the TCLAS Status subelement is shown in Figure 8-330.

				one or more TCLAS Elements	
	Subelement ID	Length	FMSID	TCLAS Elements	TCLAS Processing Element (optional)
Octets:	1	1	1	variable	0 or 3

Figure 8-330—TCLAS Status Subelement format

The Subelement ID field is 2 to uniquely identify this subelement as the TCLAS Status subelement.

The value of the Length field is 1 plus the sum of the lengths of the TCLAS element(s) plus the optional TCLAS Processing element, if present.

The FMSID field is assigned by the AP and provides a unique identifier for this stream within the BSS.

The TCLAS Elements field contains one or more TCLAS elements to specify the traffic filter as defined in 8.4.2.33. The number of TCLAS elements is limited and the total size of the FMS Response element is less than or equal to 255 octets.

The TCLAS Processing Element field is optionally present and defines how multiple TCLAS elements are processed as defined in 8.4.2.35.

The FMS Response element is included in FMS Response frames, as described in 8.5.14.12. The use of the FMS Response element and frames is described in 10.2.1.16.

The Vendor Specific subelements have the same format as their corresponding elements (see 8.4.2.28).

8.4.2.80 QoS Traffic Capability element

The QoS Traffic Capability element provides information about types of traffic generated by a non-AP QoS STA, and is used by a QoS AP to indicate the access categories of associated non-AP QoS STAs. The format of the QoS Traffic Capability element is shown in Figure 8-331.

	Element ID	Length	QoS Traffic Capability Bitmask/Flags	AC STA Count List (optional)
Octets:	1	1	1	Total number of nonzero bits in Bits 0–1 of QoS Traffic Capability Bitmask/Flags field

Figure 8-331—QoS Traffic Capability Element format

The Element ID field is the QoS Traffic Capability value in Table 8-54.

The value of the Length field is 1 + *n*, where *n* equals the total number of nonzero bits in Bits 0–1 of the QoS Traffic Capability Bitmask/Flags field.

The format of QoS Traffic Capability Bitmask/Flags field is defined in Table 8-161.

Table 8-161—QoS Traffic Capability Bitmask/Flags definition

Bit	Description
0	AC_VO
1	AC_VI
2	Reserved
3	Reserved
4	UP 4 Traffic
5	UP 5 Traffic
6	UP 6 Traffic
7	Reserved

Bits 0–1 serve as QoS Traffic Capability Bitmask. The bitmask indicates the AC values that have the station count specified in the following AC STA Count List. An AP sets the bit to 1 to indicate that the station count for the corresponding AC is present in the AC STA Count List field. An AP sets the bit to 0 to indicate that the station count for the corresponding AC is not present in the AC STA Count List field. A non-AP STA always sets Bits 0–1 to 0. An AP ignores Bits 0–1 on reception.

Bits 4–6 serve as QoS Traffic Capability Flags. Each of Bits 4–6 serves as a flag for a non-AP STA to indicate application requirements about the user priorities of the traffic it generates. A non-AP STA sets the bit to 1 to indicate the existence of an application that requires generation of traffic belonging to the corresponding user priority (UP). A non-AP STA sets the bit to 0 to indicate that such application does not exist. An AP always sets Bits 4–6 to 0. A non-AP STA ignores Bits 4–6 on reception.

Bits 2–3 and Bit 7 are reserved.

The AC STA Count List comprises a sequence of STA Count fields corresponding to the nonzero bits in the Bits 0–1 of the QoS Traffic Capability Bitmask/Flags field. The STA Count field is 1 octet long and contains an unsigned integer, encoded according to 8.2.2. The STA Count field specifies the number of associated QoS STAs that have indicated QoS Traffic Capability of the corresponding AC. If the number of STAs is greater than 255, the STA Count field is 255. The AC STA Count List field is present only when the QoS AP transmits the QoS Traffic Capability element.

The QoS Traffic Capability element is included in Beacon frames, as described in 8.3.3.2; Probe Response frames, as described in 8.3.3.10; Association Request frames, as described in 8.3.3.5; and Reassociation Request frames, as described in 8.3.3.7.

8.4.2.81 BSS Max Idle Period element

The BSS Max Idle Period element contains the time period a non-AP STA can refrain from transmitting frames to the AP before the AP disassociates the STA due to inactivity. The format of the BSS Max Idle Period element is shown in Figure 8-332.

	Element ID	Length	Max Idle Period	Idle Options
Octets:	1	1	2	1

Figure 8-332—BSS Max Idle Period element format

The Element ID field is the BSS Max Idle Period value in Table 8-54.

The value of the Length field is 3.

The Max Idle Period field indicates the time period during which a STA can refrain from transmitting frames to its associated AP without being disassociated. The Max Idle Period field is a 16-bit unsigned integer. The time period is specified in units of 1000 TUs. The value of 0 is reserved. A non-AP STA is considered inactive if the AP has not received a data frame or management frame of a frame exchange sequence initiated by the STA for a time period equal to or greater than the time specified by the Max Idle Period field value.

The Idle Options field indicates the options associated with the BSS Idle capability. The Idle Options field is shown in Figure 8-333.

	B0	B1-B7
	Protected Keep-Alive Required	Reserved
Bits:	1	7

Figure 8-333—Idle Options field

The Protected Keep-Alive Required bit set to 1 indicates that the STA sends an RSN protected frame to the AP to reset the Idle Timer at the AP for the STA, as defined in 10.23.12. If the Protected Keep-Alive Required bit is 0, the STA sends either an unprotected or a protected frame to the AP to reset the Idle Timer at the AP.

The BSS Max Idle Period element is included in Association Response frames, as described in 8.3.3.6, and Reassociation Response frames, as described in 8.3.3.8. The use of the BSS Max Idle Period element and frames is described in 10.23.12.

8.4.2.82 TFS Request element

The TFS Request element defines information about the traffic filters that are enabled at the AP for the requesting non-AP STA. The format of the TFS Request element is defined in Figure 8-334.

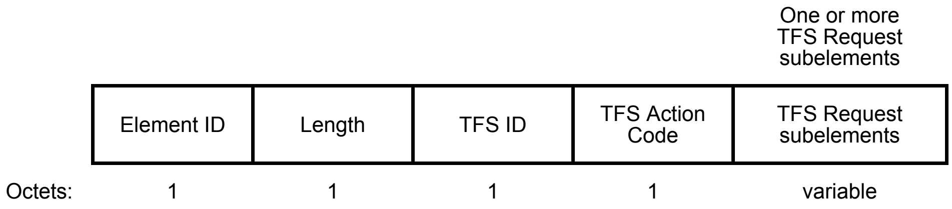

Figure 8-334—TFS Request element format

The Element ID field is equal to the TFS Request value in Table 8-54.

The Length field is 2 + *n*, where *n* indicates the total length of all TFS subelements contained in the element.

The TFS ID field is assigned by the STA and provides a unique identifier for the set of traffic filters specified in the TFS subelements.

The TFS Action Code field defines the actions taken at the AP when a frame matches a traffic filter. The functions of the bits in this field are shown in Table 8-162.

Table 8-162—TFS Action Code field values

Bit(s)	Information	Notes
0	Delete after match	Setting this field to 1 indicates the traffic filter is to be deleted when a frame matches the traffic filter. A value of 0 for this field indicates no deletion of the traffic filter.
1	Notify	Setting this field to 1 indicates the STA is to be sent a TFS Notify frame when a frame matches the traffic filter. Setting this field to 0 indicates the AP does not send a TFS Notify frame to the requesting STA.
2–7	Reserved	All other bits are reserved, and are set to 0 on transmission and ignored on reception.

The TFS Request Subelements field contains one or more TFS Request subelements described in Table 8-163.

Table 8-163—TFS Request subelements

Identifier	Subelement name	Length (in octets)
1	TFS subelement	5 to 254
221	Vendor Specific subelement	5 to 254
0, 2 to 220, 222 to 255	Reserved	

The format of the TFS subelement is shown in Figure 8-335.

			One or more TCLAS Elements	
	Subelement ID	Length	TCLAS Elements	TCLAS Processing Element (optional)
Octets:	1	1	variable	0 or 3

Figure 8-335—TFS Subelement format

The Subelement ID field uniquely identifies this subelement to be the TFS subelement. The value of this field is 1.

The value of the Length field is the sum of the lengths of the TCLAS element(s) plus the optional TCLAS Processing element, if present.

The TCLAS Elements field contains one or more TCLAS elements to specify the traffic filter as defined in 8.4.2.33.

The TCLAS Elements field contains one or more TCLAS elements to specify the traffic filter as defined in 8.4.2.33. The number of TCLAS elements is limited and the total size of the TFS Request element is less than 255 octets.

The TCLAS Processing Element field is optionally present and defines how multiple TCLAS elements are processed as defined in 8.4.2.35.

The TFS Request element is included in TFS Request frames, as described in 8.5.14.15, and WNM-Sleep Mode Request frames, as described in 8.5.14.18. The use of the TFS Request element and frames is described in 10.23.11.

8.4.2.83 TFS Response element

The TFS Response element defines information about the status of the requested traffic filter. The format of the TFS Response element is defined in Figure 8-336.

			One or more Status subelements
	Element ID	Length	Status subelements
Octets:	1	1	4*n*

Figure 8-336—TFS Response element format

The Element ID field is equal to the TFS Response value in Table 8-54.

The Length field is 4*n*, where *n* indicates the total number of TFS Status subelements contained in the element.

The Status Subelement field contains one or more Status subelements described in Table 8-164.

Table 8-164—Status subelements

Identifier	Subelement name	Length (in octets)
1	TFS Status subelement	4 to 254
2	TFS subelement	5 to 254
221	Vendor Specific subelement	5 to 254
0, 3 to 220, 222 to 255	Reserved	

The TFS Status Subelement field contains the information as defined in Figure 8-337.

	Subelement ID	Length	TFS Response Status	TFS ID
Octets:	1	1	1	1

Figure 8-337—TFS Status Subelement format

The Subelement ID field uniquely identifies this subelement to be the TFS Status subelement. The value of this field is 1.

The value of the Length field is 2.

The TFS Response Status field indicates the status returned by the AP responding to the STA's requested traffic filter, as indicated in Table 8-160.

The TFS ID field indicates the unique ID for the TFS traffic filter set.

The TFS Response element is included in TFS Response frames, as described in 8.5.14.16, and WNM-Sleep Mode Response frames, as described in 8.5.14.19. The use of the TFS Response element and frames is described in 10.23.11.

8.4.2.84 WNM-Sleep Mode element

The WNM-Sleep Mode element is used to enter and exit the WNM-Sleep mode. The format of the WNM-Sleep Mode element is shown in Figure 8-338.

	Element ID	Length	Action Type	WNM-Sleep Mode Response Status	WNM-Sleep Interval
Octets:	1	1	1	1	2

Figure 8-338—WNM-Sleep Mode element format

The Element ID field is equal to the WNM-Sleep Mode value in Table 8-54.

The value of the Length field is 4.

The Action Type field is a number that identifies the type of WNM-Sleep mode request and response. The Action Types are shown in Table 8-165.

Table 8-165—Action Type definitions

Name	Action Type value
Enter WNM-Sleep Mode	0
Exit WNM-Sleep Mode	1
Reserved	2–255

The WNM-Sleep Mode Response Status field indicates the status returned by the AP responding to the non-AP STA's WNM-Sleep mode request as defined in Table 8-166. This field is valid only in the WNM Sleep Mode element in a WNM-Sleep Mode Response frame and is reserved otherwise.

Table 8-166—WNM-Sleep Mode Response Status definition

Value	Description
0	Enter/Exit WNM-Sleep Mode Accept.
1	Exit WNM-Sleep Mode Accept, GTK/IGTK update required.
2	Denied. The AP is unable to perform the requested action.
3	Denied temporarily. The AP is unable to perform the requested action at the current time. The request can be submitted again at a later time.
4	Denied. Due to the pending key expiration.
5	Denied. The requested action was not granted due to other WNM services in use by the requesting STA.
6–255	Reserved

The WNM-Sleep Interval field is reserved if the Action Type field is 1.

The WNM-Sleep Interval field indicates to the AP how often a STA in WNM-Sleep Mode wakes to receive Beacon frames, defined as the number of DTIM intervals. The value set to 0 indicates that the requesting non-AP STA does not wake up at any specific interval.

The WNM-Sleep Mode element is included in WNM-Sleep Mode Request frames, as described in 8.5.14.18, and WNM-Sleep Mode Response frames, as described in 8.5.14.19. The use of the WNM-Sleep Mode element and frames is described in 10.2.1.18.

8.4.2.85 TIM Broadcast Request element

The TIM Broadcast Request element contains information about the periodic TIM broadcast being requested by the non-AP STA. The format of the TIM Broadcast Request element is shown in Figure 8-339.

	Element ID	Length	TIM Broadcast Interval
Octets:	1	1	1

Figure 8-339—TIM Broadcast Request element format

The Element ID field is equal to the TIM Broadcast Request value in Table 8-54.

The value of the Length field is 1.

The TIM Broadcast Interval field is the number of beacon periods between TIM frame transmissions. A value of 0 terminates the use of TIM Broadcast for the requesting station.

The TIM Broadcast Request element is included in TIM Broadcast Request frames, as described in 8.5.14.20; Association Request frames, as described in 8.3.3.5; and Reassociation Request frames, as described in 8.3.3.7. The use of the TIM Broadcast Request element and frames is described in 10.2.1.17.

8.4.2.86 TIM Broadcast Response element

The TIM Broadcast Response element contains information about the periodic TIM broadcast by the AP. The format of the TIM Broadcast Response element is shown in Figure 8-340.

	Element ID	Length	Status	TIM Broadcast Interval (optional)	TIM Broadcast Offset (optional)	High Rate TIM Rate (optional)	Low Rate TIM Rate (optional)
Octets:	1	1	1	0 or 1	0 or 4	0 or 2	0 or 2

Figure 8-340—TIM Broadcast Response element format

The Element ID field is equal to the TIM Broadcast Response value in Table 8-54.

The value of the Length field is 1 or 10, depending on the presence of a TIM Broadcast schedule (TIM Broadcast Interval, TIM Broadcast Offset, High Rate TIM Rate, and Low Rate TIM Rate).

The Status field indicates the status of the AP responding to the STA's requested delivery interval, as indicated in Table 8-167.

When the Status field is 0, 1, or 3, the TIM Broadcast Interval field, TIM Broadcast Offset field, High Rate TIM Rate field, and Low Rate TIM Rate field are included in the TIM Broadcast Response element.

Table 8-167—Status field values

Field value	Description
0	Accept
1	Accept, valid timestamp present in TIM frames
2	Denied
3	Overridden
4–255	Reserved

The TIM Broadcast Interval field contains the number of beacon periods between scheduled TIM frame transmissions.

The TIM Broadcast Offset field contains the offset in microseconds with a tolerance of ± 4 microseconds relative to the TBTT for which a TIM frame is scheduled for transmission. The field contains a signed integer.

The High Rate TIM Rate field provides an indication of the rate that is used to transmit the high data rate TIM frame, in units of 0.5 Mb/s. A value of 0 indicates that the high rate TIM frame is not transmitted.

The Low Rate TIM Rate field provides an indication of the rate that is used to transmit the low data rate TIM frame, in units of 0.5 Mb/s. A value of 0 indicates that the low rate TIM frame is not transmitted.

The TIM Broadcast Response element is included in TIM Broadcast Response frames, as described in 8.5.14.21; Association Response frames, as described in 8.3.3.6; and Reassociation Response frames, as described in 8.3.3.8. The use of the TIM Broadcast Response element and frames is described in 10.2.1.17.

8.4.2.87 Collocated Interference Report element

The Collocated Interference Report element contains some characteristics of the reported collocated interference. The Collocated Interference Report element is defined in Figure 8-341.

	Element ID	Length	Report Period	Interference Level	Interference Level Accuracy/ Interference Index
Octets:	1	1	1	1	1

	Interference Interval	Interference Burst Length	Interference Start Time/Duty Cycle	Interference Center Frequency	Interference Bandwidth
Octets	4	4	4	4	2

Figure 8-341— Collocated Interference Report element format

The Element ID field is equal to the Collocated Interference Report value in Table 8-54.

The value of the Length field is 21.

The Report Period field contains an unsigned integer value in units of 200 TUs. If the Report Period field is a value that is greater than 0, then the reporting is periodic, and the field contains the period of sending the report. If the Report Period field is 0, then the reporting is not periodic, and a report is generated when the STA knows of a change in the collocated interference. See 10.23.8 for further details.

The Interference Level field is a twos complement signed integer indicating the maximum level of the collocated interference power in units of dBm over all receive chains averaged over a 4 μs period during an interference period and across interference bandwidth. When the interference level is unknown, the field is +127 dBm. When the interference level is equal or greater than 126 dBm, the field is +126 dBm. If no collocated interference is present the field is –128 dBm. When the interference level is equal or lower than –127 dBm, the field is –127 dBm. The interference level is referenced to the antenna connector (see “antenna connector” in 3.1) used for reception, like RCPI.

The Interference Level Accuracy/Interference Index field is shown in Figure 8-342.

	B0 B3	B4 B7
	Expected Accuracy	Interference Index
Bits	4	4

Figure 8-342—Interference Level Accuracy/Interference Index field format

The Expected Accuracy field represents an unsigned integer indicating the expected accuracy of the estimate of interference in dB with 95% confidence interval. If the Interference Level field is X (dBm) and the expected accuracy field is Y (dB), the actual interference level is in the range of [X – Y, X +Y] with the probability of 95%. The range of expected accuracy is from 0 dB to 14 dB. If accuracy is unknown or greater than 14 dB, then the Expected Accuracy field is 15.

The Interference Index field indicates the interference index that is unique for each type of interference source. The field set to 0 indicates that no collocated interference is present. See 10.23.8 for further details.

The Interference Interval field indicates the interval between two successive periods of interference in microseconds. When the interval between two successive periods of interference is variable the field is 2^{32}–1. When the interval between two successive periods of interference is equal or greater than 2^{32}– 2 the field is 2^{32}– 2. If no collocated interference is present, the field is 0.

The Interference Burst Length field indicates the duration of each period of interference in microseconds. When the duration of each period of interference is variable the field is 2^{32}– 1. When the duration of each period of interference is equal or greater than 2^{32}– 2 the field is 2^{32}– 2. If no collocated interference is present, the field is 0.

The Interference Start Time/Duty Cycle field contains the least significant 4 octets (i.e., B0–B31) of the TSF timer at the start of the interference burst. When either the Interference Interval or the Interference Burst Length fields are set to 2^{32}– 1, this field indicates the average duty cycle. The average duty cycle value is defined as follows:

$$\text{Average duty cycle} = \text{Round-to-Integer}\ ((2^{32} - 2) \times (T_B / T_I))$$

where
T_B is the average interference burst length
T_I is the average interference interval

When the interference is nonperiodic or no collocated interference is present, the Interference Start Time field is 0.

The Interference Center Frequency field indicates the center frequency of interference in units of 5 kHz. When center frequency is unknown, the center frequency of the STA’s operating channel is reported. If no collocated interference is present the field is 0.

The Interference Bandwidth field indicates the bandwidth in units of 5 kHz at the –3 dB roll-off point of the interference signal. When bandwidth of the interference signal is unknown, the field is 65 535. When bandwidth of the interference signal is equal or greater than 65 534 the field is 65 534. If no collocated interference is present, the field is 0.

8.4.2.88 Channel Usage element

The Channel Usage element defines the channel usage information for noninfrastructure networks or an off channel TDLS direct link. The format of the Channel Usage element is shown in Figure 8-343.

				zero or more entries
	Element ID	Length (2*n*+1)	Usage Mode	Channel Entry
Octets:	1	1	1	2*n*

Figure 8-343—Channel Usage element format

The Element ID field is equal to the Channel Usage value in Table 8-54.

The Length field is 2*n* + 1, where *n* indicates the total number of Channel Entry subelements contained in the element.

The Usage Mode field is a number that identifies the usage of the recommended channels listed in the Operating Class/Channel Number pair fields. The Usage Mode definitions are shown in Table 8-168.

Table 8-168—Usage Mode definitions

Value	Usage Mode
0	Noninfrastructure IEEE 802.11 network
1	Off-channel TDLS direct link
2–255	Reserved

The Channel Entry field includes zero or more Operating Class and Channel pairs. The format of Channel Entry field is shown in Figure 8-313.

The Channel Usage element may be included in Probe Request frames, as described in 8.3.3.9; Probe Response frames, as described in 8.3.3.10; Channel Usage Request frames, as described in 8.5.14.23; and Channel Usage Response frames, as described in 8.5.14.24. The use of the Channel Usage element and frames is described in 10.23.14.

8.4.2.89 Time Zone element

The Time Zone element contains the local time zone of the AP. The format of the Time Zone element is shown in Figure 8-344.

	Element ID	Length	Time Zone
Octets:	1	1	variable

Figure 8-344—Time Zone element format

The Element ID field is the Time Zone value in Table 8-54.

The value of the Length field is variable.

The format of the Time Zone field is as specified in 8.3 of IEEE Std 1003.1-2004:

stdoffset[dst[offset][,start[/time],end[/time]]]

The length of the field is no less than 4 octets and no more than TZNAME_MAX, as defined in IEEE Std 1003.1-2004. The Time Zone field represents the time zone at the AP's location. The encoding of the field is in ASCII characters as shown in the following Example-1.

Example-1: EST5

Example-2: EST5EDT4,M3.2.0/02:00,M11.1.0/02:00

In the Example-2, the string is interpreted as a time zone that is normally five hours behind UTC, and four hours behind UTC during DST, which runs from the second Sunday in March at 02:00 local time through the first Sunday in November at 02:00 local time. Normally, the time zone is abbreviated "EST" but during DST it is abbreviated "EDT."

8.4.2.90 DMS Request element

The DMS Request element defines information about the group addressed frames to be transmitted as individual addressed frames. The format of the DMS Request element is shown in Figure 8-345.

	Element ID	Length	DMS Descriptor List
Octets:	1	1	variable

Figure 8-345—DMS Request element format

The Element ID field is the DMS Request value in Table 8-54.

The value of the Length field is the length of the DMS Descriptor List field.

The DMS Descriptor List field contains one or more DMS Descriptors. The format of the DMS Descriptor is defined in Figure 8-346.

zero or more
TCLAS
Elements

	DMSID	DMS Length	Request Type	TCLAS Elements	TCLAS Processing Element (optional)	TSPEC Element (optional)	Optional Subelements
Octets:	1	1	1	variable	0 or 3	0 or 57	variable

Figure 8-346—DMS Descriptor

The DMSID field is set to 0 when the Request Type field is “Add” as defined in Table 8-169; otherwise, the DMSID field is set to the nonzero value assigned by the AP STA to identify the DMS traffic flow.

The DMS Length field is set to 1 + *n*, where *n* indicates the total length in octets of all the TCLAS Elements, optional TCLAS Processing Element, optional TSPEC Element, and Optional Subelements fields contained in the DMS Descriptor field.

The Request Type field identifies the type of DMS request. The Request Types are shown in Table 8-169.

Table 8-169—Request Type definitions

Description	Request Type value
Add	0
Remove	1
Change	2
Reserved	3–255

When the Request Type field contains “Add,” the TCLAS Elements field contains one or more TCLAS elements to specify group addressed frames as defined in 8.4.2.33. When the Request Type field contains any value other than “Add,” the TCLAS Elements field contains zero TCLAS elements.

When the Request Type field contains “Add” and when there are two or more TCLAS elements present, the TCLAS Processing Element field contains one TCLAS Processing element to define how these TCLAS elements are to be processed, as defined in 8.4.2.35. Otherwise, the TCLAS Processing Element field contains zero TCLAS Processing elements.

When the Request Type field contains “Add” or “Change,” the TSPEC Element field optionally contains one TSPEC element to specify the characteristics and QoS expectations of the corresponding traffic flow as defined in 8.4.2.32. Otherwise, the TSPEC Element field contains zero TSPEC elements.

The Optional Subelements field format contains zero or more subelements, each consisting of a 1-octet Subelement ID field, a 1-octet Length field and a variable-length Data field, as shown in Figure 8-402. The optional subelements are ordered by nondecreasing Subelement ID.

The Subelement ID field values for the defined optional subelements are shown in Table 8-170. A Yes in the Extensible column of a subelement listed in Table 8-170 indicates that the length of the subelement might be extended in future revisions or amendments of this standard. When the Extensible column of an element is Subelement, then the subelement might be extended in future revisions or amendments of this standard by defining additional subelements within the subelement. See 9.24.9.

Table 8-170—Optional Subelement IDs for DMS Descriptor

Subelement ID	Name	Length field (octets)	Extensible
0–220	Reserved		
221	Vendor Specific	3 to 248	
222–255	Reserved		

The DMS Request element is included in DMS Request frames, as described in 8.5.14.25, and Reassociation Request frames, as described in 8.3.3.7. The use of the DMS Request element and frames is described in 10.23.15.

8.4.2.91 DMS Response element

The DMS Response element provides the status information about the requested group addressed frames. The format of the DMS Response element is shown in Figure 8-347.

			one or more DMS Status field
	Element ID	Length	DMS Status List
Octets:	1	1	variable

Figure 8-347—DMS Response element format

The Element ID field is the DMS Response value in Table 8-54.

The value of the Length field is the total length of the DMS Status List field.

The DMS Status List field contains one or more DMS Status field. The format of the DMS Status field is defined in Figure 8-348.

					zero or more TCLAS Elements			
	DMSID	DMS Length	Response Type	Last Sequence Control	TCLAS Elements	TCLAS Processing Element (optional)	TSPEC Element (optional)	Optional Subelements
Octets:	1	1	1	2	variable	0 or 3	0 or 57	variable

Figure 8-348—DMS Status field format

The DMSID field is assigned by the AP and provides a unique identifier within the BSS for the DMS traffic flow identified by the TCLAS Elements, TCLAS Processing Element, and TSPEC Element fields. The uniqueness of the identifier is independent of the ordering of the TCLAS elements.

The value of the DMS Length field is set to 3 + *n*, where *n* indicates the total length in octets of all the TCLAS Elements, optional TCLAS Processing Element, optional TSPEC Element, and Optional Subelements fields contained in the DMS Status field. When the Response Type field is set to "Terminate," the value of the DMS Length field is set to 3.

The Response Type field indicates the response type returned by the AP responding to the non-AP STA's request, as indicated in Table 8-171.

Table 8-171—Response Type field values

Field value	Description	Notes
0	Accept	AP accepts the DMS request
1	Denied	AP rejects the DMS request
2	Terminate	AP terminates DMS previously accepted DMS request
3–255	Reserved	

When the Last Sequence Control field is not supported the Last Sequence Control field is set to 65 535. When the Last Sequence Control field is supported and the Response Type field does not contain "Terminate," the Last Sequence Control field is reserved.

When the Response Type field is "Terminate" and the Last Sequence Control field is supported, Bit 0 to Bit 3 of the Last Sequence Control field is 0, and Bit 4 to Bit 15 of the Last Sequence Control field contains the sequence number of the last group addressed frame that the AP converted to an individually addressed frame and sent successfully to the non-AP STA that is the recipient of the DMS Response frame. If this last frame received by the non-AP STA prior to DMS termination has not also been sent using a group addressed frame, the Last Sequence Control field is set to 65 534.

When the Response Type field contains "Accept" or "Denied," the TCLAS Elements field contains one or more TCLAS elements to specify group addressed frames as defined in 8.4.2.33. Otherwise, the TCLAS Elements field contains zero TCLAS elements.

When the Response Type field contains "Accept" or "Denied," the TCLAS Processing Element field optionally contains one TCLAS Processing element to define how these TCLAS elements are to be processed, as defined in 8.4.2.35. When the Response Type field contains "Terminate" or when there is only one TCLAS element, the TCLAS Processing Element field contains zero TCLAS Processing elements.

When the Response Type field contains "Accept" or "Denied," the TSPEC Element field optionally contains one TSPEC element to specify the characteristics and QoS expectations of the corresponding traffic flow as defined in 8.4.2.32. Otherwise, the TSPEC Element field contains zero TSPEC elements.

The Optional Subelements field contains zero or more subelements, each consisting of a 1-octet Subelement ID field, a 1-octet Length field and a variable-length Data field, as shown in Figure 8-402. The optional subelements are ordered by nondecreasing Subelement ID.

The Subelement ID field values for the defined optional subelements are shown in Table 8-172. A Yes in the Extensible column of a subelement listed in Table 8-172 indicates that the length of the subelement might be extended in future revisions or amendments of this standard. When the Extensible column of an element is Subelement, then the subelement might be extended in future revisions or amendments of this standard by defining additional subelements within the subelement. See 9.24.9.

Table 8-172—Optional Subelement IDs for DMS Status

Subelement ID	Name	Length field (octets)	Extensible
0–220	Reserved		
221	Vendor Specific	3 to 248	
222–255	Reserved		

The DMS Response element is included in DMS Response frames, as described in 8.5.14.26, and Reassociation Response frames, as described in 8.3.3.8. The use of the DMS Response element and frames is described in 10.23.15.

8.4.2.92 Destination URI element

The Destination URI element contains URI and ESS Detection Interval values from the requesting STA that the responding STA may use to deliver Event or Diagnostic Report frames. The format of the Destination URI element is given in Figure 8-349.

	Element ID	Length	ESS Detection Interval	URI
Octets:	1	1	1	1–253

Figure 8-349—Destination URI element format

The Element ID field is equal to the Destination URI value in Table 8-54.

The value of the Length field is 1 plus the length of the URI field.

The ESS Detection Interval field is defined in 8.4.2.73.2 and its use for Event and Diagnostic requests is described in 10.23.2 and 10.23.3.

The URI field specifies the destination URI for Event and Diagnostic reports using the format defined in IETF RFC 3986. The URI field value is limited to 253 octets.

The Destination URI element is included as the last element in an Event or Diagnostic Request frame.

The Destination URI element is included in Event Request frames, as described in 8.5.14.2, or Diagnostic Request frames, as described in 8.5.14.4.

Use of the Destination URI element in an Event Request frame is described in 10.23.2.1. Use of the Destination URI element in a Diagnostic Request frame is described in 10.23.3.1.

8.4.2.93 U-APSD Coexistence element

The U-APSD Coexistence provides the duration of requested transmission during a U-APSD service period. The format of the U-APSD Coexistence element is shown in Figure 8-350.

	Element ID	Length	TSF 0 Offset	Interval/ Duration	Optional Subelements
Octets:	1	1	8	4	variable

Figure 8-350—U-APSD Coexistence element format

The Element ID field is equal to the U-APSD Coexistence value in Table 8-54.

The value of the Length field is 12 plus the length of any additional subelements present.

A nonzero value of the TSF 0 Offset field is the number of microseconds since TSF time 0 when the non-AP STA knew the start of interference. The AP uses the TSF 0 Offset field together with the Interval/Duration field to enqueue frames for transmission to the non-AP STA using the procedures as described in 10.2.1.5.2.

A TSF 0 Offset field value of 0 indicates the non-AP STA requests the AP transmit frames to the non-AP STA using the procedure described in 10.2.1.5.2 for the case where TSF 0 Offset is equal to 0.

The Interval/Duration field is defined as follows:

- When the TSF 0 Offset is 0, the Interval/Duration field is the number of microseconds during the U-APSD service period when the AP transmits frames to the non-AP STA as described in 10.2.1.5.2.
- When the TSF 0 Offset is nonzero, the Interval/Duration field is the number of microseconds between the start of consecutive interference bursts.

The Interval/Duration field value of 0 is reserved.

The Optional Subelements field format contains zero or more subelements, each consisting of a 1-octet Subelement ID field, a 1-octet Length field and a variable-length Data field, as shown in Figure 8-402. The optional subelements are ordered by nondecreasing Subelement ID.

The Subelement ID field values for the defined optional subelements are shown in Table 8-173. A Yes in the Extensible column of a subelement listed in Table 8-173 indicates that the length of the subelement might be extended in future revisions or amendments of this standard. When the Extensible column of an element is Subelement, then the subelement might be extended in future revisions or amendments of this standard by defining additional subelements within the subelement. See 9.24.9.

Table 8-173—Optional Subelement IDs for U-APSD Coexistence

Subelement ID	Name	Length field (octets)	Extensible
0–220	Reserved		
221	Vendor Specific	1 to 239	
222–255	Reserved		

8.4.2.94 Interworking element

The Interworking element contains information about the interworking service capabilities of a STA as shown in Figure 8-351.

	Element ID	Length	Access Network Options	Venue Info (optional)	HESSID (optional)
Octets:	1	1	1	0 or 2	0 or 6

Figure 8-351—Interworking element format

The Length field is a 1-octet field whose value is 1 plus the sum of the lengths of each optional field present in the element.

The format of Access Network Options field is shown in Figure 8-352.

Bits:	B0 B3	B4	B5	B6	B7
	Access Network Type	Internet	ASRA	ESR	UESA

Figure 8-352—Access Network Options field format

A non-AP STA sets Internet, ASRA, ESR, and UESA fields to 0 when including the Interworking element in the Probe Request frame. A non-AP STA sets the Internet, ASRA and ESR bits to 0 when including the Interworking element in (Re)association Request frames. A mesh STA sets the Internet bit to 0 when including the Interworking element in Mesh Peering Open frames. In (Re)association Request frames, a non-AP STA sets the UESA bit according to the procedures in 10.3.5. The access network types are shown in Table 8-174. The Access Network Type field is set by the AP or the mesh STA to advertise its access network type to non-AP STAs. A non-AP STA uses this field to indicate the desired access network type in an active scan. See V.2 for informative text on usage of fields contained within the Interworking element.

Table 8-174—Access network type

Access network type	Meaning	Description
0	Private network	Nonauthorized users are not permitted on this network. Examples of this access network type are home networks and enterprise networks, which may employ user accounts. Private networks do not necessarily employ encryption.
1	Private network with guest access	Private network but guest accounts are available. Example of this access network type is enterprise network offering access to guest users.
2	Chargeable public network	The network is accessible to anyone, however, access to the network requires payment. Further information on types of charges may be available through other methods (e.g., IEEE 802.21, http/https redirect or DNS redirection). Examples of this access network type is a hotspot in a coffee shop offering internet access on a subscription basis or a hotel offering in-room internet access service for a fee.

Table 8-174—Access network type *(continued)*

Access network type	Meaning	Description
3	Free public network	The network is accessible to anyone and no charges apply for the network use. An example of this access network type is an airport hotspot or municipal network providing free service.
4	Personal device network	A network of personal devices. An example of this type of network is a camera attaching to a printer, thereby forming a network for the purpose of printing pictures.
5	Emergency services only network	A network dedicated and limited to accessing emergency services.
6 to 13	Reserved	Reserved
14	Test or experimental	The network is used for test or experimental purposes only.
15	Wildcard	Wildcard access network type

Bit 4 is the Internet field. The AP or mesh STA sets this field to 1 if the network provides connectivity to the Internet; otherwise it is set to 0 indicating that it is unspecified whether the network provides connectivity to the Internet.

Bit 5 is the Additional Step Required for Access (ASRA) field. It is set to 1 by the AP to indicate that the network requires a further step for access. It is set to 0 whenever dot11RSNAActivated is true. For more information, refer to Network Authentication Type Information in 8.4.4.6. For a mesh STA the ASRA field is used as an emergency indicator. If a mesh STA requires emergency services, the ASRA field is set to 1; otherwise it is set to 0. See 10.24.6.

Bit 6 is the ESR (emergency services reachable) field. It is set to 1 by the AP or mesh STA to indicate that emergency services are reachable through the AP or mesh STA; otherwise it is set to 0 indicating that it is unable to reach the emergency services. See 10.24.6.

Bit 7 is the UESA (unauthenticated emergency service accessible) field. When set to 0, this field indicates that no unauthenticated emergency services are reachable through this AP or mesh STA. When set to 1, this field indicates that higher layer unauthenticated emergency services are reachable through this AP or mesh STA. A STA uses the Interworking element with the UESA bit set to 1 to gain unauthenticated access to a BSS to access emergency services. A mesh STA uses the Interworking element with the UESA bit set to 1 to gain unauthenticated access to another mesh STA to access emergency services. See 10.3.5.

The Venue Info field is defined in 8.4.1.34.

The HESSID field, which is the identifier for a homogeneous ESS, specifies the value of HESSID; see 10.24.2. A STA uses this field to indicate the desired HESSID in an active scan per 10.1.4. The HESSID field for an AP is set to the value of dot11HESSID. This optional field is not used by mesh STAs.

8.4.2.95 Advertisement Protocol element

The Advertisement Protocol element contains information that identifies a particular advertisement protocol and its corresponding Advertisement Control. The Advertisement Protocol element format is shown in Figure 8-353.

	Element ID	Length	Advertisement Protocol Tuple # 1	...	Advertisement Protocol Tuple # n (optional)
Octets:	1	1	variable		variable

Figure 8-353—Advertisement Protocol element format

The Length field is a 1-octet field whose value is equal to the sum of the lengths of the Advertisement Protocol Tuple fields.

The format of Advertisement Protocol Tuple field is shown in Figure 8-354.

	Query Response Info	Advertisement Protocol ID
Octets:	1	variable

Figure 8-354—Advertisement Protocol Tuple field format

The format of Query Response Info field is shown in Figure 8-355.

Bits:	B0 B6	B7
	Query Response Length Limit	PAME-BI

Figure 8-355—Query Response Info field format

The Query Response Info field is defined as follows:

- The Query Response Length Limit indicates the maximum number of octets a STA will transmit in the Query Response field contained within one or more GAS Comeback Response frames. The Query Response Length Limit may be set to a value larger than the maximum MMPDU size in which case the Query Response spans multiple MMPDUs. The Query Response Length Limit is encoded as an integer number of 256 octet units. A value of 0 is not permitted. A value of 0x7F means the maximum limit enforced is determined by the maximum allowable number of fragments in the GAS Query Response Fragment ID (see 8.4.1.33). The requesting STA sets the Query Response Length Limit to 0 on transmission and the responding STA ignores it upon reception.
- Bit 7, the Preassociation Message Exchange BSSID Independent (PAME-BI) bit, is used by an AP to indicate whether the Advertisement Server, which is the non-AP STA's peer for this Advertisement Protocol, will return a Query Response that is independent of the BSSID used for the GAS frame exchange. This bit is set to 1 to indicate the Query Response is independent of the BSSID; it is set to 0 to indicate that the Query Response may be dependent on the BSSID. See 10.24.3.1 for further information. Bit 7 is reserved for non-AP STAs.

The Advertisement Protocol ID is a variable-length field. When this field contains a vendor-specific Advertisement Protocol ID, then this field will be structured per the Vendor Specific element defined in 8.4.2.28, where the Element ID of the Vendor Specific element of 8.4.2.28 is the first octet of the field and contains the vendor-specific value for Advertisement Protocol ID defined in Table 8-175; otherwise its length is 1 octet and its value is one of the values in Table 8-175. When one or more vendor-specific tuples are included in the Advertisement Protocol element, their total length needs to be constrained such that the total length of all the Advertisement Protocol Tuple fields (both vendor specific and otherwise) is less than or equal to 255 octets.

Table 8-175—Advertisement protocol ID definitions

Name	Value
Access Network Query Protocol (ANQP)	0
MIH Information Service	1
MIH Command and Event Services Capability Discovery	2
Emergency Alert System (EAS)	3
Reserved	4–220
Vendor Specific	221
Reserved	222–255

- ANQP supports information retrieval from an Advertisement Server. ANQP is a protocol used by a requesting STA to query another STA (i.e., the receiving STA might respond to queries with or without proxying the query to a server in an external network). See 10.24.3.2 for information on ANQP procedures.
- MIH Information Service is a service defined in IEEE Std 802.21-2008 to support information retrieval from an information repository.
- MIH Command and Event Services capability discovery is a mechanism defined in IEEE 802.21 (see IEEE Std 802.21-2008) to support discovering capabilities of command service and event service entities in a STA or an external network.
- The EAS allows a network to disseminate emergency alert notifications from an external network to non-AP STAs. EAS uses the message format as defined in OASIS EDXL.
- Advertisement Protocol ID 221 is reserved for Vendor Specific Advertisement Protocols. When the Advertisement Protocol ID is equal to 221, the format of the Advertisement Protocol ID subfield follows the format of the Vendor Specific element in 8.4.2.28.

8.4.2.96 Expedited Bandwidth Request element

The Expedited Bandwidth Request element is transmitted from a non-AP STA to an AP in an ADDTS Request frame containing a TSPEC element and provides usage information for the bandwidth request. The Expedited Bandwidth Request element format is shown in Figure 8-356.

	Element ID	Length	Precedence Level
Octets:	1	1	1

Figure 8-356—Expedited Bandwidth Request element format

The Length field is 1.

The Precedence Level field is provided in Table 8-176.

The precedence levels are derived from the 3rd Generation Partnership Project (3GPP) document 3GPP TS 22.067 [B3].

The first responders (public) in Table 8-176 are government agencies or entities acting on behalf of the government, and the first responders (private) are private entities, such as individuals or companies.

Table 8-176—Precedence Level field description

Precedence level value	Description
0–15	Reserved
16	Emergency call, defined in NENA 08-002 [B52]
17	First responder (public)
18	First responder (private)
19	MLPP Level A
20	MLPP Level B
21	MLPP Level 0
22	MLPP Level 1
23	MLPP Level 2
24	MLPP Level 3
25	MLPP Level 4
26–255	Reserved

8.4.2.97 QoS Map Set element

The QoS Map Set element is transmitted from an AP to a non-AP STA in a (Re)association Response frame or a QoS Map Configure frame and provides the mapping of higher layer quality-of-service constructs to User Priorities defined by transmission of Data frames in this standard. This element maps the higher layer priority from the DSCP field used with the Internet Protocol to User Priority as defined by this standard. The QoS Map Set element is shown in Figure 8-357.

	Element ID	Length	DSCP Exception #1 (optional)	...	DSCP Exception #n (optional)	UP 0 DSCP Range	UP 1 DSCP Range	UP 2 DSCP Range	...	UP 7 DSCP Range
Octets:	1	1	2		2	2	2	2		2

Figure 8-357—QoS Map Set element description

The Length field is set to 16+2×n, where n is the number of Exception fields in the QoS Map set.

DSCP Exception fields are optionally included in the QoS Map Set. If included, the QoS Map Set has a maximum of 21 DSCP Exception fields. The format of the exception field is shown in Figure 8-358.

	DSCP Value	User Priority
Octets:	1	1

Figure 8-358—DSCP Exception format

The DSCP value in the DSCP Exception field is in the range 0 to 63 inclusive, or 255; the User Priority value is between 0 and 7, inclusive.

— When a non-AP STA begins transmission of a Data frame containing the Internet Protocol, it matches the DSCP field in the IP header to the corresponding DSCP value contained in this element.

The non-AP STA will first attempt to match the DSCP value to a DSCP exception field and uses the UP from the corresponding UP in the same DSCP exception field if successful; if no match is found then the non-AP STA attempts to match the DSCP field to a UP n DSCP Range field, and uses the n as the UP if successful; and otherwise uses a UP of 0.

- Each DSCP Exception field has a unique DSCP Value.

	DSCP Low Value	DSCP High Value
Octets:	1	1

Figure 8-359—DSCP Range description

The QoS Map Set has a DSCP Range field corresponding to each of the 8 user priorities. The format of the range field is shown in Figure 8-359. The DSCP Range value is between 0 and 63 inclusive, or 255.

- The DSCP range for each user priority is nonoverlapping.
- The DSCP High Value is greater than or equal to the DSCP Low Value.
- If the DSCP Range high value and low value are both equal to 255, then the corresponding UP is not used.

8.4.2.98 Roaming Consortium element

The Roaming Consortium element contains information identifying the roaming consortium and/or SSP whose security credentials can be used to authenticate with the AP transmitting this element; see 10.24.8. The element's format is shown in Figure 8-360.

	Element ID	Length	Number of ANQP OIs	OI #1 and #2 Lengths	OI #1	OI #2 (optional)	OI #3 (optional)
Octets:	1	1	1	1	variable	variable	variable

Figure 8-360—Roaming Consortium element format

The Length field is a 1-octet field whose value is equal to 2 plus the sum of the number of octets in each OI field present.

The format of the Number of ANQP OIs field is a one-octet unsigned integer whose value is the number of additional roaming consortium organization identifiers (OIs) obtainable via ANQP. A value of 0 means that no additional OIs will be returned in response to an ANQP query for the Roaming Consortium list. A value of 255 means that 255 or more additional OIs are obtainable via ANQP.

The OI #1 and #2 Lengths field format is shown in Figure 8-361.

- The value of the OI #1 Length subfield is the length in octets of the OI #1 field.
- The value of the OI #2 Length subfield is the length in octets of the OI #2 field. If the OI #2 field is not present, the value of the OI #2 Length subfield is set to 0.

NOTE—When there are three OIs, the OI #3 Length is calculated by subtracting sum of 2 plus the value of the OI #1 Length subfield plus the value of the OI #2 Length subfield from the value of the Length field.

Bits:	B0 B3	B4 B7
	OI #1 Length	OI #2 Length

Figure 8-361—OI #1 and #2 Lengths field format

The OI field is defined in 8.4.1.31. Each OI identifies a roaming consortium (group of SSPs with inter-SSP roaming agreement) or a single SSP. The value of the OI(s) in this table are equal to the value of the first 3 OIs in the dot11RoamingConsortiumTable. If fewer than 3 values are defined in the dot11RoamingConsortiumTable, then only as many OIs as defined in the table are populated in this element. The values of the OIs in this element are equal to the values of the first OIs, up to 3, from the table.

8.4.2.99 Emergency Alert Identifier element

The Emergency Alert Identifier element provides a hash to identify instances of the active EAS messages that are currently available from the network. The hash allows the non-AP STA to assess whether an EAS message advertised by an AP has been previously received and therefore whether it is necessary to download from the network. The format of the Emergency Alert Identifier element is provided in Figure 8-362.

	Element ID	Length	Alert Identifier Hash
Octets:	1	1	8

Figure 8-362—Emergency Alert Identifier element format

The Length field is a 1-octet field whose value is equal to 8.

The Alert Identifier Hash (AIH) is an 8-octet field. It is a unique value used to indicate an instance of an EAS message. The value of this field is the hash produced by the HMAC-SHA1-64 hash algorithm operating on the EAS message.

AIH =HMAC-SHA1-64(“ES_ALERT”, Emergency_Alert_Message)

Where AIH is then truncated to the first 64 bits of this function.

Emergency_Alert_Message is the EAS message itself.

8.4.2.100 Mesh Configuration element

8.4.2.100.1 General

The Mesh Configuration element shown in Figure 8-363 is used to advertise mesh services. It is contained in Beacon frames and Probe Response frames transmitted by mesh STAs, and is also contained in Mesh Peering Open and Mesh Peering Confirm frames.

	Element ID	Length	Active Path Selection Protocol Identifier	Active Path Selection Metric Identifier	Congestion Control Mode Identifier	Synchronization Method Identifier	Authentication Protocol Identifier	Mesh Formation Info	Mesh Capability
Octets	1	1	1	1	1	1	1	1	1

Figure 8-363—Mesh Configuration element format

The Element ID field is set to the value given in Table 8-54 for this element.

The Length field is set to 7.

The remainder of the fields are described in the following subclauses.

8.4.2.100.2 Active Path Selection Protocol Identifier

The Active Path Selection Protocol Identifier field indicates the path selection protocol that is currently activated in the MBSS. Table 8-177 provides path selection protocol identifier values defined by this standard.

Table 8-177—Active Path Selection Protocol Identifier field values

Value	Meaning
0	Reserved
1	Hybrid wireless mesh protocol (default path selection protocol) defined in 13.10 (default path selection protocol)
2–254	Reserved
255	Vendor specific (The active path selection protocol is specified in a Vendor Specific element)

When the Active Path Selection Protocol Identifier field is 255, the active path selection protocol is specified by a Vendor Specific element that is present in the frame. The content of the Vendor Specific element is beyond the scope of this standard. (See 8.4.2.28.)

8.4.2.100.3 Active Path Selection Metric Identifier

The Active Path Selection Metric Identifier field indicates the path metric that is currently used by the active path selection protocol in the MBSS. Table 8-178 provides the path selection metric identifier values defined by this standard.

Table 8-178—Active Path Selection Metric Identifier field values

Value	Meaning
0	Reserved
1	Airtime link metric defined in 13.9 (default path selection metric)
2–254	Reserved
255	Vendor specific (The active metric is specified in a Vendor Specific element)

When the Active Path Selection Metric Identifier field is 255, the active path metric is specified by a Vendor Specific element that is present in the frame. The content of the Vendor Specific element is beyond the scope of this standard. (See 8.4.2.28.)

8.4.2.100.4 Congestion Control Mode Identifier

The Congestion Control Mode Identifier field indicates the congestion control protocol that is currently activated in the MBSS. Table 8-179 provides the congestion control mode identifier values defined by this standard.

Table 8-179—Congestion Control Mode Identifier field values

Value	Meaning
0	Congestion control is not activated (default congestion control mode)
1	Congestion control signaling protocol defined in 13.12.2
2–254	Reserved
255	Vendor specific (The active congestion control protocol is specified in a Vendor Specific element)

The congestion mode identifier value of 0 indicates the mesh STA has no active congestion control protocol, and is set as the default value for the congestion control mode identifier in the MBSS.

When the Congestion Control Mode Identifier field is 255, the active congestion control protocol is specified by a Vendor Specific element that is present in the frame. The content of the Vendor Specific element is beyond the scope of this standard. (See 8.4.2.28.)

8.4.2.100.5 Synchronization Method Identifier

The Synchronization Method Identifier field indicates the synchronization method that is currently activated in the MBSS. Table 8-180 provides the synchronization method identifier values defined by this standard.

Table 8-180—Synchronization Method Identifier field values

Value	Meaning
0	Reserved
1	Neighbor offset synchronization method defined in 13.13.2.2 (default synchronization method)
2–254	Reserved
255	Vendor specific (The active synchronization method is specified in a Vendor Specific element)

The neighbor offset synchronization method is defined as the default synchronization method among mesh STAs. The details of the neighbor offset synchronization method are described in 13.13.2.2.

When the Synchronization Method Identifier field is 255, the active synchronization method is specified by a Vendor Specific element that is present in the frame. The content of the Vendor Specific element is beyond the scope of this standard. (See 8.4.2.28.)

8.4.2.100.6 Authentication Protocol Identifier

The Authentication Protocol Identifier field indicates the type of authentication protocol that is currently used to secure the MBSS. Table 8-181 provides the authentication protocol identifier values defined by this standard.

Table 8-181—Authentication Protocol Identifier field values

Value	Meaning
0	No authentication method is required to establish mesh peerings within the MBSS
1	SAE defined in 11.3
2	IEEE 802.1X authentication
3–254	Reserved
255	Vendor specific (The active authentication protocol is specified in a Vendor Specific element)

When the Authentication Protocol Identifier field is 255, the active authentication protocol is specified by a Vendor Specific element that is present in the frame. The content of the Vendor Specific element is beyond the scope of this standard. (See 8.4.2.28.)

8.4.2.100.7 Mesh Formation Info

The format of the Mesh Formation Info field is shown in Figure 8-364.

	B0	B1 B6	B7
	Connected to Mesh Gate	Number of Peerings	Connected to AS
Bits:	1	6	1

Figure 8-364—Mesh Formation Info field

The Connected to Mesh Gate subfield is set to 1, if the mesh STA has a mesh path to a mesh gate that announces its presence using GANN elements, RANN elements, or PREQ elements, and set to 0 otherwise.

The Number of Peerings subfield contains an unsigned integer that indicates the number of mesh peerings currently maintained by the mesh STA or 63, whichever is smaller.

The Connected to AS subfield is set to 1 if the Authentication Protocol Identifier field in the Mesh Configuration element is set to 2 (indicating IEEE 802.1X authentication) and the mesh STA has an active connection to an AS.

NOTE—When an AS is collocated with an IEEE 802.1X authenticator an active connection is implicitly true.

8.4.2.100.8 Mesh Capability

The Mesh Capability field comprises a set of values indicating whether a mesh STA is a possible candidate for mesh peering establishment. The details of the Mesh Capability field are shown in Figure 8-365.

	B0	B1	B2	B3	B4	B5	B6	B7
	Accepting Additional Mesh Peerings	MCCA Supported	MCCA Enabled	Forwarding	MBCA Enabled	TBTT Adjusting	Mesh Power Save Level	Reserved
Bits:	1	1	1	1	1	1	1	1

Figure 8-365—Mesh Capability field

The Accepting Additional Mesh Peerings subfield is set to 1 if the mesh STA is willing to establish additional mesh peerings with other mesh STAs and set to 0 otherwise (i.e., the Accepting Additional Mesh Peerings subfield is set in accordance with dot11MeshAcceptingAdditionalPeerings). When the Mesh Configuration element is included in the Mesh Peering Open frame and in the Mesh Peering Confirm frame, the Accepting Additional Mesh Peerings subfield is set to 1.

The MCCA Supported subfield is set to 1 if the mesh STA implements MCCA and set to 0 otherwise (i.e., the MCCA Supported subfield is set in accordance with dot11MCCAImplemented).

The MCCA Enabled subfield is set to 1 if the mesh STA is using the MCCA and set to 0 otherwise (i.e., the MCCA Enabled subfield is set in accordance with dot11MCCAActivated).

The Forwarding subfield is set to 1 if the mesh STA forwards MSDUs and set to 0 otherwise (i.e., the Forwarding subfield is set in accordance with dot11MeshForwarding).

The MBCA Enabled subfield is set to 1 if the mesh STA is using MBCA, and is set to 0 otherwise (i.e., the MBCA Enabled subfield is set in accordance with dot11MBCAActivated). (See 13.13.4.)

The TBTT Adjusting subfield is set to 1 while the TBTT adjustment procedure is ongoing, and is set to 0 otherwise. (See 13.13.4.4.3.)

The Mesh Power Save Level subfield is set to 1 if at least one of the peer-specific mesh power modes is deep sleep mode and set to 0 otherwise. The Mesh Power Save Level subfield is reserved when the Power Management field in the Frame Control Field is set to 0. See 8.2.4.5.11.

8.4.2.101 Mesh ID element

The Mesh ID element is used to advertise the identification of an MBSS and is described in 13.2.2. The format of the Mesh ID element is shown in Figure 8-366. The Mesh ID element is transmitted in Mesh Peering Open frames, Mesh Peering Confirm frames, Mesh Peering Close frames, Beacon frames, and Probe Request and Response frames.

	Element ID	Length	Mesh ID
Octets:	1	1	0–32

Figure 8-366—Mesh ID element format

The Element ID field is set to the value given in Table 8-54 for this element.

The Length field is between 0 and 32 octets.

A Mesh ID field of length 0 indicates the wildcard Mesh ID, which is used within Probe Request frame.

Detailed usage of the Mesh ID element is described in 13.2.2.

8.4.2.102 Mesh Link Metric Report element

The Mesh Link Metric Report element is transmitted by a mesh STA to a neighbor peer mesh STA to indicate the quality of the link between the transmitting mesh STA and the neighbor peer mesh STA. The format of the Mesh Link Metric Report element is shown in Figure 8-367.

	Element ID	Length	Flags	Link Metric
Octets:	1	1	1	variable

Figure 8-367—Mesh Link Metric Report element format

The Element ID field is set to the value given in Table 8-54 for this element.

The Length field indicates the number of octets in the Information field (fields following the Element ID and Length fields).

The format of the Flags field is shown in Figure 8-368.

	B0	B1 B7
	Request	Reserved
Bits:	1	7

Figure 8-368—Flags field

The Flags field is set as follows:

- Bit 0: Request subfield (0 = not a request, 1 = link metric report request). A Request subfield equal to 1 indicates that the recipient of Mesh Link Metric Report element is requested to send a link metric report to the transmitter of the Mesh Link Metric Report element.
- Bit 1–7: Reserved.

The Link Metric field indicates the value of the link metric associated with the mesh link between the peer mesh STA transmitting the Mesh Link Metric Report and the neighbor mesh STA receiving the Mesh Link Metric Report. The length and the data type of the Link Metric field are determined by the active path selection metric identifier (see 8.4.2.100.3). The length and the data type for the airtime link metric are given in Table 13-5 in 13.9.

8.4.2.103 Congestion Notification element

The Congestion Notification element is used to indicate the congestion status of the mesh STA per mesh destination and AC, and the duration for which the STA expects the congestion to last. The format of the Congestion Notification element is shown in Figure 8-369. The Congestion Notification element is included in Congestion Control Notification frames, as described in 8.5.17.5.

	Element ID	Length	Destination Mesh STA Address	Congestion Notification Duration Timer (AC_BK)	Congestion Notification Duration Timer (AC_BE)	Congestion Notification Duration Timer (AC_VI)	Congestion Notification Duration Timer (AC_VO)
Octets:	1	1	6	2	2	2	2

Figure 8-369—Congestion Notification element format

The Element ID field is set to the value given in Table 8-54 for this element.

The Length field is set to 14.

The Destination Mesh STA Address field is represented as a 48-bit MAC address and is set to the address of the mesh destination for which the intra-mesh congestion control is applied. It is set to the broadcast address if the intra-mesh congestion control is applied to all destinations.

The element contains four Congestion Notification Duration fields for the four EDCA access categories to indicate the estimated congestion duration per AC at the mesh STA transmitting the congestion notification. The congestion notification duration values are encoded as unsigned integers in units of 100 µs.

8.4.2.104 Mesh Peering Management element

The Mesh Peering Management element is used to manage a mesh peering with a neighbor mesh STA. The format of the Mesh Peering Management element is shown in Figure 8-370.

	Element ID	Length	Mesh Peering Protocol Identifier	Local Link ID	Peer Link ID (conditional)	Reason Code (conditional)	Chosen PMK (optional)
Octets:	1	1	2	2	2	2	16

Figure 8-370—Mesh Peering Management element format

The Element ID field is set to the value given in Table 8-54 for this element.

The Length field is set to the number of octets in the Mesh Peering Management element following the Length field itself.

The Mesh Peering Protocol Identifier field indicates the type of mesh peering protocol that is currently used to establish mesh peerings. Table 8-182 provides the mesh peering protocol identifier values defined by this standard.

Table 8-182—Mesh Peering Protocol Identifier field values

Value	Meaning
0	Mesh peering management protocol
1	Authenticated mesh peering exchange protocol
2–254	Reserved
255	Vendor specific (The active mesh peering protocol is specified in a Vendor Specific element)

When the Mesh Peering Protocol Identifier field is 255, the active mesh peering protocol is specified by a Vendor Specific element that is present in the frame. The content of the Vendor Specific element is beyond the scope of this standard. (See 8.4.2.28.)

The Local Link ID field is the unsigned integer value generated by the local mesh STA to identify the mesh peering instance.

The conditional components of the Mesh Peering Management element are present depending on the Action field value of the frame in which the Mesh Peering Management element is conveyed.

The Peer Link ID field is the unsigned integer value generated by the peer mesh STA to identify the mesh peering instance. This field is not present for the Mesh Peering Open frame, is present for the Mesh Peering Confirm frame, and is optionally present for the Mesh Peering Close frame. The presence or absence of the Peer Link ID in a Mesh Peering Close is inferred by the Length field.

The Reason Code field enumerates reasons for sending a Mesh Peering Close. It is present for the Mesh Peering Close frame and is not present for Mesh Peering Open or Mesh Peering Confirm frames. The reason code is defined in 8.4.1.7.

The Chosen PMK field is present when dot11MeshSecurityActivated is true and a PMK is shared between the transmitter and receiver of the frame containing the element. It contains the PMKID that identifies the PMK used to protect the Mesh Peering Management frame.

Detailed usage of the Mesh Peering Management element is described in 13.3.6, 13.3.7, 13.3.8, and 13.5.5.

8.4.2.105 Mesh Channel Switch Parameters element

The Mesh Channel Switch Parameters element is used together with Channel Switch Announcement element and Extended Channel Switch Announcement element by a mesh STA in an MBSS to advertise to other mesh STAs when it is changing to a new operating channel and/or operating class. The format of the Mesh Channel Switch Parameters element is shown in Figure 8-371.

	Element ID	Length	Time To Live	Flags	Reason Code	Precedence Value
Octets:	1	1	1	1	2	2

Figure 8-371—Mesh Channel Switch Parameters element format

The Element ID field is set to the value given in Table 8-54 for this element.

The Length field is set to 6.

The Time To Live field is coded as an unsigned integer and indicates the remaining number of hops allowed for this element.

The Flags field indicates the attribute of this channel switch attempt. The format of the Flags field is shown in Figure 8-372.

	B0	B1	B2	B3 B7
	Transmit Restrict	Initiator	Reason	Reserved
Bits:	1	1	1	5

Figure 8-372—Flags field

The Transmit Restrict subfield is set to 1 when the mesh STA asks neighboring peer mesh STAs not to transmit further frames except frames containing Mesh Channel Switch Parameters element on the current channel until the scheduled channel switch. The Transmit Restrict subfield is set to 0 otherwise.

The Initiator subfield is set to 1 when the mesh STA initiates this channel switch attempt. The Initiator subfield is set to 0 when this channel switch attempt is initiated by another mesh STA and propagated by the current mesh STA.

The Reason subfield indicates the validity of the Reason Code field. It is set to 1 if the Reason Code field is valid, and is set to 0 otherwise. When the Reason subfield is 0, the content of the Reason Code field is reserved.

The Reason Code field specifies the reason for the mesh channel switch. The Reason Code is defined in 8.4.1.7. The content of the Reason Code field is valid only when Reason subfield of Flags field is set to 1, and is reserved otherwise.

The Precedence Value field is coded as unsigned integer and is set to a random value in the range 0 to 65535 determined by the initiator of this channel switch attempt.

The Mesh Channel Switch Parameters element is included in Channel Switch Announcement frames, as described in 8.5.2.6, and Extended Channel Switch Announcement frames, as described in 8.5.8.7. During MBSS Channel Switch, the Mesh Channel Switch Parameters element is included in Beacon frames, as described in 8.3.3.2, and Probe Response frames, as described in 8.3.3.10, until scheduled channel switch.

8.4.2.106 Mesh Awake Window element

The Mesh Awake Window element is present in DTIM Beacon frames and is optionally present in Beacon and Probe Response frames. The format of the Mesh Awake Window element is shown in Figure 8-373.

	Element ID	Length	Mesh Awake Window
Octets:	1	1	2

Figure 8-373—Mesh Awake Window element format

The Element ID field is set to the value given in Table 8-54 for this element.

The Length field is set to 2.

The Mesh Awake Window field is 2 octets long and contains an unsigned integer that indicates the duration of the mesh awake window in TUs.

8.4.2.107 Beacon Timing element

The Beacon Timing element is used to advertise the beacon timing information of neighbor STAs (mesh STAs, APs, or STAs in an IBSS). The format of the Beacon Timing element is shown in Figure 8-374.

	Element ID	Length	Report Control	Beacon Timing Information #1	...	Beacon Timing Information #N
Octets:	1	1	1	6	...	6

Figure 8-374—Beacon Timing element format

The Element ID field is set to the value given in Table 8-54 for this element.

The Length field indicates the number of octets in the Information field (fields following the Element ID and Length fields).

The Report Control field is used to signal information about the beacon timing information tuple contained in the Beacon Timing element. The structure of the Report Control field is defined in Figure 8-375.

	Status Number	Beacon Timing Element Number	More Beacon Timing Elements
Bits:	4	3	1

Figure 8-375—Report Control field

The Status Number subfield is set to the status number of the beacon timing information set. The status number is managed as described in 13.13.4.2.4.

The Beacon Timing Element Number subfield is an unsigned integer that indicates the index of the beacon timing information tuple contained in this Beacon Timing element. The Beacon Timing Element Number is set to 0 in the Beacon Timing element for the first or only tuple of the beacon timing information and is incremented by one for each successive tuple of the beacon timing information. The beacon timing information tuples are managed as described in 13.13.4.2.5.

The More Beacon Timing Element subfield is set to 1 if a successive tuple of beacon timing information exists, and set to 0 otherwise.

The Beacon Timing Information field contains the beacon timing information of a neighbor STA. When the mesh STA reports multiple beacon timing information, multiple Beacon Timing Information fields are included in the Beacon Timing element. The structure of the Beacon Timing Information field is defined in Figure 8-376.

	Neighbor STA ID	Neighbor TBTT	Neighbor Beacon Interval
Octets:	1	3	2

Figure 8-376—Beacon Timing Information field

The Neighbor STA ID subfield is an unsigned integer that indicates the identification of the neighbor STA corresponding to this beacon timing information. When a mesh peering is established with this neighbor STA, the MSB of this field is set to 0, and the rest of this field is set to the last 7 digits (7 LSBs) of the AID value assigned to this neighbor mesh STA. When a mesh peering is not established with this neighbor STA, the MSB of this field is set to 1, and the rest of this field is set to the last 7 digits (7 LSBs, taking the I/G bit as the MSB) of the 48-bit MAC address of this neighbor STA.

NOTE—Since the Neighbor STA ID subfield is provided in abbreviated form, it is possible that the same Neighbor STA ID value appears in multiple Beacon Timing Information fields.

The Neighbor TBTT subfield is an unsigned integer that indicates a TBTT of the corresponding neighbor STA, measured in the local TSF timer of the mesh STA. The value is indicated in multiples of 32 μs. When the active synchronization method is the neighbor offset synchronization method, the TBTT is calculated as described in 13.13.4.2.2. The B5 to the B28 (taking the B0 as the LSB) of the calculated TBTT are contained in this subfield.

The Neighbor Beacon Interval subfield is an unsigned integer that indicates the beacon interval being used by the corresponding neighbor STA. The unit of the Neighbor Beacon Interval subfield is TU.

Detailed usage of the Beacon Timing element is described in 13.13.4.2.

8.4.2.108 MCCAOP Setup Request element

8.4.2.108.1 General

The MCCAOP Setup Request element is used to make an MCCAOP reservation. This element is transmitted in individually addressed MCCA Setup Request frames or in group addressed MCCA Setup Request frames. The mesh STA transmitting the MCCA Setup Request element is the MCCAOP owner of the MCCAOPs that will be scheduled with this reservation setup request. The receivers of the MCCAOP Setup Request are the MCCAOP responders. The format of the element is shown in Figure 8-377.

	Element ID	Length	MCCAOP Reservation ID	MCCAOP Reservation
Octets	1	1	1	5

Figure 8-377—MCCAOP Setup Request element format

The Element ID field is set to the value given in Table 8-54 for this element.

The Length field is set to 6.

The MCCAOP Reservation ID field is an eight bit unsigned integer that represents the ID for the MCCAOP reservation. It is determined by the MCCAOP owner. When used in combination with the MAC address of the MCCAOP owner, the MCCAOP Reservation ID uniquely identifies the MCCAOP reservation. If this MCCAOP Setup Request is for an individually addressed transmission, the MCCAOP Reservation ID is between 0 and 127 and the MCCAOP Setup Request element is transmitted in an individually addressed frame to the intended responder. If this MCCAOP Setup Request is for a group addressed transmission, the MCCAOP Reservation ID is between 128 and 254 and the MCCAOP Setup Request element is transmitted in a group addressed frame. The value 255 is not used to identify a single MCCAOP reservation.

The MCCAOP Reservation field is described in 8.4.2.108.2.

8.4.2.108.2 MCCAOP Reservation field

The MCCAOP Reservation field is a 5 octet field specifying a schedule for frame transmissions called MCCAOPs. The MCCAOP Reservation field consists of three subfields and its format is shown in

Figure 8-378.

	MCCAOP Duration	MCCAOP Periodicity	MCCAOP Offset
Octets:	1	1	3

Figure 8-378—MCCAOP Reservation field

The MCCAOP Duration subfield is 1 octet in length and contains an unsigned integer. It specifies the duration of the MCCAOPs in multiples of 32 µs.

The MCCAOP Periodicity subfield is 1 octet in length and contains a positive integer. It specifies the number of MCCAOPs scheduled in each DTIM interval.

The MCCAOP Offset subfield is three octets in length and contains an unsigned integer. It specifies the beginning of the first MCCAOP in each DTIM interval. The value is specified in multiples of 32 µs. The sum of MCCAOP Offset plus MCCAOP Duration is constrained to be smaller than the duration of the DTIM interval divided by MCCAOP Periodicity.

8.4.2.109 MCCAOP Setup Reply element

The MCCAOP Setup Reply element is used to reply to an MCCAOP Setup Request. This element is transmitted in individually addressed MCCA Setup Reply frames. The mesh STA transmitting the MCCA Setup Reply element is the MCCAOP responder of the MCCAOPs scheduled in this reservation setup. The receiver of the MCCAOP Setup Reply is the MCCAOP owner. The format of the element is shown in Figure 8-379.

	Element ID	Length	MCCAOP Reservation ID	MCCA Reply Code	MCCAOP Reservation
Octets:	1	1	1	1	0 or 5

Figure 8-379—MCCAOP Setup Reply element format

The Element ID field is set to the value given in Table 8-54 for this element.

The Length field is set to 2 or 7 octets.

The MCCAOP Reservation ID field is an eight bit unsigned integer that represents the ID for the requested series of MCCAOPs. It is determined by the MCCAOP owner and copied from the MCCAOP Setup Request element. When used in combination with the MAC address of the MCCAOP owner, the MCCAOP Reservation ID uniquely identifies the MCCAOP reservation. If this MCCAOP Setup Request is for an individually addressed transmission, the MCCAOP Reservation ID is between 0 and 127. If this MCCAOP Setup Request is for a group addressed transmission, the MCCAOP Reservation ID is between 128 to 254. The value 255 is not used to identify a single MCCAOP reservation.

The MCCA Reply Code field is a 1 octet field that contains the reply code used in an MCCAOP Setup Reply element. The reply codes are defined in Table 8-183.

Table 8-183—MCCA Reply Code field values

MCCA reply code	Meaning
0	Accept
1	Reject: MCCAOP reservation conflict
2	Reject: MAF limit exceeded
3	Reject: MCCA track limit (dot11MCCAMaxTrackStates) exceeded
4–255	Reserved

The MCCAOP Reservation field includes an alternative to the MCCAOP reservation specified in the MCCAOP Setup Request message. Its format is described in 8.4.2.108.2. When the MCCA Reply Code is 1, the MCCAOP Reservation field might be present. When the MCCA Reply Code is set to other values, the MCCAOP Reservation field is not present.

8.4.2.110 MCCAOP Advertisement Overview element

The MCCAOP Advertisement Overview element is used by a mesh STA to advertise its MCCA Information and information about its MCCAOP Advertisement elements, representing its MCCAOP advertisement set, to its neighbors. This element is transmitted in MCCA Advertisement frames and optionally present in Beacon frames. The format of the MCCAOP Advertisement Overview element is shown in Figure 8-380.

	Element ID	Length	Advertisement Set Sequence Number	Flags	MCCA Access Fraction	MAF Limit	Advertisement Elements Bitmap
Octets	1	1	1	1	1	1	2

Figure 8-380—MCCAOP Advertisement Overview element format

The Element ID field is set to the value given in Table 8-54 for this element.

The Length field is set to 6.

The Advertisement Set Sequence Number field is 1 octet in length and is coded as an unsigned integer. It is set to the advertisement set sequence number of the current MCCAOP advertisement set. The Advertisement Set Sequence Number, together with the MAC address of the transmitter of the MCCAOP Advertisement Overview element, identifies an MCCAOP advertisement set and provides an identifier and a chronological order of different MCCAOP advertisement sets of the same mesh STA.

The format of the Flags field is shown in Figure 8-381.

	B0	B1 B7
	Accept Reservations	Reserved
Bits:	1	7

Figure 8-381—Flags field format

The Flags field is set as follows:

- — Bit 0: Accept Reservations subfield. The Accept Reservations subfield is set to 1 if the mesh STA accepts additional reservations. It is set to 0 otherwise.
- — Bit 1–7: Reserved

The MCCA Access Fraction field is an eight bit unsigned integer. The MCCA Access Fraction field is set to the current value of the MCCA access fraction at the mesh STA rounded down (Floor) to the nearest multiple of (1/255) of the DTIM interval length.

The MAF Limit field is an eight bit unsigned integer. The MAF Limit field is set to the maximum MCCA access fraction allowed at the mesh STA rounded down (Floor) to the nearest multiple of (1/255) of the DTIM interval length.

The Advertisement Elements Bitmap field is 2 octets in length and indicates the MCCAOP Advertisement elements that are part of this MCCAOP advertisement set. The Advertisement Elements Bitmap field is a bitmap. Bit *i* in this bitmap equals 1 if the MCCAOP Advertisement element with MCCAOP Advertisement Element Index equal to *i* is part of this MCCAOP advertisement set, and it equals 0 otherwise.

8.4.2.111 MCCAOP Advertisement element

8.4.2.111.1 General

The MCCAOP Advertisement element is used by a mesh STA to advertise MCCAOP reservations to its neighbors. This element is transmitted in MCCA Advertisement frames and optionally present in Beacon frames. The format of the element is shown in Figure 8-382.

	Element ID	Length	Advertisement Set Sequence Number	MCCAOP Advertisement Element Information	TX-RX Periods Report	Broadcast Periods Report	Interference Periods Report
Octets:	1	1	1	1	variable	variable	variable

Figure 8-382—MCCAOP Advertisement element format

The Element ID field is set to the value given in Table 8-54 for this element.

The Length field is set to 2 to 255 octets.

The Advertisement Set Sequence Number field is 1 octet in length and is coded as an unsigned integer. It is set to the advertisement set sequence number of the current MCCAOP advertisement set. The Advertisement Set Sequence Number, together with the MAC address of the transmitter of the MCCAOP Advertisement element, identifies an MCCAOP advertisement set and provides an identifier and a chronological order of different MCCAOP advertisement sets of the same mesh STA.

The MCCAOP Advertisement Element Information field is 1 octet in length. It is described in 8.4.2.111.2.

The TX-RX Periods Report field is a variable-length field that contains an MCCAOP Reservation Report field, as described in 8.4.2.111.3. This field is only present when the TX-RX Report Present subfield of the MCCAOP Advertisement Element Information field is equal to 1. The TX-RX Periods Report field is described in 9.20.3.7.2.

The Broadcast Periods Report field is a variable-length field that contains an MCCAOP Reservation Report field, as described in 8.4.2.111.3. This field is only present when the Broadcast Report Present subfield of the MCCAOP Advertisement Element Information field is equal to 1. The Broadcast Periods Report field is described in 9.20.3.7.2.

The Interference Periods Report field is a variable-length field that contains an MCCAOP Reservation Report field, as described in 8.4.2.111.3. This field is only present when the Interference Report Present subfield of the MCCAOP Advertisement Element Information field is equal to 1. The Interference Periods Report field is described in 9.20.3.7.2.

8.4.2.111.2 MCCAOP Advertisement Element Information field

The MCCA Information field is 1 octets in length and provides information on the MCCAOP reservations. The field consists of four subfields and its format is shown in Figure 8-383.

	B0 B3	B4	B5	B6	B7
	MCCAOP Advertisement Element Index	TX-RX Report Present	Broadcast Report Present	Interference Report Present	Reserved
Bits:	4	1	1	1	1

Figure 8-383—MCCAOP Advertisement Element Information field

The MCCAOP Advertisement Element Index subfield is a 4-bit unsigned integer. It identifies the MCCAOP Advertisement element.

The TX-RX Report Present subfield is 1 bit in length. It is set to 1 if the TX-RX Periods Report field is present in the MCCAOP Advertisement element and set to 0 if no TX-RX Periods Report field is present.

The Broadcast Report Present subfield is 1 bit in length. It is set to 1 if the Broadcast Periods Report field is present in the MCCAOP Advertisement element and set to 0 if no Broadcast Periods Report field is present.

The Interference Report Present subfield is 1 bit in length. It is set to 1 if the Interference Periods Report field is present in the MCCAOP Advertisement element and set to 0 if no Interference Periods Report field is present.

8.4.2.111.3 MCCAOP Reservation Report field

The MCCAOP Reservation Report field is of variable length and is used to report a number of MCCAOP reservations. The field consists of a variable number of subfields and its format is shown in Figure 8-384.

	Number of Reported MCCAOP Reservations	MCCAOP Reservation 1	...	MCCAOP Reservation n
Octets:	1	5		5

Figure 8-384—MCCAOP Reservation Report field

The Number of Reported MCCAOP reservations is a field of 1 octet with an unsigned integer that specifies the number, n, of MCCAOP Reservations reported in this MCCAOP Reservation Report field.

The MCCAOP Reservation 1 through MCCAOP Reservation n fields specify the MCCAOP reservations reported. Each MCCAOP Reservation field is 5 octets in length and its format is shown in Figure 8-378 in 8.4.2.108.2.

8.4.2.112 MCCAOP Teardown element

The MCCAOP Teardown element is used to announce the teardown of an MCCAOP reservation. The MCCAOP Teardown element is transmitted in individually addressed MCCA Teardown frames or in group addressed MCCA Teardown frames. Its format is shown in Figure 8-385.

	Element ID	Length	MCCAOP Reservation ID	MCCAOP Owner
Octets:	1	1	1	0 or 6

Figure 8-385—MCCAOP Teardown element format

The Element ID field is set to the value given in Table 8-54 for this element.

The Length field is variable and set to 1 or 7 octets.

An MCCAOP Teardown element is transmitted by either the MCCAOP owner or the MCCAOP responder of a MCCAOP reservation to tear down the MCCAOP reservation.

The MCCAOP Reservation ID field is an eight bit unsigned integer that represents the ID for the MCCAOP reservation.

The MCCAOP Owner field is an optional field. It is 6 octets long and indicates the 48-bit MAC address of the MCCAOP owner. This field is only included if the element is transmitted by the MCCAOP responder.

8.4.2.113 GANN element

The GANN (gate announcement) element is used for announcing the presence of a mesh gate in the MBSS. The GANN element is transmitted in a Gate Announcement frame (see 8.5.17.4). The format of the GANN element is shown in Figure 8-386.

	Element ID	Length	Flags	Hop Count	Element TTL	Mesh Gate Address	GANN Sequence Number	Interval
Octets:	1	1	1	1	1	6	4	2

Figure 8-386—GANN element format

The Element ID field is set to the value given in Table 8-54 for this element.

The Length field is set to 15.

The Flags field is reserved.

The Hop Count field is coded as an unsigned integer and indicates the number of hops from the originating mesh gate to the mesh STA transmitting this element.

The Element TTL field is coded as an unsigned integer and indicates the remaining number of hops allowed for this element.

The Mesh Gate Address field is represented as a 48-bit MAC address and is set to the MAC address of the mesh gate.

The GANN Sequence Number field is coded as an unsigned integer and is set to a GANN Sequence Number specific for the originating mesh gate.

The Interval field is coded as an unsigned integer and is set to the number of seconds between the periodic transmissions of Gate Announcements by the mesh gate.

Detailed usage of the GANN element is described in 13.11.2.

8.4.2.114 RANN element

The RANN (root announcement) element is used for announcing the presence of a mesh STA configured as root mesh STA with dot11MeshHWMProotMode set to rann (4). RANN elements are sent out periodically by such a root mesh STA. The RANN element is transmitted in an HWMP Mesh Path Selection frame (see 8.5.17.3). The format of the RANN element is shown in Figure 8-387.

	Element ID	Length	Flags	Hop Count	Element TTL	Root Mesh STA Address	HWMP Sequence Number	Interval	Metric
Octets:	1	1	1	1	1	6	4	4	4

Figure 8-387—RANN element format

The Element ID field is set to the value given in Table 8-54 for this element.

The Length field is set to 21.

The format of the Flags field is shown in Figure 8-388.

	B0	B1 B7
	Gate Announcement	Reserved
Bits:	1	7

Figure 8-388—Flags field format

The Flags field is set as follows:

- Bit 0: Gate Announcement subfield (0 = gate announcement protocol not activated, 1 = gate announcement protocol activated). A Gate Announcement subfield equal to 1 indicates that the Root Mesh STA Address is a mesh gate with dot11MeshGateAnnouncements equal to true.
- Bit 1–7: Reserved.

The Hop Count field is coded as an unsigned integer and indicates the number of hops from the originating root mesh STA to the mesh STA transmitting this element.

The Element TTL field is coded as an unsigned integer and indicates the remaining number of hops allowed for this element.

The Root Mesh STA Address field is represented as a 48-bit MAC address and is set to the MAC address of the root mesh STA.

The HWMP Sequence Number field is coded as an unsigned integer and is set to the HWMP sequence number (SN) specific to the root mesh STA.

The Interval field is coded as an unsigned integer and is set to the number of TUs between the periodic transmissions of Root Announcements.

The Metric field is set to the cumulative metric from the originating root mesh STA to the mesh STA transmitting the announcement.

Detailed usage of the RANN element is described in 13.10.12.

8.4.2.115 PREQ element

The PREQ (path request) element is used for discovering a path to one or more target mesh STAs, maintaining a path (optional), building a proactive (reverse) path selection tree to the root mesh STA, and confirming a path to a target mesh STA (optional). The PREQ element is transmitted in an HWMP Mesh Path Selection frame (see 8.5.17.3). The format of the PREQ element is shown in Figure 8-389.

	Element ID	Length	Flags	Hop Count	Element TTL	Path Discovery ID	Originator Mesh STA Address	Originator HWMP Sequence Number	Originator External Address	Lifetime
Octets:	1	1	1	1	1	4	6	4	0 or 6	4

Metric	Target Count	Per Target Flags #1	Target Address #1	Target HWMP Sequence Number #1	...	Per Target Flags #N	Target Address #N	Target HWMP Sequence Number #N
4	1	1	6	4	...	1	6	4

Figure 8-389—PREQ element format

The Element ID field is set to the value given in Table 8-54 for this element.

The Length field is set to 37 to 252 octets.

The format of the Flags field is shown in Figure 8-390.

	B0	B1	B2	B3 B5	B6	B7
	Gate Announcement	Addressing Mode	Proactive PREP	Reserved	AE	Reserved
Bits	1	1	1	3	1	1

Figure 8-390—Flags field format

The Flags field is set as follows:

- Bit 0: Gate Announcement subfield (0 = gate announcement protocol not activated, 1 = gate announcement protocol activated). A Gate Announcement subfield equal to 1 indicates that the Originator Mesh STA Address is a mesh gate with dot11MeshGateAnnouncements equal to true.
- Bit 1: Addressing Mode subfield (0 = group addressed, 1 = individually addressed). When the Addressing Mode subfield is 0, the PREQ element is sent in an HWMP Mesh Path Selection frame that is group addressed to all neighbor peer mesh STAs. When the Addressing Mode subfield is 1, the PREQ element is sent in an HWMP Mesh Path Selection frame that is individually addressed to a neighbor peer mesh STA. Detailed addressing information is provided in 13.10.7.
- Bit 2: Proactive PREP subfield (0 = off, 1 = on). The Proactive PREP subfield is only of relevance if the Target Address is the broadcast address (all ones). If equal to 1, every recipient of a PREQ with Target Address equal to the broadcast address replies with a PREP. If equal to 0, it will only reply under certain conditions (see 13.10.4.2).
- Bit 3–5: Reserved.
- Bit 6: AE (Address Extension) subfield (1= external address present, 0 = otherwise). An AE subfield equal to 1 indicates that the field Originator External Address is present, and that the originator mesh STA is a proxy for this external address.
- Bit 7: Reserved.

The Hop Count field is coded as an unsigned integer and is set to the number of hops from the originator to the mesh STA transmitting this element.

The Element TTL field is coded as an unsigned integer and indicates the remaining number of hops allowed for this element.

The Path Discovery ID field is coded as an unsigned integer and is set to some unique ID for this PathDiscovery.

The Originator Mesh STA Address field is represented as a 48-bit MAC address and is set to the originator MAC address.

The Originator HWMP Sequence Number field is coded as an unsigned integer and is set to the HWMP SN specific to the originator.

The Originator External Address field is the MAC address of an external STA proxied by the Originator. This field is only present if the AE subfield in the Flags field is set to 1 and is represented as a 48-bit MAC address.

The Lifetime field is coded as an unsigned integer and is set to the time for which mesh STAs receiving the PREQ consider the forwarding information to be valid. The lifetime is measured in TUs.

The Metric field is set to the cumulative metric from the originator to the mesh STA transmitting the PREQ.

The Target Count N field is coded as an unsigned integer and gives the number of targets (N) contained in this PREQ. The maximum value of N is 20. The Per Target Flags field, the Target Address field, and the Target HWMP Sequence Number field are repeated N times in the element.

The format of the Per Target Flags field is shown in Figure 8-391.

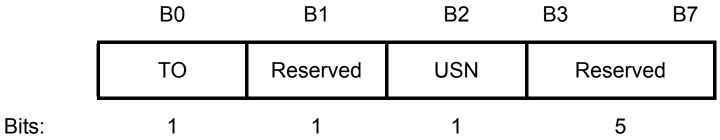

Figure 8-391—Per Target Flags field format

The Per Target Flags field is set as follows:

- Bit 0: TO (Target Only) subfield: The TO subfield defines which mesh STA responds with a PREP element to the PREQ element containing an individual target address. If TO = 1, only the target mesh STA responds with an individually addressed PREP. If TO = 0, intermediate mesh STAs with active forwarding information to the target mesh STA also respond.
- Bit 1: Reserved.
- Bit 2: USN (Unknown Target HWMP Sequence Number) subfield: The USN subfield indicates whether the Target HWMP Sequence Number field of the corresponding target is interpreted as HWMP SN (USN = 0) or not (USN = 1), the latter meaning that a target HWMP SN is unknown at the originator mesh STA.
- Bit 3–7: Reserved.

The Target Address field is represented as a 48-bit MAC address.

The Target HWMP Sequence Number field is coded as an unsigned integer and is the latest known HWMP SN received in the past by the originator mesh STA for any path towards the target. If such a target HWMP SN is not known, the USN subfield is set to 1 and Target HWMP Sequence Number field is reserved.

Detailed usage of the PREQ element is described in 13.10.9.

8.4.2.116 PREP element

The PREP (path reply) element is used to establish a forward path to a target and to confirm that a target is reachable. The PREP is issued in response to a PREQ. The PREP element is transmitted in an HWMP Mesh Path Selection frame (see 8.5.17.3). The format of the PREP element is shown in Figure 8-392.

	Element ID	Length	Flags	Hop Count	Element TTL	Target Mesh STA Address	Target HWMP Sequence Number	Target External Address	Lifetime	Metric	Originator Mesh STA Address	Originator HWMP Sequence Number
Octets:	1	1	1	1	1	6	4	0 or 6	4	4	6	4

Figure 8-392—PREP element format

The Element ID field is set to the value given in Table 8-54 for this element.

The Length field is set to 31 or 37 octets.

The format of the Flags field is shown in Figure 8-393.

	B0 B5	B6	B7
	Reserved	AE	Reserved
Bits:	6	1	1

Figure 8-393—Flags field format

The Flags field is set as follows:

- Bit 0–5: Reserved.
- Bit 6: AE (Address Extension) subfield (1 = external address present, 0 = otherwise). An AE subfield equal to 1 indicates that the field Target External Address is present, and that the target mesh STA is a proxy for this external address.
- Bit 7: Reserved.

The Hop Count field is coded as an unsigned integer and is set to the number of hops from the path target to the mesh STA transmitting this element.

The Element TTL field is coded as an unsigned integer and indicates the remaining number of hops allowed for this element.

The Target Mesh STA Address is the MAC address of the target mesh STA or target proxy mesh gate and is represented as a 48-bit MAC address.

The Target HWMP Sequence Number field is coded as an unsigned integer and is set to the HWMP SN of the target mesh STA (if the AE subfield in the Flags field is set to 0) or target proxy mesh gate (if the AE subfield in the Flags field is set to 1).

The Target External Address field is set to the external address on behalf of which the PREP is sent. This field is present only if Bit 6 (AE subfield) in Flags field equals 1 and is represented as a 48-bit MAC address.

The Lifetime field is coded as an unsigned integer and is set to the time for which mesh STAs receiving the PREP consider the forwarding information to be valid. The lifetime is measured in TUs.

The Metric field indicates the cumulative metric from the path target to the mesh STA transmitting this element.

The Originator Mesh STA Address field is represented as a 48-bit MAC address and is set to the MAC address of the originator, which is contained in the PREQ.

The Originator HWMP Sequence Number field is coded as an unsigned integer and is set to the HWMP SN of the originator mesh STA contained in the PREQ.

The detailed usage of the PREP element is described in 13.10.10.

8.4.2.117 PERR element

The PERR (path error) element is used for announcing an unreachable destination. The PERR element is transmitted in an HWMP Mesh Path Selection frame (see 8.5.17.3). The format of the PERR element is shown in Figure 8-394.

	Element ID	Length	Element TTL	Number of Destinations N	Flags #1	Destination Address #1	HWMP Sequence Number #1	Destination External Address #1	Reason Code #1	...
Octets:	1	1	1	1	1	6	4	0 or 6	2	

Figure 8-394—PERR element format

The Element ID field is set to the value given in Table 8-54 for this element.

The Length field is variable and set to (2 + 13 × Number of Destinations) or to (2 + 19 × Number of Destinations) octets.

The Element TTL field is coded as an unsigned integer and indicates the remaining number of hops allowed for this element.

The Number of Destinations N field is coded as an unsigned integer and indicates the number of announced destinations in PERR. The maximum value of N is 19. The Flags field, the Destination Address field, the HWMP Sequence Number field, the Destination External Address field, and the Reason Code field are repeated N times in the element.

The format of the Flags field is shown in Figure 8-395.

	B0 B5	B6	B7
	Reserved	AE	Reserved
Bits:	4	1	1

Figure 8-395—Flags field format

The Flags field is set as follows:

— Bit 0–5: Reserved.

— Bit 6: AE (Address Extension) subfield (1 = destination external address is present, 0 = otherwise).

— Bit 7: Reserved.

The Destination Address field is represented as a 48-bit MAC address and indicates the detected unreachable destination MAC address.

The HWMP Sequence Number field is coded as an unsigned integer and indicates the HWMP SN for the invalidated destination, if applicable. Otherwise, the HWMP Sequence Number field is reserved depending on the reason code.

The Destination External Address field is set to the external address, on behalf of which the PERR is sent. This field is present only if Bit 6 (AE subfield) in the Flags field equals 1 and is represented as a 48-bit MAC address.

The Reason Code field specifies the reason for sending a PERR element. The Reason Code is defined in 8.4.1.7.

The detailed usage of the PERR element is described in 13.10.11.

8.4.2.118 PXU element

The PXU (proxy update) element is used to inform the destination mesh STA of the proxy information at the originator mesh STA. The PXU element is transmitted in a Proxy Update frame (see 8.5.18.2). The format of the PXU element is shown in Figure 8-396.

	Element ID	Length	PXU ID	PXU Originator MAC Address	Number of Proxy Information (N)	Proxy Information #1	...	Proxy Information #N
Octets:	1	1	1	6	1	11, 15, 17, or 21		11, 15, 17, or 21

Figure 8-396—PXU element format

The Element ID field is set to the value given in Table 8-54 for this element.

The Length field is set to 8 + length of N Proxy Information fields.

The PXU ID field is coded as an unsigned integer and is set to the sequence number of the PXU. The source mesh STA sets the PXU ID field in the PXU element to a value from a single modulo-256 counter that is incremented by 1 for each new PXU element.

The PXU Originator MAC Address field is represented as a 48-bit MAC address and is the MAC address of the mesh STA that originates this PXU element.

The Number of Proxy Information fields is coded as an unsigned integer and is set to the number N of Proxy Information field that follow this field and that are reported to the destination mesh STA. The maximum value of N is 22.

The Proxy Information field contains a single proxy information (see 13.11.4.2). The length of the Proxy Information field depends on the settings of the subfields in the Flags subfield and is 11, 15, 17, or 21 octets.

The format of the Proxy Information field is defined in Figure 8-397.

	Flags	External MAC Address	Proxy Information Sequence Number	Proxy MAC Address	Proxy Information Lifetime
Octets:	1	6	4	0 or 6	0 or 4

Figure 8-397—Proxy Information field

The format of the Flags subfield is shown in Figure 8-398.

	B0	B1	B2	B3 B7
	Delete	Originator Is Proxy	Lifetime	Reserved
Bits:	1	1	1	5

Figure 8-398—Flags subfield

The Flags subfield is set as follows:

- Bit 0: The Delete subfield indicates whether this proxy information is to be deleted. It is set to 1 if the proxy information is to be deleted, and set to 0 otherwise.
- Bit 1: The Originator Is Proxy subfield indicates that the originator mesh STA of the PXU element is the proxy mesh gate of this proxy information when set to 1. In this case, there is no Proxy MAC Address subfield present in this Proxy Information field. When the Originator Is Proxy subfield is 0, the Proxy MAC Address subfield is present in this Proxy Information field.
- Bit 2: The Lifetime subfield indicates that the Proxy Information Lifetime subfield is present in this Proxy Information field when set to 1.
- Bit 3–7: Reserved.

The External MAC Address subfield is represented as a 48-bit MAC address and is the MAC address of the external STA proxied by the proxy mesh gate.

The Proxy Information Sequence Number field is coded as an unsigned integer and is set to the sequence number of the proxy information. The sequence number of the proxy information defines a chronological order of the proxy information for the external STA at this proxy mesh gate.

The Proxy MAC Address subfield is represented as a 48-bit MAC address and is set to the MAC address of proxy mesh gate. It is only present if the Originator Is Proxy subfield of the Flags subfield is 0.

The Proxy Information Lifetime subfield is coded as an unsigned integer and is set to the time for which the mesh STA receiving this PXU considers this proxy information to be valid. The proxy information lifetime is measured in TUs. It is only present if the Lifetime subfield of the Flags subfield is 1.

8.4.2.119 PXUC element

The PXUC (proxy update confirmation) element is used to confirm the previously received PXU. The PXUC element is transmitted in a Proxy Update Confirmation frame (see 8.5.18.3). The format of PXUC element is shown in Figure 8-399.

	Element ID	Length	PXU ID	PXU Recipient MAC Address
Octets	1	1	1	6

Figure 8-399—PXUC element format

The Element ID field is set to the value given in Table 8-54 for this element.

The Length field is set to 7.

The PXU ID field is coded as an unsigned integer and is the PXU ID of the received PXU that is being confirmed.

The PXU Recipient MAC Address is represented as a 48-bit MAC address and is set to the MAC address of the recipient of the PXU, i.e., the originator of the PXUC element.

8.4.2.120 Authenticated Mesh Peering Exchange element

The Authenticated Mesh Peering Exchange element includes information needed to perform the authentication sequence during an authenticated mesh peering exchange. This element is shown in Figure 8-400.

	Element ID	Length	Selected Pairwise Cipher Suite	Local Nonce	Peer Nonce	Key Replay Counter	GTKdata	IGTKdata (optional)
Octets	1	1	4	32	32	8	variable	variable

Figure 8-400—Authenticated Mesh Peering Exchange element format

The Element ID field is set to the value given in Table 8-54 for this element.

The Length field is variable and indicates the number of octets in the information field (fields following the Element ID and Length fields).

The Selected Pairwise Cipher Suite field contains a pairwise cipher suite selector, as defined in 8.4.2.27.2, indicating a cipher suite to be used to secure the link.

The Local Nonce field contains a nonce value chosen by the mesh STA that is sending the element. It is encoded following the conventions from 8.2.2.

The Peer Nonce field contains a nonce value that was chosen by the peer mesh STA or candidate peer mesh STA to which the element is being sent. It is encoded following the conventions from 8.2.2.

The Key Replay Counter field is optional. It is only used for the Mesh Group Key Inform frame (see 13.6.3) and the Mesh Group Key Acknowledge frame (see 13.6.4). It is represented as an unsigned binary number.

The GTKdata field is optional. When present, it contains the bit string of {GTK || Key RSC || GTKExpirationTime} as the GTK data material. When present, the GTKdata field is protected by the exchange in which it is contained (see 13.5). The Key RSC denotes the last frame sequence number sent using the GTK and is specified in Table 11-5 of 11.6.2. GTKExpirationTime denotes the key lifetime of the GTK in seconds and the format is specified in Figure 11-36 of 11.6.2.

The IGTKdata field is present when dot11RSNAProtectedManagementFramesActivated equals true. When present, it contains the KeyID, IPN and IGTK used with BIP for management frame protection. The format of the IGTKdata field is specified in Figure 11-38 of 11.6.2.

Detailed usage of the Authenticated Mesh Peering Exchange element is described in 13.5.5 and in 13.6.

8.4.2.121 MIC element

The MIC element provides message integrity to Mesh Peering Management frames. The format of the MIC element is shown in Figure 8-401.

	Element ID	Length	MIC
Octets:	1	1	16

Figure 8-401—MIC element format

The Element ID field is set to the value given in Table 8-54 for this element.

The Length field is set to 16.

The MIC field contains a message integrity code calculated over the Mesh Peering Management frame (as specified in 13.5) and the mesh group key handshake frame (as specified in 13.6).

8.4.3 Information Subelements

Subelements are defined to have a common general format consisting of a 1-octet element-specific Subelement ID field, a 1-octet Length field, and a variable-length subelement-specific Data field. Each subelement is assigned a subelement ID that is unique within the containing element or subelement. The Length field specifies the number of octets in the Data field. See Figure 8-402. Subelements are ordered by nondecreasing Subelement ID. See 9.24.9.

	Subelement ID	Length	Data
Octets:	1	1	Variable

Figure 8-402—Subelement format

8.4.4 Access Network Query Protocol (ANQP) elements

8.4.4.1 General

ANQP-elements are defined to have a common format consisting of a 2-octet Info ID field (information identifier), a 2-octet Length field, and a variable-length element-specific Information field. Each element is assigned a unique Info ID as defined in this standard. The ANQP-element format is shown in Figure 8-403. See V.2 for informative text on ANQP usage.

	Info ID	Length	Information
Octets:	2	2	variable

Figure 8-403—ANQP-element format

Each ANQP-element in 8.4.4 is assigned a unique 2-octet Info ID. The set of valid Info IDs are defined in Table 8-184. The 2-octet Info ID field is encoded following the conventions given in 8.2.2.

Table 8-184—ANQP-element definitions

ANQP-element name	InfoID	ANQP-element (subclause)
Reserved	0–255	n/a
Query List	256	8.4.4.2
Capability List	257	8.4.4.3
Venue Name	258	8.4.4.4
Emergency Call Number	259	8.4.4.5
Network Authentication Type	260	8.4.4.6
Roaming Consortium	261	8.4.4.7
IP Address Type Availability	262	8.4.4.9
NAI Realm	263	8.4.4.10
3GPP Cellular Network	264	8.4.4.11
AP Geospatial Location	265	8.4.4.12
AP Civic Location	266	8.4.4.13
AP Location Public Identifier URI	267	8.4.4.14
Domain Name	268	8.4.4.15
Emergency Alert Identifier URI	269	8.4.4.16
TDLS Capability	270	8.4.4.18
Emergency NAI	271	8.4.4.17
Neighbor Report	272	8.4.4.19
Reserved	273– 56796	n/a
Vendor Specific	56797	8.4.4.8
Reserved	56798–65535	n/a

The Length field specifies the number of octets in the Information field and is encoded following the conventions given in 8.2.2.

The ANQP-elements that may be configured are shown in Table 8-184. If information is not configured for a particular ANQP-element, then a query for that element will return that element with all optional fields not present.

8.4.4.2 Query List ANQP-element

The Query List ANQP-element provides a list of identifiers of ANQP-elements for which the requesting STA is querying. Each ANQP-element may be returned in response to an Query List ANQP-element using the procedures in 10.24.3.2.2).

The format of the Query List ANQP-element is provided in Figure 8-404.

	Info ID	Length	ANQP Query ID #1	…	ANQP Query ID #N (optional)
Octets:	2	2	2	…	0 or 2

Figure 8-404—Query List ANQP-element format

The Info ID field is a 2-octet field whose value is drawn from Table 8-184 corresponding to the Query List ANQP-element.

The Length field is a 2-octet field whose value is set to 2 times the number of ANQP Query ID fields.

Each ANQP Query ID field value is an Info ID drawn from Table 8-184. Including an Info ID in the Query List ANQP-element declares that the STA performing the ANQP query is requesting the ANQP-element corresponding to that Info ID be returned in the ANQP query response. The Info IDs included in the Query List ANQP-element are ordered by monotonically increasing Info ID value. The ANQP query response is defined in 10.24.3.2.1.

8.4.4.3 Capability List ANQP-element

The Capability List ANQP-element provides a list of information/capabilities that has been configured on a STA. The Capability List ANQP-element is returned in response to a Query List ANQP-element containing the Info ID of the Capabililty List ANQP-element.

The format of the Capability List ANQP-element is provided in Figure 8-405.

	Info ID	Length	ANQP Capability #1	…	ANQP Capability #N (optional)	Vendor Specific ANQP-element #1 (optional)	…	Vendor Specific ANQP-element #N (optional)
Octets:	2	2	2	…	0 or 2	variable	…	variable

Figure 8-405—Capability List ANQP-element format

The Info ID field is a 2-octet field whose value is drawn from Table 8-184 corresponding to the Capability List ANQP-element.

The Length field is a 2-octet field whose value is set to 2 times the number of ANQP Capability fields following the Length field plus the sum of the lengths of the Vendor Specific ANQP-elements.

Each ANQP Capability field value is an Info ID drawn from Table 8-184. If included in the Capability List ANQP-element, it declares that a Query List ANQP-element including that Info ID will return the requested ANQP-element. The Info ID for Capability List ANQP-element is always included in the Capability List ANQP-element returned in a GAS Query Response. The list does not include any duplicate Info IDs, except possibly the Info ID for the Vendor Specific ANQP-element. The Info IDs returned in the Capability List ANQP-element are ordered by nondecreasing Info ID value.

The Vendor Specific ANQP-element is defined in 8.4.4.8. The Vendor Specific ANQP-element is structured such that the first 2 octets of the Vendor Specific ANQP-element is the Info ID whose value corresponds to the Vendor Specific ANQP-element (see Table 8-184). When a Vendor Specific ANQP-element is present in the Capability List ANQP-element, the Vendor Specific ANQP-element element contains the capabilities of that vendor-specific query protocol.

8.4.4.4 Venue Name ANQP-element

The Venue Name ANQP-element provides zero or more venue names associated with the BSS. The format of the Venue Name ANQP-element is shown in Figure 8-406. The Venue Name ANQP-element may be used to provide additional metadata on the BSS. For example, the information may be used to assist a user in selecting the appropriate BSS with which to associate. Zero or more Venue Name fields may be included in the same or different languages.

	Info ID	Length	Venue Info	Venue Name Duple #1 (optional)	…	Venue Name Duple #N (optional)
Octets:	2	2	2	variable	…	variable

Figure 8-406—Venue Name ANQP-element format

The Info ID field is equal to the value in Table 8-184 corresponding to the Venue Name ANQP-element.

The Length field is a 2-octet field whose value is set to two plus the total length of the Venue Name Duple fields.

The Venue Info field is a 2-octet field and is defined in 8.4.1.34.

The format of the Venue Name Duple field is shown in Figure 8-407.

	Length	Language Code	Venue Name
Octets:	1	3	variable

Figure 8-407—Venue Name Duple field

— The Length field is a 1-octet field whose value is equal to 3 plus the number of octets in the Venue Name field.

— The Language Code is a 3-octet ISO-14962-1997 [B45] encoded string field that defines the language used in the Venue Name field. The Language Code field is a two or three character language code selected from ISO-639 [B44]. A two character language code has 0 (“null” in ISO-14962-1997) appended to make it 3 octets in length.

— The Venue Name is a variable-length UTF-8 formatted field containing the venue's name. The maximum length of this field is 252 octets. UTF-8 format is defined in IETF RFC 3629.

8.4.4.5 Emergency Call Number ANQP-element

The Emergency Call Number ANQP-element provides a list of emergency phone numbers to an emergency responder, such as directed by a public safety answering point (PSAP), that is used in the geographic location of the STA. The format of the Emergency Call Number ANQP-element is provided in Figure 8-408.

	Info ID	Length	Emergency Call Number Unit #1 (optional)	…	Emergency Call Number Unit #N (optional)
Octets:	2	2	variable	…	variable

Figure 8-408—Emergency Call Number ANQP-element format

The Info ID field is equal to the value in Table 8-184 corresponding to the Emergency Call Number ANQP-element.

The Length field is a 2-octet field whose value is set to the total length of the Emergency Call Number Unit fields.

Each Emergency Call Number Unit field has the structure shown in Figure 8-409.

	Length of Emergency Call Number	Emergency Call Number
Octets:	1	variable

Figure 8-409—Emergency Call Number Unit field format

The Length of Emergency Call Number field is a 1-octet field whose value is set to the length of the Emergency Call Number field.

The Emergency Call Number field is a variable-length UTF-8 formatted field containing information, used to reach emergency services, from the network (e.g., dialed digits, emergency service URN label [B41]). UTF-8 format is defined in IETF RFC 3629.

8.4.4.6 Network Authentication Type ANQP-element

The Network Authentication Type ANQP-element provides a list of authentication types when ASRA is set to 1. The format of the Network Authentication Type ANQP-element is shown in Figure 8-410.

	Info ID	Length	Network Authentication Type Unit #1 (optional)	…	Network Authentication Type Unit #N (optional)
Octets:	2	2	variable	…	variable

Figure 8-410—Network Authentication Type ANQP-element format

The Info ID field is equal to the value in Table 8-184 corresponding to the Network Authentication Type ANQP-element.

The Length field is a 2-octet field whose value is set to the total length of the Network Authentication Type Units fields.

Each Network Authentication Type Unit has the structure shown in Figure 8-411.

	Network Authentication Type Indicator	Redirect URL Length	Redirect URL (optional)
Octets:	1	2	variable

Figure 8-411—Network Authentication Type Unit field format

The Network Authentication Type Indicator field is a 1-octet field and has one of the values shown in Table 8-185.

Table 8-185—Network Authentication Type Indicator definitions

Value	Meaning
0	Acceptance of terms and conditions
1	On-line enrollment supported
2	http/https redirection
3	DNS redirection
4–255	Reserved

Each Network Authentication Type Indicator defines additional information that may be communicated.

If the Network Authentication Type Indicator is 0, the network requires the user to accept terms and conditions. The Redirect URL can be used by the non-AP STA to obtain the terms and conditions. If the Redirect URL is not present, then, the Redirect URL Length is set to 0.

If the Network Authentication Type Indicator is 1, the network supports on-line enrollment. Higher layer protocols on the non-AP STA may indicate to the user that accounts may be created. When the Network Authentication Type Indicator is 1, the Redirect URL Length is set to 0 and the Redirect URL is not present.

If the Network Authentication Type Indicator is 2, the network infrastructure performs http/https redirect. The ReDirect URL is used by the non-AP STA to perform additional steps required for network access.

If the Network Authentication Type Indicator is 3, the network supports DNS redirection. Higher layer software on the non-AP STA will exchange credentials with the network, the Redirect URL Length is set to 0 and the Redirect URL is not present.

The Redirect URL Length field is a 2-octet field whose value is the length of the Redirect URL. The value of the Redirect URL Length field is set to 0 whenever the Redirect URL is not present.

The Redirect URL field is a variable-length field that is optionally included if the Network Authentication Type Indicator is either 0 or 2. If the Network Authentication Type Indicator is other than 0 or 2, a Redirect URL is not included. The URL is formatted in accordance with IETF RFC 3986.

8.4.4.7 Roaming Consortium ANQP-element

The Roaming Consortium ANQP-element provides a list of information about the Roaming Consortium and/or SSPs whose networks are accessible via this AP. This list may be returned in response to a GAS Query using procedures in 10.24.3.2.3. The format of the Roaming Consortium ANQP-element is provided in Figure 8-412.

	Info ID	Length	OI Duple #1 (optional)	…	OI Duple #N (optional)
Octets:	2	2	variable		variable

Figure 8-412—Roaming Consortium ANQP-element format

The Info ID field is equal to the value in Table 8-184 corresponding to the Roaming Consortium ANQP-element.

The Length field is a 2-octet field whose value is set to the total length of the OI Duple fields.

OIs contained within the Roaming Consortium element (see 8.4.2.98) are also included in this ANQP-element. The value of the OI subfield(s) in this ANQP-element are equal to the values of the OI(s) in the dot11RoamingConsortiumTable.

The format of the OI Duple field is provided in Figure 8-413.

- The value of the OI Length field is equal to the number of octets in the OI field.
- The OI field is defined in 8.4.1.31. Each OI identifies a roaming consortium (group of SSPs with inter-SSP roaming agreement) or a single SSP.

	OI Length	OI
Octets:	1	variable

Figure 8-413—OI Duple field format

8.4.4.8 Vendor Specific ANQP-element

The Vendor Specific ANQP-element is used to query for information not defined in this standard within a single defined format, so that reserved Info IDs are not usurped for nonstandard purposes and interoperability is more easily achieved in the presence of nonstandard information. The ANQP-element is in the format shown in Figure 8-414.

	Info ID	Length	OI	Vendor Specific Content
Octets:	2	2	variable	variable

Figure 8-414—Vendor Specific ANQP-element format

The Info ID field is equal to the value in Table 8-184 corresponding to the Vendor Specific ANQP-element.

The Length field is a 2-octet field whose value is set to the length of the OI field plus the length of the Vendor Specific Content field.

The OI field is defined in 8.4.1.31.

The Vendor Specific Content field is a variable-length field whose content is defined by the entity identified in the OI field.

8.4.4.9 IP Address Type Availability ANQP-element

The IP Address Type Availability ANQP-element provides STA with the information about the availability of IP address version and type that could be allocated to the STA after successful association. The format of the IP Address Type Availability ANQP-element is shown in Figure 8-415.

	Info ID	Length	IP Address
Octets:	2	2	1

Figure 8-415—IP Address Type Availability ANQP-element

The Info ID field is equal to the value in Table 8-184 corresponding to the IP Address Type Availability ANQP-element.

The Length field is a 2-octet field whose value is set to 1.

The format of the IP Address field shown in Figure 8-416.

Bits:	B0B1	B2B7
	IPv6 Address	IPv4 Address

Figure 8-416—IP Address field format

The IPv6 Address field values are shown in Table 8-186.

Table 8-186—IPv6 Address field values

Address value	Meaning
0	Address type not available
1	Address type available
2	Availability of the address type not known
3	Reserved

The IPv4 Address field values are shown in Table 8-187.

Table 8-187— IPv4 Address field values

Address value	Meaning
0	Address type not available
1	Public IPv4 address available
2	Port-restricted IPv4 address available
3	Single NATed private IPv4 address available
4	Double NATed private IPv4 address available
5	Port-restricted IPv4 address and single NATed IPv4 address available
6	Port-restricted IPv4 address and double NATed IPv4 address available
7	Availability of the address type is not known
8–63	Reserved

8.4.4.10 NAI Realm ANQP-element

The NAI Realm ANQP-element provides a list of network access identifier (NAI) realms corresponding to SSPs or other entities whose networks or services are accessible via this AP; optionally included for each NAI realm is a list of one or more EAP Method subfields, which that NAI realm uses for authentication. The format of the NAI Realm ANQP-element is provided in Figure 8-417.

	Info ID	Length	NAI Realm Count (optional)	NAI Realm Data #1 (optional)	. . .	NAI Realm Data #N (optional)
Octets:	2	2	2	variable		variable

Figure 8-417—NAI Realm ANQP-element format

The Info ID field is equal to the value in Table 8-184 corresponding to the NAI Realm ANQP-element.

The Length field is a 2-octet field whose value is set to 2 plus the total length of the NAI Realm Data fields.

The NAI Realm Count field is a 2-octet field that specifies the number of NAI realms included in the NAI Realm ANQP-element.

The format of the NAI Realm Data field is shown in Figure 8-418.

	NAI Realm Data Field Length	NAI Realm Encoding	NAI Realm Length	NAI Realm	EAP Method Count	EAP Method #1 (optional)	. . .	EAP Method #N (optional)
Octets:	2	1	1	variable	1	variable		variable

Figure 8-418—NAI Realm Data field format

The NAI Realm Data Field Length is a 2-octet subfield whose value is equal to 3 plus the length of the NAI Realm subfield plus the sum of the lengths of the EAP Method subfields.

The NAI Realm Encoding is a 1-octet subfield whose format is shown in Figure 8-419.

Bits:	B0	B1B7
	NAI Realm Encoding Type	Reserved

Figure 8-419—NAI Realm Encoding subfield format

The NAI Realm Encoding Type is a 1-bit subfield. It is set to 0 to indicate that the NAI Realm in the NAI Realm subfield is formatted in accordance with IETF RFC 4282. It is set to 1 to indicate it is a UTF-8 formatted character string that is not formatted in accordance with IETF RFC 4282.

NOTE—This encoding is to facilitate roaming consortium or other entities that use nonstandard NAI Realm formats.

NAI Realm Length subfield is a 1-octet subfield whose value is the length in octets of the NAI Realm subfield.

The NAI Realm subfield is one or more NAI Realms formatted as defined in the NAI Realm Encoding Type bit of the NAI Realm Encoding subfield. If there is more than one NAI Realm in this subfield, the NAI Realms are delimited by a semi-colon character (i.e., ";", which is encoded in UTF-8 format as 0x3B). All the realms included in the NAI Realm subfield support all the EAP methods identified by the EAP Method subfields, if present. The maximum length of this subfield is 255 octets.

The EAP Method Count specifies the number of EAP methods subfields for the NAI realm. If the count is 0, there is no EAP method information provided for the NAI realm.

The format of the optional EAP Method subfield is shown in Figure 8-420. Each EAP Method subfield contains a set of Authentication Parameters associated with the EAP-Method.

	Length	EAP Method	Authentication Parameter Count	Authentication Parameter #1 (optional)	. . .	Authentication Parameter #N (optional)
Octets:	1	1	1	variable		variable

Figure 8-420—EAP Method subfield format

The Length subfield is a 1-octet subfield whose value is equal to 2 plus the length of the Authentication Parameter subfields.

The EAP method subfield is a 1-octet subfield that is set to the EAP Type value as given in IANA EAP Method Type Numbers.

The Authentication Parameter Count indicates how many additional Authentication Parameter subfields are specified for the supported EAP Method. If the Authentication Parameters Count subfield is 0, there are no Authentication Parameters subfields present, meaning no additional Authentication Parameters are specified for the EAP Method.

The format of the Authentication Parameter subfield is shown in Figure 8-421.

	ID	Length	Authentication Parameter Value
Octets:	1	1	variable

Figure 8-421—Authentication Parameter subfield format

The ID subfield is a 1-octet subfield that indicates the type of authentication information provided.

The Length subfield is a 1-octet subfield whose value is set to the length of the Authentication Parameter Value subfield.

The Authentication Parameter Value subfield is a variable-length subfield containing the value of the parameter indicated by the ID.

The ID and its associated formats are specified in Table 8-188. Each ID indicates a different type of information. Use of multiple Authentication Parameter subfields allows all the required authentication parameter requirements to be provided.

Table 8-188—Authentication Parameter types

Authentication information	ID	Description	Length (octets)
Reserved	0		
Expanded EAP Method	1	Expanded EAP Method Subfield	7
Non-EAP Inner Authentication Type	2	Enum (0 - Reserved, 1 - PAP, 2 - CHAP, 3 - MSCHAP, 4 - MSCHAPV2)	1
Inner Authentication EAP Method Type	3	Value drawn from IANA EAP Method Type Numbers	1
Expanded Inner EAP Method	4	Expanded EAP Method Subfield	7
Credential Type	5	Enum (1 - SIM, 2 - USIM, 3 - NFC Secure Element, 4 - Hardware Token, 5 - Softoken, 6 - Certificate, 7 - username/password, 8 - none*, 9 - Reserved, 10 - Vendor Specific) *none means server-side authentication only	1
Tunneled EAP Method Credential Type	6	Enum (1 - SIM, 2 - USIM, 3 - NFC Secure Element, 4 - Hardware Token, 5 - Softoken, 6 - Certificate, 7 - username/password, 8 - Reserved, 9 - Anonymous, 10 - Vendor Specific)	1
Reserved	7–220		
Vendor Specific	221	Variable	variable
Reserved	222–255		

If the EAP Method type is an Expanded EAP type (the EAP Method value is 254), the Authentication Parameter is used to specify additional information on the EAP method. Table 8-189 describes the Authentication Parameter format for the Expanded EAP method; values for the Vendor ID and Vendor Type are specified in IETF RFC 3748. The Vendor ID and Vendor Type fields are expressed in big endian byte order.

Table 8-189—Authentication Parameter format for the Expanded EAP method

Parameters	Length (octets)
ID	1
Length	1
Vendor ID	3
Vendor Type	4

The Non-EAP Inner Authentication Type is specified as single enumerated value given in Table 8-188. This Authentication Information type is used for non-EAP Inner Authentication methods. The possible values are PAP (as specified in IETF RFC 1334), CHAP (as specified in IETF RFC 1994), MSCHAP (as specified in IETF RFC 2433), and MSCHAPv2 (as specified in IETF RFC 2759).

The Inner Authentication EAP Method Type is specified as the EAP number as defined in IANA EAP Method Type Numbers. This Authentication Information type is used when the Inner Authentication method is an EAP method. If the Inner Authentication EAP Method Type is equal to 254 indicating an Expanded EAP Type, then the Expanded EAP Method Authentication Parameter is included.

A Credential Type is specified as a single enumerated value as shown in Table 8-188. If the value is equal to the "Vendor Specific" value, then a Vendor-Specific Authentication Parameter is included.

Vendor-Specific Authentication Parameters are specified as shown in Table 8-190.

Table 8-190—Vendor Specific Authentication Parameters

Parameters	Length (octets)
ID	1
Length	1
OI	variable
Authentication Parameter Value	Vendor-specific content

8.4.4.11 3GPP Cellular Network ANQP-element

The 3GPP Cellular Network ANQP-element contains cellular information such as network advertisement information e.g., network codes and country codes to assist a 3GPP non-AP STA in selecting an AP to access 3GPP networks. The format of the 3GPP Cellular Network ANQP-element is shown in Figure 8-422.

	Info ID	Length	Payload (optional)
Octets:	2	2	variable

Figure 8-422—3GPP Cellular Network ANQP-element format

The Info ID field is equal to the value in Table 8-184 corresponding to the 3GPP Cellular Network ANQP-element.

The Length field is a 2-octet field whose value is set to the length of the Payload field.

The Payload field is a variable-length field and is a generic container. An example of the format and content is defined in Annex A of 3GPP TS 24.234.

8.4.4.12 AP Geospatial Location ANQP-element

The AP Geospatial Location ANQP-element provides the AP's location in LCI format; see 8.4.2.24.10.

The format of the AP Geospatial Location ANQP-element is provided in Figure 8-423.

	Info ID	Length	Location Configuration Report
Octets:	2	2	18

Figure 8-423—AP Geospatial Location ANQP-element format

The Info ID field is equal to the value in Table 8-184 corresponding to the AP Geospatial Location ANQP-element.

The Length field is a 2-octet field whose value is set to 18.

The Location Configuration Report is an 18-octet field and the format is provided in 8.4.2.24.10. There are no Optional Subelements field present in the Location Configuration Report when it is used in the AP Geospatial Location ANQP-element. This information is taken from the dot11APLCITable MIB object.

8.4.4.13 AP Civic Location ANQP-element

The AP Civic Location ANQP-element provides the AP's location in Civic format. The format of the AP Civic Location ANQP-element is provided in Figure 8-424.

	Info ID	Length	Location Civic Report
Octets:	2	2	variable

Figure 8-424—AP Civic Location ANQP-element format

The Info ID field is equal to the value in Table 8-184 corresponding to the AP Civic Location ANQP-element.

The Length field is a 2-octet field whose value is set to the length of the Location Civic Report.

The Location Civic Report is a variable-length field and the format is provided in 8.4.2.24.13. This information is taken from the dot11ApCivicLocation MIB object.

8.4.4.14 AP Location Public Identifier URI ANQP-element

The AP Location Public Identifier URI ANQP-element provides an indirect reference to the location information for the AP. This list element may be returned in response to a GAS Query using the procedures in 10.24.3.2. The format of the AP Location Public Identifier URI ANQP-element is provided in Figure 8-425.

	Info ID	Length	Public Identifier URI
Octets:	2	2	variable

Figure 8-425—AP Location Public Identifier URI ANQP-element format

The Info ID field is equal to the value in Table 8-184 corresponding to the AP Location Public Identifier URI.

The Length field is a 2-octet field whose value is set to the length of the AP Location Public Identifier URI field.

The Public Identifier URI field is a variable-length field and is defined in 8.4.2.24.13.

8.4.4.15 Domain Name ANQP-element

The Domain Name ANQP-element provides a list of one or more domain names of the entity operating the IEEE 802.11 access network. Domain Names in this ANQP-element are taken from dot11DomainNameTable. The format of the Domain Name ANQP-element is provided in Figure 8-426.

	Info ID	Length	Domain Name field #1 (optional)	. . .	Domain Name field #N (optional)
Octets:	2	2	variable		variable

Figure 8-426—Domain Name ANQP-element format

The Info ID field is equal to the value in Table 8-184 corresponding to the Domain Name ANQP-element.

The Length field is a 2-octet field whose value is set to the total length of the Domain Name Fields.

The format of the Domain Name subfield is shown in Figure 8-427.

	Length	Domain Name
Octets:	1	variable

Figure 8-427—Domain Name subfield format

The Length subfield is a 1-octet subfield whose value is set to the length in octets of the Domain Name subfield.

The Domain Name subfield is of variable length and contains a domain name compliant with the “Preferred Name Syntax” as defined in IETF RFC 1035. The maximum length of this field is 255 octets.

8.4.4.16 Emergency Alert URI ANQP-element

The Emergency Alert URI ANQP-element provides a URI for EAS message retrieval.

The format of the Emergency Alert URI ANQP-element is provided in Figure 8-428.

	Info ID	Length	Emergency Alert URI
Octets:	2	2	variable

Figure 8-428—Emergency Alert URI ANQP-element format

The Info ID field is equal to the value in Table 8-184 corresponding to the Emergency Alert URI ANQP-element.

The Length field is a 2-octet field whose value is set to the length of the Emergency Alert Identifier URI field.

The Emergency Alert URI field is a variable-length field used to indicate the URI at which an EAS message may be retrieved as described in 10.24.7. The Emergency Alert URI field is formatted in accordance with IETF RFC 3986.

8.4.4.17 Emergency NAI ANQP-element

The Emergency NAI ANQP-element contains an emergency string, which is available for use by a STA as its identity to indicate emergency access request. The format of the Emergency NAI ANQP-element is provided in Figure 8-429.

	Info ID	Length	Emergency NAI Information
Octets:	2	2	variable

Figure 8-429—Emergency NAI ANQP-element format

The Info ID field is equal to the value in Table 8-184 corresponding to the Emergency NAI ANQP-element.

The Length field is a 2-octet field whose value is set to the length of Emergency NAI Information field.

The Emergency NAI Information field is a variable-length UTF-8 field formatted in accordance with IETF RFC 4282. UTF-8 format is defined in IETF RFC 3629.

8.4.4.18 TDLS Capability ANQP-element

The TDLS Capability ANQP-element is used by a STA to discover the TDLS capabilities of a peer STA. The format of the TDLS Capability is provided in Figure 8-430.

	Info ID	Length	Peer Information
Octets:	2	2	variable

Figure 8-430—TDLS Capability ANQP-element format

The Info ID field is equal to the value in Table 8-184 corresponding to the TDLS Capability ANQP-element.

The Length field is a 2-octet field whose value is set to the length of the Peer Information field

The Peer Information field is a variable-length field containing information that a STA can use to establish a TDLS link and is defined as an XML schema (see V.6). An example of the peer information is described in 10.24.3.2.10.

8.4.4.19 Neighbor Report ANQP-element

The Neighbor Report ANQP-element provides zero or more neighbor reports about neighboring APs. This is of benefit to a STA in a preassociated state.

	Info ID	Length	Neighbor Report element (optional)
Octets:	2	2	variable

Figure 8-431—Neighbor Report ANQP-element format

The Info ID field is equal to the value in Table 8-184 corresponding to the Neighbor Report ANQP-element.

The Length field is a 2-octet field whose value is set to the number of octets in the Neighbor Report field.

The format of the Neighbor Report element is shown in Figure 8-215 defined in 8.4.2.39. The Element ID and the Length fields of the Neighbor Report element, as shown in Figure 8-215, are not included.

8.5 Action frame format details

8.5.1 Introduction

Subclause 8.5 describes the Action field formats allowed in each of the action categories defined in Table 8-38 in 8.4.1.11.

8.5.2 Spectrum management Action frames

8.5.2.1 General

Five Action frame formats are defined for spectrum management. A Spectrum Management Action field, in the octet field immediately after the Category field, differentiates the five formats. The Spectrum Management Action field values associated with each frame format are defined in Table 8-191.

Table 8-191—Spectrum Management Action field values

Spectrum Mangement Action field value	Description
0	Measurement Request
1	Measurement Report
2	TPC Request
3	TPC Report
4	Channel Switch Announcement
5–255	Reserved

8.5.2.2 Measurement Request frame format

The Measurement Request frame uses the Action frame body format and is transmitted by a STA requesting another STA to measure one or more channels. The format of the Measurement Request Action field is shown in Figure 8-432.

	Category	Spectrum Management Action	Dialog Token	Measurement Request Elements
Octets:	1	1	1	variable

Figure 8-432—Measurement Request frame Action field format

The Category field is set to 0 (representing spectrum management).

The Spectrum Management Action field is set to 0 (representing a Measurement Request frame).

The Dialog Token field is set to a nonzero value chosen by the STA sending the measurement request to identify the request/report transaction.

The Measurement Request Elements field contains one or more of the Measurement Request elements described in 8.4.2.23. The number and length of the Measurement Request elements in a Measurement Request frame is limited by the maximum allowed MMPDU size.

8.5.2.3 Measurement Report frame format

The Measurement Report frame uses the Action frame body format and is transmitted by a STA in response to a Measurement Request frame or by a STA autonomously providing measurement information. The format of the Measurement Report Action field is shown in Figure 8-433.

	Category	Spectrum Management Action	Dialog Token	Measurement Report Elements
Octets:	1	1	1	variable

Figure 8-433—Measurement Report frame Action field format

The Category field is set to 0 (representing spectrum management).

The Spectrum Management Action field is set to 1 (representing a Measurement Report frame).

The Dialog Token field is set to the value in any corresponding Measurement Request frame. If the Measurement Report frame is not being transmitted in response to a Measurement Request frame, then the Dialog token is set to 0.

The Measurement Report Elements field contains one or more of the Measurement Report elements described in 8.4.2.24. The number and length of the Measurement Report elements in a Measurement Report frame is limited by the maximum allowed MMPDU size.

8.5.2.4 TPC Request frame format

The TPC Request frame uses the Action frame body format and is transmitted by a STA requesting another STA for transmit power and link margin information. The format of the TPC Request Action field is shown in Figure 8-434.

	Category	Spectrum Management Action	Dialog Token	TPC Request element
Octets:	1	1	1	2

Figure 8-434—TPC Request frame Action field format

The Category field is set to 0 (representing spectrum management).

The Spectrum Management Action field is set to 2 (representing a TPC Request frame).

The Dialog Token field is set to a nonzero value chosen by the STA sending the request to identify the transaction.

The TPC Request element is set as described in 8.4.2.18.

8.5.2.5 TPC Report frame format

The TPC Report frame uses the Action frame body format and is transmitted by a STA in response to a TPC Request frame. The format of the TPC Report Action field is shown in Figure 8-435.

	Category	Spectrum Management Action	Dialog Token	TPC Report element
Octets:	1	1	1	4

Figure 8-435—TPC Report frame Action field format

The Category field is set to 0 (representing spectrum management).

The Spectrum Management Action field is set to 3 (representing a TPC Report frame).

The Dialog Token field is set to the Dialog Token value in the corresponding TPC Request frame.

The TPC Report element is set as described 8.4.2.19.

8.5.2.6 Channel Switch Announcement frame format

The Channel Switch Announcement frame uses the Action frame body format and is transmitted by an AP in a BSS, a STA in an IBSS, or a mesh STA in an MBSS to advertise a channel switch. The format of the Channel Switch Announcement Action field is shown in Figure 8-436.

	Category	Spectrum Management Action	Channel Switch Announcement element	Secondary Channel Offset element	Mesh Channel Switch Parameters element
Octets:	1	1	5	3	6

Figure 8-436—Channel Switch Announcement frame Action field format

The Category field is set to 0 (representing spectrum management).

The Spectrum Management Action field is set to 4 (representing a Channel Switch Announcement frame).

The Channel Switch Announcement element is set as described 8.4.2.21.

The Secondary Channel Offset element is defined in 8.4.2.22. This element is present when switching to a 40 MHz channel. It may be present when switching to a 20 MHz channel (in which case the secondary channel offset is set to SCN).

The Mesh Channel Switch Parameters element is defined in 8.4.2.105. This element is present when a mesh STA performs MBSS channel switch. The Mesh Channel Switch Parameters element is not included for channel switch other than MBSS.

8.5.3 QoS Action frame details

8.5.3.1 General

Several Action frame formats are defined for QoS purposes. These frames are identified by the single octet QoS Action field, which follows immediately after the Category field. The values of the QoS Action field are defined in Table 8-192.

Table 8-192—QoS Action field values

QoS Action field value	Meaning
0	ADDTS Request
1	ADDTS Response
2	DELTS
3	Schedule
4	QoS Map Configure
5–255	Reserved

8.5.3.2 ADDTS Request frame format

The ADDTS frames are used to carry TSPEC and optionally TCLAS elements to set up and maintain TSs using the procedures defined in 10.4.

The Action field of the ADDTS Request frame contains the information shown in Table 8-193.

Table 8-193—ADDTS Request frame Action field format

Order	Information
1	Category
2	QoS Action
3	Dialog Token
4	TSPEC
5–n	TCLAS (optional)
n + 1	TCLAS Processing (optional)
n + 2	U-APSD Coexistence (optional)
n + 3	Expedited Bandwidth Request element (optional)

The Category field is set to 1 (representing QoS).

The QoS Action field is set to 0 (representing ADDTS request).

The Dialog Token, TCLAS, and TCLAS Processing fields of this frame are contained in an MLME-ADDTS.request primitive that causes the frame to be sent. Some of the TSPEC parameters are contained in the MLME-ADDTS.request primitive while the other parameters (i.e., Surplus Bandwidth Allowance, Minimum Service Interval, Maximum Service Interval, and Minimum PHY Rate) are generated within the MAC.

The TSPEC element, defined in 8.4.2.32, and the optional TCLAS element, defined in 8.4.2.33, contain the QoS parameters that define the TS. The TS is identified by the TSID and Direction fields within the TSPEC element. The TCLAS element is optional at the discretion of the STA that sends the ADDTS Request frame, regardless of the setting of the access policy (EDCA or HCCA). There may be one or more TCLAS elements in the ADDTS frame. The TCLAS Processing element is present when there are more than one TCLAS element and is defined in 8.4.2.35. There may be one Expedited Bandwidth Request element, which is defined in 8.4.2.96.

The U-APSD Coexistence element, defined in 8.4.2.93, contains the coexistence parameters requested by the non-AP STA when using the U-APSD Coexistence capability as described in 10.2.1.5.2. The U-APSD Coexistence element is optionally present.

8.5.3.3 ADDTS Response frame format

The ADDTS Response frame is transmitted in response to an ADDTS Request frame. The Action field of the ADDTS Response frame contains the information shown in Table 8-194.

Table 8-194—ADDTS Response frame Action field format

Order	Information
1	Category
2	QoS Action
3	Dialog Token

Table 8-194—ADDTS Response frame Action field format *(continued)*

Order	Information
4	Status Code
5	TS Delay
6	TSPEC
7–n	TCLAS (optional)
n + 1	TCLAS Processing (optional)
n + 2	Schedule
n + 3	Expedited Bandwidth Request (optional)

The Category field is set to 1(representing QoS).

The QoS Action field is set to 1 (representing ADDTS response).

The Status Code field is defined in 8.4.1.9.

The Dialog Token, TS Delay, TSPEC, TCLAS, TCLAS Processing, and Expedited Bandwidth Request fields in this frame are contained in an MLME-ADDTS.response primitive that causes the frame to be sent. The TS Delay element is present in an ADDTS Response frame only if the status code is equal to 47.

The Schedule element, defined in 8.4.2.36, is present in an ADDTS Response frame only if the status code is equal to 0 (i.e., when the TS is admitted).

8.5.3.4 DELTS frame format

The DELTS frame is used to delete a TS using the procedures defined in 10.4.9.

The Action field of a DELTS frame contains the information shown in Table 8-195.

Table 8-195—DELTS frame Action field format

Order	Information
1	Category
2	QoS Action
3	TS Info
4	Reason Code

The Category field is set to 1 (representing QoS).

The QoS Action field is set to 2 (representing DELTS).

The TS Info field is defined in 8.4.2.32.

The Reason Code field is defined in 8.4.1.7.

A DELTS frame is used to delete a TS characterized by the TS Info field in the frame. A DELTS frame may be sent from the HC to the source STA of that TS, or vice versa, to indicate an imperative request, to which no response is required from the recipient STA.

8.5.3.5 Schedule frame format

The Schedule frame is transmitted by the HC to announce the schedule of delivery of data and polls. The Action field of the Schedule frame contains the information shown in Table 8-196.

Table 8-196—Schedule frame Action field format

Order	Information
1	Category
2	QoS Action
3	Schedule

The Category field is set to 1 (representing QoS).

The QoS Action field is set to 3 (representing Schedule).

The Schedule element is defined in 8.4.2.36.

8.5.3.6 QoS Map Configure frame format

The QoS Map Configure frame is used by an AP to provide the QoS Map Set to a non-AP STA using the procedures defined in 10.24.9.

The frame body of the QoS Map Configure frame contains the information shown in Table 8-197.

Table 8-197—QoS Map configure frame body

Order	Information
0	Category
1	Action
2	QoS Map Set

The Category field is set to the value in Table 8-38.

The Action field is set to the value in Table 8-192.

The QoS Map Set element is defined in 8.4.2.97.

8.5.4 DLS Action frame details

8.5.4.1 General

Several Action frame formats are defined for DLS management purposes. A DLS Action field, in the octet field immediately after the Category field, differentiates the formats. The DLS Action field values associated with each frame format are defined in Table 8-198.

Table 8-198—DLS Action field values

DLS Action field value	Meaning
0	DLS Request
1	DLS Response
2	DLS Teardown
3–255	Reserved

8.5.4.2 DLS Request frame format

The DLS Request frame is used to set up a direct link with a peer MAC. The Action field of the DLS Request frame contains the information shown in Table 8-199, with some fields being optionally present as indicated in the “Notes” column of the table.

Table 8-199—DLS Request frame Action field format

Order	Information	Notes
1	Category	
2	DLS Action	
3	Destination MACAddress	
4	Source MACAddress	
5	Capability Information	
6	DLS Timeout Value	
7	Supported rates	
8	Extended Supported Rates	
9	HT Capabilities	The HT Capabilities element is present when the dot11HighThroughputOptionImplemented attribute is true.

The Category field is set to 2 (representing DLS).

The DLS Action field is set to 0 (representing DLS request).

The Destination MAC Address field value is the MAC address of the target destination.

The Source MAC Address field value is the MAC address of the initiating STA.

The Capability Information field value is the capability information of the originator of the request.

The DLS Timeout Value field is defined in 8.4.1.13.

The Supported Rates and Extended Supported Rates fields contain the supported rates information of the originator.

8.5.4.3 DLS Response frame format

The DLS Response frame is sent in response to a DLS Request frame. The Action field of a DLS Response frame contains the information shown in Table 8-200, with some fields being optionally present as indicated in the "Notes" column of the table.

Table 8-200—DLS Response frame Action field format

Order	Information	Notes
1	Category	
2	DLS Action	
3	Status Code	
4	Destination MACAddress	
5	Source MACAddress	
6	Capability Information	
7	Supported rates	
8	Extended Supported rates	
9	HT Capabilities	The HT Capabilities element is present when the dot11HighThroughputOptionImplemented attribute is true.

The Category field is set to 2 (representing DLS).

The DLS Action field is set to 1 (representing DLS response).

The Status Code field is defined in 8.4.1.9.

The Destination MAC Address field value and the Source MAC Address field value are copied from the corresponding fields in the DLS Request frame.

The Capability Information field is the capability information of the target destination. This information is included only if the DLS result code corresponds to SUCCESS (DLS status code 0).

The Supported Rates and Extended Supported Rates fields contain the supported rates information of the target destination. This information is included only if the DLS result code corresponds to SUCCESS (DLS status code 0).

8.5.4.4 DLS Teardown frame format

The DLS Teardown frame is sent to terminate a direct link with a peer MAC. The Action field of the DLS Teardown frame contains the information shown in Table 8-201.

Table 8-201—DLS Teardown frame Action field format

Order	Information
1	Category
2	DLS Action
3	Destination MAC Address
4	Source MAC Address
5	Reason Code

The Category field is set to 2 (representing DLS).

The DLS Action field is set to 2 (representing DLS teardown).

The Destination MAC Address field value is the MAC address of the target destination.

The Source MAC Address field value is the MAC address of the initiating STA.

The Reason Code field is defined in 8.4.1.7.

8.5.5 Block Ack Action frame details

8.5.5.1 General

The ADDBA frames are used to set up or, if PBAC is used, to modify Block Ack for a specific TC or TS. A Block Ack Action field, in the octet immediately after the Category field, differentiates the Block Ack Action frame formats. The Block Ack Action field values associated with each frame format within the Block Ack category are defined in Table 8-202.

Table 8-202—Block Ack Action field values

Block Ack Action field values	Meaning
0	ADDBA Request
1	ADDBA Response
2	DELBA
3–255	Reserved

8.5.5.2 ADDBA Request frame format

An ADDBA Request frame is sent by an originator of Block Ack to another STA. The Action field of an ADDBA Request frame contains the information shown in Table 8-203.

Table 8-203—ADDBA Request frame Action field format

Order	Information
1	Category
2	Block Ack Action
3	Dialog Token
4	Block Ack Parameter Set
5	Block Ack Timeout Value
6	Block Ack Starting Sequence Control

The Category field is set to 3 (representing Block Ack).

The Block Ack Action field is set to 0 (representing ADDBA request).

The Dialog Token field is set to a nonzero value chosen by the STA.

The Block Ack Parameter Set field is defined in 8.4.1.14.

The Block Ack Timeout Value field is defined in 8.4.1.15.

The Block Ack Starting Sequence Control field is defined in 8.3.1.8.

8.5.5.3 ADDBA Response frame format

The ADDBA Response frame is sent in response to an ADDBA Request frame. The Action field of an ADDBA Response frame contains the information shown in Table 8-204.

Table 8-204—ADDBA Response frame Action field format

Order	Information
1	Category
2	Block Ack Action
3	Dialog Token
4	Status Code
5	Block Ack Parameter Set
6	Block Ack Timeout Value

The Category field is set to 3 (representing Block Ack).

The Block Ack Action field is set to 1 (representing ADDBA response).

The Dialog Token field value is copied from the corresponding received ADDBA Request frame.

The Status Code field is defined in 8.4.1.9.

The Block Ack Parameter Set field is defined in 8.4.1.14.

The Block Ack Timeout Value field is defined in 8.4.1.15.

8.5.5.4 DELBA frame format

The DELBA frame is sent by either the originator of the traffic or the recipient to terminate the Block Ack participation. The Action field of a DELBA frame format contains the information shown in Table 8-205.

Table 8-205—DELBA frame Action field format

Order	Information
1	Category
2	Block Ack Action
3	DELBA Parameter Set
4	Reason Code

The Category field is set to 3 (representing DELBA).

The Block Ack Action field is set to 2 (representing DELBA).

The DELBA Parameters field is defined in 8.4.1.16.

The Reason Code field is defined in 8.4.1.7.

8.5.6 Vendor-specific action details

The Vendor Specific Action frame is defined for vendor-specific signaling. The format of the Action field of the Vendor Specific Action frame is shown in Figure 8-437. An Organization Identifier, in the octet field immediately after the Category field, differentiates the vendors (see 8.4.1.31).

NOTE—If management frame protection is negotiated, then Vendor Specific Protected Action frames (see Table 8-38) are protected; otherwise they are unprotected.

	Category	Organization Identifier	Vendor Specific Content
Octets:	1	*j*	Variable

Figure 8-437—Vendor Specific Action frame Action field format

The Category field is set to the value indicating the vendor-specific category, as specified in Table 8-38.

The Organization Identifier contains a public organizationally unique identifier assigned by the IEEE and is specified in 8.4.1.31. The order of the Organization Identifier field is described in 8.2.2.

The Vendor Specific Content contains vendor-specific field(s). The length of the Vendor Specific Content in a Vendor Specific Action frame is limited by the maximum allowed MMPDU size.

8.5.7 Radio Measurement action details

8.5.7.1 General

Several Action frame formats are defined for Radio Measurement purposes. A Radio Measurement Action field, in the octet field immediately after the Category field, differentiates the formats. The Radio Measurement Action field values associated with each frame format are defined in Table 8-206.

Table 8-206—Radio Measurement Action field values

Radio Measurement Action field value	Description
0	Radio Measurement Request
1	Radio Measurement Report
2	Link Measurement Request
3	Link Measurement Report
4	Neighbor Report Request
5	Neighbor Report Response
6–255	Reserved

8.5.7.2 Radio Measurement Request frame format

The Radio Measurement Request frame uses the Action frame body format. It is transmitted by a STA requesting another STA to make one or more measurements on one or more channels. The format of the Action field in the Radio Measurement Request frame is shown in Figure 8-438.

	Category	Radio Measurement Action	Dialog Token	Number of Repetitions	Measurement Request Elements
Octets:	1	1	1	2	variable

Figure 8-438—Radio Measurement Request frame Action field format

The Category field is set to the value indicating the Radio Measurement category, as specified in Table 8-38 in 8.4.1.11.

The Radio Measurement Action field is set to indicate a Measurement Request according to Table 8-206 in 8.5.7.

The Dialog Token field is set to a nonzero value chosen by the STA sending the radio measurement request to identify the request/report transaction.

The Number of Repetitions field contains the requested number of repetitions for all the Measurement Request elements in this frame. A value of 0 in the Number of Repetitions field indicates Measurement Request elements are executed once without repetition. A value of 65 535 in the Number of Repetitions field indicates Measurement Request elements are repeated until the measurement is cancelled or superseded.

The Measurement Request Elements field contains zero or more of the Measurement Request elements described in 8.4.2.23. The number and length of the Measurement Request elements in a Measurement Request frame is limited by the maximum allowed MMPDU size.

8.5.7.3 Radio Measurement Report frame format

The Radio Measurement Report frame uses the Action frame body format. It is transmitted by a STA in response to a Radio Measurement Request frame or by a STA providing a triggered autonomous measurement report. The format of the Action field in the Radio Measurement Report frame is shown in Figure 8-439.

	Category	Radio Measurement Action	Dialog Token	Measurement Report Elements
Octets:	1	1	1	variable

Figure 8-439—Radio Measurement Report frame Action field format

The Category field is set to indicate the Radio Measurement category according to Table 8-38 in 8.4.1.11.

The Radio Measurement Action field is set to indicate a radio measurement report according to Table 8-206 in 8.5.7.

The Dialog Token field is set to the value in the corresponding Radio Measurement Request frame. If the Radio Measurement Report frame is not being transmitted in response to a Radio Measurement Request frame then the Dialog token is set to 0.

The Measurement Report Elements field contains one or more Measurement Report elements described in 8.4.2.24. The number and length of the Measurement Report elements in a single Radio Measurement Report frame is limited by the maximum allowed MMPDU size. Subclause 10.11.6 describes the required behavior for multiframe Radio Measurement Report frame responses.

8.5.7.4 Link Measurement Request frame format

The Link Measurement Request frame uses the Action frame body format and is transmitted by a STA to request another STA to respond with a Link Measurement Report frame to enable measurement of link path loss and estimation of link margin. The format of the Action field in the Link Measurement Request frame is shown in Figure 8-440.

	Category	Radio Measurement Action	Dialog Token	Transmit Power Used	Max Transmit Power	Optional Subelements
Octets:	1	1	1	1	1	variable

Figure 8-440—Link Measurement Request frame Action field format

The Category field is set to the value indicating the Radio Measurement category, as specified in Table 8-38 in 8.4.1.11.

The Radio Measurement Action field is set to indicate a Link Measurement Request according to Table 8-206 in 8.5.7.

The Dialog Token field is set to a nonzero value chosen by the STA sending the request to identify the transaction.

The Transmit Power Used field is set to the transmit power used to transmit the frame containing the Link Measurement Request, as described in 8.4.1.20.

The Max Transmit Power field provides the upper limit on the transmit power as measured at the output of the antenna connector to be used by the transmitting STA on its operating channel. This field is described in 8.4.1.19. The Max Transmit Power field is a twos complement signed integer and is 1 octet in length, providing an upper limit, in a dBm scale, on the transmit power as measured at the output of the antenna connector to be used by the transmitting STA on its operating channel. The maximum tolerance for the value reported in Max Transmit Power field is ±5 dB. The value of the Max Transmit Power field is equal to the minimum of the maximum powers at which the STA is permitted to transmit in the operating channel by device capability, policy, and regulatory authority.

The Optional Subelements field format contains zero or more subelements, each consisting of a 1-octet Subelement ID field, a 1-octet Length field, and a variable-length Data field, as shown in Figure 8-402. Any optional subelements are ordered by nondecreasing subelement ID.

The Subelement ID field values for the defined optional subelements are shown in Table 8-207. A Yes in the Extensible column of a subelement listed in Table 8-207 indicates that the Length of the subelement might be extended in future revisions or amendments of this standard. When the Extensible column of an element is equal to Subelements, then the subelement might be extended in future revisions or amendments of this standard by defining additional subelements within the subelement. See 9.24.9.

Table 8-207—Optional subelement IDs for Link Measurement Request frame

Subelement ID	Name	Length field (octets)	Extensible
0–220	Reserved		
221	Vendor Specific	1 to 255	
222–255	Reserved		

The Vendor Specific subelements have the same format as their corresponding elements (see 8.4.2.28). Multiple Vendor Specific subelements are optionally present in the list of optional subelements.

8.5.7.5 Link Measurement Report frame format

The Link Measurement Report frame uses the Action frame body format and is transmitted by a STA in response to a Link Measurement Request frame. The format of the Action field in the Link Measurement Report frame is shown in Figure 8-441.

	Category	Radio Measurement Action	Dialog Token	TPC Report element	Receive Antenna ID	Transmit Antenna ID	RCPI	RSNI	Optional Subelements
Octets:	1	1	1	4	1	1	1	1	variable

Figure 8-441—Link Measurement Report frame Action field format

The Category field is set to indicate the Radio Measurement category according to Table 8-38 in 8.4.1.11.

The Radio Measurement Action field is set to indicate a Link Measurement Report according to Table 8-206 in 8.5.7.

The Dialog Token field is set to the Dialog Token value in the corresponding Link Measurement Request frame.

The TPC Report element is set as described in 8.4.2.19.

The Receive Antenna ID field contains the identifying number for the antenna(s) used to receive the corresponding Link Measurement Request frame. Antenna ID is defined in 8.4.2.42.

The Transmit Antenna ID field contains the identifying number for the antenna(s) used to transmit this Link Measurement Report frame. Antenna ID is defined in 8.4.2.42.

RCPI indicates the received channel power of the corresponding Link Measurement Request frame, which is a logarithmic function of the received signal power, as defined in the RCPI measurement subclause for the indicated PHY Type, as described in 8.4.2.40.

RSNI indicates the received signal to noise indication for the corresponding Link Measurement Request frame, as described in 8.4.2.43.

The Optional Subelements field format contains zero or more subelements, each consisting of a 1-octet Subelement ID field, a 1-octet Length field, and a variable-length Data field, as shown in Figure 8-402. Any optional subelements are ordered by nondecreasing subelement ID.

The Subelement ID field values for the defined optional subelements are shown in Table 8-208. A Yes in the Extensible column of a subelement listed in Table 8-208 indicates that the Length of the subelement might be extended in future revisions or amendments of this standard. When the Extensible column of an element is equal to Subelements, then the subelement might be extended in future revisions or amendments of this standard by defining additional subelements within the subelement. See 9.24.9.

Table 8-208—Optional subelement IDs for Link Measurement Report frame

Subelement ID	Name	Length field (octets)	Extensible
0–220	Reserved		
221	Vendor Specific	1 to 255	
222–255	Reserved		

The Vendor Specific subelements have the same format as their corresponding elements (see 8.4.2.28). Multiple Vendor Specific subelements are optionally present in the list of optional subelements.

8.5.7.6 Neighbor Report Request frame format

The Neighbor Report Request frame uses the Action frame body format and is transmitted by a STA requesting information in the neighbor report about neighboring APs. The format of the Action field in the Neighbor Report Request frame is shown in Figure 8-442.

	Category	Radio Measurement Action	Dialog Token	Optional Subelements
Octets:	1	1	1	variable

Figure 8-442—Neighbor Report Request frame Action field format

The Category field is set to the value indicating the Radio Measurement category, as specified in Table 8-38 in 8.4.1.11.

The Radio Measurement Action field is set to the value indicating Neighbor Report Request, as specified in Table 8-206 in 8.5.7.

The Dialog Token field is set to a nonzero value chosen by the STA sending the measurement request to identify the request/report transaction.

The Optional Subelements field format contains zero or more subelements each consisting of a 1-octet Subelement ID field, a 1-octet Length field, and a variable-length Data field, as shown in Figure 8-402. Any optional subelements are ordered by nondecreasing subelement ID.

The Subelement ID field values for the defined optional subelements are shown in Table 8-209. A Yes in the Extensible column of a subelement listed in Table 8-209 indicates that the Length of the subelement might be extended in future revisions or amendments of this standard. When the Extensible column of an element is equal to Subelements, then the subelement might be extended in future revisions or amendments of this standard by defining additional subelements within the subelement. See 9.24.9.

Table 8-209—Optional subelement IDs for Neighbor Report Request frame

Subelement ID	Name	Length field (octets)	Extensible
0	SSID	0 to 32	
1–220	Reserved		
221	Vendor Specific	1 to 255	
222–255	Reserved		

The SSID and Vendor Specific subelements have the same format as their corresponding elements (see 8.4.2.2 and 8.4.2.28, respectively). Multiple Vendor Specific subelements are optionally present in the list of optional subelements.

The presence of an optional SSID subelement in a Neighbor Report Request frame indicates a request for a neighbor list for the specified SSID in the SSID Element. The absence of an SSID element indicates neighbor report for the current ESS.

8.5.7.7 Neighbor Report Response frame format

The Neighbor Report Response frame uses the Action frame body format and is transmitted by a STA in response to a Neighbor Report Request frame. The format of the Action field in the Neighbor Report Response frame is shown in Figure 8-443.

	Category	Radio Measurement Action	Dialog Token	Neighbor Report Elements
Octets:	1	1	1	variable

Figure 8-443—Neighbor Report Response frame Action field format

The Category field is set to the value indicating the Radio Measurement category, as specified in Table 8-38 in 8.4.1.11.

The Radio Measurement Action field is set to the value indicating Neighbor Report Response, as specified in Table 8-206 in 8.5.7.

The Dialog Token field set to the value in the corresponding Neighbor Report Request frame. If the Neighbor Report Response frame is not being transmitted in response to a Neighbor Report Request frame, then the Dialog token is set to 0.

The Neighbor Report Elements field contains the Neighbor Report elements for validated APs described in 8.4.2.39. If the STA has no information in response to the Neighbor Report Request, the Neighbor Report elements are omitted. The number and length of the Neighbor Report Elements in a Neighbor Report frame is limited by the maximum allowed MMPDU size.

8.5.8 Public Action details

8.5.8.1 Public Action frames

The Public Action frame is defined to allow the following:

- Inter-BSS and AP to unassociated-STA communications
- Intra-BSS communication
- GAS

A Public Action field, in the octet immediately after the Category field, differentiates the Public Action frame formats. The defined Public Action frames are listed in Table 8-210.

Table 8-210—Public Action field values

Public Action field value	Description
0	20/40 BSS Coexistence Management (see 8.5.8.2)
1	DSE enablement
2	DSE deenablement

Table 8-210—Public Action field values *(continued)*

Public Action field value	Description
3	DSE Registered Location Announcement
4	Extended Channel Switch Announcement
5	DSE measurement request
6	DSE measurement report
7	Measurement Pilot
8	DSE power constraint
9	Vendor Specific
10	GAS Initial Request (see 8.5.8.12)
11	GAS Initial Response (see 8.5.8.13)
12	GAS Comeback Request (see 8.5.8.14)
13	GAS Comeback Response (see 8.5.8.15)
14	TDLS Discovery Response
15	Location Track Notification
16–255	Reserved

8.5.8.2 20/40 BSS Coexistence Management frame format

The 20/40 BSS Coexistence Management frame is a Public Action frame. The format of its Action field is defined in Table 8-211.

Table 8-211—20/40 BSS Coexistence Management frame Action field format

Order	Information	Notes
1	Category	
2	Public Action	
3	20/40 BSS Coexistence (see 8.4.2.62)	
4	20/40 BSS Intolerant Channel Report (see 8.4.2.60)	Appears zero or more times

The Category field is set to the value for Public, specified in Table 8-38.

The Public Action field is set to the value for 20/40 BSS Coexistence Management, specified in Table 8-210.

8.5.8.3 Measurement Pilot frame format

The Measurement Pilot frame uses the Action frame format. The format of the Action field is shown in Figure 8-444.

	Category	Public Action	Condensed Capability Information	Condensed Country String	Operating Class	Channel	Measurement Pilot Interval	Optional Subelements
Octets:	1	1	1	2	1	1	1	variable

Figure 8-444—Measurement Pilot frame Action field format

The Category field is set to the value indicating the Public category, as specified in Table 8-38 in 8.4.1.11.

The Public Action field is set to the value indicating Measurement Pilot, as specified in Table 8-210 in 8.5.8.1.

The Condensed Capability Information field contains two subfields as shown in Figure 8-445.

	B0	B1	B2 B7
	Spectrum Management	Short Slot Time	Reserved
Bits:	1	1	6

Figure 8-445—Condensed Capability Information field

The Spectrum Management subfield is set to 1 if dot11SpectrumManagementRequired is true; otherwise, it is set to 0.

The Short Slot Time subfield is set to 1 if dot11ShortSlotTimeOptionImplemented and dot11ShortSlotTimeOptionActivated are true. Otherwise, the Short Slot Time subfield is set to 0.

The Condensed Country String field is set to the first two octets of the value contained in dot11CountryString.

Operating Class indicates the operating class value for the operating channel. Country, Operating Class, and Channel Number together specify the channel frequency and spacing for the operating channel. Valid values of Operating Class are shown in Annex E.

Channel Number indicates the operating channel. Channel Number is defined within an Operating Class as shown in Annex E.

The Measurement Pilot Interval field is set to the value contained in dot11RMMeasurementPilotPeriod.

The Optional Subelements field format contains zero or more subelements each consisting of a 1-octet Subelement ID field, a 1-octet Length field, and a variable-length Data field, as shown in Figure 8-402. Any optional subelements are ordered by nondecreasing subelement ID.

The Subelement ID field values for the defined optional subelements are shown in Table 8-212. A Yes in the Extensible column of a subelement listed in Table 8-212 indicates that the Length of the subelement might be extended in future revisions or amendments of this standard. When the Extensible column of an element is equal to Subelements, then the subelement might be extended in future revisions or amendments of this standard by defining additional subelements within the subelement. See 9.24.9.

Table 8-212—Optional subelement IDs for Measurement Pilot frame

Subelement ID	Name	Length field (octets)	Extensible
0–70	Reserved		
71	Multiple BSSID	1 to 255	Subelements
72–220	Reserved		
221	Vendor Specific	1 to 255	
222–255	Reserved		

The Multiple BSSID and Vendor Specific subelements have the same format as the Multiple BSSID and Vendor Specific elements (see 8.4.2.48 and 8.4.2.38, respectively). Multiple Vendor Specific subelements may be included in the list of optional subelements.

8.5.8.4 DSE Enablement frame format

The DSE Enablement frame is an Action frame. It is transmitted by a STA as part of enablement. The format of the DSE Enablement frame Action field is shown in Figure 8-446.

	Category	Public Action	Requester STA Address	Responder STA Address	Reason Result Code	Enablement Identifier
Octets:	1	1	6	6	1	2

Figure 8-446—DSE Enablement frame Action field format

The Category field is set to the value for public action defined in Table 8-38.

The Public Action field is set to indicate a DSE Enablement frame, as defined in Table 8-210.

The RequesterSTAAddress field is the MAC address of the requesting STA that initiates the enablement process. The length of the RequesterSTAAddress field is 6 octets.

The ResponderSTAAddress field is the MAC address of the responding STA that grants enablement. The length of the ResponderSTAAddress field is 6 octets.

The Reason Result Code field is used to indicate the reason that a DSE Enablement frame was generated. The length of the Reason Result Code field is 1 octet. The reason result codes that have been allocated are shown in Table 8-213.

Table 8-213—Reason Result Code field values

Reason Result Code field value	Name	Description
0		Reserved
1		Reserved
2		Enablement requested

Table 8-213—Reason Result Code field values *(continued)*

Reason Result Code field value	Name	Description
3	SUCCESS	Success
4	REFUSED	Request declined
5	INVALID_PARAMETERS	Request not successful as one or more parameters have invalid values
6	TOO_MANY_ SIMULTANEOUS_REQUESTS	Enablement denied because the enabling STA is unable to handle additional dependent STAs
7–255		Reserved

The Enablement Identifier field is a 16-bit number assigned by an enabling STA to a dependent STA; otherwise, it is 0, set using the procedures defined in 10.12.

8.5.8.5 DSE Deenablement frame format

The DSE Deenablement frame is an Action frame. It is transmitted by a STA as part of deenablement. The format of the DSE Deenablement frame Action field is shown in Figure 8-447.

	Category	Public Action	Requester STA Address	Responder STA Address	Reason Result Code
Octets:	1	1	6	6	1

Figure 8-447—DSE Deenablement frame Action field format

The Category field is set to the value for public action defined in Table 8-38.

The Public Action field is set to indicate a DSE Deenablement frame, as defined in Table 8-210.

The RequesterSTAAddress field is the MAC address of the requesting STA that initiates the deenablement process. The length of the RequesterSTAAddress field is 6 octets.

The ResponderSTAAddress field is the MAC address of the responding STA that becomes deenabled. The length of the ResponderSTAAddress field is 6 octets.

The Reason Result Code field is used to indicate the reason that a DSE Deenablement frame was generated. The length of the Reason Result Code field is 1 octet. The reason result codes that have been allocated are shown in Table 8-214.

Table 8-214—Reason Result Code field values

Reason Result Code field value	Description
0	Reserved
1	Reserved
2	Deenablement requested
3–255	Reserved

8.5.8.6 DSE Registered Location Announcement frame format

The DSE Registered Location Announcement frame is transmitted by a dependent STA to advertise the registered location of its enabling STA. The format of the DSE Registered Location Announcement frame Action field is shown in Figure 8-448.

	Category	Public Action	DSE Registered Location element body fields
Octets:	1	1	20

Figure 8-448—DSE Registered Location Announcement frame Action field format

The Category field is set to the value for public action defined in Table 8-38.

The Public Action field is set to indicate a DSE Registered Location Announcement frame, as defined in Table 8-210.

The remaining fields are as defined in the DSE Registered Location element body (see 8.4.2.54).

8.5.8.7 Extended Channel Switch Announcement frame format

The Extended Channel Switch Announcement frame is transmitted by an AP in an infrastructure BSS, a STA in an IBSS, or a mesh STA in an MBSS to advertise a channel switch. The format of the Extended Channel Switch Announcement frame Action field is shown in Figure 8-449.

	Category	Public Action	Channel Switch Mode	New Operating Class	New Channel Number	Channel Switch Count	Mesh Channel Switch Parameters element
Octets:	1	1	1	1	1	1	6

Figure 8-449—Extended Channel Switch Announcement frame Action field format

The Category field is set to the value for public action defined in Table 8-38.

The Public Action field is set to indicate an Extended Channel Switch Announcement frame, as defined in Table 8-210.

The Channel Switch Mode, New Operating Class, New Channel Number, and Channel Switch Count fields are as described in the Extended Channel Switch Announcement element (see 8.4.2.55).

Mesh Channel Switch Parameters element is defined in 8.4.2.105. This element is present when a mesh STA performs MBSS channel switch. The Mesh Channel Switch Parameters element is not included for channel switch other than the MBSS channel switch.

8.5.8.8 DSE Measurement Request frame format

The DSE Measurement Request frame is a Public Action frame requesting a DSE measurement report. It is transmitted by a STA using the procedures defined in 10.12. The format of the DSE Measurement Request frame Action field is shown in Figure 8-450.

	Category	Public Action	Requester STA Address	Responder STA Address	Operating Class	Channel Number	Measurement Start Time	Measurement Duration
Octets:	1	1	6	6	1	1	8	2

Figure 8-450—DSE Measurement Request frame Action field format

The Category field is set to the value for public action defined in Table 8-38.

The Public Action field is set to indicate a DSE Measurement Request frame, as defined in Table 8-210.

The RequesterSTAAddress field is the MAC address of the requesting STA that grants enablement. The length of the RequesterSTAAddress field is 6 octets.

The ResponderSTAAddress field is the MAC address of the responding STA that operates based on the enablement. The length of the ResponderSTAAddress field is 6 octets.

The Operating Class field indicates the channel set for which the measurement request applies. The Operating Class and Channel Number fields together specify the channel frequency and channel bandwidth for which the measurement request applies. Valid values for the Operating Class field are shown in Annex E.

The Measurement Start Time field is set to the timing synchronization function (TSF) at the time (± 1 TU) at which the requested DSE request measurement starts. A value of 0 indicates it starts immediately.

The Measurement Duration field is set to the duration of the requested measurement, expressed in number of time units (TUs).

8.5.8.9 DSE Measurement Report frame format

The DSE Measurement Report frame is a Public Action frame. It is transmitted by a STA using the procedures defined in 10.12. The format of the DSE Measurement Report frame Action field is shown in Figure 8-451.

	Category	Public Action	Requester STA Address	Responder STA Address	Length	Operating Class	Channel Number	Measure-ment Report Mode	Actual Measure-ment Start Time	Measure-ment Duration	Reported DSE LCI fields
Octets:	1	1	6	6	2	1	1	1	8	2	n x 26

Figure 8-451—DSE Measurement Report frame Action field format

The Category field is set to the value for public action defined in Table 8-38.

The Public Action field is set to indicate a DSE Measurement Report frame, as defined in Table 8-210.

The RequesterSTAAddress field is the MAC address of the requesting STA that grants enablement. The length of the RequesterSTAAddress field is 6 octets.

The ResponderSTAAddress field is the MAC address of the responding STA that operates based on the enablement. The length of the ResponderSTAAddress field is 6 octets.

The Length field indicates the length of the remaining frame fields in octets, and the value is variable. The minimum value of the Length field is 13.

The Operating Class field indicates the channel set for which the measurement report applies. The Operating Class and Channel Number fields together specify the channel frequency and spacing for which the measurement request applies. Valid values for the Operating Class field are shown in Annex E.

The Measurement Report Mode field is as defined in 8.4.2.24 (see Figure 8-141).

The Actual Measurement Start Time field is set to the measuring STA’s TSF timer at the time (± 1 TU) at which the DSE measurement started.

The Measurement Duration field is set to the duration over which the requested measurement was measured, expressed in number of TUs.

The reported DSE LCI fields contain the DSE LCI received at the measuring STA. If the reported DSE LCI fields would cause the frame to exceed the maximum MAC management protocol data unit (MMPDU) size, then the reported DSE LCI fields are truncated so that the last reported DSE LCI field is complete. The DSE LCI field format is shown in Figure 8-452.

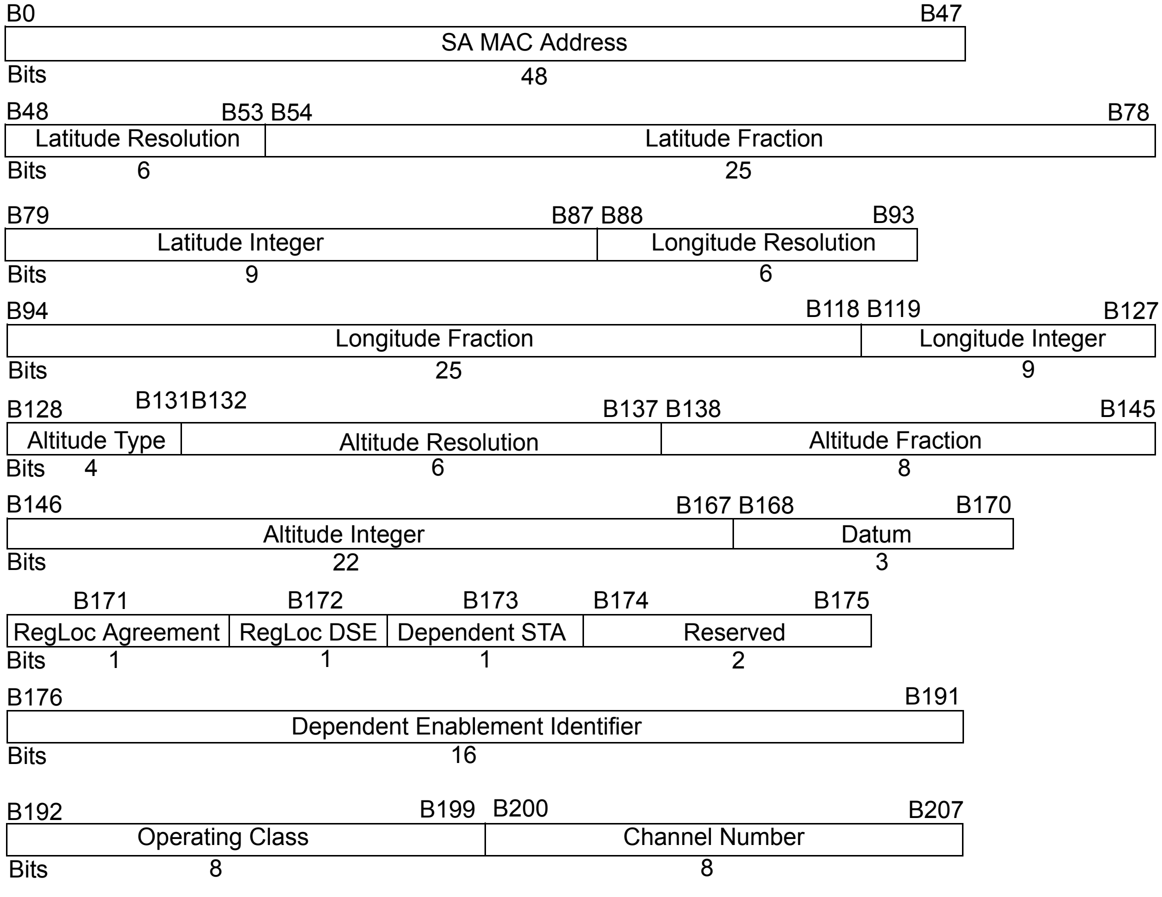

Figure 8-452—DSE LCI field format

The SA MAC Address field contains the SA MAC address from the Beacon or Public Action frame containing a DSE Registered Location element being reported.

The remaining fields are as defined in the DSE Registered Location element body (see 8.4.2.54).

8.5.8.10 DSE Power Constraint frame format

The DSE Power Constraint frame is a Public Action frame requesting that a dependent STA constrain transmit power below the regulatory limit. It is transmitted by an enabling STA as part of enablement. The format of the DSE Power Constraint frame Action field is shown in Figure 8-453.

	Category	Public Action	Requester STA Address	Responder STA Address	Reason Result Code	Local Power Constraint
Octets:	1	1	6	6	1	1

Figure 8-453—DSE Power Constraint frame Action field format

The Category field is set to the value for public action defined in Table 8-38.

The Public Action field is set to indicate a DSE Power Constraint frame, as defined in Table 8-210.

The RequesterSTAAddress field is the MAC address of the requesting STA that grants the enablement. The length of the RequesterSTAAddress field is 6 octets.

The ResponderSTAAddress field is the MAC address of the responding STA that initiates the enablement. The length of the ResponderSTAAddress field is 6 octets.

The Reason Result Code field is used to indicate the reason that a DSE Power Constraint frame was generated. The length of the Reason Result Code field is 1 octet. The reason result codes that have been allocated are shown in Table 8-215.

Table 8-215—Reason Result Code field values

Reason Result Code field value	Name	Description
0		Reserved
1		Reserved
2		Power constraint requested
3	SUCCESS	Success
4	REFUSED	Refused - no reason specified
5	INVALID_PARAMETERS	Request not successful as one or more parameters have invalid values
6-255		Reserved

The Local Power Constraint field is coded as an unsigned integer in units of decibels relative to 1 mW. The local maximum transmit power for a channel is thus defined as the maximum transmit power level specified for the channel in the Country element minus the local power constraint specified for the channel in the DSE Power Constraint frame.

8.5.8.11 Vendor Specific Public Action frame format

The Vendor Specific Public Action frame is defined for vendor-specific signaling between unassociated STAs. The format of the Action field of the Vendor Specific Public Action frame is shown in Figure 8-454.

	Category	Public Action	Organization Itentifier	Vendor Specific Content
Octets:	1	1	variable	variable

Figure 8-454—Vendor Specific Public Action frame Action field format

The Category field is set to the value indicating the Public category, as specified in Table 8-38 in 8.4.1.11.

The Public Action field is set to the value indicating Vendor Specific Public, as specified in Table 8-210 in 8.5.8.1.

The Organization Identifier field contains a public organizationally unique identifier assigned by the IEEE and is specified in 8.4.1.31. The order of the Organization Identifier field is described in 8.2.2. The length of the Organization Identifier field is variable, as specified in 8.4.1.31.

The Vendor Specific Content contains the vendor-specific fields and may include elements defined in the standard. The length of the Vendor Specific Content in a Vendor Specific Public Action frame is limited by the maximum allowed MMPDU size.

8.5.8.12 GAS Initial Request frame format

The GAS Initial Request frame is a Public Action frame. It is transmitted by a requesting STA to request information from another STA. The format of the GAS Initial Request frame body is shown in Table 8-216.

Table 8-216—GAS Initial Request frame body format

Order	Information
0	Category
1	Action
2	Dialog Token
3	Advertisement Protocol element
4	Query Request length
5	Query Request

The Category field is set to the value indicating a Public Action frame, as specified in Table 8-38.

The Action field is set to the value specified in Table 8-210 for a GAS Initial Request frame.

The Dialog Token field is defined in 8.4.1.12 and set by the requesting STA.

The Advertisement Protocol element is defined in 8.4.2.95. The Advertisement Protocol element includes exactly one Advertisement Protocol ID.

The Query Request length field is defined in Figure 8-455. The value of the Query Request length field is set to the total number of octets in the Query Request field.

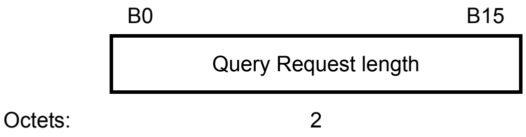

Figure 8-455—Query Request length field

The Query Request field is defined in Figure 8-456. The Query Request field is a generic container whose value is a GAS Query that is formatted in accordance with the protocol specified in the Advertisement Protocol element.

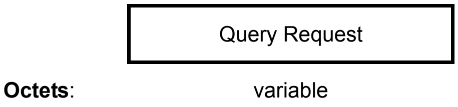

Figure 8-456—Query Request field

8.5.8.13 GAS Initial Response frame format

The GAS Initial Response frame is a Public Action frame. It is transmitted by a STA responding to a GAS Initial Request frame. The format of the GAS Initial Response frame body is shown in Table 8-217.

Table 8-217—GAS Initial Response frame body format

Order	Information
0	Category
1	Action
2	Dialog Token
3	Status Code
4	GAS Comeback Delay
5	Advertisement Protocol element
6	Query Response Length
7	Query Response (optional)

The Category field is set to the value indicating a Public Action frame, as specified in Table 8-38.

The Action field is set to the value specified in Table 8-210 for a GAS Initial Response frame.

The Dialog Token field is copied from the corresponding GAS Initial Request frame.

The Status Code values are defined in Table 8-37.

The GAS Comeback Delay field specifies the delay time value in TUs. The GAS Comeback Delay field format is provided in Figure 8-457. The behavior is described in 10.24.3.1. The value 0 will be returned by the STA when a Query Response is provided in this frame.

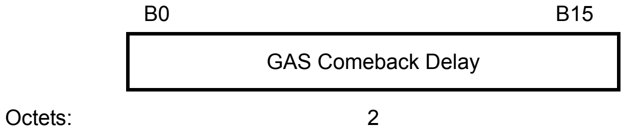

Figure 8-457—GAS Comeback Delay field

The Advertisement Protocol element is defined in 8.4.2.95. The Advertisement Protocol element includes exactly one Advertisement Protocol ID.

The Query Response Length field is defined in Figure 8-458. The value of the Query Response Length field is set to the total number of octets in the Query Response field. If the Query Response Length field is set to 0, then there is no Query Response included in this Action frame.

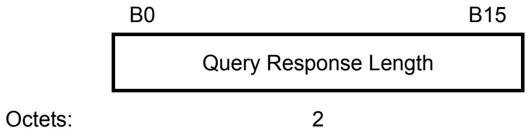

Figure 8-458—Query Response length field

The Query Response field is defined in Figure 8-459. The Query Response field is a generic container whose value is the response to a GAS Query and is formatted in accordance with the protocol specified in the Advertisement Protocol element.

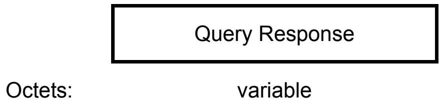

Figure 8-459—Query Response field

8.5.8.14 GAS Comeback Request frame format

The GAS Comeback Request frame is a Public Action frame. It is transmitted by a requesting STA to a responding STA. The format of the GAS Comeback Request frame body is shown in Table 8-218.

Table 8-218—GAS Comeback Request frame body format

Order	Information
0	Category
1	Action
2	Dialog Token

The Category field is set to the value indicating a Public Action frame, as specified in Table 8-38.

The Action field is set to the value specified in Table 8-210 for a GAS Comeback Request frame.

The Dialog Token field is copied from the corresponding GAS Initial Request frame.

8.5.8.15 GAS Comeback Response frame format

The GAS Comeback Response frame is a Public Action frame. It is transmitted by a responding STA to a requesting STA. The format of the GAS Comeback Response frame body is shown in Table 8-219.

Table 8-219—GAS Comeback Response frame body format

Order	Information
0	Category
1	Action
2	Dialog Token
3	Status Code
4	GAS Query Response Fragment ID
5	GAS Comeback Delay
6	Advertisement Protocol element
7	Query Response Length
8	Query Response (optional)

The Category field is set to the value indicating a Public Action frame, as specified in Table 8-38.

The Action field is set to the value specified in Table 8-210 for a GAS Comeback Response frame.

The Dialog Token field is copied from the Dialog Token field of the corresponding GAS Comeback Request frame. The same dialog token value will be present in all fragments of a multi-fragment query response.

The Status Code values are defined in Table 8-37. The same status code value will be present in all fragments of a multi-fragment query response.

The GAS Query Response Fragment ID is defined in 8.4.1.33. If the responding STA has not received a response to the query that it posted on behalf of a requesting STA, then the responding STA sets the GAS Query Response Fragment ID to 0. When there is more than one query response fragment, the responding STA sets the GAS Query Response Fragment ID to 0 for the initial fragment and increments it by 1 for each subsequent fragment in a multi-fragment Query Response. The More GAS Fragments field is set to 0 whenever the final fragment of a query response is being transmitted. A GAS Query Response Fragment ID field having a nonzero Fragment ID and the More GAS Fragments field set to 1 indicates to the requesting STA that another GAS Comeback frame exchange should be performed to continue the retrieval of the query response.

The GAS Comeback Delay field format is provided in Figure 8-457. A nonzero GAS Comeback Delay value is returned by the responding STA in this frame to indicate that the GAS Query being carried out on behalf of the requesting STA is still in progress.

- A nonzero value indicates to the requesting STA that another GAS Comeback frame exchange should be performed after expiry of the GAS Comeback Delay timer in order to retrieve the query response.
- This field is set to 0 for all GAS Comeback Response frames containing a query response or a fragment of a multi-fragment query response.

The Advertisement Protocol element is defined in 8.4.2.95. The Advertisement Protocol element includes exactly one Advertisement Protocol ID.

The Query Response Length field is defined in Figure 8-458. The value of the Query Response Length field is the total number of octets in the Query Response field. If the Query Response Length field is set to 0, then there is no Query Response included in this Action frame.

The Query Response field is defined in Figure 8-459. The value of the Query Response field is a generic container dependent on the advertisement protocol specified in the Advertisement Protocol element and the query itself. In a multi-fragment query response, the response to the query posted on behalf of a requesting STA is fragmented such that each fragment to be transmitted fits within the MMPDU size limitation.

8.5.8.16 TDLS Discovery Response frame format

The TDLS Discovery Response frame contains the information shown in Table 8-220.

Table 8-220—Information for TDLS Discovery Response frame

Order	Information	Notes
1	Category	The Category field is set to the value for Public, as defined in Table 8-38.
2	Action	The Action field is set to 14, representing TDLS Discovery Response.
3	Dialog Token	The Dialog Token is copied from the corresponding TDLS Discovery Request frame. The Dialog Token is specified in 8.4.1.12.
4	Capability	The Capability field indicates the capabilities of the STA. The Capability field is defined in 8.4.1.4.
5	Supported rates	The Supported Rates element indicates the rates which are supported by the STA. The Supported Rates element is defined in 8.4.2.3.
6	Extended supported rates	The Extended Supported Rates element is present whenever there are more than eight supported rates, and it is optional otherwise. The Extended Supported Rates element is defined in 8.4.2.15.
7	Supported Channels	The Supported Channels element is present if the TDLS channel switching capability field is equal to 1. The Supported Channels element is defined in 8.4.2.20.
8	RSNE	The RSNE is optionally present if security is required on the direct link. The RSNE is defined in 8.4.2.27.
9	Extended Capabilities	The Extended Capabilities element is optionally present if any of the fields in this element are nonzero. The Extended Capabilities element is defined in 8.4.2.29.
10	FTE	The FTE is optionally present if security is required on the direct link. The FTE is defined in 8.4.2.50.

Table 8-220—Information for TDLS Discovery Response frame *(continued)*

Order	Information	Notes
11	Timeout Interval (TPK Key Lifetime)	The Timeout Interval element contains the TPK Key Lifetime. It is present if security is required on the direct link. The Timeout Interval element is defined in 8.4.2.51.
12	Supported Operating Classes	The Supported Operating Classes element is present if the TDLS channel switching capability field is equal to 1. The Supported Operating Classes element is defined in 8.4.2.56.
13	HT Capabilities	The HT Capabilities element is present when dot11HighThroughputOptionImplemented is true. The HT Capabilities element is defined in 8.4.2.58.
14	20/40 BSS Coexistence	The 20/40 BSS Coexistence element is present when dot112040BSSCoexistenceManagementSupport is true. The 20/40 BSS Coexistence element is defined in 8.4.2.60.
15	Link Identifier	The Link Identifier element is defined in 8.4.2.64.

The TDLS Discovery Response frame is transmitted directly (i.e., not via the AP) to the TDLS peer STA that sent the corresponding TDLS Discovery Request frame. See 10.22.

8.5.8.17 Location Track Notification frame format

The Location Track Notification frame uses the Action frame body format and is transmitted by a STA to allow remote location determination to occur by another STA. The format of the Location Track Notification frame body is shown in Figure 8-460.

	Category	Action	Location Parameters Element	Measurement Report Element (optional)
Octets:	1	1	variable	variable

Figure 8-460—Location Track Notification frame format

The Category field is the value for Public Action defined Table 8-38.

The Action field is the value indicating Location Track Notification, as specified in Table 8-210.

The Location Parameters Element field contains the Location Parameters subelements, described in Table 8-153. Table 8-221 defines the allowed Location Parameters subelements for a Location Parameters element that is included in the frame.

Table 8-221—Location Parameters Element field for Location Track Notification frame

Allowed subelements	Subelement ID	Notes
Location Indication Channels	2	The Location Indication Channels subelement is included in the Location Track Notification frame.
Radio Information	4	The Radio Information subelement is included in the Location Track Notification frame.

Table 8-221—Location Parameters Element field for Location Track Notification frame *(continued)*

Allowed subelements	Subelement ID	Notes
Motion	5	The Motion subelement is included in the Location Track Notification frame if dot11MgmtOptionMotionDetectionActivated is true.
Time of Departure	7	The Time of Departure subelement is included in the Location Track Notification frame if dot11MgmtOptionTODActivated is true.
Location Indication Options	8	The Location Indication Options subelement is included in the Location Track Notification frame if the successful Location Configuration Request frame that configured the STA included a Location Indication Options subelement.
Vendor Specific	221	The Vendor Specific subelement may be included in the Location Track Notification frame.

The Measurement Report Element field contains a Measurement Report element of type Beacon Report as defined in 8.4.2.24.7. The Measurement Report Element field is included in the Location Track Notification frame if the Location Parameters Element field contains a Location Indication Options subelement. The Measurement Report element Measurement Token field is set to the same value of the Dialog Token in the Location Configuration Request frame that configured the STA.

8.5.9 FT Action frame details

8.5.9.1 General

Four Action frame formats are defined to support fast BSS transitions over the DS, which are initiated through the currently associated AP. The FT Action frames are sent over the air between the STA and the current AP. The Action frame is used as a transport mechanism for data that are destined for the target AP. An FT Action field, in the octet immediately after the Category field, differentiates the FT Action frame formats. The FT Action field values associated with each FT Action frame format are defined in Table 8-222.

Table 8-222—FT Action field values

FT Action field value	Description
0	Reserved
1	FT Request frames
2	FT Response frames
3	FT Confirm frames
4	FT Ack frames
5–255	Reserved

8.5.9.2 FT Request frame

The FT Request frame is sent by the STA to its associated AP to initiate an over-the-DS fast BSS transition.

Figure 8-461 shows the format of the FT Request frame Action field.

	Category	FT Action	STA Address	Target AP Address	FT Request frame body
Octets:	1	1	6	6	variable

Figure 8-461—FT Request frame Action field format

The Category field is set to the value given in 8.4.1.11 for FT Action frames.

The FT Action field is set to the value given in Table 8-222 for FT Request frames.

The STA Address field is set to the FTO’s MAC address.

The Target AP Address field is set to the BSSID value of the target AP.

The FT Request frame body contains the information shown in Table 8-223.

Table 8-223—FT Request frame body

Order	Information	Notes
1	RSN	A RSNE is present if dot11RSNAActivated is true.
2	Mobility Domain	The MDE is present.
3	Fast BSS Transition	An FTE is present if dot11RSNAActivated is true.

The usage of these elements is defined in 12.8.2.

8.5.9.3 FT Response frame

The FT Response frame is transmitted by the currently associated AP as a response to the STA’s FT Request frame. Figure 8-462 shows the format of the FT Response frame Action field.

	Category	FT Action	STA Address	Target AP Address	Status Code	FT Response frame body
Octets:	1	1	6	6	2	variable

Figure 8-462—FT Response frame Action field format

The Category field is set to the value given in 8.4.1.11 for FT Action frames.

The FT Action field is set to the value given in Table 8-222 for FT Response frames.

The STA Address field is set to the FTO’s MAC address.

The Target AP Address field is set to the BSSID value of the target AP.

The Status Code field is a value from the options listed in 8.4.1.9.

If the Status Code field is 0, then the FT Response frame body contains the information shown in Table 8-224.

Table 8-224—FT Response frame body

Order	Information	Notes
1	RSN	The RSNE is present if dot11RSNAActivated is true.
2	Mobility Domain	The MDE is present.
3	Fast BSS Transition	An FTE is present if dot11RSNAActivated is true.

The usage of these elements is defined in 12.8.3.

8.5.9.4 FT Confirm frame

The FT Confirm frame in an RSN is confirmation to the target AP of receipt of the ANonce and indicates the liveness of the PTKSA. The FT Confirm frame is optionally used by the FTO to request resources. Figure 8-463 shows the FT Confirm frame Action field format.

	Category	FT Action	STA Address	Target AP Address	FT Confirm frame body
Octets:	1	1	6	6	variable

Figure 8-463—FT Confirm frame Action field format

The Category field is set to the value given in 8.4.1.11 for FT Action frames.

The FT Action field is set to the value given in Table 8-222 for FT Confirm frames.

The STA Address field is set to the FTO's MAC address.

The Target AP Address field is set to the BSSID value of the target AP.

The FT Confirm frame body contains the information shown in Table 8-225.

Table 8-225—FT Confirm frame body

Order	Information	Notes
1	RSN	The RSNE is present if dot11RSNAActivated is true.
2	Mobility Domain	The MDE is present.
3	Fast BSS Transition	An FTE is present if dot11RSNAActivated is true.
4	RIC	The RIC Request field is present if resources are being requested.

The usage of these elements is defined in 12.8.4.

8.5.9.5 FT Ack frame

The FT Ack frame is transmitted by the currently associated AP as a response to the STA’s FT Confirm frame. Figure 8-464 shows the FT Ack frame Action field format.

	Category	FT Action	STA Address	Target AP Address	Status Code	FT Ack frame body
Octets	1	1	6	6	2	variable

Figure 8-464—FT Ack frame Action field format

The Category field is set to the value given in 8.4.1.11 for FT Action frames.

The FT Action field is set to the value given in Table 8-222 for FT Ack frames.

The STA Address field is set to the FTO’s MAC address.

The Target AP Address field is set to the BSSID value of the target AP.

The Status Code field is a value from the options listed in 8.4.1.9.

If the Status Code field is 0, then the FT Ack frame body contains the information shown in Table 8-226.

Table 8-226—FT Ack frame body

Order	Information	Notes
1	RSN	The RSNE is present if dot11RSNAActivated is true.
2	Mobility Domain	The MDE is present.
3	Fast BSS Transition	An FTE is present if dot11RSNAActivated is true.
4	Timeout Interval (reassociation deadline)	A TIE containing the reassociation deadline interval is present if resources were requested in the FT Confirm frame and dot11RSNAActivated is false.
5	RIC	The RIC Response field is present if resources were requested in the FT Confirm frame.

The usage of these elements is defined in 12.8.5.

8.5.10 SA Query Action frame details

8.5.10.1 General

Two Action frame formats are defined for the SA Query procedure. A SA Query Action field, in the octet field immediately after the Category field, differentiates the formats. The Action field values associated with each frame format are defined in Table 8-227.

NOTE—The SA query functionality defined in this standard is used to prevent the Association Lockout problem (defined in 10.3).

Table 8-227—SA Query Action field values

SA Query Action field value	Description
0	SA Query Request
1	SA Query Response

8.5.10.2 SA Query Request frame

The SA Query Request frame is used to request a SA Query Response from the receiving STA. The format of the Action field is shown in Figure 8-465.

	Category	SA Query Action	Transaction Identifier
Octets:	1	1	2

Figure 8-465—SA Query Request frame Action field format

The Category field is set to the value indicating the SA Query category, as specified in Table 8-38 in 8.4.1.11.

The SA Query Action field is set to the value indicating SA Query Request frame, as specified in Table 8-227 in 8.5.10.

The Transaction Identifier field is a 16-bit non-negative counter value set by the STA sending the SA Query Request frame to identify any outstanding request/response transaction.

8.5.10.3 SA Query Response frame

The SA Query Response frame is used to respond to an SA Query Request frame from another STA. The format of the Action field is shown in Figure 8-466.

	Category	SA Query Action	Transaction Identifier
Octets:	1	1	2

Figure 8-466—SA Query Response frame Action field format

The Category field is set to the value indicating the SA Query category, as specified in Table 8-38 in 8.4.1.11.

The SA Query Action field is set to the value indicating SA Query Response frame, as specified in Table 8-227 in 8.5.10.

The Transaction Identifier field is set to the same value as the Transaction Identifier field in the corresponding SA Query Request frame.

8.5.11 Protected Dual of Public Action frames

The Protected Dual of Public Action frame is defined to allow robust STA-STA communications of the same information that is conveyed in Action frames that are not robust (see 8.4.1.11). A Public Action field, in the octet immediately after the Category field, differentiates the Protected Dual of Public Action frame formats. The defined Protected Dual of Public Action frames are listed in Table 8-228.

The Protected Dual of Public Action frames have the same format as the corresponding nonprotected Public Action frame.

Table 8-228—Public Action field values defined for Protected Dual of Public Action frames

Public Action field value	Description	Defined in
0	Reserved	
1	Protected DSE Enablement	8.5.8.4
2	Protected DSE Deenablement	8.5.8.5
3	Reserved	
4	Protected Extended Channel Switch Announcement	8.5.8.7
5	Protected Measurement Request	8.5.8.8
6	Protected Measurement Report	8.5.8.9
7	Reserved	
8	Protected DSE Power Constraint	8.5.8.10
9	Protected Vendor Specific	8.5.8.11
10	Protected GAS Initial Request	8.5.8.12
11	Protected GAS Initial Response	8.5.8.13
12	Protected GAS Comeback Request	8.5.8.14
13	Protected GAS Comeback Response	8.5.8.15
14–255	Reserved	

8.5.12 HT Action frame details

8.5.12.1 HT Action field

Several Action frame formats are defined to support HT features. An HT Action field, in the octet immediately after the Category field, differentiates the HT Action frame formats. The HT Action field values associated with each frame format within the HT category are defined in Table 8-229. The frame formats are defined in 8.5.12.2 through 8.5.12.9.

Table 8-229—HT Action field values

HT Action field value	Meaning	Time priority
0	Notify Channel Width	No
1	SM Power Save	No

Table 8-229—HT Action field values *(continued)*

HT Action field value	Meaning	Time priority
2	PSMP	Yes
3	Set PCO Phase	Yes
4	CSI	Yes
5	Noncompressed Beamforming	Yes
6	Compressed Beamforming	Yes
7	ASEL Indices Feedback	Yes
8–255	Reserved	—

8.5.12.2 Notify Channel Width frame format

A STA sends the Notify Channel Width frame to another STA if it wants to change the channel width of frames that the other STA sends to it. See definition in 10.15.2.

The format of the Notify Channel Width frame Action field is defined in Table 8-230.

Table 8-230—Notify Channel Width frame Action field format

Order	Information
1	Category
2	HT Action
3	Channel Width (see 8.4.1.21)

This frame can be sent by both non-AP STA and AP. If an AP wishes to receive 20 MHz packets, it broadcasts this Action frame to all STAs in the BSS. In addition, the AP indicates its current STA channel width in the HT Operation element in the beacon.

The Category field is set to the value for HT, specified in 8-38.

The HT Action field is set to the value for Notify Channel Width, specified in Table 8-229.

8.5.12.3 SM Power Save frame format

The SM Power Save frame is of category HT. The SM Power Save frame is used to manage SM power-saving state transitions as defined in 10.2.4.

The Action field of the SM Power Save frame is defined in Table 8-231.

Table 8-231—SM Power Save frame Action field format

Order	Information
1	Category
2	HT Action
3	SM Power Control (see 8.4.1.22)

The Category field is set to the value for HT, specified in Table 8-38.

The HT Action field is set to the value for SM Power Save, specified in Table 8-229.

8.5.12.4 PSMP frame format

PSMP is an Action frame of category HT.

The DA field of this frame is a group address. (See 9.26.1.8.)

The PSMP Parameter Set field and PSMP STA Info fields define zero or more PSMP-DTT and PSMP-UTT time allocations that follow immediately after the PSMP frame.

The Action field of this frame is defined in Table 8-232. The PSMP Parameter Set field is followed by zero or more PSMP STA Info fields.

Table 8-232—PSMP frame Action field format

Order	Information
1	Category
2	HT Action
3	PSMP Parameter Set (see 8.4.1.24)
4 to (N_STA+3)	PSMP STA Info (see 8.4.1.25) Repeated N_STA times (N_STA is a subfield of the PSMP Parameter Set field)

The Category field is set to the value for HT, specified in Table 8-38.

The HT Action field is set to the value for PSMP, specified in Table 8-229.

The PSMP STA Info fields within a PSMP frame are ordered by STA_INFO Type as follows: group addressed (STA_INFO Type=1) and then individually addressed (STA_INFO Type=2).

8.5.12.5 Set PCO Phase frame format

Set PCO Phase is an Action frame of category HT that announces the phase change between 20 MHz and 40 MHz. The format of its Action field is defined in Table 8-233. The operation of the PCO feature is defined in 10.16.

Table 8-233—Set PCO Phase frame Action field format

Order	Information
1	Category
2	HT Action
3	PCO Phase Control (see 8.4.1.23)

The Category field is set to the value for HT, specified in Table 8-38.

The HT Action field is set to the value for Set PCO Phase, specified in Table 8-229.

This frame is sent by a PCO active AP.

8.5.12.6 CSI frame format

The CSI frame is an Action or an Action No Ack frame of category HT. The format of its Action field is defined in Table 8-234.

Table 8-234—CSI frame Action field format

Order	Information
1	Category
2	HT Action
3	MIMO Control (see 8.4.1.26)
4	CSI Report (see 8.4.1.27)

The Category field is set to the value for HT, specified in Table 8-38.

The HT Action field is set to the value for CSI, specified in Table 8-229.

In a CSI frame, the fields of the MIMO Control field (see 8.4.1.26) are used as described in Table 8-42. The Codebook Information subfield is reserved in this frame.

8.5.12.7 Noncompressed Beamforming frame format

The Noncompressed Beamforming frame is an Action or an Action No Ack frame of category HT. The format of its Action field is defined in Table 8-235.

Table 8-235—Noncompressed Beamforming frame Action field format

Order	Information
1	Category
2	HT Action
3	MIMO Control (see 8.4.1.26)
4	Noncompressed Beamforming Report (see 8.4.1.28)

The Category field is set to the value for HT, specified in Table 8-38.

The HT Action field is set to the value for Noncompressed Beamforming, specified in Table 8-229.

In a Noncompressed Beamforming frame, the fields of the MIMO Control field (see 8.4.1.26) are used as described in Table 8-42. The Codebook Information subfield is reserved in this frame.

8.5.12.8 Compressed Beamforming frame format

The Compressed Beamforming frame is an Action or an Action No Ack frame of category HT. The format of its Action field is defined in Table 8-236.

Table 8-236—Compressed Beamforming frame Action field format

Order	Information
1	Category
2	HT Action
3	MIMO Control (see 8.4.1.26)
4	Compressed Beamforming Report (see 8.4.1.29)

The Category field is set to the value for HT, specified in Table 8-38.

The HT Action field is set to the value for Compressed Beamforming, specified in Table 8-229.

In a Compressed Beamforming frame, the fields of the MIMO Control field (see 8.4.1.26) are used as described in Table 8-42. The Coefficient Size subfield is reserved in this frame.

8.5.12.9 Antenna Selection Indices Feedback frame format

The Antenna Selection Indices Feedback frame is an Action or Action No Ack frame of category HT. The format of its Action field is defined in Table 8-237.

Table 8-237—Antenna Selection Indices Feedback frame Action field format

Order	Information
1	Category
2	HT Action
3	Antenna Selection Indices (see 8.4.1.30)

The Category field is set to the value for HT, specified in Table 8-38.

The HT Action field is set to the value for ASEL Indices Feedback, specified in Table 8-229.

8.5.13 TDLS Action field formats

8.5.13.1 General

Several Action field formats are defined to support TDLS. A TDLS Action field, in the octet immediately after the Category field, differentiates the TDLS Action field formats. The TDLS Action field values associated with each Action field format within the TDLS category are defined in Table 8-238.

Table 8-238—TDLS Action field values

Action field value	Meaning
0	TDLS Setup Request
1	TDLS Setup Response
2	TDLS Setup Confirm
3	TDLS Teardown
4	TDLS Peer Traffic Indication
5	TDLS Channel Switch Request
6	TDLS Channel Switch Response
7	TDLS Peer PSM Request
8	TDLS Peer PSM Response
9	TDLS Peer Traffic Response
10	TDLS Discovery Request
11–255	Reserved

References to one of the TDLS Action field values as a frame, e.g., “TDLS Setup Request frame,” denote a Data frame carrying a TDLS Action Field and any vendor-specific elements tunneled as described in 10.22.1.

8.5.13.2 TDLS Setup Request Action field format

The Action field of a TDLS Setup Request Action field contains the information shown in Table 8-239.

Table 8-239—Information for TDLS Setup Request Action field

Order	Information	Notes
1	Category	The Category field is set to the value for TDLS, as defined in Table 8-38.
2	Action	The Action field is set to 0, representing TDLS Setup Request.
3	Dialog Token	The Dialog Token field contains a unique nonzero value for the conversation between the STAs involved in this request. The Dialog Token is specified in 8.4.1.12.
4	Capability	The Capability field indicates the capabilities of the STA. The Capability field is defined in 8.4.1.4.

Table 8-239—Information for TDLS Setup Request Action field *(continued)*

Order	Information	Notes
5	Supported rates	The Supported Rates element indicates the rates that are supported by the STA. The Supported Rates element is defined in 8.4.2.3.
6	Country	The Country element is present when dot11MultiDomainCapabilityActivated is true or dot11SpectrumManagementRequired is true. The Country element is defined in 8.4.2.10.
7	Extended supported rates	The Extended Supported Rates element is present whenever there are more than eight supported rates, and it is optionally present otherwise. The Extended Supported Rates element is defined in 8.4.2.15.
8	Supported Channels	The Supported Channels element is present if the TDLS channel switching capability field is equal to 1. The Supported Channels element is defined in 8.4.2.20.
9	RSNE	The RSNE is present if security is required on the direct link. The RSNE is defined in 8.4.2.27.
10	Extended Capabilities	The Extended Capabilities element is optionally present if any of the fields in this element are nonzero. The Extended Capabilities element is defined in 8.4.2.29.
11	QoS Capability	The QoS Capability element is present when dot11QosOptionImplemented is true and not present otherwise. The QoS Capability element is defined in 8.4.2.37.
12	FTE	The FTE is present if security is required on the TDLS direct link. The FTE is defined in 8.4.2.50.
13	Timeout Interval (TPK Key Lifetime)	The Timeout Interval element contains the TPK Key Lifetime and is present if security is required on the direct link. The Timeout Interval element is defined in 8.4.2.51.
14	Supported Operating Classes	The Supported Operating Classes element is present if the TDLS channel switching capability field is equal to 1. The Supported Operating Classes element is defined in 8.4.2.56 (optional).
15	HT Capabilities	The HT Capabilities element is defined in 8.4.2.58. The HT Capabilities element is present when dot11HighThroughputOptionImplemented is true.
16	20/40 BSS Coexistence	The 20/40 BSS Coexistence element is defined in 8.4.2.62. The 20/40 BSS Coexistence element is optionally present.
17	Link Identifier	The Link Identifier element is specified in 8.4.2.64.

The TDLS Setup Request Action field is encapsulated in a Data frame and transmitted to the recipient STA through the AP to request the setup of a TDLS direct link. See 10.22.

8.5.13.3 TDLS Setup Response Action field format

The Action field of a TDLS Setup Response Action field contains the information shown in Table 8-240.

Table 8-240—Information for TDLS Setup Response Action field

Order	Information	Notes
1	Category	The Category field is set to the value for TDLS, as defined in Table 8-38.
2	Action	The Action field is set to 1, representing TDLS Setup Response.
3	Status Code	The Status Code is defined in 8.4.1.9.
4	Dialog Token	The Dialog Token is copied from the corresponding TDLS Setup Request. The Dialog Token is specified in 8.4.1.12.
5	Capability	The Capability field indicates the capabilities of the STA and is present when the Status Code is 0 (successful), and is not present otherwise. The Capability field is defined in 8.4.1.4.
6	Supported rates	The Supported Rates element indicates the rates that are supported by the STA and is present when the Status Code is 0 (successful), and is not present otherwise.The Supported Rates element is defined in 8.4.2.3.
7	Country	The Country element is present when Status Code is 0 and either dot11MultiDomainCapabilityActivated is true or dot11SpectrumManagementRequired is true, and is not present otherwise. The Country element is defined in 8.4.2.10
8	Extended supported rates	The Extended Supported Rates element is present when there are more than 8 supported rates and Status Code is 0. It is optionally present when there are less than 8 supported rates and Status Code is 0. Otherwise it is not present. The Extended Supported Rates element is defined in 8.4.2.15.
9	Supported Channels	The Supported Channels element is defined in 8.4.2.20. It is present if the TDLS channel switching capability bit is equal to 1 and the Status Code is 0 (Successful), and not present otherwise.
10	RSNE	The RSNE is present if security is required on the TDLS direct link and the Status Code is 0 (successful), and not present otherwise. The RSNE is defined in 8.4.2.27.
11	Extended Capabilities	The Extended Capabilities element is present if any of the fields in this element are nonzero and the Status Code is 0 (Successful), and not present otherwise. The Extended Capabilities element is defined in 8.4.2.29.
12	QoS Capability	The QoS Capability element is present when dot11QosOptionImplemented is true and the Status Code is 0 (Successful) and not present otherwise. The QoS Capability element is defined in 8.4.2.37.
13	FTE	The FTE is present if security is required on the TDLS direct link and the Status Code is 0 (Successful), and not present otherwise. The FTE is defined in 8.4.2.50.
14	Timeout Interval (TPK Key Lifetime)	The Timeout Interval element, containing the TPK Key Lifetime, is present if security is required on the direct link and the Status Code is 0 (successful), and not present otherwise. The Timeout Interval element is defined in 8.4.2.51.
15	Supported Operating Classes	The Supported Operating Classes element is present if the TDLS channel switching capability bit is equal to 1 and the Status Code is 0 (successful) and not present otherwise. The Supported Operating Classes element is defined in 8.4.2.56.

Table 8-240—Information for TDLS Setup Response Action field *(continued)*

Order	Information	Notes
16	HT Capabilities	The HT Capabilities element is present if dot11HighThroughputOptionImplemented is true and the Status Code is 0 (successful) and is not present otherwise. The HT Capabilities element is defined in 8.4.2.58.
17	20/40 BSS Coexistence	The 20/40 BSS Coexistence element is optionally present if the Status Code is 0 and not present otherwise. The 20/40 BSS Coexistence element is defined in 8.4.2.62.
18	Link Identifier	The Link Identifier element is present if the Status Code is 0. The Link Identifier is specified in 8.4.2.64.

The TDLS Setup Response Action field is encapsulated in a Data frame and transmitted to the TDLS initiator STA through the AP in response to a received TDLS Setup Request Action field. See 10.22.

8.5.13.4 TDLS Setup Confirm Action field format

The Action field of a TDLS Setup Confirm Action field contains the information shown in Table 8-241.

Table 8-241—Information for TDLS Setup Confirm Action field

Order	Information	Notes
1	Category	The Category field is set to the value for TDLS, as defined in Table 8-38.
2	Action	The Action field is set to 2, representing TDLS Setup Confirm.
3	Status Code	The Status Code is defined in 8.4.1.9.
4	Dialog Token	The Dialog Token is copied from the corresponding TDLS Setup Response. The Dialog Token is specified in 8.4.1.12.
5	RSNE	The RSNE is present if security is required on the TDLS direct link and the Status Code is 0 (successful), and not present otherwise. The RSNE is defined in 8.4.2.27.
6	EDCA Parameter Set	The EDCA parameter set is present if QoS is supported on the direct link. The EDCA Parameter Set element is specified in 8.4.2.31. It is present for Status Code 0 (Successful).
7	FTE	The FTE is defined in 8.4.2.50. The FTE is present if security is required on the TDLS direct link and the Status Code is 0 (Successful), and not present otherwise.
8	Timeout Interval (TPK Key Lifetime)	The Timeout Interval element is defined in 8.4.2.51. The Timeout Interval, containing the TPK Key Lifetime, is present if security is required on the direct link and the Status Code is 0 (successful), and not present otherwise.
9	HT Operation	The HT Operation element is present if dot11HighThroughputOptionImplemented is true, the TDLS Setup Response Action field contained an HT Capabilities element, the Status Code is 0 (success), and the BSS does not support HT. The HT Operation element is defined in 8.4.2.59.
10	Link Identifier	The Link Identifier is specified in 8.4.2.64. It is present if the Status Code is 0.

The TDLS Setup Confirm Action field is encapsulated in a Data frame and transmitted to the TDLS responder STA through the AP in response to a received TDLS Setup Response Action field. See 10.22.

8.5.13.5 TDLS Teardown Action field format

The Action field of a TDLS Teardown Action field contains the information shown in Table 8-242.

Table 8-242—Information for TDLS Teardown Action field

Order	Information	Notes
1	Category	The Category field is set to the value for TDLS, as defined in Table 8-38.
2	Action	The Action field is set to 3, representing TDLS Teardown.
3	Reason Code	The Reason Code is defined in 8.4.1.7.
4	FTE	The FTE is present if a TPK handshake was successful for this session (optional). The FTE is defined in 8.4.2.50.
5	Link Identifier	The Link Identifier is specified in 8.4.2.64.

The TDLS Teardown Action field is encapsulated in a Data frame and transmitted to the TDLS peer STA directly or through the AP to tear down a TDLS direct link. See 10.22.

8.5.13.6 TDLS Peer Traffic Indication Action field format

The Action field of a TDLS Peer Traffic Indication Action field contains the information shown in Table 8-243.

Table 8-243—Information for TDLS Peer Traffic Indication Action field

Order	Information	Notes
1	Category	The Category field is set to the value for , as defined in Table 8-38
2	Action	The Action field is set to 4, representing Peer Traffic Indication.
3	Dialog Token	The Dialog Token is specified in 8.4.1.12.
4	Link Identifier	The Link Identifier is specified in 8.4.2.64.
5	PTI Control	The PTI Control element is optionally present. It is defined in 8.4.2.67.
6	TPU Buffer Status	The TPU Buffer Status element is defined in 8.4.2.68.

The TDLS Peer Traffic Indication Action field indicates the state of the power save buffer at the STA supporting TDLS Peer U-APSD that is buffering data for a TDLS peer STA in power save mode.

The TPU Buffer Status element indicates the status of the AC buffers at the TPU buffer STA.

The PTI Control element is optionally included in the TDLS Peer Traffic Indication Action field (see 10.2.1.15) to identify the latest MPDU transmitted to the TPU sleep STA that is the destination of the TDLS Peer Traffic Indication Action field.

The TDLS Peer Traffic Indication Action field is encapsulated in a Data frame and transmitted to the TDLS peer STA through the AP. See 10.2.1.15.

8.5.13.7 TDLS Channel Switch Request Action field format

The Action field of the TDLS Channel Switch Request Action field contains the information shown in Table 8-244.

Table 8-244—Information for TDLS Channel Switch Request Action field

Order	Information	Notes
1	Category	The Category field is set to the value for TDLS, as defined in Table 8-38.
2	Action	The Action field is set to 5, representing TDLS Channel Switch Request.
3	Target Channel	1 octet field that specifies the channel number of the target channel. See 8.4.1.35.
4	Operating Class	1 octet field that specifies the operating class for the target channel. The Operating Channel field is defined in 8.4.1.36.
5	Secondary Channel Offset	The secondary channel offset is present if a switch to a 40 MHz direct link is indicated and is absent otherwise. See 8.4.2.22.
6	Link Identifier	The Link Identifier element is specified in 8.4.2.64.
7	Channel Switch Timing	The Channel Switch Timing element is specified in 8.4.2.66.

The TDLS Channel Switch Request Action field is encapsulated in a Data frame and transmitted directly to the TDLS peer STA to request for the TDLS direct link to be switched to another channel. See 10.22.

8.5.13.8 TDLS Channel Switch Response Action field format

The Action field of the TDLS Channel Switch Response Action field contains the information shown in Table 8-245.

Table 8-245—Information for TDLS Channel Switch Response Action field

Order	Information	Notes
1	Category	The Category field is set to the value for TDLS, as defined in Table 8-38.
2	Action	The Action field is set to 6, representing TDLS Channel Switch Response.
3	Status Code	The Status Code is defined in 8.4.1.9.
5	Link Identifier	The Link Identifier element is specified in 8.4.2.64. It is present if the Status Code is 0.
6	Channel Switch Timing	The Channel Switch Timing element is specified in 8.4.2.66.

The TDLS Channel Switch Response Action field is encapsulated in a Data frame and transmitted directly to the TDLS peer STA in response to a received TDLS Channel Switch Request Action field. See 10.22.

8.5.13.9 TDLS Peer PSM Request Action field format

The TDLS Peer PSM Request Action field contains the information shown in Table 8-246.

Table 8-246—Information for TDLS Peer PSM Request Action field

Order	Information	Notes
1	Category	The Category field is set to the value for TDLS, as defined in Table 8-38.
2	Action	The Action field is set to 7, representing TDLS Peer PSM Request.
3	Dialog Token	The Dialog Token contains a value that is unique among TDLS Peer PSM Request Action fields for which a corresponding TDLS Peer PSM Response Action field has not been received. The Dialog Token is specified in 8.4.1.12.
4	Link Identifier	The Link Identifier element is specified in 8.4.2.64.
5	Wakeup Schedule	The Wakeup Schedule element is specified in 8.4.2.65.

The TDLS Peer PSM Request Action field is encapsulated in a Data frame and transmitted to the TDLS peer STA, directly or through the AP, to setup or change a periodic wakeup schedule on the TDLS direct link. See 10.2.1.14.

8.5.13.10 TDLS Peer PSM Response Action field format

The TDLS Peer PSM Response Action field contains the information shown in Table 8-247.

Table 8-247—Information for TDLS Peer PSM Response Action field

Order	Information	Notes
1	Category	The Category field is set to the value for TDLS, as defined in Table 8-38.
2	Action	The Action field is set to 8, representing TDLS Peer PSM Response.
3	Dialog Token	The Dialog Token is set to the value contained in the corresponding TDLS Peer PSM Request Action field. The Dialog Token is specified in 8.4.1.12.
4	Status Code	The Status Code is specified in 8.4.1.9.
5	Link Identifier	The Link Identifier element is specified in 8.4.2.64. It is present if the Status Code is 0.
6	Wakeup Schedule	The Wakeup Schedule element is present is present if the status code is set to 2 (“TDLS Wakeup Schedule rejected but alternative schedule provided”) and is not present otherwise. The Wakeup Schedule is specified in 8.4.2.65.

The TDLS Peer PSM Response Action field is encapsulated in a Data frame and transmitted to the TDLS peer STA directly in response to a TDLS Peer PSM Request Action field. See 10.2.1.14.

8.5.13.11 TDLS Peer Traffic Response Action field format

The Action field of a TDLS Peer Traffic Response Action field contains the information shown in Table 8-248.

Table 8-248—Information for TDLS Peer Traffic Response Action field

Order	Information	Notes
1	Category	The Category field is set to the value for TDLS, as defined in Table 8-38.
2	Action	The Action field is set to 9, representing TDLS Peer Traffic Response.
3	Dialog Token	The Dialog Token is specified in 8.4.1.12.
4	Link Identifier	The Link Identifier element is specified in 8.4.2.64.

The TDLS Peer Traffic Response Action field indicates the receipt of the corresponding TDLS Peer Traffic Indication Action field.

The Dialog Token field is set to the nonzero value of the corresponding TDLS Peer Traffic Indication Action field.

The Link Identifier field is set to identify the TDLS direct link in relation to which the TDLS Peer Traffic Response Action field is transmitted.

The Peer Traffic Response Action field is encapsulated in a Data frame and transmitted to the TDLS peer STA directly. See 10.2.1.15.

8.5.13.12 TDLS Discovery Request Action field format

The TDLS Discovery Request Action field contains the information shown in Table 8-249.

Table 8-249—Information for TDLS Discovery Request Action field

Order	Information	Notes
1	Category	The Category field is set to the value for TDLS, as defined in Table 8-38.
2	Action	The Action field is set to 10, representing TDLS Discovery Request.
3	Dialog Token	The Dialog Token can be used to match TDLS Discovery Response frames to the corresponding TDLS Discovery Request frame. The Dialog Token is specified in 8.4.1.12.
4	Link Identifier	The Link Identifier element is specified in 8.4.2.64.

The TDLS Discovery Request Action field is encapsulated in a Data frame and transmitted to a TDLS peer STA through the AP, to request TDLS capable STAs in the same BSS to respond with a TDLS Discovery Response frame. See 10.22.

8.5.14 WNM Action details

8.5.14.1 WNM Action fields

Several Action frame formats are defined for wireless network management (WNM) purposes. An Action field, in the octet field immediately after the Category field, differentiates the formats. The Action field values associated with each frame format are defined in Table 8-250.

Table 8-250—WNM Action field values

Action field value	Description
0	Event Request
1	Event Report
2	Diagnostic Request
3	Diagnostic Report
4	Location Configuration Request
5	Location Configuration Response
6	BSS Transition Management Query
7	BSS Transition Management Request
8	BSS Transition Management Response
9	FMS Request
10	FMS Response
11	Collocated Interference Request
12	Collocated Interference Report
13	TFS Request
14	TFS Response
15	TFS Notify
16	WNM-Sleep Mode Request
17	WNM-Sleep Mode Response
18	TIM Broadcast Request
19	TIM Broadcast Response
20	QoS Traffic Capability Update
21	Channel Usage Request
22	Channel Usage Response
23	DMS Request
24	DMS Response
25	Timing Measurement Request
26	WNM-Notification Request

Table 8-250—WNM Action field values *(continued)*

Action field value	Description
27	WNM-Notification Response
28–255	Reserved

8.5.14.2 Event Request frame format

The Event Request frame uses the Action frame body format and is transmitted by a STA to request another STA to report one or more events. The format of the frame is shown in Figure 8-467.

	Category	Action	Dialog Token	Event Request Elements	Destination URI Element (optional)
Octets:	1	1	1	variable	variable

Figure 8-467—Event Request frame body format

The Category field is the value indicating the WNM category, as specified in Table 8-38 in 8.4.1.11.

The Action field is the value indicating Event Request frame, as specified in Table 8-250 in 8.5.14.1.

The Dialog Token field is a nonzero value chosen by the STA sending the event request to identify the request/report transaction.

The Event Request Elements field contains one or more of the Event Request elements described in 8.4.2.69.

The Destination URI element field contains zero or one Destination URI element described in 8.4.2.92.

8.5.14.3 Event Report frame format

The Event Report frame uses the Action frame body format and is transmitted by a STA in response to an Event Request frame, or autonomously. The format of the Event Report frame body is shown in Figure 8-468.

	Category	Action	Dialog Token	Event Report Elements
Octets:	1	1	1	variable

Figure 8-468—Event Report frame body format

The Category field is the value indicating the WNM category, as specified in Table 8-38 in 8.4.1.11.

The Action field is the value indicating Event Report, as specified in Table 8-250 in 8.5.14.1.

The Dialog Token field is the nonzero value of the corresponding Event Request frame. If the Event Report frame is being transmitted other than in response to an Event Request frame, then the Dialog token is 0.

The Event Report Elements field contains one or more of the Event Report elements described in 8.4.2.70.

8.5.14.4 Diagnostic Request frame format

The Diagnostic Request frame uses the Action frame body format and is transmitted by a STA requesting the receiving STA to execute a diagnostic test. The format of the frame is shown in Figure 8-469.

	Category	Action	Dialog Token	Diagnostic Request Elements	Destination URI Element (optional)
Octets:	1	1	1	variable	variable

Figure 8-469—Diagnostic Request frame body format

The Category field is the value indicating the WNM category, as specified in Table 8-38 in 8.4.1.11.

The Action field is the value indicating Diagnostic Request frame, as specified in Table 8-250 in 8.5.14.1.

The Dialog Token field is a nonzero value chosen by the STA sending the Diagnostic request frame to identify the request/report transaction.

The Diagnostic Request Elements field contains one or more of the Diagnostic Request elements described in 8.4.2.71. The number and length of the Diagnostic Request elements in a Diagnostic Request frame is limited by the maximum MMPDU size (see 8.3.3.1).

The Destination URI element field contains zero or one Destination URI element described in 8.4.2.92.

8.5.14.5 Diagnostic Report frame format

The Diagnostic Report frame uses the Action frame body format transmitted by a STA in response to a Diagnostic Request frame. The format of the Diagnostic Report frame body is shown in Figure 8-470.

	Category	Action	Dialog Token	Diagnostic Report Elements
Octets:	1	1	1	variable

Figure 8-470—Diagnostic Report frame body format

The Category field is the value indicating the WNM category, as specified in Table 8-38 in 8.4.1.11.

The Action field is the value indicating Diagnostic Report, as specified in Table 8-250 in 8.5.14.1.

The Dialog Token field is the nonzero value in any corresponding Diagnostic Request frame.

The Diagnostic Report Elements field contains one or more of the Diagnostic Report elements described in 8.4.2.72. The number and length of the Diagnostic Report elements in a Diagnostic Report frame is limited by the maximum MMPDU size (see 8.3.3.1).

8.5.14.6 Location Configuration Request frame format

The Location Configuration Request frame uses the Action frame body format and is transmitted by a STA to configure another STA to send a Location Track Notification frame on a set of channels periodically for the purposes of determining location of the STA. The format of the Location Configuration Request frame body is shown in Figure 8-471.

	Category	Action	Dialog Token	Location Parameters Element
Octets:	1	1	1	variable

Figure 8-471—Location Configuration Request frame body format

The Category field is the value indicating the WNM category, as specified in Table 8-38 in 8.4.1.11.

The Action field is the value indicating Location Configuration Request, as specified in Table 8-250 in 8.5.14.1.

The Dialog Token field is a nonzero value that is unique among the Location Configuration Request frames sent to each destination MAC address for which a corresponding Location Configuration Response frame has not been received.

The Location Parameters Element field contains the location parameters subelements, described in 8.4.2.73. Table 8-251 defines the allowed Location Parameters subelements for a Location Parameters element that is included in the Location Configuration Request frame.

Table 8-251—Location Parameters Element field for Location Configuration Request frame

Allowed subelement fields	Subelement ID	Notes
Location Indication Parameters	1	The Location Indication Parameters subelement is included in the Location Configuration Request frame.
Location Indication Channels	2	The Location Indication Channels subelement is included in the Location Configuration Request frame.
Location Indication Broadcast Data Rate	6	The Location Indication Broadcast Data Rate subelement is included in the Location Configuration Request frame.
Location Indication Options	8	The Location Indication Options subelement may be included in the Location Configuration Request frame.
Vendor Specific Information	221	The Vendor Specific Information subelement may be included in the Location Configuration Request frame.

8.5.14.7 Location Configuration Response frame format

The Location Configuration Response frame uses the Action frame body format and is transmitted by a STA in response to the receipt of a Location Configuration Request frame. The format of the Location Configuration Response frame body is shown in Figure 8-472.

	Category	Action	Dialog Token	Location Parameters Element
Octets:	1	1	1	variable

Figure 8-472—Location Configuration Response frame body format

The Category field is the value indicating the WNM category, as specified in Table 8-38 in 8.4.1.11.

The Action field is the value indicating Location Configuration Response, as specified in Table 8-250 in 8.5.14.1.

The Dialog Token field is the nonzero value received in the Location Configuration Request frame to identify the request/response transaction.

The Location Parameters Element field contains the location parameters subelements, described in 8.4.2.73. Table 8-252 defines the allowed Location Parameters subelements for a Location Parameters element that is included in the Location Configuration Response frame.

Table 8-252—Location Parameters Element field for Location Configuration Response frame

Allowed subelement fields	Subelement ID	Notes
Location Indication Parameters	1	The Location Indication Parameters subelement may be included in the Location Configuration Response frame.
Location Indication Channels	2	The Location Indication Channels subelement may be included in the Location Configuration Response frame.
Location Indication Broadcast Data Rate	6	The Location Indication Broadcast Data Rate subelement may be included in the Location Configuration Response frame.
Location Indication Options	8	The Location Indication Options subelement may be included in the Location Configuration Response frame.
Location Status	3	The Location Status subelement is included in the Location Configuration Response frame. If all configuration of the subelements contained in a Location Configuration Request frame was successful, then a single Location Status subelement is included in the Location Configuration Response frame. For each subelement contained in the Location Configuration Request frame that is not successful a Location Status subelement is included in the Location Configuration Response frame that indicates the subelement ID and the unsuccessful status code for that subelement ID.
Vendor Specific Information	221	The Vendor Specific Information subelement may be included in the Location Configuration Response frame.

8.5.14.8 BSS Transition Management Query frame format

The BSS Transition Management Query frame uses the Action frame body format and is transmitted by a STA requesting or providing information on BSS transition candidate APs. The format of the BSS Transition Management Query frame body is shown in Figure 8-473.

	Category	Action	Dialog Token	BSS Transition Query Reason	BSS Transition Candidate List Entries (Optional)
Octets:	1	1	1	1	variable

Figure 8-473—BSS Transition Management Query frame body format

The Category field is the value indicating the WNM category, as specified in Table 8-38 in 8.4.1.11.

The Action field is the value indicating BSS Transition Management Query, as specified in Table 8-250 in 8.5.14.1.

The Dialog Token field is a nonzero value chosen by the STA sending the BSS Transition Management Query to identify the query/request/response transaction.

The BSS Transition Query Reason field contains the reason code for a BSS transition management query as defined in Table 8-138.

The BSS Transition Candidate List Entries field contains zero or more Neighbor Report elements, as described in 8.4.2.39. The Neighbor Report elements are collected by the STA as part of its scanning procedures and provided to the AP as described in 10.23.6.2. The length of the BSS Transition Candidate List Entries field in a BSS Transition Management Query frame is limited by the maximum MMPDU size (see 8.3.3.1).

8.5.14.9 BSS Transition Management Request frame format

The BSS Transition Management Request frame uses the Action frame body format and is transmitted by an AP STA in response to a BSS Transition Management Query frame, or autonomously. The format of the BSS Transition Management Request frame body is shown in Figure 8-474.

	Category	Action	Dialog Token	Request mode	Disassociation Timer
Octets:	1	1	1	1	2

	Validity Interval	BSS Termination Duration (optional)	Session Information URL (optional)	BSS Transition Candidate List Entries
Octets:	1	0 or 12	variable	variable

Figure 8-474—BSS Transition Management Request frame body format

The Category field is the value indicating the WNM category, as specified in Table 8-38 in 8.4.1.11.

The Action field is the value indicating BSS Transition Management Request frame, as specified in Table 8-250 in 8.5.14.1.

The Dialog Token field is the nonzero value received in the BSS Transition Management Query frame if the BSS Transition Management Request frame is being transmitted in response to a BSS Transition Management Query frame. If the BSS Transition Management Request frame is being transmitted other than in response to a BSS Transition Management Query frame, then the Dialog Token field is a nonzero value chosen by the AP STA sending the BSS Transition Management Request frame to identify the request/response transaction.

The Request mode field is defined in Figure 8-475.

	Preferred Candidate List Included	Abridged	Disassociation Imminent	BSS Termination Included	ESS Disassociation Imminent	Reserved
Bit:	0	1	2	3	4	5- 7

Figure 8-475—Request Mode field

- The Preferred Candidate List Included (bit 0) field indicates whether the BSS transition candidate list included in this frame is a preferred candidate list or a list of known BSS transition candidates. The Preferred Candidate List Included bit set to 0 indicates that the receiving STA may ignore the BSS Transition Candidate List Entries field. The Preferred Candidate List Included bit set to 1 indicates that the sender expects the receiving STA to process this frame.
- The Abridged (bit 1) field indicates to the recipient of the frame the intended treatment of all BSSIDs not listed in the BSS Transition Candidate List Entries field. The AP sets the Abridged bit in the Request Mode field to 1 when a preference value of 0 is assigned to all BSSIDs that do NOT appear in the BSS Transition Candidate List. The AP sets the Abridged bit in the Request Mode field to 0 when the AP has no recommendation for or against any BSSID not present in the BSS Transition Candidate List Entries field.
- The Disassociation Imminent (bit 2) field indicates whether the STA will be disassociated from the current AP. The Disassociation Imminent bit in the Request Mode field set to 1 indicates that STA is to be disassociated from the current AP. The Disassociation Imminent field set to 0 indicates that disassociation from the AP is not imminent.
- The BSS Termination Included (bit 3) field indicates that the BSS Termination Duration field is included, the BSS is shutting down and the STA will be disassociated. The AP sets the BSS Termination Included bit in the Request mode field to 1 to indicate that the BSS is shutting down. The BSS Termination Included bit is 0 if no BSS Termination Duration information is included in the BSS Transition Management Request frame.
- The ESS Disassociation Imminent (bit 4) field indicates that the Session Information URL field is included, and that the STA will be disassociated from the ESS. The ESS Disassociation Imminent bit in the Request Mode field set to 1 indicates that STA is to be disassociated from the ESS. When the ESS Disassociation Imminent bit is 1, a Session Information URL field is included in the BSS Transition Management Request frame. The ESS Disassociation Imminent field set to 0 indicates that disassociation from the ESS is not imminent.

The Disassociation Timer indicates the time after which the AP will issue a Disassociation frame to this STA. The Disassociation Timer field is the number of beacon transmission times (TBTTs) until the AP sends a Disassociation frame to this STA. A value of 0 indicates that the AP has not determined when it will send a Disassociation frame to this STA. If the Disassociation Imminent field is 0, the Disassociation Timer field is reserved. The format of the Disassociation Timer field is shown in Figure 8-476.

	B0 B15
	Disassociation Timer
Bits	16

Figure 8-476—Disassociation Timer field format

The Validity Interval field is the number of beacon transmission times (TBTTs) until the BSS transition candidate list is no longer valid. A value of 0 is reserved.

The BSS Termination Duration field contains the BSS Termination Duration subelement (see 8.4.2.39) for the current BSS and is present only when the BSS Termination Included field is 1 in the Request mode field.

The format of the optional Session Information URL field is shown in Figure 8-477. This field is present when the ESS Disassociation Imminent field is 1.

	URL Length	URL (optional)
Octets:	1	variable

Figure 8-477—Session Information URL field format

The URL Length field is the value of the length of the URL field. The URL Length field is 0 when the URL field is not present.

The URL field is a variable-length field formatted in accordance with IETF RFC 3986-2005.

The BSS Transition Candidate List Entries field contains one or more Neighbor Report elements described in 8.4.2.39. If the STA has no information in response to the BSS Transition Management Query frame, the Neighbor Report elements are omitted and the Preferred Candidate List Included bit is 0. The length of the BSS Transition Candidate List Entries in a BSS Transition Management Request frame is limited by the maximum MMPDU size (see 8.3.3.1).

8.5.14.10 BSS Transition Management Response frame format

The BSS Transition Management Response frame uses the Action frame body format and is optionally transmitted by a STA in response to a BSS Transition Management Request frame. The format of the BSS Transition Management Response frame body is shown in Figure 8-478.

	Category	Action	Dialog Token	Status code	BSS Termination Delay	Target BSSID (Optional)	BSS Transition Candidate List Entries (Optional)
Octets:	1	1	1	1	1	0 or 6	variable

Figure 8-478— BSS Transition Management Response frame body format

The Category field is the value indicating the WNM category, as specified in Table 8-38 in 8.4.1.11.

The Action field is the value indicating BSS Transition Response, as specified in Table 8-250 in 8.5.14.1.

The Dialog Token field is the value in the corresponding BSS Transition Management Request frame. The BSS Transition Management Response frame is only transmitted in response to a BSS Transition Management Request frame.

The Status code field contains the status code in response to a BSS Transition Management Request frame as defined in Table 8-253. If the STA will transition to another BSS, then the status code is 0 (i.e., Accept). If the STA intends to retain the association with the current BSS, the status code is one of the “Reject” status codes.

Table 8-253—Status code definitions

Status code	Status code description
0	Accept
1	Reject—Unspecified reject reason.
2	Reject—Insufficient Beacon or Probe Response frames received from all candidates.
3	Reject—Insufficient available capacity from all candidates.
4	Reject—BSS Termination undesired.
5	Reject—BSS Termination delay requested.
6	Reject—STA BSS Transition Candidate List provided.
7	Reject—No suitable BSS transition candidates.
8	Reject—Leaving ESS.
9–255	Reserved

The BSS Termination Delay field is the number of minutes that the responding STA requests the BSS to delay termination. This field is reserved if the Status code field value is not set to 5.

The Target BSSID field is the BSSID of the BSS that the non-AP STA transitions to. This field is not present if the STA does not transition or if no transition information is available.

The BSS Transition Candidate List Entries field contains zero or more Neighbor Report elements described in 8.4.2.39. The Neighbor Report elements are collected by the STA as part of its scanning procedures and provided to the AP as described in 10.23.6.4. The length of the BSS Transition Candidate List Entries field in a BSS Transition Management Response frame is limited by the maximum MMPDU size (see 8.3.3.1).

8.5.14.11 FMS Request frame format

The FMS Request frame is sent by a non-AP STA to the AP to request the specified FMS and to propose delivery intervals for a set of group addressed streams. The FMS Request frame is also sent by a non-AP STA to request a modification to a previous FMS Request. The format of the frame is shown in Figure 8-479.

	Category	Action	Dialog Token	FMS Request Element
Octets:	1	1	1	variable

Figure 8-479—FMS Request frame format

The Category field is the value indicating the WNM category, as specified in Table 8-38 in 8.4.1.11.

The Action field is the value indicating FMS Request frame, as specified in Table 8-250 in 8.5.14.1.

The Dialog Token field is a nonzero value that is unique among the FMS Request frame sent to each destination MAC address for which a corresponding FMS Report frame has not been received.

The FMS Request Element field indicates the group addressed traffic streams that are requested by the non-AP STA. The FMS Request Element field contains one FMS Request element described in 8.4.2.78.

8.5.14.12 FMS Response frame format

The FMS Response frame is sent by an AP in response to an FMS Request frame, or sent by the AP to the STA to instruct the non-AP STA to change the delivery interval or data rate. The format of the frame is shown in Figure 8-480.

	Category	Action	Dialog Token	FMS Response Element
Octets:	1	1	1	variable

Figure 8-480—FMS Response frame format

The Category field is the value indicating the WNM category, as specified in Table 8-38 in 8.4.1.11.

The Action field is the value indicating FMS Response frame, as specified in Table 8-250 in 8.5.14.1.

The Dialog Token field is the nonzero value received in the FMS Request frame to identify the request/response transaction. If an FMS Response frame is being transmitted other than in response to an FMS Request frame, then the Dialog Token field is 0.

The FMS Response Element indicates the group addressed traffic streams that the AP supports and the corresponding delivery intervals. The FMS Response Element field contains one FMS Response elements, described in 8.4.2.79.

8.5.14.13 Collocated Interference Request frame format

The Collocated Interference Request frame uses the Action frame body format and is transmitted by a STA to request collocated interference reports, sent using Collocated Interference Report frames. The format of the Collocated Interference Request frame body is shown in Figure 8-481.

	Category	Action	Dialog Token	Request Info
Octets:	1	1	1	1

Figure 8-481—Collocated Interference Request frame format

The Category field is the value indicating the WNM category, as specified in Table 8-38 in 8.4.1.11.

The Action field is the value indicating Collocated Interference Request, as specified in Table 8-250 in 8.5.14.1.

The Dialog Token field is any nonzero value to identify the request/response transaction.

The Request Info field is shown in Figure 8-482.

	B0 B1	B2 B7
	Automatic Report Enabled	Report Timeout
Bits:	2	6

Figure 8-482—Request Info field format

The Automatic Report Enabled subfield contains an unsigned integer value.

The Automatic Report Enabled subfield set to 0 indicates that the requesting STA cancels the previous requests so that the receiving STA stops sending collocated interference reports.

The Automatic Report Enabled subfield set to 1 indicates that the requesting STA requests the receiving STA to send a collocated interference report when the STA knows of a change in the collocated interference, subject to meeting the Report Timeout requirement.

The Automatic Report Enabled subfield set to 2 indicates that the requesting STA requests the receiving STA to send a collocated interference report periodically using the period included in the Report Period field in the Collocated Interference Report element; see 8.4.2.87.

The Automatic Report Enabled subfield set to 3 indicates that the requesting STA requests the receiving STA to send collocated interference reports periodically using the period included in the Report Period field in the Collocated Interference Report element; see 8.4.2.87, or send a collocated interference report when the STA knows of a change in the collocated interference, subject to meeting the Report Timeout requirement.

The Report Timeout field contains a value in units of 200 TUs and indicates the minimum duration between two consecutive Collocated Interference Report frames from the reporting STA. When the Automatic Report Enabled subfield is 0, the Report Timeout field is reserved.

8.5.14.14 Collocated Interference Report frame format

The Collocated Interference Report frame uses the Action frame body format and is transmitted in response to Collocated Interference Request frame. The format of the Collocated Interference Report frame body is shown in Figure 8-483.

	Category	Action	Dialog Token	Collocated Interference Report Elements
Octets:	1	1	1	variable

Figure 8-483—Collocated Interference Report frame format

The Category field is the value indicating the WNM category, as specified in Table 8-38 in 8.4.1.11.

The Action field is the value indicating Collocated Interference Report frame, as specified in Table 8-250 in 8.5.14.1.

The Dialog Token field is the nonzero value received in the corresponding Collocated Interference Request frame to identify the request/response transaction.

The Collocated Interference Report Elements field contains one or more Collocated Interference Report elements to indicate the characteristics of the reported collocated interferences, as defined in 8.4.2.87.

8.5.14.15 TFS Request frame format

The TFS Request frame is sent by a non-AP STA to the AP to request the specified traffic filtering. The format of TFS Request frame is defined in Figure 8-484.

				One or more TFS Request elements
	Category	Action	Dialog Token	TFS Request Elements
Octets:	1	1	1	variable

Figure 8-484—TFS Request frame format

The Category field is the value indicating the WNM category, as specified in Table 8-38 in 8.4.1.11.

The Action field is the value indicating TFS Request frame, as specified in Table 8-250 in 8.5.14.1.

The Dialog Token field is a value chosen by the STA sending the TFS Request frame to identify the request/response transaction.

The TFS Request Elements field contains one or more TFS Request elements to specify the traffic filters that are requested by the non-AP STA, as defined in 8.4.2.82.

8.5.14.16 TFS Response frame format

The TFS Response frame is sent by an AP in response to a TFS Request frame. The format of the TFS Response frame is defined in Figure 8-485.

				One or more TFS Response elements
	Category	Action	Dialog Token	TFS Response Elements
Octets:	1	1	1	variable

Figure 8-485—TFS Response frame format

The Category field is the value indicating the WNM category, as specified in Table 8-38 in 8.4.1.11.

The Action field is the value indicating TFS Response frame, as specified in Table 8-250 in 8.5.14.1.

The Dialog Token field is the value in the corresponding TFS Request frame.

The TFS Response Elements field contains one or more TFS Response elements to indicate the traffic filters that the AP is configured to support, as defined in 8.4.2.83.

8.5.14.17 TFS Notify frame format

The TFS Notify frame is sent by an AP to a STA when a frame matching a traffic filter is encountered. The format of the TFS Notify frame is defined in Figure 8-486.

				One or more TFS IDs
	Category	Action	Number of TFS IDs	TFS ID List
Octets:	1	1	1	variable

Figure 8-486—TFS Notify frame format

The Category field is the value indicating the WNM category, as specified in Table 8-38 in 8.4.1.11.

The Action field is the value indicating TFS Notify frame, as specified in Table 8-250 in 8.5.14.1.

The Number of TFS IDs field indicates the number of 1-octet TFS IDs present in the TFS ID List field.

The TFS ID field indicates the traffic filter set containing the matched TCLAS element.

8.5.14.18 WNM-Sleep Mode Request frame format

The WNM-Sleep Mode Request frame is sent by a non-AP STA to the AP to enter the WNM-Sleep Mode. The format of the WNM-Sleep Mode Request frame is defined in Figure 8-487.

					One or more TFS Request elements
	Category	Action	Dialog Token	WNM-Sleep Mode Element	TFS Request Elements
Octets:	1	1	1	variable	variable

Figure 8-487—WNM-Sleep Mode Request frame format

The Category field is the value indicating the WNM category, as specified in Table 8-38 in 8.4.1.11.

The Action field is the value indicating WNM-Sleep Mode Request frame, as specified in Table 8-250 in 8.5.14.1.

The Dialog Token field is a value chosen by the non-AP STA sending the WNM-Sleep Mode Request frame to identify the request/response transaction.

The WNM-Sleep Mode Element field contains a WNM-Sleep Mode element that is requested by a non-AP STA, as described in 8.4.2.84.

The TFS Request Elements field contains one or more TFS Request elements to specify the traffic filters that are requested by a non-AP STA, as defined in 8.4.2.82.

8.5.14.19 WNM-Sleep Mode Response frame format

The WNM-Sleep Mode Response frame is sent by an AP in response to a WNM-Sleep Mode Request frame. The format of the WNM-Sleep Mode Response frame is defined in Figure 8-488.

	Category	Action	Dialog Token	Key Data Length	Key Data
Octets:	1	1	1	2	variable

		One or more TFS Response elements
	WNM-Sleep Mode Element	TFS Response Elements
Octets:	variable	variable

Figure 8-488—WNM-Sleep Mode Response frame format

The Category field is the value indicating the WNM category, as specified in Table 8-38 in 8.4.1.11.

The Action field is the value indicating WNM-Sleep Mode Response frame, as specified in Table 8-250 in 8.5.14.1.

The Dialog Token field is the value in the corresponding WNM-Sleep Mode Request frame.

The Key Data Length field is the length of the Key Data field. If the management frame protection is not used, this field is 0.

The Key Data field contains zero or more subelements that provide the current GTK and IGTK to the STA. The format of these subelements is given in Figure 8-489 and Figure 8-490. The subelement IDs for these subelements are defined in Table 8-254. Each subelement starts with the ID and Length fields. The Length field in the subelement is the length of the contents of the subelement. When management frame protection is not used, the Key Data field is not present.

Table 8-254—WNM-Sleep Mode subelement IDs

Value	Contents of subelement
0	GTK
1	IGTK
2–255	Reserved

The GTK subelement contains the Group Key as shown in Figure 8-489.

	Subelement ID	Length	Key Info	Key Length	RSC	Key
Octets:	1	1	2	1	8	5 to 32

Figure 8-489—WNM-Sleep Mode GTK subelement format

The Subelement ID field is 0.

The value of the Length field is 16 or 43.

The Key Info field is defined in Figure 11-29.

The Key Length field is the length of the Key field in octets.

The RSC field contains the receive sequence counter (RSC) for the GTK being installed. The RSC field gives the current message number for the GTK to allow a STA to identify replayed MPDUs. If the RSC field value is less than 8 octets in length, the remaining octets are set to 0. The least significant octet of the TSC or PN is in the first octet of the RSC field.

NOTE—The RSC field value for TKIP is the Transmit Sequence Counter (TSC), and is stored in the first 6 octets; for CCMP it is the Packet Number (PN), and is stored in the first 6 octets; see Table 11-5.

The IGTK subelement contains the Integrity GTK as shown in Figure 8-490.

	Subelement ID	Length	KeyID	PN	Key
Octets:	1	1	2	6	16

Figure 8-490—WNM-Sleep Mode IGTK subelement format

The Subelement ID field is 1.

The value of the Length field is 24.

The KeyID field indicates the value of the BIP key ID.

The PN field indicates the receive sequence counter for the IGTK being installed. The PN field gives the current message number for the IGTK, to allow a STA to identify replayed MPDUs.

The Key field is the IGTK being distributed.

NOTE 1—There may be multiple GTK and multiple IGTK subelements if a group rekeying is in process when the non-AP STA wakes up from WNM-Sleep mode.

NOTE 2—Management frame protection is used to provide confidentiality, replay, and integrity protection for GTK/IGTK update in WNM-Sleep Mode Response frames.

The WNM-Sleep Mode Element field contains a WNM-Sleep Mode element, as described in 8.4.2.84.

The TFS Response Elements field contains one or more TFS Response elements to specify the traffic filters, as defined in 8.4.2.83.

8.5.14.20 TIM Broadcast Request frame format

The format of the TIM Broadcast Request frame is shown in Figure 8-491.

	Category	Action	Dialog Token	TIM Broadcast Request Element
Octets:	1	1	1	3

Figure 8-491—TIM Broadcast Request frame format

The Category field is the value indicating the WNM category, as specified in Table 8-38 in 8.4.1.11.

The Action field is the value indicating TIM Broadcast Request frame, as specified in Table 8-250 in 8.5.14.1.

The Dialog Token field is a nonzero value chosen by the STA sending the TIM Broadcast Request frame to identify the request/response transaction.

The TIM Broadcast Request Element field contains a TIM Broadcast Request Element as specified in 8.4.2.85.

8.5.14.21 TIM Broadcast Response frame format

The format of the TIM Broadcast Response frame is shown in Figure 8-492.

	Category	Action	Dialog Token	TIM Broadcast Response Element
Octets:	1	1	1	3 or 12

Figure 8-492—TIM Broadcast Response frame format

The Category field is the value indicating the WNM category, as specified in Table 8-38 in 8.4.1.11.

The Action field is the value indicating TIM Broadcast Response frame, as specified in Table 8-250 in 8.5.14.1.

The Dialog Token field is the nonzero value of the corresponding TIM Broadcast Request frame. If the TIM Broadcast Response frame is being transmitted other than in response to a TIM Broadcast Request frame, then the Dialog token is 0.

The TIM Broadcast Response Element field contains a TIM Broadcast Response Element as specified in 8.4.2.86.

8.5.14.22 QoS Traffic Capability Update frame format

The QoS Traffic Capability Update frame is sent by a non-AP STA to the AP to update QoS Traffic Capability information. The format of the frame is shown in Figure 8-493.

	Category	Action	QoS Traffic Capability Flags
Octets:	1	1	1

Figure 8-493—QoS Traffic Capability Update frame format

The Category field is the value indicating the WNM category, as specified in Table 8-38 in 8.4.1.11.

The Action field is the value indicating QoS Traffic Capability Update frame, as specified in Table 8-250 in 8.5.14.1.

The QoS Traffic Capability Flags field is defined in Table 8-255. The QoS Traffic Capability Flags field comprises 1 octet, with the bits 4–6 serving as QoS Traffic Capability Flags. Each of the bits 4–6 serves as a flag for one of the three user priorities, UP 4–6. The field is 1 to indicate the expectation of generating traffic belonging to the corresponding user priority (UP). The field is 0 to indicate that such expectation does not exist. The use of the QoS Traffic Capability Update frame is described in 10.23.9.

Table 8-255—QoS Traffic Capability Flags definition

Bit	Description
0–3	Reserved
4	UP 4 Traffic
5	UP 5 Traffic
6	UP 6 Traffic
7	Reserved

8.5.14.23 Channel Usage Request frame format

The Channel Usage Request frame is sent by a non-AP STA to the AP to request the specified Channel Usage information. The format of the Channel Usage Request frame is defined in Figure 8-494.

	Category	Action	Dialog Token	Channel Usage Elements	Supported Operating Classes Element
Octets:	1	1	1	variable	variable

Figure 8-494—Channel Usage Request frame format

The Category field is the value indicating the WNM category, as specified in 8.4.1.11.

The Action field is the value indicating Channel Usage Request frame, as specified in 8.5.14.1.

The Dialog Token field is a nonzero value chosen by the non-AP STA sending the Channel Usage Request frame to identify the request/response transaction.

The Channel Usage Element field includes one or more Channel Usage elements described in 8.4.2.88 to identify the request Usage Mode.

The Supported Operating Classes Element field includes a Supported Operating Classes element to indicate the supported operating classes for the requested network type, consistent with the Country element advertised by the AP. The Supported Operating Classes is described in 8.4.2.56.

8.5.14.24 Channel Usage Response frame format

The Channel Usage Response frame is sent by an AP STA in response to a Channel Usage Request frame, or autonomously. The format of the Channel Usage Response frame is shown in Figure 8-495.

	Category	Action	Dialog Token	Channel Usage Elements	Country String	Power Constraint Element (optional)	EDCA Parameter Set Element (optional)
Octets:	1	1	1	variable	3	0 or 3	0 or 20

Figure 8-495—Channel Usage Response frame format

The Category field is the value indicating the WNM category, as specified in 8.4.1.11.

The Action field is the value indicating Channel Usage Response frame, as specified in 8.5.14.1.

The Dialog Token field is the nonzero value received in the Channel Usage Request frame if the Channel Usage Response frame is being transmitted in response to a Channel Usage Request frame. The Dialog Token field is 0 if the Channel Usage Response frame is being transmitted other than in response to a Channel Usage Request frame.

The Channel Usage Element field includes zero or more Channel Usage elements described in 8.4.2.88.

The Country String field is the value contained in the dot11CountryString attribute.

The Power Constraint Element field includes zero or one Power Constraint elements described in 8.4.2.16. The use of the Power Constraint element included in the Power Constraint Element field is described in 10.23.14.

The EDCA Parameter Set Element field includes zero or one EDCA Parameter Set elements described in 8.4.2.31. The use of the EDCA Parameter Set element included in the EDCA Parameter Set Element field is described in 10.23.14.

8.5.14.25 DMS Request frame format

The DMS Request frame is sent by a non-AP STA to the AP to define information about a DMS request to the AP. The format of the DMS Request frame is defined in Figure 8-496.

	Category	Action	Dialog Token	DMS Request Element
Octets:	1	1	1	variable

Figure 8-496—DMS Request frame format

The Category field is the value indicating the WNM category, as specified in Table 8-38 in 8.4.1.11.

The Action field is the value indicating DMS Request frame, as specified in Table 8-250 in 8.5.14.1.

The Dialog Token field is a nonzero value chosen by the non-AP STA sending the DMS Request frame to identify the request/response transaction.

The DMS Request Element field contains a DMS Request element as specified in 8.4.2.90.

8.5.14.26 DMS Response frame format

The DMS Response frame is sent by an AP in response to a DMS Request frame, or autonomously to terminate a requested DMS stream. The format of the DMS Response frame is shown in Figure 8-497.

	Category	Action	Dialog Token	DMS Response Element
Octets:	1	1	1	variable

Figure 8-497—DMS Response frame format

The Category field is the value indicating the WNM category, as specified in Table 8-38 in 8.4.1.11.

The Action field is the value indicating DMS Response as specified in Table 8-250 in 8.5.14.1.

The Dialog Token field is the nonzero value received in the DMS Request frame if the DMS Response frame is being transmitted in response to a DMS Request frame. The Dialog Token field is 0 if the DMS Response frame is being transmitted autonomously, and not in response to a DMS Request frame.

The DMS Response Element field contains a DMS Response element as specified in 8.4.2.91.

8.5.14.27 Timing Measurement Request frame format

The format of the Timing Measurement Request frame is shown in Figure 8-498.

	Category	Action	Trigger
Octets:	1	1	1

Figure 8-498—Timing Measurement Request frame format

The Category field is the value indicating the WNM category, as specified in Table 8-38 in 8.4.1.11.

The Action field is the value indicating Timing Measurement Request frame as specified in Table 8-250 in 8.5.14.1.

The Trigger field set to the value 1 indicates that the sending STA requests a Timing Measurement procedure at the receiving STA as defined in 10.23.5. The trigger field set to the value 0 indicates that the sending STA requests that the receiving STA stops sending Timing Measurement frames. Trigger field values 2–255 are reserved.

8.5.14.28 WNM-Notification Request frame format

The format of the WNM-Notification Request frame is shown in Figure 8-499.

	Category	Action	Dialog Token	Type	Optional Subelements
Octets:	1	1	1	1	variable

Figure 8-499—WNM-Notification Request frame format

The Category field is the value indicating the WNM category, as specified in Table 8-38 in 8.4.1.11.

The Action field is the value indicating WNM-Notification Request frame as specified in Table 8-250 in 8.5.14.1.

The Dialog Token field is set to a nonzero value chosen by the STA sending the WNM-Notification request to identify the request/response transaction.

The Type field indicates the type of WNM-Notification, as defined in Table 8-256.

Table 8-256—WNM-Notification type

Value	Description
0	Firmware Update Notification
1–255	Reserved

The Optional Subelements field format contains zero or more subelements, each consisting of a 1-octet Subelement ID field, a 1-octet Length field and a variable-length Data field, as shown in Figure 8-402. The optional subelements are ordered by nondecreasing subelement ID.

The Subelement ID field values for the defined optional subelements are shown in Table 8-257. A Yes in the Extensible column of a subelement listed in Table 8-257 indicates that the length of the subelement might be extended in future revisions or amendments of this standard. When the Extensible column of an element is Subelement, then the subelement might be extended in future revisions or amendments of this standard by defining additional subelements within the subelement. See 9.24.9.

Table 8-257—Optional subelement IDs for WNM-Notification Request

Subelement ID	Name	Length field (octets)	Extensible
0	AP Descriptor	10	
1	Firmware Version—Current	3 to 251	
2	Firmware Version—New	3 to 251	
3–220	Reserved		
221	Vendor Specific	1 to 239	
222–255	Reserved		

When the Type field is 0, the AP Descriptor, Firmware Version—Current, and Firmware Version—New optional subelements are included in the WNM-Notification Request frame. The AP descriptor field format is as defined in Figure 8-290. The Firmware Version—Current subelement contains the current firmware version, in the Firmware Version subelement format defined in Figure 8-296. The Firmware Version—New subelement contains the new firmware version, in the Firmware Version subelement format defined in Figure 8-296.

The Vendor Specific subelements have the same format as their corresponding elements (see 8.4.2.28). Multiple Vendor Specific subelements are optionally present in the list of optional subelements.

8.5.14.29 WNM-Notification Response frame format

The format of the WNM-Notification Response frame is shown in Figure 8-500.

	Category	Action	Dialog Token	Response Status	Optional Subelements
Octets:	1	1	1	1	variable

Figure 8-500—WNM-Notification Response frame format

The Category field is the value indicating the WNM category, as specified in Table 8-38 in 8.4.1.11.

The Action field is the value indicating WNM-Notification Response frame as specified in Table 8-250 in 8.5.14.1.

The Dialog Token field is set to the nonzero value of the corresponding WNM-Notification Request frame.

The Response Status field indicates the Response Status value, as defined in Table 8-258.

Table 8-258—WNM-Notification Response Status

Value	Description
0	Notification Acknowledged
1–255	Reserved

The Optional Subelements field format contains zero or more subelements, each consisting of a 1-octet Subelement ID field, a 1-octet Length field and a variable-length Data field, as shown in Figure 8-402. The optional subelements are ordered by nondecreasing subelement ID.

The Subelement ID field values for the defined optional subelements are shown in Table 8-259. A Yes in the Extensible column of a subelement listed in Table 8-259 indicates that the length of the subelement might be extended in future revisions or amendments of this standard. When the Extensible column of an element is Subelement, then the subelement might be extended in future revisions or amendments of this standard by defining additional subelements within the subelement. See 9.24.9.

Table 8-259—Optional subelement IDs for WNM-Notification Response

Subelement ID	Name	Length field (octets)	Extensible
0–220	Reserved		
221	Vendor Specific	1 to 239	
222–255	Reserved		

The Vendor Specific subelements have the same format as their corresponding elements (see 8.4.2.28). Multiple Vendor Specific subelements are optionally present in the list of optional subelements.

8.5.15 Unprotected WNM Action details

8.5.15.1 Unprotected WNM Action fields

Unprotected WNM Action frames are not encapsulated using mechanisms defined for robust management frames. An Action field, in the octet field immediately after the Category field, differentiates the formats. The Action field values associated with each frame format is defined in Table 8-260.

Table 8-260—Unprotected WNM Action field values

Action field value	Description
0	TIM
1	Timing Measurement
2–255	Reserved

8.5.15.2 TIM frame format

The format of the TIM frame is shown in Figure 8-501.

	Category	Action	Check Beacon	Timestamp	TIM Element
Octets:	1	1	1	8	6–257

Figure 8-501—TIM frame format

The Category field is the value indicating the Unprotected WNM category, as specified in Table 8-38 in 8.4.1.11.

The Action field is the value indicating TIM frame, as specified in Table 8-260 in 8.5.15.1.

The Check Beacon field is defined as an unsigned integer initialized to 0, that increments when a critical update to the Beacon frame has occurred; see 10.2.1.17.

The Timestamp field is defined in 8.4.1.10. The field contains a valid TSF timestamp when the TIM Broadcast Response frame contained a reason code “Accept, valid timestamp present in TIM frames.” The field is reserved otherwise.

The TIM Element field contains a TIM element as specified in 8.4.2.7. The bit corresponding to buffered group addressed frames is 0 for all BSSIDs and ignored upon reception.

8.5.15.3 Timing Measurement frame format

The Timing Measurement frame is used to support the timing measurement procedure described in 10.23.5. The format of the Timing Measurement frame is shown in Figure 8-502.

	Category	Action	Dialog Token	Follow Up Dialog Token	TOD
Octets:	1	1	1	1	4

	TOA	Max TOD Error	Max TOA Error
Octets:	4	1	1

Figure 8-502—Timing Measurement frame format

The Category field is the value indicating the Unprotected WNM category, as specified in Table 8-38 in 8.4.1.11.

The Action field is the value indicating Timing Measurement as specified in Table 8-260 in 8.5.15.1.

The Dialog Token field is a nonzero value chosen by the sending STA to identify the Timing Measurement frame as the first of a pair, with the second or follow-up Timing Measurement frame to be sent later. The Dialog Token field is set to 0 to indicate that the Timing Measurement frame will not be followed by a subsequent follow-up Timing Measurement frame.

The Follow Up Dialog Token is the nonzero value of the Dialog Token field of the previously transmitted Timing Measurement frame to indicate that it is the follow up Timing Measurement frame and that the TOD, TOA, Max TOD Error and Max TOA Error fields contain the values of the timestamps captured with the first Timing Measurement frame of the pair. The Follow Up Dialog Token is 0 to indicate that the Timing Measurement frame is not a follow up to a previously transmitted Timing Measurement frame. The value 0 in this field also indicates that the TOD, TOA, Max TOD Error, and Max TOA Error fields are reserved. See 10.23.5.

The TOD, TOA, Max TOD Error, and Max TOA Error fields are expressed in units of 10 ns.

The TOD field contains a timestamp that represents the time at which the start of the preamble of the previously transmitted Timing Measurement frame appeared at the transmit antenna port.

The TOA field contains a timestamp that represents the time at which the start of the preamble of the ACK to the previously transmitted Timing Measurement frame arrived at the receive antenna port.

NOTE—The values specified in the TOD and TOA fields are described in 6.3.68.

The Max TOD Error field contains an upper bound for the error in the value specified in the TOD field. For instance, a value of 2 in the Max TOD Error field indicates that the value in the TOD field has a maximum error of ± 20 ns.

The Max TOA Error field contains an upper bound for the error in the value specified in the TOA field. For instance, a value of 2 in the Max TOA Error field indicates that the value in the TOA field has a maximum error of ± 20 ns.

A value of 0 for the Max TOD Error or the Max TOA Error field indicates that the upper bound on the error in the corresponding TOD or TOA value is unknown. A value of 255 indicates that the upper bound on the error is greater than or equal to 2.55 µs.

8.5.16 Self-protected Action frame details

8.5.16.1 Self-protected Action fields

The Self-protected Action frame is defined to allow robust STA-STA communications of the Action frames that are not robust (see 8.4.1.11). The protocols that use these Action frames are responsible for deciding whether to protect these frames and supporting protection mechanisms for these frames as needed.

Self-protected Action frames have a different nature than Public Action frames and Robust Action frames. Robust Action frames assume the existence of a completely established security association. Self-protected Action frames typically exist to manage the creation and destruction of security associations, regardless of whether they are completely established.

Public Action frames are defined as public for all STAs, including those that are not in the BSS and MBSS. Self-protected Action frames, however, are used for relationship creation and maintenance between two specific STAs. Their public nature is incidental.

A Self-protected Action field, in the octet field immediately after the Category field, differentiates the formats. The defined Self-protected Action frames are listed in Table 8-261.

Table 8-261—Self-protected Action field values

Self-protected Action field value	Description
0	Reserved
1	Mesh Peering Open
2	Mesh Peering Confirm
3	Mesh Peering Close
4	Mesh Group Key Inform
5	Mesh Group Key Acknowledge
6–255	Reserved

The Mesh Peering Open frame, the Mesh Peering Confirm frame, and the Mesh Peering Close frame are referred to as “Mesh Peering Management frames.”

8.5.16.2 Mesh Peering Open frame format

8.5.16.2.1 Mesh Peering Open frame self protection

Protection of this frame is provided when authenticated mesh peering exchange (AMPE) is enabled. AMPE provides integrity protection of Mesh Peering Open frames.

When the Mesh Peering Open frame is used by the mesh peering management (MPM) protocol, integrity protection on the frame is not enabled.

8.5.16.2.2 Mesh Peering Open frame details

The Mesh Peering Open frame is used to open a mesh peering using the procedures defined in 13.3.6 and in 13.5.5. The Mesh Peering Open frame is also, together with Mesh Peering Confirm and Mesh Peering Close frames, referred to as a Mesh Peering Management frame. The format of the Mesh Peering Open frame Action field is shown in Table 8-262.

Table 8-262—Mesh Peering Open frame Action field format

Order	Information	Notes
1	Category	
2	Self-protected Action	
3	Capability	
4	Supported Rates	
5	Extended Supported Rates	The Extended Supported Rates element is present if there are more than eight supported rates, and is optionally present otherwise.
6	Power Capability	The Power Capability element is present if dot11SpectrumManagementRequired is true.
7	Supported Channels	The Supported Channels element is present if dot11SpectrumManagementRequired is true and dot11ExtendedChannelSwitchActivated is false.
8	RSN	The RSNE is present only if dot11MeshSecurityActivated is true.
9	Mesh ID	The Mesh ID element is set as described in 8.4.2.101.
10	Mesh Configuration	The Mesh Configuration element is set as described in 8.4.2.100.
11	Mesh Peering Management	The Mesh Peering Management element is set as described in 8.4.2.104.
12	ERP Information	The ERP element is present if ERP mesh STA detects NonERP STAs in its vicinity, and is optionally present otherwise.
13	Supported Operating Classes	The Supported Operating Classes element is present if dot11ExtendedChannelSwitchActivated is true.
14	HT Capabilities	The HT Capabilities element is present when dot11HighThroughputOptionImplemented is true.
15	HT Operation	The HT Operation element is included when dot11HighThroughputOptionImplemented is true.
16	20/40 BSS Coexistence element	The 20/40 BSS Coexistence element is optionally present when the dot112040BSSCoexistenceManagementSupport is true.
17	Extended Capabilities element	The Extended Capabilities element is optionally present if any of the fields in this element are nonzero.
18	Interworking	The Interworking element is present if dot11InterworkingServiceActivated is true.
Last–2	Vendor Specific	One or more vendor-specific elements are optionally present. These elements follow all other elements except MIC element and Authenticated Mesh Peering Exchange element.

Table 8-262—Mesh Peering Open frame Action field format *(continued)*

Order	Information	Notes
Last–1	MIC element	MIC element is present when dot11MeshSecurityActivated is true and a PMK exists between the sender and recipient of this frame.
Last	Authenticated Mesh Peering Exchange	The Authenticated Mesh Peering Exchange element is present when dot11MeshSecurityActivated is true and a PMK exists between the sender and recipient of this frame.

The Category field is set to the value in Table 8-38 for category Self-protected.

The Self-protected Action field is set to the value in Table 8-261 representing Mesh Peering Open.

The MIC element appears prior to the Authenticated Mesh Peering Exchange element in the Mesh Peering Open frame. The information following the MIC element through to the end of the Mesh Peering Open frame body is encrypted and authenticated (see 13.5).

8.5.16.3 Mesh Peering Confirm frame format

8.5.16.3.1 Mesh Peering Confirm frame self protection

Protection of this frame is provided when authenticated mesh peering exchange (AMPE) is enabled. AMPE provides integrity protection of Mesh Peering Confirm frames.

When the Mesh Peering Confirm frame is used by the mesh peering management (MPM) protocol, integrity protection on the frame is not enabled.

8.5.16.3.2 Mesh Peering Confirm frame details

The Mesh Peering Confirm frame is used to confirm a mesh peering using the procedures defined in 13.3.7 and 13.5.5. The Mesh Peering Confirm frame is also, together with Mesh Peering Open and Mesh Peering Close frames, referred to as a Mesh Peering Management frame. The format of the Mesh Peering Confirm frame Action field is shown in Table 8-263.

Table 8-263—Mesh Peering Confirm frame Action field format

Order	Information	Notes
1	Category	
2	Self-protected Action	
3	Capability	
4	AID	
5	Supported Rates	
6	Extended Supported Rates	The Extended Supported Rates element is present if there are more than eight supported rates, and is optionally present otherwise.
7	RSN	The RSNE is present only when dot11MeshSecurityActivated is true.
8	Mesh ID	The Mesh ID element is set as described in 8.4.2.101.
9	Mesh Configuration	The Mesh Configuration element is set as described in 8.4.2.100.

Table 8-263—Mesh Peering Confirm frame Action field format *(continued)*

Order	Information	Notes
10	Mesh Peering Management	The Mesh Peering Management element is set as described in 8.4.2.104.
11	HT Capabilities	The HT Capabilities element is present when dot11HighThroughputOptionImplemented is true.
12	HT Operation	The HT Operation element is included when dot11HighThroughputOptionImplemented is true.
13	20/40 BSS Coexistence element	The 20/40 BSS Coexistence element is optionally present when the dot112040BSSCoexistenceManagementSupport is true.
14	Extended Capabilities element	The Extended Capabilities element is optionally present if any of the fields in this element are nonzero.
Last–2	Vendor Specific	One or more vendor-specific elements are optionally present. These elements follow all other elements except MIC element and Authenticated Mesh Peering Exchange element.
Last–1	MIC element	MIC element is present when dot11MeshSecurityActivated is true and a PMK exists between the sender and recipient of this frame.
Last	Authenticated Mesh Peering Exchange	The Authenticated Mesh Peering Exchange element is present when dot11MeshSecurityActivated is true and a PMK exists between the sender and recipient of this frame.

The Category field is set to the value in Table 8-38 for category Self-protected.

The Self-protected Action field is set to the value in Table 8-261 representing Mesh Peering Confirm.

The MIC element appears prior to the Authenticated Mesh Peering Exchange element in the Mesh Peering Open frame. The information following the MIC element through to the end of the Mesh Peering Confirm frame body is encrypted and authenticated (see 13.5).

8.5.16.4 Mesh Peering Close frame format

8.5.16.4.1 Mesh Peering Close frame self protection

Protection of this frame is provided when authenticated mesh peering exchange (AMPE) is enabled. AMPE provides integrity protection of Mesh Peering Close frames.

When the Mesh Peering Close frame is used by the mesh peering management (MPM) protocol, integrity protection on the frame is not enabled.

8.5.16.4.2 Mesh Peering Close frame details

The Mesh Peering Close frame is used to close a mesh peering using the procedures defined in 13.3.8 and in 13.5.5. The Mesh Peering Close frame is also, together with Mesh Peering Open and Mesh Peering Confirm frames, referred to as a Mesh Peering Management frame. The format of the Mesh Peering Close frame Action field is shown in Table 8-264.

Table 8-264—Mesh Peering Close frame Action field format

Order	Information	Notes
1	Category	
2	Self-protected Action	
3	Mesh ID	The Mesh ID element is set as described in 8.4.2.101.
4	Mesh Peering Management	The Mesh Peering Management element is set as described in 8.4.2.104.
Last–2	Vendor Specific	One or more vendor-specific elements are optionally present. These elements follow all other elements except MIC element and Authenticated Mesh Peering Exchange element.
Last–1	MIC element	MIC element is present when dot11MeshSecurityActivated is true and a PMK exists between the sender and recipient of this frame.
Last	Authenticated Mesh Peering Exchange	The Authenticated Mesh Peering Exchange element is present when dot11MeshSecurityActivated is true and a PMK exists between the sender and recipient of this frame.

The Category field is set to the value in Table 8-38 for category Self-protected.

The Self-protected Action field is set to the value in Table 8-261 representing Mesh Peering Close.

The MIC element appears prior to the Authenticated Mesh Peering Exchange element in the Mesh Peering Open frame. The information following the MIC element through to the end of the Mesh Peering Close frame body is encrypted and authenticated (see 13.5).

8.5.16.5 Mesh Group Key Inform frame format

8.5.16.5.1 Mesh Group Key Inform frame self protection

The protection of the frames is provided by the mesh group key handshake protocol (see 13.6) that uses Mesh Group Key Inform frames.

8.5.16.5.2 Mesh Group Key Inform frame details

The Mesh Group Key Inform frame is used to update a mesh GTK (MGTK) with a peer. The format of the Mesh Group Key Inform frame Action field is shown in Table 8-265.

Table 8-265—Mesh Group Key Inform frame Action field format

Order	Information	Notes
1	Category	
2	Self-protected Action	
3	MIC element	
4	Authenticated Mesh Peering Exchange	

The Category field is set to the value in Table 8-38 for category Self-protected.

The Self-protected Action field is set to the value in Table 8-261 representing Mesh Group Key Inform.

The MIC element is set as defined in 8.4.2.121.

The Authenticated Mesh Peering Exchange element is set according to 13.6. The information following the MIC element through to the end of the Mesh Group Key Inform frame body is encrypted and authenticated (see 13.6.2).

8.5.16.6 Mesh Group Key Acknowledge frame format

8.5.16.6.1 Mesh Group Key Acknowledge frame self protection

The protection of the frames is provided by the mesh group key handshake protocol (see 13.6) that uses Mesh Group Key Acknowledge frames.

8.5.16.6.2 Mesh Group Key Acknowledge frame details

The Mesh Group Key Acknowledge frame is used to acknowledge receipt and processing of a Mesh Group Key Inform frame. The format of the Mesh Group Key Acknowledge frame Action field is shown in Table 8-266.

Table 8-266—Mesh Group Key Acknowledge frame Action field format

Order	Information	Notes
1	Category	
2	Self-protected Action	
3	MIC element	
4	Authenticated Mesh Peering Exchange	

The Category field is set to the value in Table 8-38 for category Self-protected.

The Self-protected Action field is set to the value in Table 8-261 representing Mesh Group Key Acknowledge.

The MIC element is set as defined in 8.4.2.121.

The Authenticated Mesh Peering Exchange element is set according to 13.6. The information following the MIC element through to the end of the Mesh Group Key Acknowledge frame body is encrypted and authenticated (see 13.6.2).

8.5.17 Mesh Action frame details

8.5.17.1 Mesh Action fields

Several Mesh Action frame formats are defined for mesh BSS operation. A Mesh Action field, in the octet field immediately after the Category field, differentiates the formats. The Mesh Action field values associated with each frame format are defined in Table 8-267.

Table 8-267—Mesh Action field values

Mesh Action field value	Description
0	Mesh Link Metric Report
1	HWMP Mesh Path Selection
2	Gate Announcement
3	Congestion Control Notification
4	MCCA Setup Request
5	MCCA Setup Reply
6	MCCA Advertisement Request
7	MCCA Advertisement
8	MCCA Teardown
9	TBTT Adjustment Request
10	TBTT Adjustment Response
11–255	Reserved

8.5.17.2 Mesh Link Metric Report frame format

The Mesh Link Metric Report frame is transmitted by a mesh STA to a neighbor peer mesh STA to report metric information on the link between the two mesh STAs. It is also transmitted by a mesh STA to a neighbor peer mesh STA to request metric information on the link between the two mesh STAs from the recipient. This frame is transmitted using an individually addressed frame. The format of the Mesh Link Metric Report frame Action field is shown in Table 8-268.

Table 8-268—Mesh Link Metric Report frame Action field format

Order	Information	Notes
1	Category	
2	Mesh Action	
3	Mesh Link Metric Report element	

The Category field is set to the value in Table 8-38 for category Mesh Action.

The Mesh Action field is set to the value in Table 8-267 representing Mesh Link Metric Report.

The Mesh Link Metric Report element is set as described in 8.4.2.102.

8.5.17.3 HWMP Mesh Path Selection frame format

The HWMP Mesh Path Selection frame is transmitted by a mesh STA to establish, update or delete paths to other mesh STAs using the HWMP defined in 13.10. This frame is transmitted in an individually or group addressed frame depending on the contained elements and as defined in 13.10.7. The format of the HWMP Mesh Path Selection frame Action field is shown in Table 8-269.

HWMP Mesh Path Selection frame contains one or more of the elements indicated in Table 8-269.

Table 8-269—HWMP Mesh Path Selection frame Action field format

Order	Information	Notes
1	Category	
2	Mesh Action	
3	PREQ element	A PREQ element is optionally present
4	PREP element	A PREP element is optionally present
5	PERR element	A PERR element is optionally present
6	RANN element	A RANN element is optionally present

The Category field is set to the value in Table 8-38 for category Mesh Action.

The Mesh Action field is set to the value in Table 8-267 representing HWMP Mesh Path Selection.

The PREQ element is set as described in 8.4.2.115.

The PREP element is set as described in 8.4.2.116.

The PERR element is set as described in 8.4.2.117.

The RANN element is set as described in 8.4.2.114.

8.5.17.4 Gate Announcement frame format

The Gate Announcement frame is transmitted by a mesh gate to announce its presence in the MBSS. This frame is transmitted using group addresses. The format of the Gate Announcement frame Action field is shown in Table 8-270.

Table 8-270—Gate Announcement frame Action field format

Order	Information	Notes
1	Category	
2	Mesh Action	
3	GANN element	

The Category field is set to the value in Table 8-38 for category Mesh Action.

The Mesh Action field is set to the value in Table 8-267 representing Gate Announcement.

The GANN element is set as described in 8.4.2.113.

8.5.17.5 Congestion Control Notification frame format

A mesh STA uses the Congestion Control Notification frame to indicate its congestion status to its neighbor peer mesh STA(s). This frame is transmitted using individual addresses or group addresses. The format of the Congestion Control Notification frame Action field is shown in Table 8-271.

Table 8-271—Congestion Control Notification frame Action field format

Order	Information	Notes
1	Category	
2	Mesh Action	
3 to (*N*+2)	Congestion Notification element	One or more Congestion Notification elements (8.4.2.103) are present. Repeated *N* times (*N* is the number of Congestion Notification elements contained in the frame).

The Category field is set to the value in Table 8-38 for category Mesh Action.

The Mesh Action field is set to the value in Table 8-267 representing Congestion Control Notification.

The Congestion Notification element is set as described in 8.4.2.103.

8.5.17.6 MCCA Setup Request frame format

The MCCA Setup Request frame is used to set up an MCCAOP reservation. It is transmitted by a mesh STA with dot11MCCAActivated equal to true to one or more neighbor peer mesh STA with dot11MCCAActivated equal to true. This frame is transmitted using individual addresses or group addresses. The format of the MCCA Setup Request frame Action field is shown in Table 8-272.

Table 8-272—MCCA Setup Request frame Action field format

Order	Information	Notes
1	Category	
2	Mesh Action	
3	MCCAOP Setup Request element	

The Category field is set to the value in Table 8-38 for category Mesh Action.

The Mesh Action field is set to the value in Table 8-267 representing MCCA Setup Request.

The MCCAOP Setup Request element is described in 8.4.2.108.

8.5.17.7 MCCA Setup Reply frame format

The MCCA Setup Reply frame is used to reply to an MCCA Setup Request frame. It is transmitted by a mesh STA with dot11MCCAActivated equal to true to a neighbor peer mesh STA with dot11MCCAActivated equal to true. This frame is transmitted using individual addresses. The format of the MCCA Setup Reply frame Action field is shown in Table 8-273.

Table 8-273—MCCA Setup Reply frame Action field format

Order	Information	Notes
1	Category	
2	Mesh Action	
3	MCCAOP Setup Reply element	

The Category field is set to the value in Table 8-38 for category Mesh Action.

The Mesh Action field is set to the value in Table 8-267 representing MCCA Setup Reply.

The MCCAOP Setup Reply element is described in 8.4.2.109.

8.5.17.8 MCCA Advertisement Request frame format

The MCCA Advertisement Request frame is transmitted by a mesh STA with dot11MCCAActivated equal to true to a neighbor peer mesh STA with dot11MCCAActivated equal to true in order to request MCCAOP advertisements from the neighbor peer mesh STA. This frame is transmitted using individual addresses. The format of the MCCA Advertisement Request frame Action field is shown in Table 8-274.

Table 8-274—MCCA Advertisement Request frame Action field format

Order	Information	Notes
1	Category	
2	Mesh Action	
3	MCCAOP Advertisement Overview element	An MCCAOP Advertisement Overview element is optionally present.

The Category field is set to the value in Table 8-38 for category Mesh Action.

The Mesh Action field is set to the value in Table 8-267 representing MCCA Advertisement Request.

The MCCAOP Advertisement Overview element is described in 8.4.2.110.

8.5.17.9 MCCA Advertisement frame format

The MCCA Advertisement frame is transmitted by a mesh STA with dot11MCCAActivated equal to true to one or more neighbor peer mesh STAs with dot11MCCAActivated equal to true. This frame is transmitted using group addresses or individual addresses. The format of the MCCA Advertisement frame Action field is shown in Table 8-275.

Table 8-275—MCCA Advertisement frame Action field format

Order	Information	Notes
1	Category	
2	Mesh Action	
3	MCCAOP Advertisement Overview element	An MCCAOP Advertisement Overview element is optionally present.
4	MCCAOP Advertisement elements	If an MCCAOP Advertisement Overview element is present, zero or more MCCAOP Advertisement elements are present. If an MCCAOP Advertisement Overview element is not present, one or more MCCAOP Advertisement elements are present.

The Category field is set to the value in Table 8-38 for category Mesh Action.

The Mesh Action field is set to the value in Table 8-267 representing MCCA Advertisement.

The MCCAOP Advertisement Overview element is described in 8.4.2.110.

The MCCAOP Advertisement element is described in 8.4.2.111.

8.5.17.10 MCCA Teardown frame format

The MCCA Teardown frame is transmitted by a mesh STA with dot11MCCAActivated equal to true to one or more neighbor peer mesh STAs with dot11MCCAActivated equal to true. This frame is transmitted using group addresses or individual addresses. The format of the MCCA Teardown frame Action field is shown in Table 8-276.

Table 8-276—MCCA Teardown frame Action field format

Order	Information	Notes
1	Category	
2	Mesh Action	
3	MCCAOP Teardown element	

The Category field is set to the value in Table 8-38 for category Mesh Action.

The Mesh Action field is set to the value in Table 8-267 representing MCCA Teardown.

The MCCAOP Teardown element is described in 8.4.2.112.

8.5.17.11 TBTT Adjustment Request frame format

The TBTT Adjustment Request frame is used to request a particular neighbor peer mesh STA to adjust its TBTT. This frame is transmitted using individual addresses. The format of the TBTT Adjustment Request frame Action field is shown in Table 8-277.

Table 8-277—TBTT Adjustment Request frame Action field format

Order	Information	Notes
1	Category	
2	Mesh Action	
3 to (*N_Info*+2)	Beacon Timing element	Repeated *N_Info* times (*N_Info* is a number of beacon timing information tuples as described in 13.13.4.2.5).

The Category field is set to the value in Table 8-38 for category Mesh Action.

The Mesh Action field is set to the value in Table 8-267 representing TBTT Adjustment Request.

The Beacon Timing element is set as described in 8.4.2.107. When not all beacon timing information is included in a Beacon Timing element due to the maximum element size limit, multiple Beacon Timing elements are present. The elements are present in the order of Beacon Timing Element Number field value in the Report Control field of the Beacon Timing element.

8.5.17.12 TBTT Adjustment Response frame format

The TBTT Adjustment Response frame is used to respond to a TBTT adjustment request. This frame is transmitted using individual addresses. The format of the TBTT Adjustment Response frame Action field is shown in Table 8-278.

Table 8-278—TBTT Adjustment Response frame Action field format

Order	Information	Notes
1	Category	
2	Mesh Action	
3	Status Code	
4 to (*N_Info*+3)	Beacon Timing element (optional)	Repeated *N_Info* times (*N_Info* is a number of beacon timing information tuples as described in 13.13.4.2.5).

The Category field is set to the value in Table 8-38 for category Mesh Action.

The Mesh Action field is set to the value in Table 8-267 representing TBTT Adjustment Response.

The Status Code field is set as described in 13.13.4.4.2.

The Beacon Timing element is set as defined in 8.4.2.107. It is present only if the Status Code is set to 78 (i.e., when the request is not successful due to the neighbor constraint). When not all beacon timing information is included in a Beacon Timing element due to the maximum element size limit, multiple Beacon Timing elements are present. The elements are present in the order of Beacon Timing Element Number field value in the Report Control field of the Beacon Timing element.

8.5.18 Multihop Action frame details

8.5.18.1 Multihop Action fields

Several Multihop Action frame formats are defined for mesh BSS operation. A Multihop Action field, in the octet field immediately after the Category field, differentiates the formats. The Multihop Action field values associated with each frame format are defined in Table 8-279. The Mesh Control field is present immediately after the Multihop Action field in all Multihop Action frames.

Table 8-279—Multihop Action field values

Multihop Action field value	Description
0	Proxy Update
1	Proxy Update Confirmation
2–255	Reserved

8.5.18.2 Proxy Update frame format

The Proxy Update frame is used to inform the recipient about new, updated, or deleted proxy information. This frame is transmitted using individual addresses. The format of the Proxy Update frame Action field is shown in Table 8-280.

Table 8-280—Proxy Update frame Action field format

Order	Information	Notes
1	Category	
2	Multihop Action	
3	Mesh Control	
4 to (*N*+3)	PXU element	Repeated *N* times (*N* is the number of PXU elements contained in the frame).

The Category field is 1 octet and is set to the value in Table 8-38 for category Multihop Action.

The Multihop Action field is set to the value in Table 8-279 representing Proxy Update.

The Mesh Control field is set as defined in 8.2.4.7.3.

The PXU element is described in 8.4.2.118. The Proxy Update frame allows the inclusion of multiple PXU elements.

8.5.18.3 Proxy Update Confirmation frame format

The Proxy Update Confirmation frame is transmitted by a mesh STA in response to a Proxy Update frame. This frame is used to inform that the corresponding PXU element has been properly received, and is transmitted using individual addresses. The format of the Proxy Update Confirmation frame Action field is shown in Table 8-281.

Table 8-281—Proxy Update Confirmation frame Action field format

Order	Information	Notes
1	Category	
2	Multihop Action	
3	Mesh Control	
4 to (*N*+3)	PXUC element	Repeated *N* times (*N* is the number of PXUC elements contained in the frame).

The Category field is 1 octet and is set to the value in Table 8-38 for category Multihop Action.

The Multihop Action field is set to the value in Table 8-279 representing Proxy Update Confirmation.

The Mesh Control field is set as defined in 8.2.4.7.3.

The PXUC element is described in 8.4.2.119. The Proxy Update Confirmation frame allows the inclusion of multiple PXUC elements.

8.6 Aggregate MPDU (A-MPDU)

8.6.1 A-MPDU format

An A-MPDU consists of a sequence of one or more A-MPDU subframes as shown in Figure 8-503.

	A-MPDU subframe 1	A-MPDU subframe 2	…	A-MPDU subframe n
Octets:	variable	variable		variable

Figure 8-503—A-MPDU format

The structure of the A-MPDU subframe is shown in Figure 8-504. Each A-MPDU subframe consists of an MPDU delimiter followed by an MPDU. Except when an A-MPDU subframe is the last one in an A-MPDU, padding octets are appended to make each A-MPDU subframe a multiple of 4 octets in length. The A-MPDU maximum length is 65 535 octets. The length of an A-MPDU addressed to a particular STA may be further constrained as described in 9.12.2.

	MPDU delimiter	MPDU	Pad
Octets:	4	Variable	0–3

Figure 8-504—A-MPDU subframe format

The MPDU delimiter is 4 octets in length. The structure of the MPDU delimiter is defined in Figure 8-505.

	B0 B3	B4 B15	B16 B23	B24 B31
	Reserved	MPDU length	CRC	Delimiter Signature
Bits:	4	12	8	8

Figure 8-505—MPDU delimiter

The fields of the MPDU delimiter are defined in Table 8-282.

Table 8-282— MPDU delimiter fields

Field	Size (bits)	Description
Reserved	4	
MPDU length	12	Length of the MPDU in octets
CRC	8	8-bit CRC of the preceding 16-bits.
Delimiter Signature	8	Pattern that may be used to detect an MPDU delimiter when scanning for a delimiter. The unique pattern is set to the value 0x4E. NOTE—As the Delimiter Signature field was created by the IEEE 802.11 Task Group n, it chose the ASCII value for the character ‘N’ as the unique pattern.

The purpose of the MPDU delimiter is to locate the MPDUs within the A-MPDU so that the structure of the A-MPDU can usually be recovered when one or more MPDU delimiters are received with errors. See S.2 for a description of a deaggregation algorithm.

A delimiter with MPDU length of 0 is valid. This value is used as defined in 9.12.3 to meet the minimum MPDU start spacing requirement.

8.6.2 MPDU delimiter CRC field

The MPDU delimiter CRC field is an 8-bit CRC value. It is used as a frame check sequence (FCS) to protect the Reserved and MPDU Length fields. The CRC field is the ones complement of the remainder generated by the modulo 2 division of the protected bits by the polynomial $x^8 + x^2 + x^1 + 1$, where the shift-register state is preset to all ones.

NOTE—The order of transmission of bits within the CRC field is defined in 8.2.2.

Figure 8-506 illustrates the CRC calculation for the MPDU delimiter.

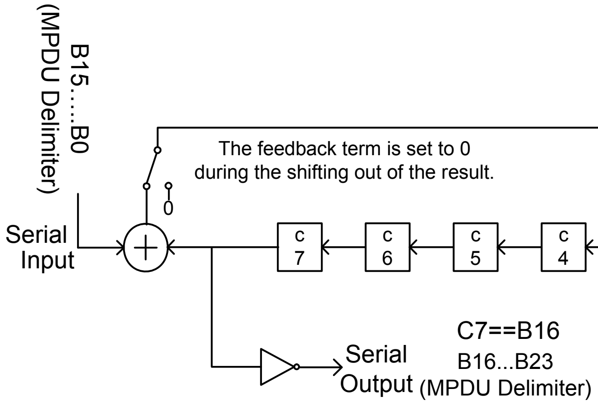

Figure 8-506—MPDU delimiter CRC calculation

8.6.3 A-MPDU contents

An A-MPDU is a sequence of MPDUs carried in a single PPDU with the TXVECTOR/RXVECTOR AGGREGATION parameter set to 1.

All the MPDUs within an A-MPDU are addressed to the same RA. All QoS data frames within an A-MPDU that have a TID for which an HT-immediate Block Ack agreement exists have the same value for the Ack Policy subfield of the QoS Control field.

All protected MPDUs within an A-MPDU have the same Key ID.

The Duration/ID fields in the MAC headers of all MPDUs in an A-MPDU carry the same value.

An A-MPDU is transmitted in one of the contexts specified in Table 8-283. Ordering of MPDUs within an A-MPDU is not constrained, except where noted in these tables. See 9.12.1.

NOTE 1—The TIDs present in a data enabled A-MPDU context are also constrained by the channel access rules (for a TXOP holder; see 9.19.2 and 9.19.3) and the RD response rules (for an RD responder, see 9.25.4). This is not shown in these tables.

NOTE 2—MPDUs carried in an A-MPDU are limited to a maximum length of 4095 octets. If a STA supports A-MSDUs of 7935 octets (indicated by the Maximum A-MSDU Length field in the HT Capabilities element), A-MSDUs transmitted by that STA within an A-MPDU are constrained so that the length of the QoS data MPDU carrying the A-MSDU is no more than 4095 octets. The use of A-MSDU within A-MPDU might be further constrained as described in 8.4.1.14 through the operation of the A-MSDU Supported field.

Table 8-283—A-MPDU Contexts

Name of Context	Definition of Context	Table defining permitted contents
Data Enabled Immediate Response	The A-MPDU is transmitted outside a PSMP sequence by a TXOP holder or an RD responder including potential immediate responses.	Table 8-284
Data Enabled No Immediate Response	The A-MPDU is transmitted outside a PSMP sequence by a TXOP holder that does not include or solicit an immediate response. See NOTE.	Table 8-285
PSMP	The A-MPDU is transmitted within a PSMP sequence.	Table 8-286
Control Response	The A-MPDU is transmitted by a STA that is neither a TXOP holder nor an RD responder that also needs to transmit one of the following immediate response frames: Ack BlockAck with a TID for which an HT-immediate Block Ack agreement exists	Table 8-287
NOTE—This context includes cases when no response is generated or when a response is generated later by the operation of the delayed Block Ack rules.		

Table 8-284—A-MPDU contents in the data enabled immediate response context

MPDU Description	Conditions	
ACK MPDU	If the preceding PPDU contains an MPDU that requires an ACK response, a single ACK MPDU at the start of the A-MPDU.	At most one of these MPDUs is present.
HT-immediate BlockAck	If the preceding PPDU contains an implicit or explicit Block Ack request for a TID for which an HT-immediate Block Ack agreement exists, at most one BlockAck for this TID, in which case it occurs at the start of the A-MPDU.	
Delayed BlockAcks	BlockAck frames with the BA Ack Policy subfield equal to No Acknowledgment with a TID for which an HT-delayed Block Ack agreement exists.	
Delayed Block Ack data	QoS Data MPDUs with a TID that corresponds to a Delayed or HT-delayed Block Ack agreement. These have the Ack Policy field equal to Block Ack.	
Action No Ack	Management frames of subtype Action No Ack.	
Delayed BlockAckReqs	BlockAckReq MPDUs with a TID that corresponds to an HT-delayed Block Ack agreement in which the BA Ack Policy subfield is equal to No Acknowledgment.	

Table 8-284—A-MPDU contents in the data enabled immediate response context *(continued)*

MPDU Description	Conditions	
Data MPDUs sent under an HT-immediate Block Ack agreement	QoS Data MPDUs with the same TID, which corresponds to an HT-immediate Block Ack agreement. These MPDUs all have the Ack Policy field equal to the same value, which is either Implicit Block Ack Request or Block Ack.	Of these, at most one of the following is present: One or more QoS Data MPDUs with the Ack Policy field equal to Implicit Block Ack Request BlockAckReq
Immediate BlockAckReq	At most one BlockAckReq frame with a TID that corresponds to an HT-immediate Block Ack agreement. This is the last MPDU in the A-MPDU. It is not present if any QoS data frames for that TID are present.	

Table 8-285—A-MPDU contents in the data enabled no immediate response context

MPDU Description	Conditions
Delayed BlockAcks	BlockAck frames for a TID for which an HT-delayed Block Ack agreement exists with the BA Ack Policy subfield equal to No Acknowledgment.
Delayed Block Ack data	QoS Data MPDUs with a TID that corresponds to a Delayed or HT-delayed Block Ack agreement. These have the Ack Policy field equal to Block Ack.
Data without a Block Ack agreement	QoS Data MPDUs with a TID that does not correspond to a Block Ack agreement. These have the Ack Policy field equal to No Ack and the A-MSDU Present subfield equal to 0.
Action No Ack	Management frames of subtype Action No Ack.
Delayed BlockAckReqs	BlockAckReq MPDUs with the BA Ack Policy subfield equal to No Acknowledgment and with a TID that corresponds to an HT-delayed Block Ack agreement.

Table 8-286—A-MPDU contents in the PSMP context

MPDU Description	Conditions	
Acknowledgment for PSMP data	At most one Multi-TID BlockAck MPDU. Acknowledgment in response to data received with the Ack Policy field equal to PSMP Ack and/or a Multi-TID BlockAckReq MPDU in the previous PSMP-UTT or PSMP-DTT.	
Delayed BlockAcks	BlockAck frames with the BA Ack Policy subfield equal to No Acknowledgment and with a TID for which an HT-delayed Block Ack agreement exists.	
HT-immediate Data	QoS Data MPDUs in which the Ack Policy field is equal to PSMP Ack or Block Ack and with a TID that corresponds to an HT-immediate Block Ack agreement.	An A-MPDU containing MPDUs with a Block Ack agreement does not also contain MPDUs without a Block Ack agreement.
Delayed Block Ack data	QoS Data MPDUs with a TID that corresponds to a Delayed or HT-delayed Block Ack agreement. These have the Ack Policy field equal to Block Ack.	
Data without a Block Ack agreement	QoS Data MPDUs with a TID that does not correspond to a Block Ack agreement. These have the Ack Policy field equal to No Ack and the A-MSDU Present subfield is equal to 0.	
Action No Ack	Management frames of subtype Action No Ack.	
Delayed BlockAckReqs	BlockAckReq MPDUs with the BA Ack Policy subfield equal to No Acknowledgment and with a TID that corresponds to an HT-delayed Block Ack.	
Multi-TID BlockAckReq	At most one Multi-TID BlockAckReq MPDU with the BA Ack Policy subfield equal to No Ack.	

Table 8-287—A-MPDU contents MPDUs in the control response context

MPDU	Conditions	
ACK	ACK transmitted in response to an MPDU that requires an ACK.	Only one of these is present at the start of the A-MPDU.
BlockAck	BlockAck with a TID that corresponds to an HT-immediate Block Ack agreement.	
Action No Ack	Management frames of subtype Action No Ack +HTC carrying a Management Action Body containing an explicit feedback response.	

9. MAC sublayer functional description

9.1 Introduction

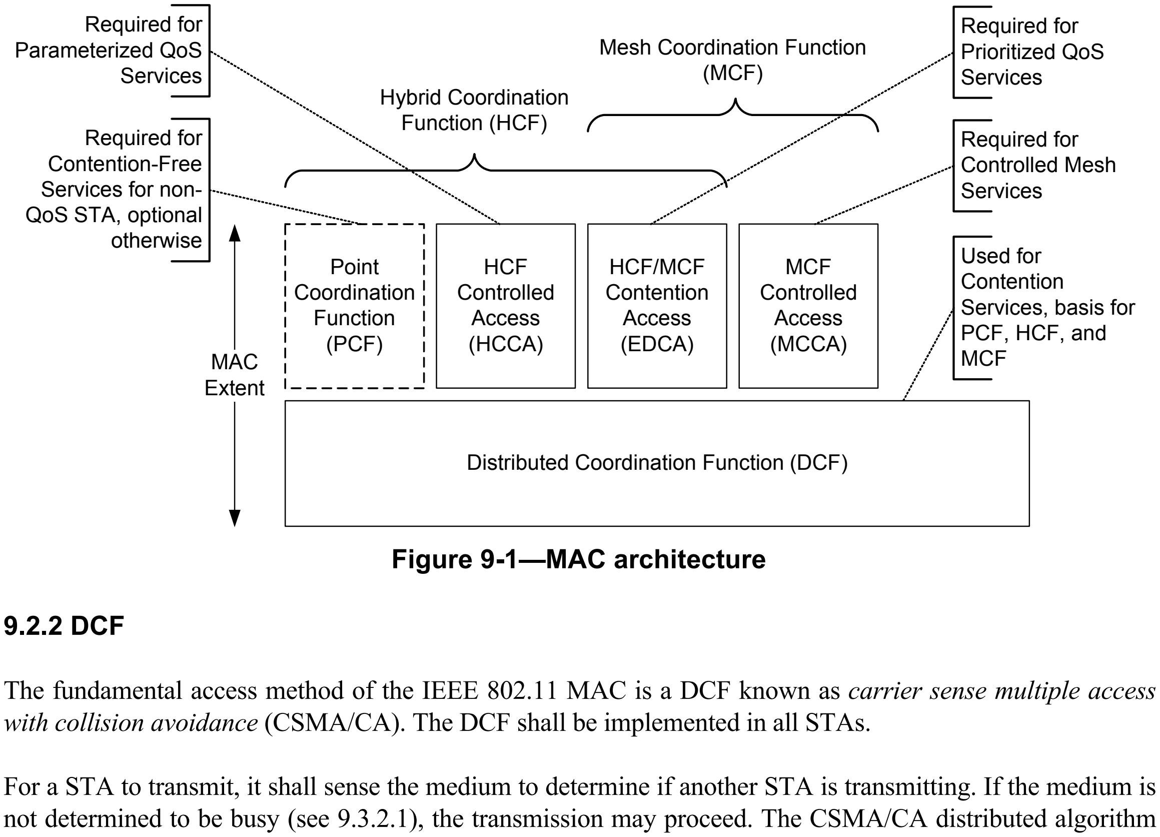
The MAC functional description is presented in this clause. The architecture of the MAC sublayer, including the distributed coordination function (DCF), the point coordination function (PCF), the hybrid coordination function (HCF), the mesh coordination function (MCF), and their coexistence in an IEEE 802.11 LAN are introduced in 9.2. These functions are expanded on in 9.3 (DCF), 9.4 (PCF), 9.19 (HCF), and 9.20 (MCF). Fragmentation and defragmentation are defined in 9.5 and 9.6. Multirate support is addressed in 9.7. A number of additional restrictions to limit the cases in which MSDUs are reordered or discarded are described in 9.8. Operation across regulatory domains is defined in 9.18. The Block Ack mechanism is described in 9.21. The No Ack mechanism is described in 9.22. The protection mechanism is described in 9.23. Rules for processing MAC frames are described in 9.24.

9.2 MAC architecture

9.2.1 General

A representation of the MAC architecture is shown in Figure 9-1 in which the PCF and HCF services are provided using the services of the DCF. Note that in a non-QoS STA, HCF is not present. In a QoS STA implementation, both DCF and HCF are present. PCF is optional in all STAs.

Due to the distributed nature of the MBSS, only the MCF is present in a mesh STA.



Required for Parameterized QoS Services
Required for Contention-Free Services for non-QoS STA, optional otherwise
Hybrid Coordination Function (HCF)
Mesh Coordination Function (MCF)
Required for Prioritized QoS Services
Required for Controlled Mesh Services
Used for Contention Services, basis for PCF, HCF, and MCF
MAC Extent
Point Coordination Function (PCF)
HCF Controlled Access (HCCA)
HCF/MCF Contention Access (EDCA)
MCF Controlled Access (MCCA)
Distributed Coordination Function (DCF)

Figure 9-1—MAC architecture

9.2.2 DCF

The fundamental access method of the IEEE 802.11 MAC is a DCF known as *carrier sense multiple access with collision avoidance* (CSMA/CA). The DCF shall be implemented in all STAs.

For a STA to transmit, it shall sense the medium to determine if another STA is transmitting. If the medium is not determined to be busy (see 9.3.2.1), the transmission may proceed. The CSMA/CA distributed algorithm mandates that a gap of a minimum specified duration exists between contiguous frame sequences. A transmitting STA shall verify that the medium is idle for this required duration before attempting to transmit. If the medium is determined to be busy, the STA shall defer until the end of the current transmission. After deferral, or prior to attempting to transmit again immediately after a successful transmission, the STA shall select a random backoff interval and shall decrement the backoff interval counter while the medium is idle. A transmission is successful either when an ACK frame is received from the STA addressed by the RA field of the transmitted frame or when a frame with a group address in the RA field is transmitted completely. A refinement of the method may be used under various circumstances to further minimize collisions—here the transmitting and receiving STA exchange short control frames (RTS and CTS frames) after determining that the medium is idle and after any deferrals or backoffs, prior to data transmission. The details of CSMA/CA, deferrals, and backoffs are described in 9.3. RTS/CTS exchanges are also presented in 9.3.

9.2.3 PCF

The IEEE 802.11 MAC may also incorporate an optional access method called a PCF, which is only usable on infrastructure network configurations. This access method uses a PC, which shall operate at the AP of the BSS, to determine which STA currently has the right to transmit. The operation is essentially that of polling, with the PC performing the role of the polling master. The operation of the PCF may require additional coordination, not specified in this standard, to permit efficient operation in cases where multiple point-coordinated BSSs are operating on the same channel, in overlapping physical space.

The PCF uses a virtual carrier sense (CS) mechanism aided by an access priority mechanism. The PCF shall distribute information within Beacon management frames to gain control of the medium by setting the NAV in STAs. In addition, all frame transmissions under the PCF may use an interframe space (IFS) that is smaller than the IFS for frames transmitted via the DCF. The use of a smaller IFS implies that point-coordinated traffic has priority access to the medium over STAs in overlapping BSSs operating under the DCF access method.

The access priority provided by a PCF may be utilized to create a CF access method. The PC controls the frame transmissions of the STAs so as to eliminate contention for a limited period of time.

9.2.4 Hybrid coordination function (HCF)

9.2.4.1 General

The QoS facility includes an additional coordination function called *HCF* that is only usable in QoS network configurations. The HCF shall be implemented in all QoS STAs except mesh STAs. Instead, mesh STAs implement the MCF. The HCF combines functions from the DCF and PCF with some enhanced, QoS-specific mechanisms and frame subtypes to allow a uniform set of frame exchange sequences to be used for QoS data transfers during both the CP and CFP. The HCF uses both a contention-based channel access method, called the *enhanced distributed channel access* (EDCA) mechanism for contention-based transfer and a controlled channel access, referred to as the *HCF controlled channel access* (HCCA) mechanism, for contention-free transfer.

STAs may obtain TXOPs using one or both of the channel access mechanisms specified in 9.19. If a TXOP is obtained using the contention-based channel access, it is defined as *EDCA TXOP*. If a TXOP is obtained using the controlled channel access, it is defined as *HCCA TXOP*. If an HCCA TXOP is obtained due to a QoS (+)CF-Poll frame from the HC, the TXOP is defined as a *polled TXOP*.

Time priority management frames are transmitted outside of the normal MAC queuing process as per individually described transmission rules. Frames listed in Table 8-229 with a value of "Yes" in the "Time Priority" column are time priority management frames. No other frames are time priority management frames.

9.2.4.2 HCF contention-based channel access (EDCA)

The EDCA mechanism provides differentiated, distributed access to the WM for STAs using eight different UPs. The EDCA mechanism defines four access categories (ACs) that provide support for the delivery of traffic with UPs at the STAs. The AC is derived from the UPs as shown in Table 9-1.

Table 9-1—UP-to-AC mappings

Priority	UP (Same as 802.1D user priority)	802.1D designation	AC	Designation (informative)
Lowest	1	BK	AC_BK	Background
	2	—	AC_BK	Background
	0	BE	AC_BE	Best Effort
	3	EE	AC_BE	Best Effort
	4	CL	AC_VI	Video
	5	VI	AC_VI	Video
	6	VO	AC_VO	Voice
Highest	7	NC	AC_VO	Voice

For each AC, an enhanced variant of the DCF, called an *enhanced distributed channel access function* (EDCAF), contends for TXOPs using a set of EDCA parameters. When communicating data frames outside the context of a BSS (dot11OCBActivated is true), the EDCA parameters are the corresponding default values or are as set by the SME in dot11EDCATable (except for TXOP limit values, which shall be set to 0 for each AC). When communicating within a BSS, the EDCA parameters used are from the EDCA Parameter Set element or from the default values for the parameters when no EDCA Parameter Set element is received from the AP of the BSS with which the STA is associated or when the STA is a mesh STA. The parameters used by the EDCAF to control its operation are defined by dot11QAPEDCATable at the AP and by dot11EDCATable at the non-AP STA.

The following rules apply for HCF contention-based channel access:

a) The minimum specified idle duration time is not the constant value (DIFS) as defined for DCF, but is a distinct value (contained in table dot11QAPEDCATableAIFSN for an AP and in table dot11EDCATableAIFSN for a non-AP STA; see 9.19.2) assigned either by a management entity or by an AP.

b) The contention window limits aCWmin and aCWmax, from which the random backoff is computed, are not fixed per PHY, as with DCF, but are variable (contained in tables dot11QAPEDCACWmin and dot11QAPEDCACWmax for an AP and in tables dot11EDCATableCWmin and dot11EDCATableCWmax for a non-AP STA) and assigned by a management entity or by an AP.

c) Collisions between contending EDCAFs within a STA are resolved within the STA so that the data frames from the higher priority AC receive the TXOP and the data frames from the lower priority colliding AC(s) behave as if there were an external collision on the WM.

   NOTE—This collision behavior does not include setting retry bits in the MAC headers of MPDUs at the head of the lower priority ACs, as would be done after a transmission attempt that was unsuccessful due to an actual external collision on the WM.

d) During an EDCA TXOP won by an EDCAF, a STA may initiate multiple frame exchange sequences to transmit MMPDUs and/or MSDUs within the same AC. The duration of this EDCA TXOP is bounded, for an AC, by the value dot11QAPEDCATXOPLimit for an AP and by dot11EDCATableTXOPLimit for a non-AP STA. A value of 0 for this duration means that the EDCA TXOP is limited as defined by the rule for TXOP Limit value 0 found in 9.19.2.2.

The QoS AP shall announce the EDCA parameters in selected Beacon frames and in all Probe Response and (Re)Association Response frames by the inclusion of the EDCA Parameter Set element using the information from the MIB entries in dot11ECDATable. If no such element is received, the STAs shall use the default values for the parameters. The fields following the QoS Info field in the EDCA Parameter Set element shall be included in all Beacon frames occurring within two (optionally more) delivery traffic indication map (DTIM) periods following a change in AC parameters, which provides all STAs an opportunity to receive the updated EDCA parameters. A QoS STA shall update its MIB values of the EDCA parameters within an interval of time equal to one beacon interval after receiving an updated EDCA parameter set. QoS STAs update the MIB attributes and store the EDCA Parameter Set update count value in the QoS Info field. An AP may change the EDCA access parameters by changing the EDCA Parameter Set element in the Beacon frame, Probe Response frame, and (Re)Association Response frame. However, the AP should change them only rarely. A QoS STA shall use the EDCA Parameter Set Update Count Value subfield in the QoS Capability element of all Beacon frames to determine whether the STA is using the current EDCA Parameter Values. If the EDCA Parameter Set update count value in the QoS Capability element is different from the value that has been stored, the QoS STA shall query the updated EDCA parameter values by sending a Probe Request frame to the AP.

In the Beacon frame, the EDCA Parameter Set Update Count subfield is initially set by the AP to 0 and is incremented every time any of the AC parameters changes.

The AP may use a different set of EDCA parameter values than it advertises to the STAs in its BSS.

A QoS STA should send individually addressed Management frames that are addressed to a non-QoS STA using the access category AC_BE and shall send all other management frames using the access category AC_VO. A QoS STA that does not send individually addressed Management frames that are addressed to a non-QoS STA using the access category AC_BE shall send them using the access category AC_VO. Management frames are exempted from any and all restrictions on transmissions arising from admission control procedures. A QoS STA shall also send management frames using the access category AC_VO before associating with any BSS and before establishing mesh peerings in an MBSS, even if there is no QoS facility available in that BSS. BlockAckReq and BlockAck frames shall be sent using the same access category as the corresponding QoS data frames. PS-Poll frames shall be sent using the access category AC_BE (to reduce the likelihood of collision following a Beacon frame) and are exempted from any and all restrictions on transmissions arising from admission control procedures. When the first frame in a frame exchange sequence is an RTS or CTS frame, the RTS or CTS frame shall be transmitted using the access category of the corresponding QoS Data/QoS Null frame(s) or AC_VO for management frames. Control Wrapper frames shall be sent using the access category that would apply to the carried control frame.

Note—A QoS STA can choose to use AC_VO when transmitting management frames to a non-QoS STA when no prior data frames have been transmitted to the non-QoS STA.

The operation rules of HCF contention-based channel access are defined in 9.19.2.

9.2.4.3 HCF controlled channel access (HCCA)

The HCCA mechanism uses a QoS-aware centralized coordinator, called a *hybrid coordinator* (HC), and operates under rules that are different from the PC of the PCF. The HC is collocated with the AP of the BSS and uses the HC's higher priority of access to the WM to initiate frame exchange sequences and to allocate TXOPs to itself and other STAs in order to provide limited-duration CAPs for contention-free transfer of QoS data.

The HC traffic delivery and TXOP allocation may be scheduled during the CP and any locally generated CFP (generated optionally by the HC) to meet the QoS requirements of a particular TC or TS. TXOP allocations and contention-free transfers of QoS traffic might be based on the HC's BSS-wide knowledge of the amounts of pending traffic belonging to different TS and/or TCs and are subject to BSS-specific QoS policies.

An AP may transmit a CF-Poll to a non-QoS STA, thereby providing non-QoS contention-free transfers during the CFP. This provisioning of contention-free transfers during the CFP to non-QoS STAs, however, is not recommended. Implementers are cautioned that QoS STAs are not required to interpret data subtypes that include QoS +CF-Ack in frames not addressed to themselves unless they set the Q-Ack subfield in the QoS Capability element to 1. QoS STAs are also not required to interpret data subtypes that are non-QoS (+)CF-Poll frames (i.e., data frames with bits 7, 5, and 4 in the Frame Control field equal to 0, 1, and 0, respectively); therefore, QoS STAs cannot be treated as CF-Pollable STAs. This requires an AP that provides non-QoS CF-polling to adhere to frame sequence restrictions considerably more complex than, and less efficient than, those specified for either PCF or HCF. In addition, the achievable service quality is likely to be degraded when non-QoS STAs are associated and being polled.

The HCF protects the transmissions during each CAP using the virtual CS mechanism.

A STA may initiate multiple frame exchange sequences during a polled TXOP of sufficient duration to perform more than one such sequence. The use of virtual CS by the HC provides improved protection of the CFP, in addition to the protection provided by having all STAs in the BSA setting their NAVs to dot11CFPMaxDuration at the target beacon transmission time (TBTT) of DTIM Beacon frames.

The operation rules of the HCCA are defined in 9.19.3.

9.2.5 Mesh coordination function (MCF)

The mesh facility includes an additional coordination function called MCF that is usable only in an MBSS. Mesh STAs shall implement the MCF only. MCF has both a contention-based channel access and contention free channel access mechanism. The contention based mechanism is EDCA and the contention free mechanism is called the MCF controlled channel access (MCCA). MCF uses the default values for the PTKSA, GTKSA and STKSA Replay Counters. The operation rules of the EDCA are defined in 9.19.2. The operation rules of the MCCA are defined in 9.20.3.

9.2.6 Combined use of DCF, PCF, and HCF

The DCF and a centralized coordination function (either PCF or HCF) are defined so they may operate within the same BSS. When a PC is operating in a BSS, the PCF and DCF access methods alternate, with a CFP followed by a CP. This is described in greater detail in 9.4. When an HC is operating in a BSS, it may generate an alternation of CFP and CP in the same way as a PC, using the DCF access method only during the CP. The HCF access methods (controlled and contention-based) operate sequentially when the channel is in CP. Sequential operation allows the polled and contention-based access methods to alternate, within intervals as short as the time to transmit a frame exchange sequence, under rules defined in 9.19.

9.2.7 Fragmentation/defragmentation overview

The process of partitioning an MSDU or an MMPDU into smaller MAC level frames, MPDUs, is called *fragmentation*. Fragmentation creates MPDUs smaller than the original MSDU or MMPDU length to increase reliability, by increasing the probability of successful transmission (as defined in 9.2.2) of the MSDU or MMPDU in cases where channel characteristics limit reception reliability for longer frames. STAs may use fragmentation to use the medium efficiently in consideration of the duration available in granted TXOPs, as long as the rules in 9.5 are followed. Fragmentation is accomplished at each immediate transmitter. The process of recombining MPDUs into a single MSDU or MMPDU is defined as *defragmentation*. Defragmentation is accomplished at each immediate recipient.

An MSDU transmitted under HT-immediate or HT-delayed Block Ack agreement shall not be fragmented even if its length exceeds dot11FragmentationThreshold. An MSDU or MMPDU transmitted within an A-MPDU shall not be fragmented even if its length exceeds dot11FragmentationThreshold. Group addressed MSDUs or MMPDUs shall not be fragmented even if their length exceeds dot11FragmentationThreshold.

NOTE 1—A fragmented MSDU or MMPDU transmitted by an HT STA to another HT STA can be acknowledged only using immediate acknowledgment (i.e., transmission of an ACK frame after a SIFS).

NOTE 2—As specified in 9.11, A-MSDUs are never fragmented.

Except as described below, when an individually addressed MSDU received from the LLC would result in an MPDU of length greater than dot11FragmentationThreshold, the MSDU shall be fragmented. Except as described below, when an individually addressed MMPDU received from the MLME, would result in an MPDU of length greater than dot11FragmentationThreshold, the MMPDU shall be fragmented.

The exception applies when an MSDU is transmitted using an HT-immediate or HT-delayed Block Ack agreement or when the MSDU or MMPDU is carried in an A-MPDU, in which case the MSDU or MMPDU is transmitted without fragmentation. Each fragment is a frame no longer than dot11FragmentationThreshold, if security encapsulation is not invoked for the MPDU. If security encapsulation is active for the MPDU, then the fragments shall be expanded by the encapsulation overhead and this may result in a fragment larger than dot11FragmentationThreshold. It is possible that any fragment may be a frame smaller than dot11FragmentationThreshold. An illustration of fragmentation is shown in Figure 9-2.

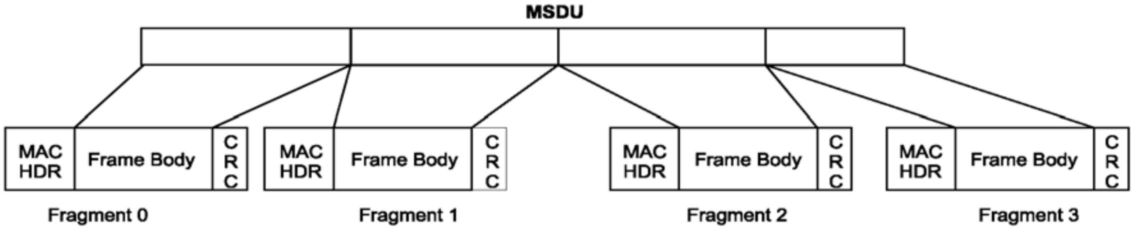


Figure 9-2—Fragmentation

The MPDUs resulting from the fragmentation of an MSDU or MMPDU are sent as independent transmissions, each of which is separately acknowledged. This permits transmission retries to occur per fragment, rather than per MSDU or MMPDU. The fragments of a single MSDU or MMPDU are either

- Sent during a CP as individual frames using the DCF, or
- Sent during a CFP as individual frames obeying the rules of the PC medium access procedure, or
- Sent as a burst in an EDCA or HCCA TXOP, subject to TXOP limits and medium occupancy limits for the attached PHY.

9.2.8 MAC data service

The MAC data service provides the transport of MSDUs between MAC peer entities as characterized in 5.1.1.

The transmission process is started by receipt of an MA-UNITDATA.request primitive containing an MSDU and the associated parameters. This might cause one or more data MPDUs containing the MSDU to be transmitted following A-MSDU aggregation, fragmentation, and security encapsulation, as appropriate.

The MA-UNITDATA.indication primitive is generated in response to one or more received data MPDUs containing an MSDU following validation, address filtering, decryption, decapsulation, defragmentation, and

A-MSDU deaggregation, as appropriate. Address filtering is performed on the Address 1 field of each MPDU contained in a PPDU and on the DA of each MSDU within an A-MSDU. When the Address 1 field or DA field contains a group address, address filtering is performed by comparing the value in the Address 1 field or DA field to all values in the dot11GroupAddressesTable. If the Address 1 field of an MPDU carrying an A-MSDU does not match any address (i.e., individual or group address) at a receiving STA, then the entire A-MSDU is discarded.

In a QoS STA, the TID parameter of the MA-UNITDATA.request primitive results in a TID being specified for the transmitted MSDU. This TID associates the MSDU with the AC or TS queue for the indicated traffic.

9.3 DCF

9.3.1 General

The basic medium access protocol is a DCF that allows for automatic medium sharing between compatible PHYs through the use of CSMA/CA and a random backoff time following a busy medium condition. In addition, all individually addressed traffic uses immediate positive acknowledgment (ACK frame) where retransmission is scheduled by the sender if no ACK is received.

The CSMA/CA protocol is designed to reduce the collision probability between multiple STAs accessing a medium, at the point where collisions would most likely occur. Just after the medium becomes idle following a busy medium (as indicated by the CS function) is when the highest probability of a collision exists. This is because multiple STAs could have been waiting for the medium to become available again. This is the situation that necessitates a random backoff procedure to resolve medium contention conflicts.

CS shall be performed both through physical and virtual mechanisms.

The virtual CS mechanism is achieved by distributing reservation information announcing the impending use of the medium. The exchange of RTS and CTS frames prior to the actual data frame is one means of distribution of this medium reservation information. The RTS and CTS frames contain a Duration field that defines the period of time that the medium is to be reserved to transmit the actual data frame and the returning ACK frame. A STA receiving either the RTS (sent by the originating STA) or the CTS (sent by the destination STA) shall process the medium reservation. Thus, a STA might be unable to receive from the originating STA and yet still know about the impending use of the medium to transmit a data frame.

Another means of distributing the medium reservation information is the Duration/ID field in individually addressed frames. This field gives the time that the medium is reserved, either to the end of the immediately following ACK, or in the case of a fragment sequence, to the end of the ACK following the next fragment.

The RTS/CTS exchange also performs both a type of fast collision inference and a transmission path check. If the return CTS is not detected by the STA originating the RTS, the originating STA may repeat the process (after observing the other medium-use rules) more quickly than if the long data frame had been transmitted and a return ACK frame had not been detected.

Another advantage of the RTS/CTS mechanism occurs where multiple BSSs utilizing the same channel overlap. The medium reservation mechanism works across the BSS boundaries. The RTS/CTS mechanism might also improve operation in a typical situation in which all STAs are able to receive from the AP, but might not be able to receive from all other STAs in the BSA.

The RTS/CTS mechanism cannot be used for MPDUs with a group addressed immediate destination because there are multiple recipients for the RTS, and thus potentially multiple concurrent senders of the CTS in response. The RTS/CTS mechanism is not used for every data frame transmission. Because the additional RTS and CTS frames add overhead inefficiency, the mechanism is not always justified, especially for short data frames.

The use of the RTS/CTS mechanism is under control of the dot11RTSThreshold attribute. This attribute may be set on a per-STA basis. This mechanism allows STAs to be configured to initiate RTS/CTS either always, never, or only on frames longer than a specified length.

NOTE—A STA configured not to initiate the RTS/CTS mechanism updates its virtual CS mechanism with the duration information contained in a received RTS or CTS frame, and responds to an RTS addressed to it with a CTS if permitted by medium access rules.

All STA that are members of a BSS are able to receive and transmit at all the data rates in the BSSBasicRateSet parameter of the MLME-START.request primitive or BSSBasicRateSet parameter of the BSSDescription representing the SelectedBSS parameter of the MLME-JOIN.request primitive; see 6.3.4.2.4 and 6.3.11.2.4. All HT STAs that are members of a BSS are able to receive and transmit using all the MCSs in the BSSBasicMCSSet parameter of the MLME-START.request primitive or BSSBasicMCSSet parameter of the BSSDescription representing the SelectedBSS parameter of the MLME-JOIN.request primitive; see 6.3.4.2.4 and 6.3.11.2.4. To support the proper operation of the RTS/CTS and the virtual CS mechanism, all STAs shall be able to interpret control frames with the Subtype field equal to RTS or CTS.

Data frames sent under the DCF shall use the frame type Data and subtype Data or Null Function. STAs receiving Data type frames shall not indicate a data frame to LLC when the subtype is Null Function, but shall indicate a data frame to LLC when the subtype is Data, even if the frame body contains zero octets.

9.3.2 Procedures common to the DCF and EDCAF

9.3.2.1 CS mechanism

Physical and virtual CS functions are used to determine the state of the medium. When either function indicates a busy medium, the medium shall be considered busy; otherwise, it shall be considered idle.

A physical CS mechanism shall be provided by the PHY. See Clause 7 for how this information is conveyed to the MAC. The details of physical CS are provided in the individual PHY specifications.

A virtual CS mechanism shall be provided by the MAC. This mechanism is referred to as the NAV. The NAV maintains a prediction of future traffic on the medium based on duration information that is announced in RTS/CTS frames prior to the actual exchange of data. The duration information is also available in the MAC headers of all frames sent during the CP other than PS-Poll frames. The mechanism for setting the NAV using RTS/CTS in the DCF is described in 9.3.2.4, use of the NAV in PCF is described in 9.4.3.3, and the use of the NAV in HCF is described in 9.19.2.2 and 9.19.3.4. Additional details regarding NAV usage and update appear in 9.3.2.5, 9.3.2.11, and 9.23.

The CS mechanism combines the NAV state and the STA's transmitter status with physical CS to determine the busy/idle state of the medium. The NAV may be thought of as a counter, which counts down to 0 at a uniform rate. When the counter is 0, the virtual CS indication is that the medium is idle; when nonzero, the indication is busy. The medium shall be determined to be busy when the STA is transmitting.

9.3.2.2 MAC-Level Acknowledgements

The reception of some frames, as described in 9.3.2.8 and 9.4.4.5, requires the receiving STA to respond with an acknowledgment if the FCS of the received frame is correct. This technique is known as positive acknowledgment.

Lack of reception of an expected frame containing an acknowledgement indicates to the STA initiating the frame exchange that an error has occurred. Note, however, that the destination STA may have received the frame correctly, and that the error may have occurred in the transfer or reception of the frame containing an acknowledgement. When a frame containing an acknowledgement is lost, the MAC that initiated the frame exchange does not receive a protocol indication of whether the initial frame was correctly received.

9.3.2.3 IFS

9.3.2.3.1 General

The time interval between frames is called the IFS. A STA shall determine that the medium is idle through the use of the CS function for the interval specified. Six different IFSs are defined to provide priority levels for access to the wireless medium. Figure 9-3 shows some of these relationships. All timings are referenced from the PHY-TXEND.confirm, PHY-TXSTART.confirm, PHY-RXSTART.indication, and PHY-RXEND.indication primitives.

The IFSs are:

a)	RIFS	reduced interframe space
b)	SIFS	short interframe space
c)	PIFS	PCF interframe space
d)	DIFS	DCF interframe space
e)	AIFS	arbitration interframe space (used by the QoS facility)
f)	EIFS	extended interframe space

The different IFSs shall be independent of the STA bit rate. The IFS timings are defined as time gaps on the medium, and the IFS timings except AIFS are fixed for each PHY (even in multirate-capable PHYs). The IFS values are determined from attributes specified by the PHY.

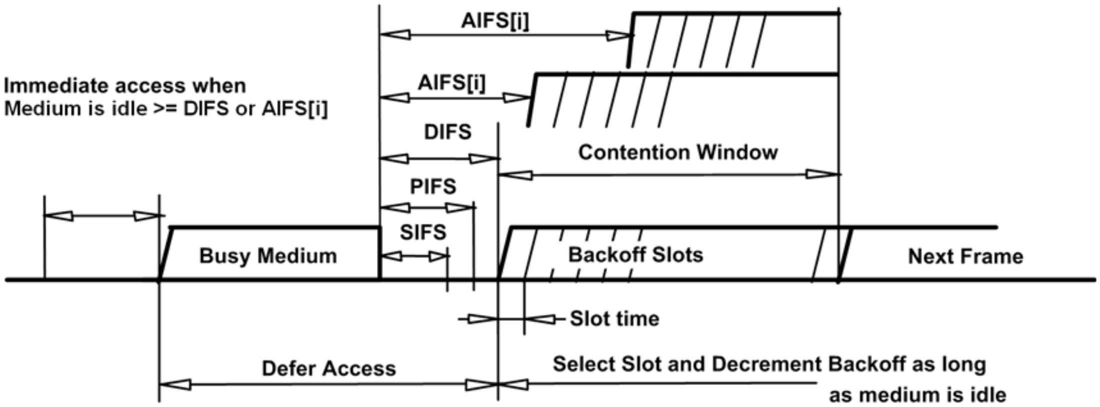

Figure 9-3—Some IFS relationships

9.3.2.3.2 RIFS

RIFS is a means of reducing overhead and thereby increasing network efficiency.

RIFS may be used in place of SIFS to separate multiple transmissions from a single transmitter, when no SIFS-separated response transmission is expected. RIFS shall not be used between frames with different RA values. The duration of RIFS is defined by the aRIFS PHY characteristic (see Table 20-25). The RIFS is the time from the end of the last symbol of the previous frame to the beginning of the first symbol of the preamble of the subsequent frame as seen at the air interface. A STA shall not allow the space between frames that are defined to be separated by a RIFS time, as measured on the medium, to vary from the nominal RIFS value (aRIFSTime) by more than ± 10% of aRIFSTime. Two frames separated by a RIFS shall both be HT PPDUs.

There are additional restrictions regarding when RIFS may be employed as defined in 9.25 and 9.26. See also 9.23.3.3.

9.3.2.3.3 SIFS

The SIFS shall be used prior to transmission of an ACK frame, a CTS frame, a PPDU containing a BlockAck frame that is an immediate response to either a BlockAckReq frame or an A-MPDU, the second or subsequent MPDU of a fragment burst, and by a STA responding to any polling by the PCF. The SIFS may also be used by a PC for any types of frames during the CFP (see 9.4). The SIFS is the time from the end of the last symbol, or signal extension if present, of the previous frame to the beginning of the first symbol of the preamble of the subsequent frame as seen at the air interface.

The SIFS timing shall be achieved when the transmission of the subsequent frame is started at the TxSIFS Slot boundary as specified in 9.3.7. An IEEE 802.11 implementation shall not allow the space between frames that are defined to be separated by a SIFS time, as measured on the medium, to vary from the nominal SIFS value by more than ±10% of aSlotTime for the PHY in use.

SIFS is the shortest of the IFSs between transmissions from different STAs. SIFS shall be used when STAs have seized the medium and need to keep it for the duration of the frame exchange sequence to be performed. Using the smallest gap between transmissions within the frame exchange sequence prevents other STAs, which are required to wait for the medium to be idle for a longer gap, from attempting to use the medium, thus giving priority to completion of the frame exchange sequence in progress.

9.3.2.3.4 PIFS

The PIFS is used to gain priority access to the medium.

The PIFS may be used as described in the following list and shall not be used otherwise:

- A STA operating under the PCF as described in 9.4
- A STA transmitting a Channel Switch Announcement frame as described in 10.9
- A STA transmitting a TIM frame as described in 10.2.1.17
- An HC starting a CFP or a TXOP as described in 9.19.3.2.3
- An HC or a non-AP QoS STA that is a polled TXOP holder recovering from the absence of an expected reception in a CAP as described in 9.19.3.2.4
- An HT STA using dual CTS protection before transmission of the CTS2 as described in 9.3.2.7
- A TXOP holder continuing to transmit after a transmission failure as described in 9.19.2.4
- An RD initiator continuing to transmit using error recovery as described in 9.25.3
- An HT AP during a PSMP sequence transmitting a PSMP recovery frame as described in 9.26.1.3
- An HT STA performing clear channel assessment (CCA) in the secondary channel before transmitting a 40 MHz mask PPDU using EDCA channel access as described in 10.15.9

With the exception of performing CCA in the secondary channel (where the timing is defined in 10.15.9), a STA using PIFS starts its transmission after its CS mechanism (see 9.3.2.1) determines that the medium is idle at the TxPIFS slot boundary as defined in 9.3.7.

9.3.2.3.5 DIFS

The DIFS shall be used by STAs operating under the DCF to transmit data frames (MPDUs) and management frames (MMPDUs). A STA using the DCF may transmit if its CS mechanism (see 9.3.2.1) determines that the medium is idle at the TxDIFS slot boundary as defined in 9.3.7 after a correctly received frame, and its backoff time has expired. A correctly received frame is one where the PHY-RXEND.indication primitive does not indicate an error and the FCS indicates the frame is error free.

9.3.2.3.6 AIFS

The AIFS shall be used by QoS STAs that access the medium using the EDCAF to transmit: all data frames (MPDUs), all management frames (MMPDUs), and the following control frames: PS-Poll, RTS, CTS (when not transmitted as a response to the RTS), BlockAckReq, and BlockAck (when not transmitted as a response to the BlockAckReq). A STA using the EDCAF shall obtain a TXOP for an AC if the STA's CS mechanism (see 9.3.2.1) determines that the medium is idle at the AIFS[AC] slot boundary (see 9.19.2.3), after a correctly received frame, and the backoff time for that AC has expired.

A QoS STA computes the time periods for each AIFS[AC] from the dot11EDCATableAIFSN attributes in the MIB. In an infrastructure BSS, QoS STAs update their dot11EDCATableAIFSN values using information in the most recent EDCA Parameter Set element of Beacon frames received from the AP of the BSS (see 8.4.2.31). A QoS AP computes the time periods for each AIFS[AC] from the dot11QAPEDCATableAIFSN attributes in its MIB.

9.3.2.3.7 EIFS

A DCF shall use EIFS before transmission, when it determines that the medium is idle following reception of a frame for which the PHY-RXEND.indication primitive contained an error or a frame for which the MAC FCS value was not correct. Similarly, a STA's EDCA mechanism under HCF shall use the EIFS-DIFS+AIFS[AC] interval. The duration of an EIFS is defined in 9.3.7. The EIFS or EIFS-DIFS+AIFS[AC] interval shall begin following indication by the PHY that the medium is idle after detection of the erroneous frame, without regard to the virtual CS mechanism. The STA shall not begin a transmission until the expiration of the later of the NAV and EIFS or EIFS-DIFS+AIFS[AC]. The EIFS and EIFS-DIFS+AIFS[AC] are defined to provide enough time for another STA to acknowledge what was, to this STA, an incorrectly received frame before this STA commences transmission. Reception of an error-free frame during the EIFS or EIFS-DIFS+AIFS[AC] resynchronizes the STA to the actual busy/idle state of the medium, so the EIFS or EIFS-DIFS+AIFS[AC] is terminated and medium access (using DIFS or AIFS as appropriate and, if necessary, backoff) continues following reception of that frame. At the expiration or termination of the EIFS or EIFS-DIFS+AIFS[AC], the STA reverts to the NAV and physical CS to control access to the medium.

EIFS shall not be invoked if the NAV is updated by the frame that would have caused an EIFS, such as when the MAC FCS fails and the L-SIG TXOP function employs L-SIG information to update the NAV. EIFS shall not be invoked for an A-MPDU if one or more of its frames are received correctly.

9.3.2.4 Setting and resetting the NAV

A STA that receives at least one valid frame within a received PSDU shall update its NAV with the information received in any valid Duration field from within that PSDU for all frames where the new NAV value is greater than the current NAV value, except for those where the RA is equal to the MAC address of the STA. Upon receipt of a PS-Poll frame, a STA shall update its NAV settings as appropriate under the data rate selection rules using a duration value equal to the time, in microseconds, required to transmit one ACK frame plus one SIFS interval, but only when the new NAV value is greater than the current NAV value. If the calculated duration includes a fractional microsecond, that value is rounded up to the next higher integer. Various additional conditions may set or reset the NAV, as described in 9.4.3.3. When the NAV is reset, a

PHY-CCARESET.request primitive shall be issued. This NAV update operation is performed when the PHY-RXEND.indication primitive is received.

Figure 9-4 indicates the NAV for STAs that may receive the RTS frame, while other STAs may only receive the CTS frame, resulting in the lower NAV bar as shown (with the exception of the STA to which the RTS was addressed).

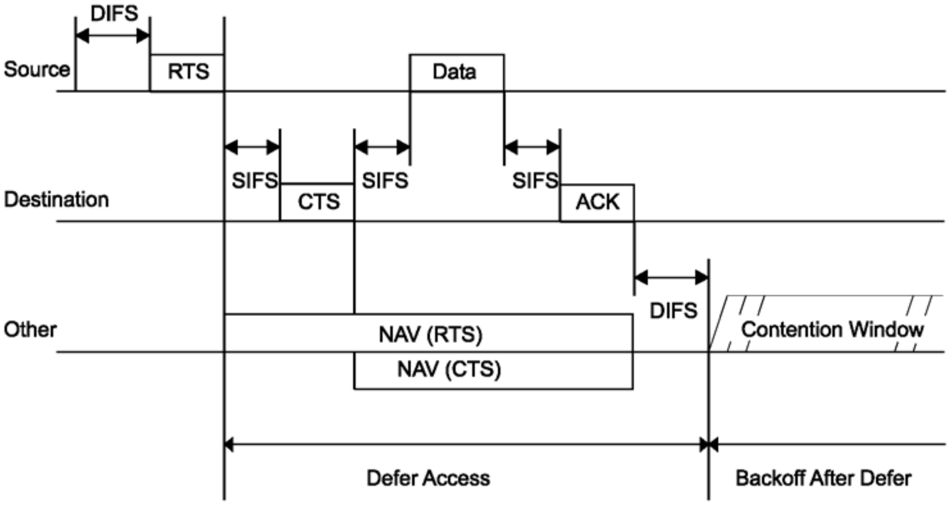

Figure 9-4—RTS/CTS/data/ACK and NAV setting

A STA that used information from an RTS frame as the most recent basis to update its NAV setting is permitted to reset its NAV if no PHY-RXSTART.indication primitive is detected from the PHY during a period with a duration of (2 × aSIFSTime) + (CTS_Time) + aPHY-RX-START-Delay + (2 × aSlotTime) starting at the PHY-RXEND.indication primitive corresponding to the detection of the RTS frame. The “CTS_Time” shall be calculated using the length of the CTS frame and the data rate at which the RTS frame used for the most recent NAV update was received.

A STA supporting L-SIG TXOP that used the information from a frame with different L-SIG duration and MAC duration endpoints (characteristics of an L-SIG TXOP initiating frame; see 9.23.5.4 for details) as the most recent basis to update its NAV setting may reset its NAV if no PHY-RXSTART.indication primitive is detected from the PHY during a period with a duration of aSIFSTime + aPHY-RX-START-Delay + (2 × aSlotTime) starting at the expiration of the L-SIG duration. For details of L-SIG duration, see 9.23.5.

9.3.2.5 RTS/CTS with fragmentation

The following is a description of using RTS/CTS for a fragmented MSDU or MMPDU. The RTS/CTS frames define the duration of the following frame and acknowledgment. The Duration/ID field in the data and ACK frames specifies the total duration of the next fragment and acknowledgment. This is illustrated in Figure 9-5.

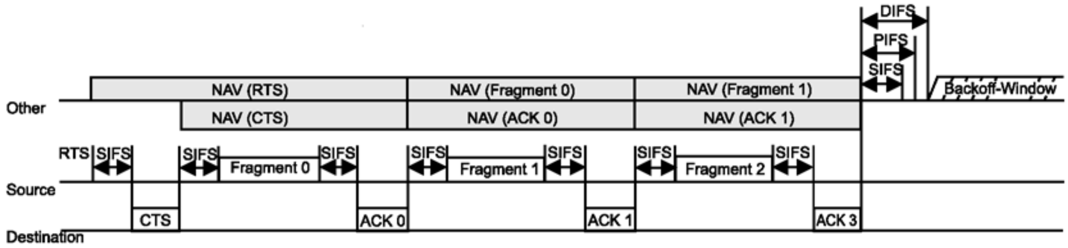

Figure 9-5—RTS/CTS with fragmented MSDU

Each frame contains information that defines the duration of the next transmission. The duration information from RTS frames shall be used to update the NAV to indicate busy until the end of ACK 0. The duration information from the CTS frame shall also be used to update the NAV to indicate busy until the end of ACK 0. Both Fragment 0 and ACK 0 shall contain duration information to update the NAV to indicate busy until the end of ACK 1. This shall be done by using the Duration/ID field in the Data and ACK frames. This shall continue until the last fragment, which shall have a duration of one ACK time plus one SIFS time, and its ACK, which shall have its Duration/ID field set to 0. Each fragment and ACK acts as a virtual RTS and CTS; therefore no further RTS/CTS frames need to be generated after the RTS/CTS that began the frame exchange sequence even though subsequent fragments may be larger than dot11RTSThreshold. At STAs using an FH PHY, when there is insufficient time before the next dwell boundary to transmit the subsequent fragment, the STA initiating the frame exchange sequence may set the Duration/ID field in the last data or management frame to be transmitted before the dwell boundary to the duration of one ACK time plus one SIFS time.

In the case where an acknowledgment is sent but not received by the source STA, STAs that heard the fragment, or ACK, mark the channel busy for the next frame exchange due to the NAV having been updated from these frames. This is the worst-case situation, and it is shown in Figure 9-6. If an acknowledgment is not sent by the destination STA, STAs that can only hear the destination STA do not update their NAV and may attempt to access the channel when their NAV updated from the previously received frame reaches 0. All STAs that hear the source are free to access the channel after their NAV updated from the transmitted fragment has expired.

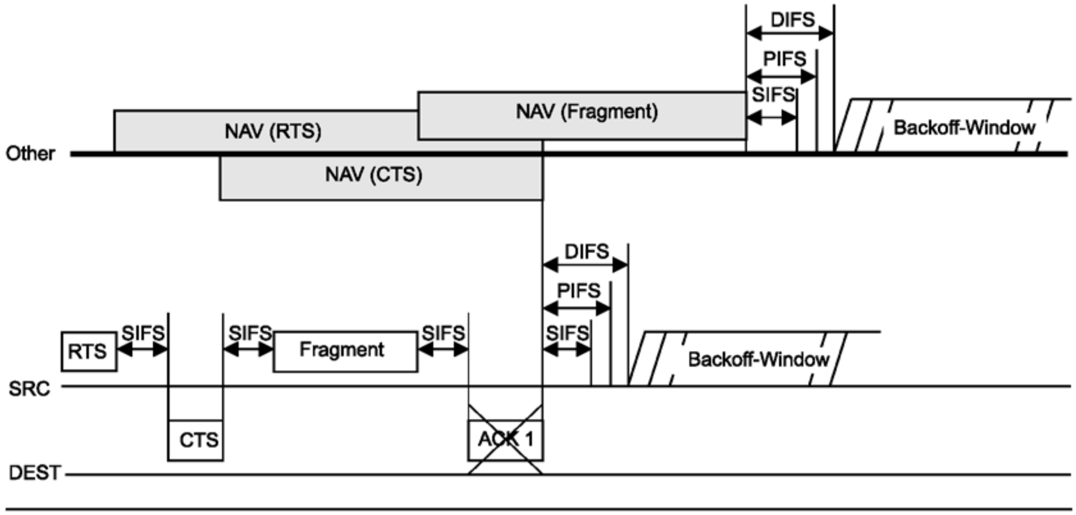

Figure 9-6—RTS/CTS with transmitter priority and missed acknowledgment

9.3.2.6 CTS procedure

A STA that is addressed by an RTS frame shall transmit a CTS frame after a SIFS period if the NAV at the STA receiving the RTS frame indicates that the medium is idle. If the NAV at the STA receiving the RTS indicates the medium is not idle, that STA shall not respond to the RTS frame. The RA field of the CTS frame shall be the value obtained from the TA field of the RTS frame to which this CTS frame is a response. The Duration field in the CTS frame shall be the duration field from the received RTS frame, adjusted by subtraction of aSIFSTime and the number of microseconds required to transmit the CTS frame at a data rate determined by the rules in 9.7.

After transmitting an RTS frame, the STA shall wait for a CTSTimeout interval, with a value of aSIFSTime + aSlotTime + aPHY-RX-START-Delay, starting at the PHY-TXEND.confirm primitive. If a PHY-RXSTART.indication primitive does not occur during the CTSTimeout interval, the STA shall conclude that the transmission of the RTS has failed, and this STA shall invoke its backoff procedure upon expiration of the CTSTimeout interval. If a PHY-RXSTART.indication primitive does occur during the CTSTimeout interval, the STA shall wait for the corresponding PHY-RXEND.indication primitive to determine whether the RTS transmission was successful. The recognition of a valid CTS frame sent by the recipient of the RTS frame, corresponding to this PHY-RXEND.indication primitive, shall be interpreted as successful response, permitting the frame sequence to continue (see Annex G). The recognition of anything else, including any other valid frame, shall be interpreted as failure of the RTS transmission. In this instance, the STA shall invoke its backoff procedure at the PHY-RXEND.indication primitive and may process the received frame.

9.3.2.7 Dual CTS protection

9.3.2.7.1 Dual CTS protection procedure

If the Dual CTS Protection field of the HT Operation element has value 1 in the Beacon frames transmitted by its AP, a non-AP HT STA shall start every TXOP with an RTS addressed to the AP. The RTS shall be an STBC frame if the STBC transmit and receive capabilities of the non-AP HT STA allow it to receive and transmit STBC frames using a single spatial stream; otherwise, the RTS shall be a non-STBC frame. The AP shall respond with a dual CTS (CTS1 followed by CTS2) separated by PIFS or SIFS. Table 9-2 describes the sequence of CTS transmissions and the required timing.

Table 9-2—Dual CTS rules

Type of RTS	CTS description	Timing
RTS (non-STBC frame)	CTS1: Same rate or MCS as the RTS (non-STBC frame) CTS2: Basic STBC MCS (STBC frame)	PIFS shall be used as the interval between CTS1 and CTS2. If the CS mechanism (see 9.3.2.1) indicates that the medium is busy at the TxPIFS slot boundary (defined in 9.3.7) following CTS1, CTS2 shall not be transmitted as part of this frame exchange.
RTS (STBC frame)	CTS1: Basic STBC MCS (STBC frame) CTS2: Lowest basic rate (non-STBC frame)	SIFS shall be used as the interval between CTS1 and CTS2. The STA resumes transmission a SIFS+CTS2+SIFS after receiving CTS1, instead of after SIFS.

The dual CTS response applies only to the AP; a non-AP STA shall respond to an RTS request with a single CTS.

If dual CTS Protection is enabled, the AP shall begin each EDCA TXOP with a CTS frame. This CTS frame uses STBC when the immediately following frame uses non-STBC and vice versa. The RA of this CTS shall be identical to the RA of the immediately following frame. The AP may continue a PIFS after the CTS, only if the CS mechanism (see 9.3.2.1) indicates that the medium is IDLE at the TxPIFS slot boundary (defined in 9.3.7) following the transmission of the CTS.

To avoid the resetting of NAV by STAs that have set their NAV due to the reception of a non-STBC RTS that is part of a dual CTS exchange, but then do not hear the CTS2, a non-AP HT STA may create a NAV that is not resettable according to the RTS NAV reset rule defined in 9.3.2.4 at the receiving STAs by initiating the TXOP with a non-STBC CTS addressed to the AP (known as *CTS-to-AP*).

NOTE—Sending a CTS-to-AP allows NAV protection to be established without causing the AP to update its NAV, as opposed to, for example, the sending of a CTS-to-self, which would potentially have caused the AP NAV to become set and then prevented it from responding to the subsequent RTS. The AP does not set a NAV in the CTS-to-AP case and is able to respond to the following RTS. The NAV at receiving STAs is not updated by the RTS because its duration does not exceed the duration of the preceding CTS, and subsequently, the NAV cannot be reset during CTS2.

An STBC CTS addressed to the AP may be transmitted prior to an STBC RTS to set a NAV that is not resettable according to the RTS NAV reset rule defined in 9.3.2.4 at receiving STAs.

NOTE—When an HT STA sends an RTS to the AP that is a non-STBC frame, the AP returns a CTS that is a non-STBC frame to the STA and then immediately transmits a CTS that is an STBC frame. The original non-AP STA is now free to transmit. But a non-HT STA that has set its NAV based on the original RTS might reset its NAV and then decrement its backoff counter, given that a SIFS + the duration of CTS2 is longer than a DIFS (i.e., the STA does not detect PHY-RXSTART.indication primitive within the period specified in 9.3.2.4). Thus, without sending a CTS-to-AP, the NAV reservation might not always work.

If dual CTS protection is enabled and a STA obtains a TXOP and does not have any frames to transmit before the expiry of the TXOP duration, the STA may indicate truncation of the TXOP provided that the remaining duration of the TXOP after the transmission of the last frame can accommodate the CF-End frame, a CF-End frame that is an STBC frame duration at the basic STBC MCS, a CF-End frame that is a non-STBC frame at the lowest basic rate, and three SIFS durations. The STA indicates truncation of the TXOP by transmitting a CF-End frame with TXVECTOR parameter restrictions as specified in 9.7.6.3.

On receiving a CF-End frame from a STA with a matching BSSID, an AP whose last transmitted HT Operation element contained the Dual CTS Protection field equal to 1 shall respond with dual CF-End frames, one CF-End frame that is an STBC frame at the basic STBC MCS and one CF-End frame that is a non-STBC frame at the lowest basic rate, after a SIFS duration. Dual CF-End frames eliminate unfairness towards STAs that are not of the same mode as the one that owns the TXOP being truncated.

If the TXOP is owned by the AP and dual CTS Protection is enabled in the system, the AP may send dual CF-End frames if it runs out of frames to transmit, provided that the remaining TXOP duration after the transmission of the last frame can accommodate a STBC CF-End frame duration at the lowest STBC basic rate, a CF-End frame that is a non-STBC frame at the lowest basic rate, and two SIFS durations.

The spacing between the dual CF-End frames sent by the AP shall be SIFS. The first CF-End frame shall use the same encoding (STBC frame versus non-STBC frame) used for transmissions in the TXOP being truncated, and the second CF-End frame shall use the other encoding.

An STBC-capable STA shall choose between control frame operation using either STBC frames or non-STBC frames. In the non-STBC frame case, it discards control frames that are STBC frames it receives. In the STBC frame case, it discards control frames that are non-STBC frames received from its own BSS. This choice is a matter of policy local at the STA.

9.3.2.7.2 Dual CTS protection examples

Figure 9-7 shows an example of the operation of the dual CTS protection mechanism. In this example, the initiating STA is an STBC non-AP STA.

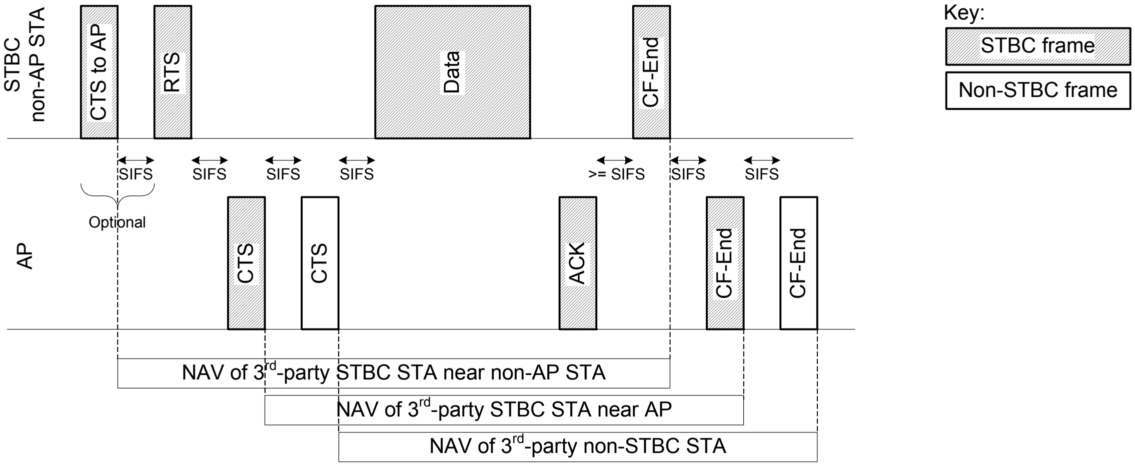

Figure 9-7—Example of dual CTS mechanism (STBC initiator)

Figure 9-8 shows an example of the operation of the dual CTS protection mechanism. In this example, the initiating STA is a non-STBC non-AP HT STA.

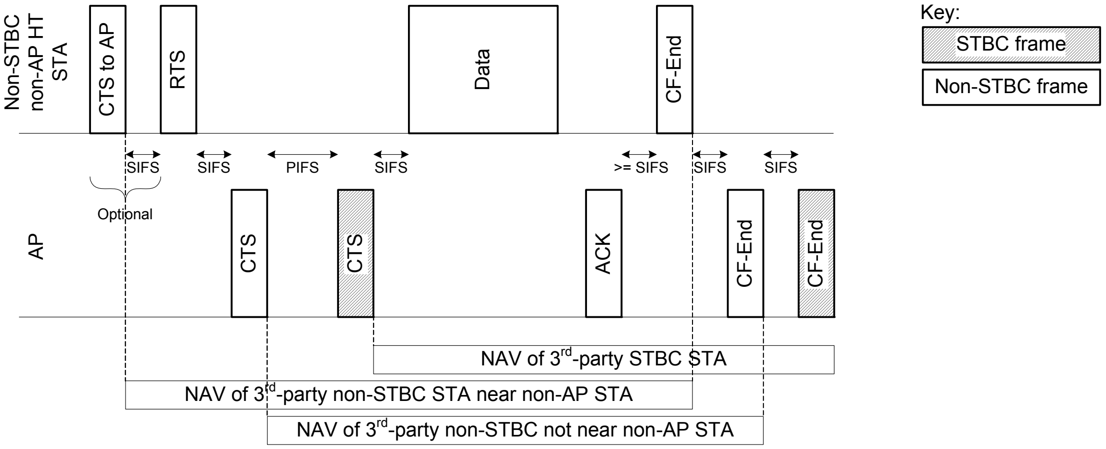

Figure 9-8—Example of the dual CTS mechanism (non-STBC initiator)

9.3.2.8 ACK procedure

The cases when an ACK frame can be generated are shown in the frame exchange sequences listed in Annex G.

On receipt of a management frame of subtype Action NoAck, a STA shall not send an ACK frame in response.

Upon successful reception of a frame of a type that requires acknowledgment with the To DS field set, an AP shall generate an ACK frame. An ACK frame shall be transmitted by the destination STA that is not an AP, when it successfully receives an individually addressed frame of a type that requires acknowledgment, but not if it receives a group addressed frame of such type. After a successful reception of a frame requiring acknowledgment, transmission of the ACK frame shall commence after a SIFS period, without regard to the busy/idle state of the medium. (See Figure 9-9.)

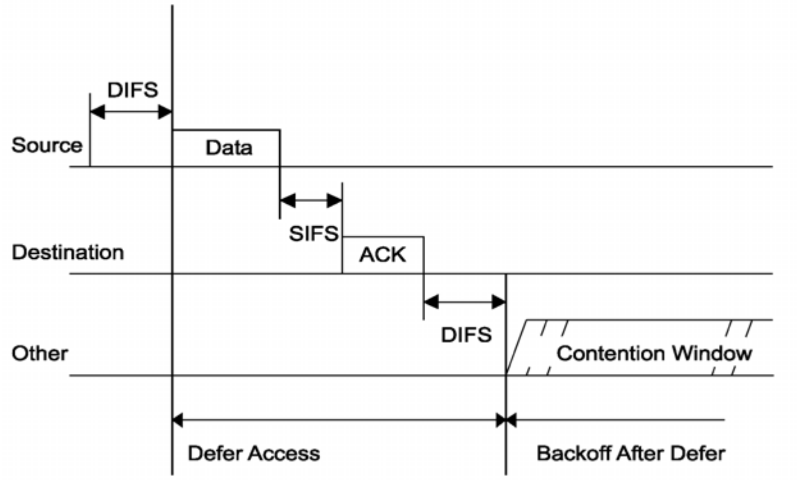

Figure 9-9—Individually addressed data/ACK MPDU

After transmitting an MPDU that requires an ACK frame as a response (see Annex G), the STA shall wait for an ACKTimeout interval, with a value of aSIFSTime + aSlotTime + aPHY-RX-START-Delay, starting at the PHY-TXEND.confirm primitive. If a PHY-RXSTART.indication primitive does not occur during the ACKTimeout interval, the STA concludes that the transmission of the MPDU has failed, and this STA shall invoke its backoff procedure upon expiration of the ACKTimeout interval. If a PHY-RXSTART.indication primitive does occur during the ACKTimeout interval, the STA shall wait for the corresponding PHY-RXEND.indication primitive to determine whether the MPDU transmission was successful. The recognition of a valid ACK frame sent by the recipient of the MPDU requiring acknowledgment, corresponding to this PHY-RXEND.indication primitive, shall be interpreted as successful acknowledgment, permitting the frame sequence to continue, or to end without retries, as appropriate for the particular frame sequence in progress. The recognition of anything else, including any other valid frame, shall be interpreted as failure of the MPDU transmission. In this instance, the STA shall invoke its backoff procedure at the PHY-RXEND.indication primitive and may process the received frame. An exception is that recognition of a valid data frame sent by the recipient of a PS-Poll frame shall also be accepted as successful acknowledgment of the PS-Poll frame.

9.3.2.9 BlockAck procedure

Upon successful reception of a frame of a type that requires an immediate BlockAck response, the receiving STA shall transmit a BlockAck frame after a SIFS period, without regard to the busy/idle state of the medium. The rules that specify the contents of this BlockAck frame are defined in 9.21.

9.3.2.10 Duplicate detection and recovery

Because MAC-level acknowledgments and retransmissions are incorporated into the protocol, there is the possibility that a frame may be received more than once. The procedures defined in this subclause attempt to filter out these duplicates. Additional duplicate filtering is performed during Receive Buffer Operation for frames that are part of a Block Ack agreement as described in 9.21.4 and 9.21.7.

Duplicate frame filtering is facilitated through the inclusion of a Sequence Control field (consisting of a sequence number and fragment number) within data and management frames as well as TID subfield in the

QoS Control field within QoS data frames. MPDUs that are part of the same MSDU or A-MSDU shall have the same sequence number, and different MSDUs or A-MSDUs have (with a high probability) a different sequence number.

A non-QoS STA shall assign sequence numbers to management frames and data frames (QoS subfield of the Subtype field is equal to 0) from a single modulo-4096 counter, starting at 0 and incrementing by 1, for each MSDU or MMPDU. A QoS STA operating as a non-QoS STA because it is in a non-QoS BSS or non-QoS IBSS shall assign sequence numbers to management frames and data frames (QoS subfield of the Subtype field is equal to 0) from a single modulo-4096 counter, starting at 0 and incrementing by 1, for each MSDU or MMPDU. A transmitting STA should cache the last used sequence number per RA for frames that are assigned sequence numbers from this counter and should ensure that the successively assigned sequence numbers for frames transmitted to a single RA do not have the same value by incrementing the counter by 2, if incrementing by 1 would have produced the same sequence number as is found in the cache for that RA.

A STA operating as a QoS STA shall maintain one modulo-4096 counter, per <Address 1, TID>, for individually addressed QoS Data frames. Sequence numbers for these frames are assigned using the counter identified by the Address 1 field and the TID subfield of the QoS Control field of the frame, and that counter is incremented by 1 for each MSDU or A-MSDU corresponding to that <Address 1, TID> tuple. Sequence numbers for management frames, QoS data frames with a group address in the Address 1 field, and all non-QoS data frames transmitted by QoS STAs shall be assigned using an additional single modulo-4096 counter, starting at 0 and incrementing by 1 for each such MSDU, A-MSDU, or MMPDU, except that a QoS STA may use values from additional modulo-4096 counters per <Address 1, TID> for sequence numbers assigned to time priority management frames. A transmitting STA should cache the last used sequence number per RA for frames that are assigned sequence numbers from this counter and should ensure that the successively assigned sequence numbers for frames transmitted to a single RA do not have the same value by incrementing the counter by 2, if incrementing by 1 would have produced the same sequence number as is found in the cache for that RA. Sequence numbers for QoS (+)Null frames may be set to any value.

A receiving STA shall keep a cache of recently received <Address 2, sequence-number, fragment-number> tuples from frames that are not QoS Data frames. The receiving STA shall keep at least the most recent cache entry per <Address 2> value in this cache. The receiving QoS STA shall also keep a cache of recently received <Address 2, TID, sequence-number, fragment-number> tuples from QoS Data frames from all STAs from which it has received QoS data frames. The receiving QoS STA shall keep at least the most recent cache entry per <Address 2, TID> pair in this cache. The receiving STA should maintain two additional caches, one containing entries of recently received <Address 2, sequence-number, fragment-number> tuples from received management frames that are not time priority management frames and the other containing entries of recently received <Address 2, sequence-number, fragment-number> tuples from received time priority management frames. The receiving STA should not include the entries in these two additional caches in any other caches. In each of these two caches, the receiving STA should keep at least the most recent cache entry per <Address 2> value. A receiving STA should omit tuples obtained from group addressed and ATIM frames from all caches.

A receiving STA shall reject as a duplicate frame any frame that is not a QoS Data frame in which the Retry bit in the Frame Control field is 1 and that matches an <Address 2, sequence-number, fragment-number> tuple of an entry in the cache that contains tuples of that format, unless the frame is a management frame and the STA is maintaining separate caches for <Address 2, sequence-number, fragment-number> tuples from received management frames. A receiving QoS STA shall also reject as a duplicate frame any QoS Data frame in which the Retry bit in the Frame Control field is 1 and that matches an <Address 2, TID, sequence-number, fragment-number> tuple of an entry in the cache that contains tuples of that format. A STA that is maintaining separate caches for <Address 2, sequence-number, fragment-number> tuples from received management frames shall reject as a duplicate frame any management frame that is not a time priority management frame in which the Retry bit in the Frame Control field is 1 and that matches an <Address 2, sequence-number, fragment-number> tuple of an entry in the management cache that contains tuples from frames that are not time priority management frames. A STA that is maintaining separate caches for <Address 2, sequence-number, fragment-number> tuples from received management frames shall reject as a duplicate frame any time priority management frame in which the Retry bit in the Frame Control field is 1 and that matches an <Address 2, sequence-number, fragment-number> tuple of an entry in the cache that contains tuples from time priority management frames.

There is a small possibility that a frame may be improperly rejected due to such a match; however, this occurrence would be rare and simply results in a lost frame (similar to an FCS error in other LAN protocols).

NOTE—The receiver STA performs the ACK and (for an AP) PS procedures on all successfully received frames requiring acknowledgment, even if the frame is discarded due to duplicate filtering.

9.3.2.11 NAV distribution

When a node needs to distribute NAV information, for instance, to reserve the medium for a transmission of a nonbasic rate frame (that may not be heard by other nodes in the BSS), the node may first transmit a CTS frame with the RA field equal to its own MAC address (CTS-to-self) and with a duration value that protects the pending transmission, plus possibly an ACK frame.

The CTS-to-self NAV distribution mechanism is lower in network overhead cost than is the RTS/CTS NAV distribution mechanism, but CTS-to-self is less robust against hidden nodes and collisions than RTS/CTS. STAs employing a NAV distribution mechanism should choose a mechanism such as CTS-to-self or RTS/CTS that is appropriate for the given network conditions. If errors occur when employing the CTS-to-self mechanism, STAs should switch to a more robust mechanism.

9.3.2.12 Operation of aSlotTime

STAs shall set the MAC variable aSlotTime to the short slot value upon transmission or reception of Beacon, Probe Response, Association Response, and Reassociation Response MMPDUs from the BSS that the STA has joined or started and that have the short slot subfield equal to 1 when dot11ShortSlotTimeOptionImplemented is true. STAs shall set the MAC variable aSlotTime to the long slot value upon transmission or reception of Beacon, Probe Response, Association Response, and Reassociation Response MMPDUs from the BSS that the STA has joined or started and that have the short slot subfield equal to 0 when dot11ShortSlotTimeOptionImplemented is true. STAs shall set the MAC variable aSlotTime to the long slot value at all times when dot11ShortSlotTime-OptionImplemented is false. When dot11ShortSlotTimeOptionImplemented is not present, or when the PHY supports only a single slot time value, then the STA shall set the MAC variable aSlotTime to the slot value appropriate for the attached PHY.

9.3.3 Random backoff time

A STA desiring to initiate transfer of data MPDUs and/or MMPDUs using the DCF shall invoke the CS mechanism (see 9.3.2.1) to determine the busy/idle state of the medium. If the medium is busy, the STA shall defer until the medium is determined to be idle without interruption for a period of time equal to DIFS when the last frame detected on the medium was received correctly, or after the medium is determined to be idle without interruption for a period of time equal to EIFS when the last frame detected on the medium was not received correctly. After this DIFS or EIFS medium idle time, the STA shall then generate a random backoff period (defined by Equation (9-1)) for an additional deferral time before transmitting, unless the backoff timer already contains a nonzero value, in which case the selection of a random number is not needed and not performed. This process minimizes collisions during contention between multiple STAs that have been deferring to the same event.

$$\text{Backoff Time} = \text{Random}() \times \text{aSlotTime} \tag{9-1}$$

where

Random() = Pseudorandom integer drawn from a uniform distribution over the interval [0,CW], where CW is an integer within the range of values of the PHY characteristics aCWmin and aCWmax, aCWmin ≤ CW ≤ aCWmax. It is important that designers recognize the need for statistical independence among the random number streams among STAs.

aSlotTime = The value of the correspondingly named PHY characteristic.

The contention window (CW) parameter shall take an initial value of aCWmin. Every STA shall maintain a STA short retry count (SSRC) as well as a STA long retry count (SLRC), both of which shall take an initial value of 0. The SSRC shall be incremented when any short retry count (SRC) associated with any MPDU of type Data is incremented. The SLRC shall be incremented when any long retry count (LRC) associated with any MPDU of type Data is incremented. The CW shall take the next value in the series every time an unsuccessful attempt to transmit an MPDU causes either STA retry counter to increment, until the CW reaches the value of aCWmax. A retry is defined as the entire sequence of frames sent, separated by SIFS intervals, in an attempt to deliver an MPDU, as described in Annex G. Once it reaches aCWmax, the CW shall remain at the value of aCWmax until the CW is reset. This improves the stability of the access protocol under high-load conditions. See Figure 9-10.

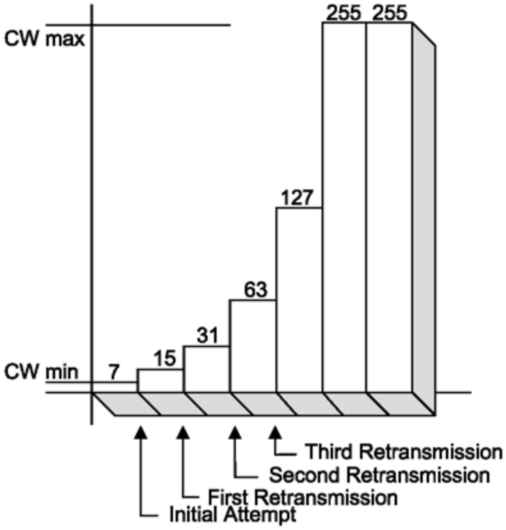

Figure 9-10—Example of exponential increase of CW

The CW shall be reset to aCWmin after every successful attempt to transmit a frame containing all or part of an MSDU or MMPDU, when SLRC reaches dot11LongRetryLimit, or when SSRC reaches dot11ShortRetryLimit. The SSRC shall be reset to 0 when a CTS frame is received in response to an RTS frame, when a BlockAck frame is received in response to a BlockAckReq frame, when an ACK frame is received in response to the transmission of a frame of length greater than dot11RTSThreshold containing all or part of an MSDU or MMPDU, or when a frame with a group address in the Address1 field is transmitted. The SLRC shall be reset to 0 when an ACK frame is received in response to transmission of a frame containing all or part of an MSDU or MMPDU of , or when a frame with a group address in the Address1 field is transmitted.

The set of CW values shall be sequentially ascending integer powers of 2, minus 1, beginning with a PHY-specific aCWmin value, and continuing up to and including a PHY-specific aCWmax value.

9.3.4 DCF access procedure

9.3.4.1 Introduction

The CSMA/CA access method is the foundation of the DCF. The operational rules vary slightly between the DCF and the PCF.

9.3.4.2 Basic access

Basic access refers to the core mechanism a STA uses to determine whether it may transmit using the DCF.

In general, a STA may transmit a pending MPDU when it is operating under the DCF access method, either in the absence of a PC, or in the CP of the PCF access method, when the STA determines that the medium is idle for greater than or equal to a DIFS period, or an EIFS period if the immediately preceding medium-busy event was caused by detection of a frame that was not received at this STA with a correct MAC FCS value. If, under these conditions, the medium is determined by the CS mechanism to be busy when a STA desires to initiate the initial frame of a frame exchange sequence (described in Annex G), exclusive of the CF period, the random backoff procedure described in 9.3.4.3 shall be followed. There are conditions, specified in 9.3.4.3 and 9.3.4.5, where the random backoff procedure shall be followed even for the first attempt to initiate a frame exchange sequence.

In a STA having an FH PHY, control of the channel is lost at the dwell time boundary and the STA shall have to contend for the channel after that dwell boundary. It is required that STAs having an FH PHY complete transmission of the entire MPDU and associated acknowledgment (if required) before the dwell time boundary. If, when transmitting or retransmitting an MPDU, there is not enough time remaining in the dwell to allow transmission of the MPDU plus the acknowledgment (if required), the STA shall defer the transmission by selecting a random backoff time, using the present CW (without advancing to the next value in the series). The short retry counter and long retry counter for the MSDU are not affected.

The basic access mechanism is illustrated in Figure 9-11.

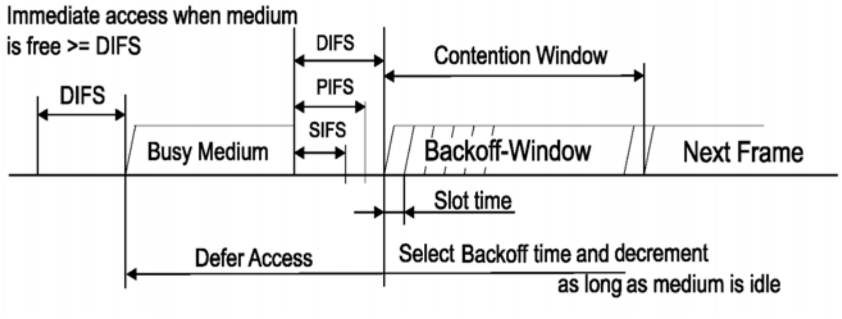

Figure 9-11—Basic access method

9.3.4.3 Backoff procedure for DCF

This subclause describes backoff procedure that is to be invoked when DCF is used. For the backoff procedure when EDCA is used, see 9.19.2.5.

The backoff procedure shall be invoked for a STA to transfer a frame when finding the medium busy as indicated by either the physical or virtual CS mechanism (see Figure 9-12). The backoff procedure shall also be invoked when a transmitting STA infers a failed transmission as defined in 9.3.2.6 or 9.3.2.8.

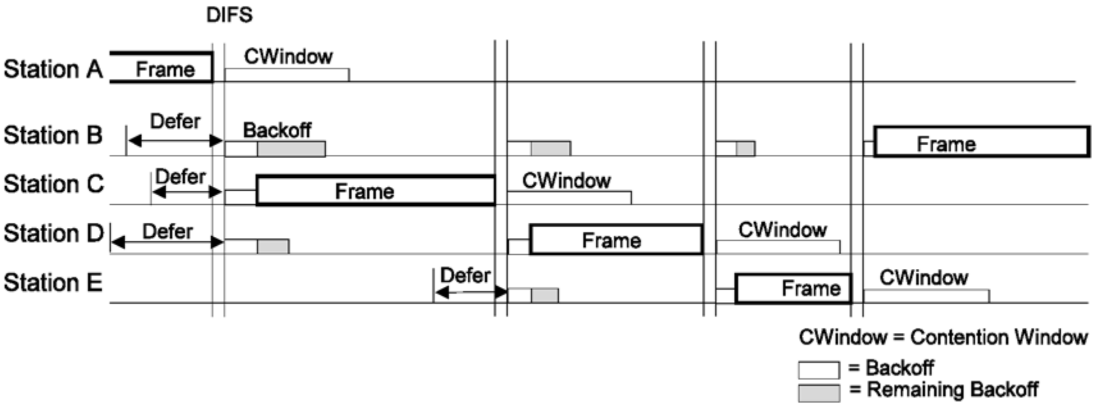

Figure 9-12—Backoff procedure

To begin the backoff procedure, the STA shall set its Backoff Timer to a random backoff time using the equation in 9.3.3. All backoff slots occur following a DIFS period during which the medium is determined to be idle for the duration of the DIFS period, or following an EIFS period during which the medium is determined to be idle for the duration of the EIFS period, as appropriate (see 9.3.2.3).

A STA performing the backoff procedure shall use the CS mechanism (see 9.3.2.1) to determine whether there is activity during each backoff slot. If no medium activity is indicated for the duration of a particular backoff slot, then the backoff procedure shall decrement its backoff time by aSlotTime.

If the medium is determined to be busy at any time during a backoff slot, then the backoff procedure is suspended; that is, the backoff timer shall not decrement for that slot. The medium shall be determined to be idle for the duration of a DIFS period or EIFS, as appropriate (see 9.3.2.3), before the backoff procedure is allowed to resume. Transmission shall commence when the Backoff Timer reaches 0.

A backoff procedure shall be performed immediately after the end of every transmission with the More Fragments bit equal to 0 of an MPDU of type Data, Management, or Control with subtype PS-Poll, even if no additional transmissions are currently queued. In the case of successful acknowledged transmissions, this backoff procedure shall begin at the end of the received ACK frame. In the case of unsuccessful transmissions requiring acknowledgment, this backoff procedure shall begin at the end of the ACKTimeout interval (as defined in 9.3.2.8). An unsuccessful transmission is one where an ACK frame is not received from the STA addressed by the RA field of the transmitted frame and the value of the RA field is an individual address. If the transmission is successful, the CW value reverts to aCWmin before the random backoff interval is chosen, and the SSRC and/or SLRC are updated as described in 9.3.3. The result of this procedure is that transmitted frames from a STA are always separated by at least one backoff interval.

The effect of this procedure is that when multiple STAs are deferring and go into random backoff, then the STA selecting the smallest backoff time using the random function wins the contention (assuming all of the contending STAs detect the same instances of WM activity at their respective receivers).

In an IBSS the backoff time for a pending non-Beacon or non-ATIM transmission shall not decrement in the period from the TBTT until the expiration of the ATIM window, and the backoff time for a pending ATIM management frame shall decrement only within the ATIM window. (See Clause 10.) Within an IBSS a separate backoff interval shall be generated to precede the transmission of a Beacon frame, as described in 10.1.3.3.

9.3.4.4 Recovery procedures and retransmit limits

Under DCF, error recovery is always the responsibility of the STA that initiates a frame exchange sequence (described in Annex G). Many circumstances may cause an error to occur that requires recovery. For example, the CTS frame might not be returned after an RTS frame is transmitted. This may happen due to a collision with another transmission, due to interference in the channel during the RTS or CTS frame, or because the STA receiving the RTS frame has an active virtual CS condition (indicating a busy medium time period).

Error recovery shall be attempted by retrying transmissions for frame exchange sequences that the initiating STA infers have failed. Retries shall continue, for each failing frame exchange sequence, until the transmission is successful, or until the relevant retry limit is reached, whichever occurs first. STAs shall maintain a SRC and a LRC for each MSDU or MMPDU awaiting transmission. These counts are incremented and reset independently of each other.

After an RTS frame is transmitted, the STA shall perform the CTS procedure, as defined in 9.3.2.6. If the RTS transmission fails, the SRC for the MSDU or MMPDU and the SSRC are incremented. This process shall continue until the number of attempts to transmit that MSDU or MMPDU reaches dot11ShortRetryLimit.

After transmitting a frame that requires acknowledgment, the STA shall perform the ACK procedure, as defined in 9.3.2.8. The SRC for an MPDU of type Data or MMPDU and the SSRC shall be incremented every time transmission of a MAC frame of length less than or equal to dot11RTSThreshold fails for that MPDU of type Data or MMPDU. This SRC and the SSRC shall be reset when a MAC frame of length less than or equal to dot11RTSThreshold succeeds for that MPDU of type Data or MMPDU. The LRC for an MPDU of type Data or MMPDU and the SLRC shall be incremented every time transmission of a MAC frame of length greater than dot11RTSThreshold fails for that MPDU of type Data or MMPDU. This LRC and the SLRC shall be reset when a MAC frame of length greater than dot11RTSThreshold succeeds for that MPDU of type Data or MMPDU. All retransmission attempts for an MPDU of type Data or MMPDU that has failed the ACK procedure one or more times shall be made with the Retry field set to 1 in the Data or Management type frame.

Retries for failed transmission attempts shall continue until the SRC for the MPDU of type Data or MMPDU is equal to dot11ShortRetryLimit or until the LRC for the MPDU of type Data or MMPDU is equal to dot11LongRetryLimit. When either of these limits is reached, retry attempts shall cease, and the MPDU of type Data (and any MSDU of which it is a part) or MMPDU shall be discarded.

A STA in PS mode, in an ESS, initiates a frame exchange sequence by transmitting a PS-Poll frame to request data from an AP. In the event that neither an ACK frame nor a data frame is received from the AP in response to a PS-Poll frame, then the STA shall retry the sequence, by transmitting another PS-Poll frame. If the AP sends a data frame in response to a PS-Poll frame, but fails to receive the ACK frame acknowledging this data frame, the next PS-Poll frame from the same STA may cause a retransmission of the last MSDU [26]. If the AP responds to a PS-Poll by transmitting an ACK frame, then responsibility for the data frame delivery error recovery shifts to the AP because the data are transferred in a subsequent frame exchange sequence, which is initiated by the AP. The AP shall attempt to deliver one MSDU to the STA that transmitted the PS-Poll, using any frame exchange sequence valid for an individually addressed MSDU. If the PS STA that transmitted the PS-Poll returns to Doze state after transmitting the ACK frame in response to successful receipt of this MSDU, but the AP fails to receive this ACK frame, then the AP retries transmission of this MSDU until the relevant retry limit is reached. See Clause 10 for details on filtering of extra PS-Poll frames.

9.3.4.5 Control of the channel

The SIFS is used to provide an efficient MSDU delivery mechanism. Once the STA has contended for the channel, that STA shall continue to send fragments until either all fragments of a single MSDU or MMPDU have been sent, an acknowledgment is not received, or the STA is restricted from sending any additional

[26] This duplicate MSDU is filtered at the receiving STA using the duplicate frame filtering mechanism.

fragments due to a dwell time boundary. Should the sending of the fragments be interrupted due to one of these reasons, when the next opportunity for transmission occurs the STA shall resume transmission. The algorithm by which the STA decides which of the outstanding MSDUs shall next be attempted after an unsuccessful transmission (as defined in 9.3.4.3) attempt is beyond the scope of this standard, but any such algorithm shall comply with the restrictions listed in 9.8.

Figure 9-13 illustrates the transmission of a multiple-fragment MSDU using the SIFS.

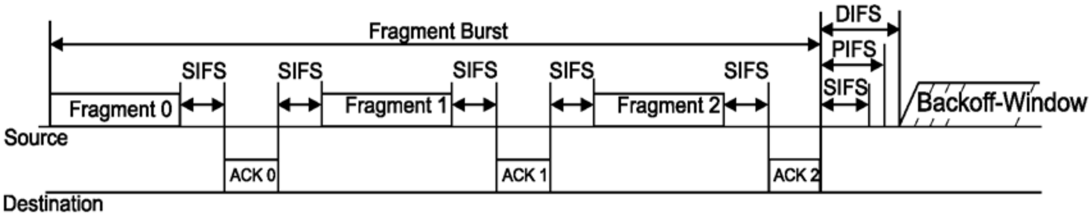

Figure 9-13—Transmission of a multiple-fragment MSDU using SIFS

When the source STA transmits a fragment, it shall release the channel, then immediately monitor the channel for an acknowledgment as described in 9.3.2.8.

When the destination STA has finished sending the acknowledgment, the SIFS following the acknowledgment shall be reserved for the source STA to continue (if necessary) with another fragment. The STA sending the acknowledgment shall not transmit on the channel immediately following the acknowledgment.

The process of sending multiple fragments after contending for the channel is defined as a fragment burst.

If the source STA receives an acknowledgment but there is not enough time to transmit the next fragment and receive an acknowledgment due to an impending dwell boundary, the source STA shall contend for the channel at the beginning of the next dwell time.

If the source STA does not receive an acknowledgment frame, it shall attempt to retransmit the failed MPDU or another eligible MPDU, as defined in 9.8, after performing the backoff procedure and the contention process.

After a STA contends for the channel to retransmit a fragment of an MSDU, it shall start with the last fragment that was not acknowledged. The destination STA shall receive the fragments in order (because the source sends them in order and they are individually acknowledged). It is possible, however, that the destination STA may receive duplicate fragments. It shall be the responsibility of the receiving STA to detect and discard duplicate fragments.

A STA shall transmit after the SIFS only under the following conditions during a fragment burst:

- The STA has just received a fragment that requires acknowledgment.
- The source STA has received an acknowledgment for a previous fragment, has more fragment(s) for the same MSDU to transmit, and there is enough time before the next dwell boundary to send the next fragment and receive its acknowledgment.

The following rules shall also apply:

- When a STA has transmitted a frame other than an initial or intermediate fragment, that STA shall not transmit on the channel following the acknowledgment for that frame, without performing the backoff procedure.

— When an MSDU has been successfully delivered or all retransmission attempts have been exhausted, and the STA has a subsequent MSDU to transmit, then that STA shall perform a backoff procedure.

9.3.5 Individually addressed MPDU transfer procedure

A STA using the DCF shall use an RTS/CTS exchange for individually addressed frames when the length of the PSDU is greater than the length threshold indicated by the dot11RTSThreshold attribute. A STA may also use an RTS/CTS exchange for individually addressed frames when it is necessary to distribute the NAV or when it is necessary to establish protection (see 9.23). Otherwise a STA using the DCF shall not use the RTS/CTS exchange.

The dot11RTSThreshold attribute is a managed object within the MAC MIB, and its value can be set and retrieved by the MLME. If dot11RTSThreshold is 0, all MPDUs shall be delivered with the use of RTS/CTS. If the value of dot11RTSThreshold is larger than the maximum PSDU length, all PSDUs shall be delivered without RTS/CTS exchanges.

When an RTS/CTS exchange is used, the PSDU shall be transmitted starting one SIFS period after the end of the CTS frame.

NOTE—No regard is given to the busy or idle status of the medium when transmitting this PSDU.

When an RTS/CTS exchange is not used, the PSDU shall be transmitted following the success of the basic access procedure. With or without the use of the RTS/CTS exchange procedure, the STA that is the destination of a data frame shall follow the ACK procedure.

9.3.6 Group addressed MPDU transfer procedure

In the absence of a PCF, when group addressed MPDUs in which the To DS field is 0 are transferred from a STA, only the basic access procedure shall be used. Regardless of the length of the frame, no RTS/CTS exchange shall be used. In addition, no ACK shall be transmitted by any of the recipients of the frame. Any group addressed MPDUs in which the To DS field is 1 transferred from a STA shall, in addition to conforming to the basic access procedure of CSMA/CA, obey the rules for RTS/CTS exchange and the ACK procedure because the MPDU is directed to the AP. When dot11SSPNInterfaceActivated is true, an AP shall distribute the group addressed message into the BSS only if dot11NonAPStationAuthSourceMulticast in the dot11InterworkingEntry identified by the source MAC address in the received message is true. When dot11SSPNInterfaceActivated is false, the group addressed message shall be distributed into the BSS. The STA originating the message receives the message as a group addressed message (prior to any filtering). Therefore, all STAs shall filter out group addressed messages that contain their address as the source address. When dot11SSPNInterfaceActivated is false, group addressed MSDUs shall be propagated throughout the ESS. When dot11SSPNInterfaceActivated is true, group addressed MSDUs shall be propagated throughout the ESS only if dot11NonAPStationAuthSourceMulticast in the dot11InterworkingEntry identified by the source MAC address in the received message is true.

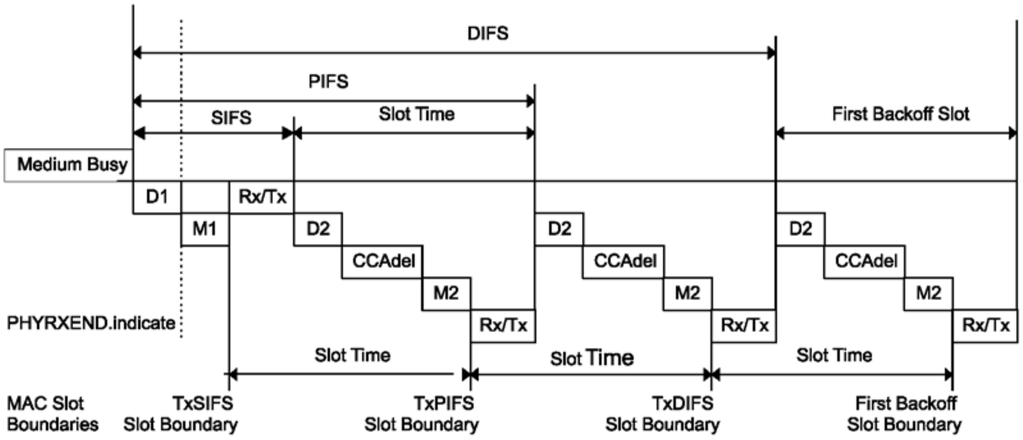
There is no MAC-level recovery on group addressed frames, except for those frames in which the To DS field is 1. As a result, the reliability of this traffic is reduced, relative to the reliability of individually addressed traffic, due to the increased probability of lost frames from interference, collisions, or time-varying channel properties.

An STBC-capable STA shall discard either all received group addressed data frames that are STBC frames or all received group addressed data frames that are non-STBC frames. How it makes this decision is outside the scope of this standard.

A STA shall discard an MPDU with a group address in the Address 1 field if the value in the Address 1 field does not match any value in the dot11GroupAddressesTable and does not match the Broadcast address value.

9.3.7 DCF timing relations

The relationships between the IFS specifications are defined as time gaps on the medium. The associated attributes are provided by the specific PHY. (See Figure 9-14.)



D1 = aRxRFDelay + aRxPLCPDelay (referenced from the end of the last symbol of a frame on the medium)
D2 = D1 + Air Propagation Time
Rx/Tx = aRXTXTurnaroundTime (begins with a PHYTXSTART.request)
M1 = M2 = aMACProcessingDelay
CCAdel = aCCA Time - D1

Figure 9-14—DCF timing relationships

All medium timings that are referenced from the end of the transmission are referenced from the end of the last symbol, or signal extension if present, of the PPDU. The beginning of transmission refers to the first symbol of the preamble of the next PPDU. All MAC timings are referenced from the PHY-TXEND.confirm, PHY-TXSTART.confirm, PHY-RXSTART.indication, and PHY-RXEND.indication primitives.

aSIFSTime and aSlotTime are determined per PHY, aSIFSTime is fixed, and aSlotTime can change dynamically as aAirPropagationTime changes (see 9.18.6).

aSIFSTime is: aRxRFDelay + aRxPLCPDelay + aMACProcessingDelay + aRxTxTurnaroundTime.

aSlotTime is: aCCATime + aRxTxTurnaroundTime + aAirPropagationTime
+ aMACProcessingDelay.

The PIFS and DIFS are derived by the Equation (9-2) and Equation (9-3), as illustrated in Figure 9-14.

$$\text{PIFS} = \text{aSIFSTime} + \text{aSlotTime} \tag{9-2}$$

$$\text{DIFS} = \text{aSIFSTime} + 2 \times \text{aSlotTime} \tag{9-3}$$

The EIFS is derived from the SIFS and the DIFS and the length of time it takes to transmit an ACK frame at the lowest PHY mandatory rate by Equation (9-4).

$$\text{EIFS} = \text{aSIFSTime} + \text{DIFS} + \text{ACKTxTime} \tag{9-4}$$

where

ACKTxTime is the time expressed in microseconds required to transmit an ACK frame, including preamble, PLCP header and any additional PHY dependent information, at the lowest PHY mandatory rate.

Figure 9-14 illustrates the relation between the SIFS, PIFS, and DIFS as they are measured on the medium and the different MAC slot boundaries TxSIFS, TxPIFS, and TxDIFS. These slot boundaries define when the transmitter shall be turned on by the MAC to meet the different IFS timings on the medium, after subsequent detection of the CCA result of the previous slot time.

Equation (9-5), Equation (9-6) and Equation (9-7) define the MAC Slot Boundaries, using attributes provided by the PHY, which are such that they compensate for implementation timing variations. The starting reference of these slot boundaries is again the end of the last symbol of the previous PPDU.

$$\text{TxSIFS} = \text{SIFS} - \text{aRxTxTurnaroundTime} \tag{9-5}$$

$$\text{TxPIFS} = \text{TxSIFS} + \text{aSlotTime} \tag{9-6}$$

$$\text{TxDIFS} = \text{TxSIFS} + 2 \times \text{aSlotTime} \tag{9-7}$$

The tolerances are specified in the physical layer management entity (PLME) SAP interface specification (see 6.5) and shall only apply to the SIFS specification so that tolerances shall not accumulate.

9.3.8 Signal Extension

Transmissions of frames with TXVECTOR parameter FORMAT of type NON_HT with NON_HT_MODULATION values of ERP-OFDM, DSSS-OFDM, and NON_HT_DUPOFDM and transmissions of frames with TXVECTOR parameter FORMAT with values of HT_MF and HT_GF include a period of no transmission of duration aSignalExtension, except for RIFS transmissions. The purpose of this signal extension is to enable the NAV value of Clause 17 STAs to be set correctly.

When an HT STA transmits a PPDU using a RIFS and with the TXVECTOR parameter FORMAT equal to NON_HT with the NON_HT_MODULATION parameter equal to one of ERP-OFDM, DSSS-OFDM, and NON_HT_DUPOFDM or a PPDU using a RIFS and with the TXVECTOR parameter FORMAT equal to HT_MF or HT_GF, it shall set the TXVECTOR parameter NO_SIG_EXTN to true. Otherwise, it shall set the TXVECTOR parameter NO_SIG_EXTN to false.

9.3.9 Determination of PLME aCWmin characteristics

In the case of the Clause 19 ERP, the aCWmin value is dependent on the requestor’s characteristic rate set. The characteristic rate set is equal to the IBSS’s supported rate set when the STA is operating as a member of an IBSS. It is equal to the AP’s supported rate set when the STA is associated with an AP. At all other times, it is equal to the STA’s mandatory rate set. The MAC variable aCWmin is set to aCWmin(0) if the characteristic rate set includes only rates in the set 1, 2, 5.5, 11; otherwise, aCWmin is set to aCWmin(1). If the returned value for aCWmin is a scalar, then the MAC always sets the variable aCWmin to the returned scalar value of aCWmin.

9.4 PCF

9.4.1 General

The PCF provides CF frame transfer. It is an option for an AP to be able to become the PC. A non-AP STA shall not become a PC. All STAs inherently obey the medium access rules of the PCF, because these rules are based on the DCF, and all STAs set their NAV at the beginning of each CFP. The operating characteristics of the PCF are such that all STAs are able to operate in the presence of a BSS in which a PC is operating, and, if associated with a point-coordinated BSS, are able to receive frames sent under PCF control. It is also an option for a STA to be able to respond to a CF-Poll received from a PC. A STA that is able to respond to CF-Polls is referred to as being CF-Pollable, and may request to be polled by an active PC. CF-Pollable STAs and the PC do not use RTS/CTS in the CFP. When polled by the PC, a CF-Pollable STA may transmit only one MPDU, which might be sent to the PC but may have any destination, and may "piggyback" the acknowledgment of a frame received from the PC using particular data frame subtypes for this transmission. If the data frame is not in turn acknowledged, the CF-Pollable STA shall not retransmit the frame unless it is polled again by the PC, or it decides to retransmit during the CP. If the addressed recipient of a CF transmission is not CF-Pollable, that STA acknowledges the transmission using the DCF acknowledgment rules, and the PC retains control of the medium. A PC may use CF frame transfer solely for delivery of frames to STAs, and never to poll CF-Pollable STAs.

A PC may perform a backoff on retransmission of an unacknowledged frame during the CFP. A PC that is maintaining a polling list may retry the unacknowledged frame the next time the particular AID is at the top of the polling list.

A PC may retransmit an unacknowledged frame during the CFP after a PIFS time.

When more than one point-coordinated BSS is operating on the same PHY channel in overlapping space, the potential exists for collisions between PCF transfer activities by the independent PCs. The rules under which multiple, overlapping point-coordinated BSSs may coexist are presented in 9.4.4.3. As shown in Figure 9-1 (in 9.2), the PCF is built on top of the CSMA/CA-based DCF, by utilizing the access priority provisions provided by this scheme. An active PC shall be located at an AP, which restricts PCF operation to infrastructure networks. PCF is activated at a PC-capable AP by setting the CFPMaxDuration parameter in the CF Parameter Set of the MLME-START.request primitive to a nonzero value.

Data frames sent by, or in response to polling by, the PC during the CFP shall use the appropriate data subtypes based upon the following usage rules:

- Data+CF-Poll, Data+CF-Ack+CF-Poll, CF-Poll, and CF-Ack+CF-Poll shall be sent only by a PC.
- Data, Data+CF-Ack, Null Function, and CF-Ack may be sent by a PC or by any CF-Pollable STA.

STAs receiving Data type frames shall consider the frame body as the basis of a possible indication to LLC only if the frame is of subtype Data, Data+CF-Ack, Data+CF-Poll, or Data+CF-Ack+CF-Poll. CF-Pollable STAs shall interpret all subtype bits of received Data type frames that contain the BSSID of the current BSS for CF purposes, but shall not inspect the frame body unless the frame is of subtype Data, Data+CF-Ack, Data+CF-Poll, or Data+CF-Ack+CF-Poll.

9.4.2 CFP structure and timing

The PCF controls frame transfers during a CFP. The CFP shall alternate with a CP, when the DCF controls frame transfers, as shown in Figure 9-15. Each CFP shall begin with a Beacon frame that contains a DTIM element (referred to as DTIM Beacon frame). The CFPs shall occur at a defined repetition rate, which shall be synchronized with the beacon interval as specified in the following paragraphs.

The PC generates CFPs at the CFP repetition interval (CFPPeriod), which is defined as a number of DTIM intervals. The PC shall determine the CFPPeriod (depicted as a repetition interval in the illustrations in Figure 9-15 and Figure 9-16) to use from dot11CFPPeriod. This value, in units of DTIM intervals, shall be communicated to other STAs in the BSS in the CFPPeriod field of the CF Parameter Set element of Beacon frames. The CF Parameter Set element shall be present only in Beacon and Probe Response frames transmitted by STAs containing an active PC.

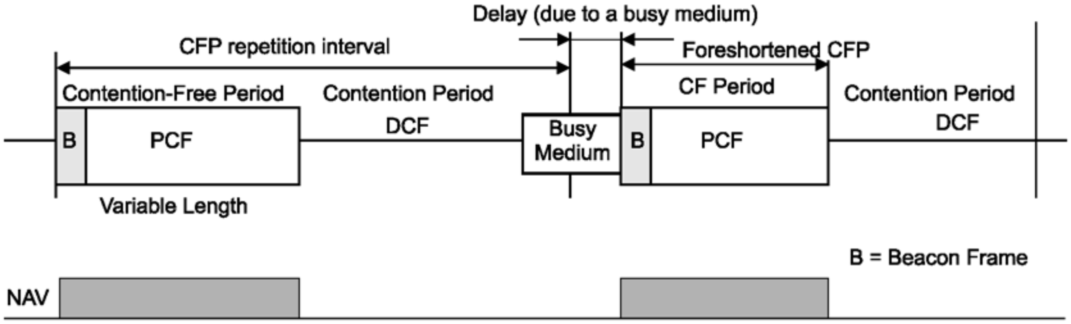


Figure 9-15—CFP/CP alternation

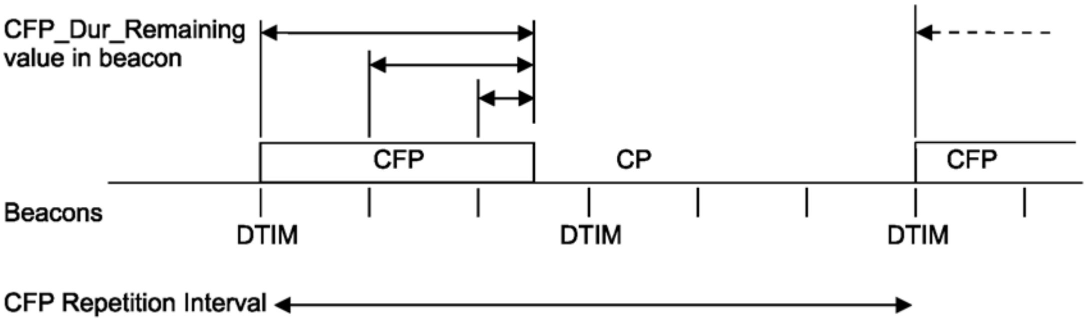

Figure 9-16—Beacon frames and CFPs

The length of the CFP is controlled by the PC, with maximum duration specified by dot11CFPMaxDuration. Neither the maximum duration nor the actual duration (signaled by transmission of a Control frame of subtype CF-End or CF-End+ACK by the PC) is constrained to be a multiple of the beacon interval. If the CFP duration is greater than the beacon interval, the PC shall transmit Beacon frames at the appropriate times during the CFP (subject to delay due to traffic at the nominal times, as with all Beacon frames). The CF Parameter Set element in all Beacon frames at the start of, or within, a CFP shall contain a nonzero value in the CFPDurRemaining field. This value, in units of TU, shall specify the maximum time from the most recent TBTT to the end of this CFP. The value of the CFPDurRemaining field shall be 0 in Beacon frames sent during the CP. An example of these relationships is illustrated in Figure 9-16, which shows a case where the CFPPeriod is two DTIM intervals, the DTIM interval is three beacon intervals, and the aCFPMaxDuration value is approximately 2.5 beacon intervals.

The PC may terminate any CFP at or before the limit given by dot11CFPMaxDuration, based on available traffic and size of the polling list. Because the transmission of any Beacon frame may be delayed due to a medium busy condition at the TBTT, a CFP may be shortened by the amount of the delay. In the case of a busy medium due to DCF traffic, the Beacon frame shall be delayed for the time required to complete the current DCF frame exchange. In cases where the Beacon frame transmission is delayed, the CFPDurRemaining value in the Beacon frame at the beginning of the CFP shall specify a time that causes the CFP to end no later than TBTT plus the value of aCFPMaxDuration. This is illustrated in Figure 9-17.

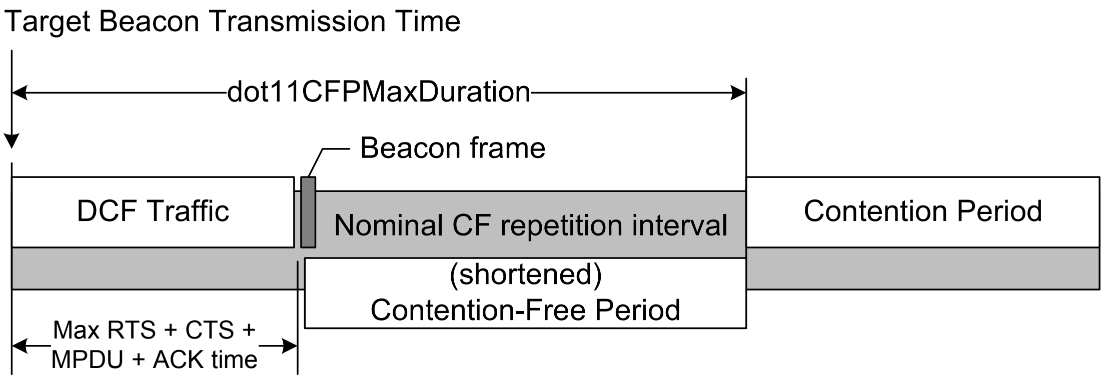

Figure 9-17—Example of delayed beacon and shortened CFP

9.4.3 PCF access procedure

9.4.3.1 General

The CF transfer protocol is based on a polling scheme controlled by a PC operating at the AP of the BSS. The PC gains control of the medium at the beginning of the CFP and attempts to maintain control for the entire CFP by waiting a shorter time between transmissions than the STAs using the DCF access procedure. All STAs that receive Beacon frames containing a CF Parameter Set element, including STAs not associated with the BSS, set their NAVs to the CFPMaxDuration value at the nominal start time of each CFP. This prevents most contention by preventing nonpolled transmissions by STAs regardless of whether they are CF-Pollable. Acknowledgment of frames sent during the CFP may be accomplished using Data+CF-ACK, CF-ACK, Data+CF-ACK+CF-Poll (only on frames transmitted by the PC), or CF-ACK+CF-Poll (only on frames transmitted by the PC) frames in cases where a Data (or Null) frame immediately follows the frame being acknowledged, thereby avoiding the overhead of separate ACK frames. Non-CF-Pollable or unpolled CF-Pollable STAs acknowledge frames during the CFP using the DCF ACK procedure.

9.4.3.2 Fundamental access

At the nominal beginning of each CFP, the PC shall sense the medium. When the medium is determined to be idle for one PIFS period, the PC shall transmit a Beacon frame containing the CF Parameter Set element and a DTIM element.

After the initial Beacon frame, the PC shall wait for one SIFS period, and then transmit one of the following: a data frame, a CF-Poll frame, a Data+CF-Poll frame, a management frame, or a CF-End frame. If the CFP is null, i.e., no traffic is buffered and no polls exist to send at the PC, a CF-End frame shall be transmitted immediately after the initial Beacon frame. If there are buffered group addressed MSDUs/MMPDUs, the PC shall transmit these prior to any individually addressed MSDUs/MMPDUs.

STAs receiving individually addressed, error-free frames from the PC are expected to respond after a SIFS period, in accordance with the transfer procedures defined in 9.4.4. If the recipient STA is not CF-Pollable, the response to receipt of an error-free data frame shall be an ACK frame.

9.4.3.3 NAV operation during the CFP

The mechanism for handling the NAV during the CFP is designed to facilitate the operation of overlapping CFP coordinated infrastructure BSSs. The mechanism by which infrastructure BSSs coordinate their CFPs is beyond the scope of this standard.

Each STA, except the STA with the PC, shall preset its NAV to the CFPMaxDuration value (obtained from the CF Parameter Set element in Beacon frames from this PC) at each TBTT (see Clause 10) at which a CFP is scheduled to start (based on the CFPCount field in the CF Parameter Set element of the Beacon frames from this PC). Each non-PC STA shall update its NAV using the CFPDurRemaining value in the CF Parameter Set element of any error-free Beacon frame that the STA receives. This includes CFPDurRemaining values in CF Parameter Set elements from Beacon frames received from other (overlapping) BSSs.

These actions prevent STAs from taking control of the medium during the CFP, which is especially important in cases where the CFP spans multiple medium-occupancy intervals, such as dwell periods of an FH PHY. This setting of the NAV also reduces the risk of hidden STAs determining the medium to be idle for a DIFS period during the CFP and possibly corrupting a transmission in progress.

A STA joining a BSS operating with a PC shall use the information in the CFPDurRemaining element of the CF parameter set of any received Beacon or Probe Response frames to update its NAV prior to initiating any transmissions.

The PC shall transmit a CF-End or CF-End+ACK frame at the end of each CFP. A STA that receives either of these frames, from any BSS, shall reset its NAV.

9.4.4 PCF transfer procedure

9.4.4.1 General

Frame transfers under the PCF may consist of frames alternately sent from the AP/PC and sent to the AP/PC. During the CFP, the ordering of these transmissions, and the STA allowed to transmit frames to the PC at any given point in time, shall be controlled by the PC. Figure 9-18 depicts frame transfer during a typical CFP. The rules under which this frame transfer takes place are detailed in 9.4.4.2 to 9.4.4.5.

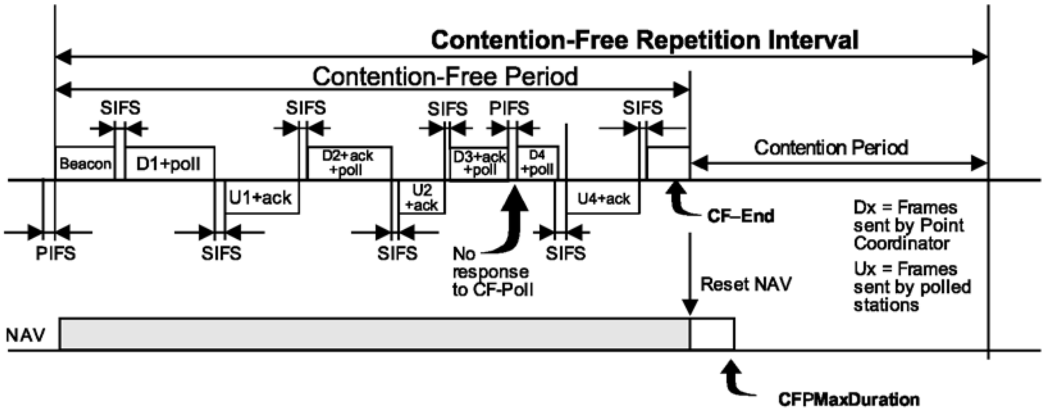

Figure 9-18—Example of PCF frame transfer

In a STA having an FH PHY, control of the channel is lost at a dwell time boundary. It is required that the current MPDU transmission and the accompanying acknowledgment of the MPDU be transmitted before the dwell time boundary. After having been polled by the PC, if there is not enough time remaining in the dwell to allow transmission of the MPDU plus the acknowledgment, the STA shall defer the transmission of the MPDU and shall transmit a Null frame or CF-ACK frame. The short retry counter and long retry counter for the MSDU shall not be affected.

MaxMPDUTime is the time to transmit the maximum-sized MAC frame, expanded by security mechanisms, plus the time to transmit the PHY preamble, header, trailer, and expansion bits, if any. In a STA having an FH

PHY, the PC shall not transmit a frame with any data subtype that includes CF-Poll to a STA if there is insufficient time remaining before the dwell boundary for the STA to respond with a Null frame or CF-ACK frame.

9.4.4.2 PCF transfers when the PC STA is transmitter or recipient

The PC shall transmit frames between the Beacon that starts the CFP and the CF-End using the SIFS except in cases where a transmission by another STA is expected by the PC and a SIFS period elapses without the receipt of the expected transmission. In such cases the PC may send its next pending transmission as soon as one PIFS after the end of its last transmission. This permits the PC to retain control of the medium in the presence of an overlapping BSS. The PC may transmit any of the following frame types to CF-Pollable STAs:

— Data, used to send data from the PC when the addressed recipient is not being polled and there is no previous frame to acknowledge;
— Data+CF-ACK, used to send data from the PC when the addressed recipient is not being polled or is not CF-Pollable or the DA is a group address and the PC needs to acknowledge the receipt of a frame received from a CF-Pollable STA a SIFS period before starting this transmission;
— Data+CF-Poll, used to send data from the PC when the addressed recipient is the next STA to be permitted to transmit during this CFP and there is no previous frame to acknowledge;
— Data+CF-ACK+CF-Poll, used to send data from the PC when the addressed recipient is the next STA to be permitted to transmit during this CFP and the PC needs to acknowledge the receipt of a frame received from a CF-Pollable STA a SIFS period before starting this transmission;
— CF-Poll, used when the PC is not sending data to the addressed recipient but the addressed recipient is the next STA to be permitted to transmit during this CFP and there is no previous frame to acknowledge;
— CF-ACK+CF-Poll, used when the PC is not sending data to the addressed recipient but the addressed recipient is the next STA to be permitted to transmit during this CFP and the PC needs to acknowledge the receipt of a frame from a CF-Pollable STA a SIFS period before starting this transmission;
— CF-ACK, used when the PC is not sending data to, or polling, the addressed recipient, but the PC needs to acknowledge receipt of a frame from a CF-Pollable STA a SIFS period before starting this transmission (useful when the next transmission by the PC is a management frame, such as a Beacon frame); or
— Any management frame that is appropriate for the AP to send under the rules for that frame type.

The PC may transmit data or management frames to non-CF-Pollable, non-PS STAs during the CFP. These STAs shall acknowledge receipt with ACK frames after a SIFS, as with the DCF. The PC may also transmit group addressed frames during the CFP. Because the Beacon frame that initiates the CFP contains a DTIM element, if there are associated STAs using PS mode, the buffered group addressed frames shall be sent immediately after any Beacon frame containing a TIM element with a DTIM count field with a value of 0.

A CF-Pollable STA that receives an individually addressed data frame of any subtype that includes CF-Poll may transmit one data frame a SIFS period after receiving the CF-Poll. CF-Pollable STAs shall ignore, but not reset, their NAV when performing transmissions in response to a CF-Poll.

Non-CF-Pollable STAs that receive an individually addressed frame during the CFP shall transmit an ACK, but shall not reset their NAV.

For frames that require MAC-level acknowledgment, CF-Pollable STAs that received a CF-Poll (of any type) may perform this acknowledgment using the Data+CF-ACK subtype in the response to the CF-Poll. For example, the U1 frame in Figure 9-18 contains the acknowledgment to the preceding D1 frame. The D2 frame contains the acknowledgment to the preceding U1 frame. The PC may use the CF-ACK subtypes to acknowledge a received frame even if the data frame sent with the CF-ACK subtype is addressed to a different

STA than the one being acknowledged. CF-Pollable STAs that are expecting an acknowledgment shall interpret the subtype of the frame (if any) sent by the PC a SIFS period after that STA's transmission to the PC. If a frame that requires MAC-level acknowledgment is received by a non-CF-Pollable STA, that STA shall not interpret the CF-Poll indication (if any), and shall acknowledge the frame by sending an ACK frame after a SIFS period.

The lengths of the frames may be variable, only bounded by the frame and/or fragment length limitations that apply for the BSS. If a CF-Pollable STA does not respond to a CF-Poll (of any type) within the SIFS period following a transmission from the PC, or a non-CF-Pollable STA does not return the ACK frame within a SIFS period following a transmission from the PC that requires acknowledgment, then the PC shall resume control and may transmit its next frame after a PIFS period from the end of the PC's last transmission.

A CF-Pollable STA shall respond to a frame with any data subtype that includes CF-Poll directed to its MAC address and received without error. If the STA has no frame to send when polled, the response shall be a Null frame. If the STA has no frame to send when polled, but an acknowledgment is required for the frame that conveyed the CF-Poll, the response shall be a CF-ACK (no data) frame. The null response is required to permit a "no-traffic" situation to be distinguished from a collision between overlapping PCs.

The CFP shall end when the CFPDurRemaining time has elapsed since the Beacon frame originating the CFP or when the PC has no further frames to transmit nor STAs to poll. In either case, the end of the CFP shall be signaled by the transmission of a CF-End by the PC. If there is a received frame that requires acknowledgment at the time the CF-End is to be transmitted, the PC shall transmit a CF-End+ACK frame instead. A STA receiving a CF-End or CF-End+ACK shall reset its NAV.

9.4.4.3 Operation with overlapping point-coordinated BSSs

Because the PCF operates without the CSMA/CA CW randomization and backoff of the DCF, there is a risk of repeated collisions if multiple, overlapping, point-coordinated BSSs are operating on the same PHY channel, and their CFP Rates and beacon intervals are approximately equal. To minimize the risk of significant frame loss due to CF collisions, the PC shall use a DIFS plus a random backoff delay (with CW in the range of 1 to aCWmin) to start a CFP when the initial Beacon frame is delayed because of deferral due to a busy medium. The PC may optionally use this backoff during the CFP prior to retransmitting an unacknowledged, individually addressed data or management frame.

To further reduce the susceptibility to inter-PC collisions, the PC shall require that the medium be determined as being idle for a DIFS period plus a random (over a range of 1 to aCWmin) number of slot times once every dot11MediumOccupancyLimit TU during the CFP. This results in loss of control of the medium to overlapping BSS or hidden STA traffic, because the STAs in this BSS are prevented from transmitting by their NAV setting to CFPMaxDuration or CFPDurRemaining. For operation of the PCF in conjunction with an FH PHY, dot11MediumOccupancyLimit shall be set equal to the dwell time. For operation in conjunction with other PHY types, dot11MediumOccupancyLimit may be set equal to CFPMaxDuration, unless extra protection against PCF collisions is desired. The dot11MediumOccupancyLimit is also useful for compliance in regulatory domains that impose limits on continuous transmission time by a single STA as part of a spectrum etiquette.

9.4.4.4 CFPMaxDuration limit

The value of CFPMaxDuration shall be limited to allow coexistence between contention and CF traffic.

The minimum value for CFPMaxDuration is two times MaxMPDUTime plus the time required to send the initial Beacon frame and the CF-End frame of the CFP. This may allow sufficient time for the AP to send one data frame to a STA, while polling that STA, and for the polled STA to respond with one data frame.

The maximum value for CFPMaxDuration is the duration of (BeaconPeriod × DTIMPeriod × CFPPeriod) minus [MaxMPDUTime plus (2 × aSIFSTime) plus (2 × aSlotTime) plus (8 × ACKSize)], expressed in microseconds. MaxMPDUTime is the time to transmit the maximum-sized MAC frame, expanded by security mechanisms, plus the time to transmit the PHY preamble, header, trailer, and expansion bits, if any. This allows sufficient time to send at least one data frame during the CP.

9.4.4.5 CF usage rules

A PC may send group addressed frames, and individually addressed data or management frames to any active STA, as well as to CF-Pollable PS STAs. During the CFP, CF-Pollable STAs shall acknowledge after a SIFS period, the receipt of each Data+CF-Poll frame or Data+CF-ACK+CF-Poll frame using Data+CF-Ack or CF-Ack (no data) frames, the receipt of each CF_Poll (no data) using Data or Null (no data), and the receipt of all other data and management frames using ACK frames. Non-CF-Pollable STAs shall acknowledge receipt of data and management frames using ACK frames sent after a SIFS period. This non-CF-Pollable operation is the same as that already employed by such STAs for DCF operation.

When polled by the PCF (Data+CF-Poll, Data+CF-ACK+CF-Poll, CF-Poll, or CF-ACK+CF-Poll) a CF-Pollable STA may send one data frame to any destination. Such a frame directed to or through the PC STA shall be acknowledged by the PC, using the CF-ACK indication (Data+CF-ACK, Data+CF-ACK+CF-Poll, CF-ACK, CF-ACK+CF-Poll, or CF-End+ACK) sent after a SIFS. Such a frame directed to a non-CF-Pollable STA shall be acknowledged using an ACK frame sent after a SIFS period. A polled CF-Pollable STA with neither a data frame nor an acknowledgment to send shall respond by transmitting a Null frame after a SIFS period. A polled CF-Pollable STA with insufficient time before the end of the CFP or current medium occupancy limit, to send its queued MPDU and receive an acknowledgment, shall respond by transmitting a Null frame, or a CF-ACK frame if polled using Data+CF-Poll or Data+CF-ACK+CF-Poll, after a SIFS period. The CF-Pollable STA may set the More Data bit to 1 in its response to permit the PC to distinguish between an empty STA queue and a response due to insufficient time to transfer an MPDU.

The PC shall not issue frames with a subtype that includes CF-Polls if insufficient time remains in the current CFP to permit the polled STA to transmit a data frame containing a minimum length MPDU.

9.4.5 CF polling list

9.4.5.1 General

If the PC supports use of the CFP for inbound frame transfer as well as for frame delivery, the PC shall maintain a “polling list” for use in selecting STAs that are eligible to receive CF-Polls during CFPs. The polling list functional characteristics are defined below. If the PC supports the use of the CFP solely for frame delivery, the PC does not require a polling list, and shall never generate data frames with a subtype that includes CF-Poll. The form of CF support provided by the PC is identified in the Capability Information field of Beacon, Association Response, Reassociation Response, and Probe Response management frames, which are sent from APs. Any such frames sent by STAs, as in noninfrastructure networks, shall have these bits set to 0.

The polling list is used to force the polling of CF-Pollable STAs, regardless of whether the PC has pending traffic to transmit to those STAs. The polling list may be used to control the use of Data+CF-Poll and Data+CF-ACK+CF-Poll types for transmission of data frames being sent to CF-Pollable STAs by the PC. The polling list is a *logical* construct, which is not exposed outside of the PC. A minimum set of polling list maintenance techniques are required to in order to provide interoperability of arbitrary CF-Pollable STAs in BSSs controlled by arbitrary APs with active PCs. APs may also implement additional polling list maintenance techniques that are outside the scope of this standard.

9.4.5.2 Polling list processing

The PC shall send a CF-Poll to at least one STA during each CFP when there are entries in the polling list. During each CFP, the PC shall issue polls to a subset of the STAs on the polling list in order by ascending AID value.

While time remains in the CFP, all CF frames have been delivered, and all STAs on the polling list have been polled, the PC may generate one or more CF-Polls to any STAs on the polling list. While time remains in the CFP, all CF frames have been delivered, and all STAs on the polling list have been polled, the PC may send data or management frames to any STAs.

In order to gain maximum efficiency from the CFP, and the ability to piggyback acknowledgments on successor data frames in the opposite direction, the PC should generally use Data+CF-Poll and Data+CF-ACK+CF-Poll types for each data frame transmitted while sufficient time for the potential response to the CF-Poll remains in the CFP.

9.4.5.3 Polling list update procedure

A STA indicates its CF-Pollability using the CF-Pollable subfield of the Capability Information field of Association Request and Reassociation Request frames.

NOTE—A STA might perform a reassociation in order to change the PC's record of its CF-Pollability.

During association, a CF-Pollable STA may request to be placed on the polling list, or to never be polled, by appropriate use of bits in the Capability Information field of the Associate Request or Reassociate Request frame, as shown in Table 8-35 (see 8.4.1.4).

CF-Pollable STAs that are not on the polling list, but did not request never to be polled during their most recent association, may be dynamically placed on the polling list by the PC to handle bursts of frame transfer activity by that STA.

9.5 Fragmentation

The MAC may fragment and reassemble individually addressed MSDUs or MMPDUs. The fragmentation and defragmentation mechanisms allow for fragment retransmission.

The length of each fragment shall be an equal number of octets for all fragments except the last, which may be smaller. The length of each fragment shall be an even number of octets, except for the last fragment of an MSDU or MMPDU, which may be either an even or an odd number of octets. The length of a fragment shall never be larger than dot11FragmentationThreshold unless security encapsulation is invoked for the MPDU. If security encapsulation is active for the MPDU, then the MPDU shall be expanded by the encapsulation overhead and this may result in a fragment larger than dot11FragmentationThreshold.

A fragment is an MPDU, the payload of which carries all or a portion of an MSDU or MMPDU. When data are to be transmitted, the number of octets in the fragment (before processing by the security mechanism) shall be determined by dot11FragmentationThreshold and the number of octets in the MPDU that have yet to be assigned to a fragment at the instant the fragment is constructed for the first time. Once a fragment is transmitted for the first time, its frame body content and length shall be fixed until it is successfully delivered to the immediate receiving STA. A STA shall be capable of receiving fragments of arbitrary length that is less than the maximum allowed MSDU size, plus any encapsulation headers.

If a fragment requires retransmission, its frame body content and length shall remain fixed for the lifetime of the MSDU or MMPDU at that STA. After a fragment is transmitted once, contents and length of that fragment are not allowed to fluctuate to accommodate the dwell time boundaries. Each fragment shall contain a

Sequence Control field, which is comprised of a sequence number and fragment number. When a STA is transmitting an MSDU or MMPDU, the sequence number shall remain the same for all fragments of that MSDU or MMPDU. The fragments shall be sent in order of lowest fragment number to highest fragment number, where the fragment number value starts at 0, and increases by 1 for each successive fragment. The Frame Control field also contains a bit, the More Fragments bit, that is equal to 0 to indicate the last (or only) fragment of the MSDU or MMPDU.

The source STA shall maintain a transmit MSDU timer for each MSDU being transmitted. The attribute dot11MaxTransmitMSDULifetime specifies the maximum amount of time allowed to transmit an MSDU. The timer starts on the initial attempt to transmit the first fragment of the MSDU. If the timer exceeds dot11MaxTransmitMSDULifetime, then all remaining fragments are discarded by the source STA and no attempt is made to complete transmission of the MSDU.

9.6 Defragmentation

Each fragment contains information to allow the complete MSDU or MMPDU to be reassembled from its constituent fragments. The header of each fragment contains the following information that is used by the destination STA to reassemble the MSDU or MMPDU:

- Frame type
- Address of the sender, obtained from the Address2 field
- Destination address
- *Sequence Control field:* This field allows the destination STA to check that all incoming fragments belong to the same MSDU or MMPDU, and the sequence in which the fragments should be reassembled. The sequence number within the Sequence Control field remains the same for all fragments of an MSDU or MMPDU, while the fragment number within the Sequence Control field increments for each fragment.
- *More Fragments indicator:* Indicates to the destination STA that this is not the last fragment of the MSDU or MMPDU. Only the last or sole fragment of the MSDU or MMPDU shall have this bit set to 0. All other fragments of the MSDU or MMPDU shall have this bit set to 1.

The destination STA shall reconstruct the MSDU or MMPDU by combining the fragments in order of fragment number subfield of the Sequence Control field. If security encapsulation has been applied to the fragment, it shall be deencapsulated and decrypted before the fragment is used for defragmentation of the MSDU or MMPDU. If the fragment with the More Fragments bit equal to 0 has not yet been received, then the destination STA knows that the MSDU or MMPDU is not yet complete. As soon as the STA receives the fragment with the More Fragments bit equal to 0, the STA knows that no more fragments may be received for the MSDU or MMPDU.

All STAs shall support the concurrent reception of fragments of at least three MSDUs or MMPDUs. Note that a STA receiving more than three fragmented MSDUs or MMPDUs concurrently may experience a significant increase in the number of frames discarded.

The destination STA shall maintain a Receive Timer for each MSDU or MMPDU being received, for a minimum of three MSDUs or MMPDUs. The STA may implement additional timers to be able to receive additional concurrent MSDUs or MMPDUs. The receiving STA shall discard all fragments that are part of an MSDU or MMPDU for which a timer is not maintained. There is also dot11MaxReceiveLifetime, that specifies the maximum amount of time allowed to receive an MSDU. The receive MSDU or MMPDU timer starts on the reception of the first fragment of the MSDU or MMPDU. If the receive MSDU timer exceeds dot11MaxReceiveLifetime, then all received fragments of this MSDU or MMPDU are discarded by the destination STA. If additional fragments of an individually addressed MSDU or MMPDU are received after its dot11MaxReceiveLifetime is exceeded, those fragments shall be acknowledged and discarded.

To properly reassemble MPDUs into an MSDU or MMPDU, a destination STA shall discard any duplicated fragments received. A STA shall discard duplicate fragments as described in 9.3.2.10. However, an acknowledgment shall be sent in response to a duplicate fragment of an individually addressed MSDU.

9.7 Multirate support

9.7.1 Overview

Some PHYs have multiple data transfer rate capabilities that allow implementations to perform dynamic rate switching with the objective of improving performance. The algorithm for performing rate switching is beyond the scope of this standard, but in order to provide coexistence and interoperability on multirate-capable PHYs, this standard defines a set of rules to be followed by all STAs.

Only the data transfer rates of the mandatory rate set of the attached PHY are guaranteed to be supported when a STA for which dot11OCBActivated is true transmits a management or data frame. Higher layer protocols may negotiate a rate outside the mandatory rate set.

A STA that transmits a frame shall select a rate defined by the rules for determining the rates of transmission of protection frames in 9.23 when the following conditions apply:

— The STA’s protection mechanism for non-ERP receivers is enabled.

— The frame is a protection mechanism frame.

— The frame initiates an exchange.

Otherwise, the frame shall be transmitted using a rate that is in accordance with rules defined in 9.7.5 and 9.7.6.

For the Clause 18, Clause 17, Clause 19, and Clause 20 PHYs, the time required to transmit a frame for use in calculating the value for the Duration/ID field is determined using the PLME-TXTIME.request primitive (see 6.5.7) and the PLME-TXTIME.confirm primitive (see 6.5.8), both defined in 18.4.3, 17.3.4, 19.8.3.2, 19.8.3.3, 19.8.3.4, or 20.4.3 depending on the PHY options. In QoS STAs, the Duration/ID field may cover multiple frames and may involve using the PLME-TXTIME.request primitive several times.

9.7.2 Basic MCS Set field

An AP that transmits a frame containing an HT Operation element with either the Dual Beacon field or the Dual CTS Protection field equal to 1 shall include at least one MCS that has only one spatial stream in the Basic MCS Set field of the HT Operation element of that frame.

9.7.3 Basic STBC MCS

The basic STBC MCS has the value null when any of the following conditions is true:

— The Dual Beacon field in the HT Operation element is equal to 0, and the Dual CTS Protection field in the HT Operation element is equal to 0.

— No HT Operation element is present in the most recently received Association Response frame that was addressed to this STA.

— The BSSBasicMCSSet is empty or does not exist.

— The lowest MCS of the BSSBasicMCSSet has NSS value greater than 1 (the mapping of MCS to NSS is PHY dependent, for the HT PHY see 20.6).

If none of the above conditions is true, then the basic STBC MCS is the lowest MCS index of the BSSBasicMCSSet parameter.

When an MCS from the basic STBC MCS is required in 9.7.5 and 9.7.6 but the basic STBC MCS has the value null, the STA shall select a mandatory MCS of the attached PHY.

9.7.4 Basic Rate Set and Basic MCS Set for mesh STA

A mesh STA shall not establish a mesh peering with a mesh STA using a different BSSBasicRateSet (see 13.2.7 and 13.2.8).

Mesh STAs should adopt the mandatory PHY rates as the default BSSBasicRateSet to reduce the risk that a candidate peer mesh STA utilizes a different BSSBasicRateSet. If the mesh STA is also an HT STA, it should adopt the MCSs of mandatory MCSs as the default BSSBasicMCSSet.

Once the mesh STA establishes a mesh peering with a mesh STA, it shall change neither the BSSBasicRateSet nor the BSSBasicMCSSet parameters.

9.7.5 Rate selection for data and management frames

9.7.5.1 Rate selection for non-STBC Beacon and non-STBC PSMP frames

If the BSSBasicRateSet parameter is not empty, a non-STBC PSMP frame that is not part of an FMS stream or a non-STBC Beacon shall be transmitted in a non-HT PPDU using one of the rates included in the BSSBasicRateSet parameter.

If the BSSBasicRateSet parameter is empty, the frame shall be transmitted in a non-HT PPDU using one of the mandatory PHY rates.

All non-STBC PSMP frames with a group address in the Address 1 field that are part of an FMS stream shall be transmitted using the rate chosen by the AP as described in 10.23.7.

9.7.5.2 Rate selection for STBC group addressed data and management frames

When a STA has dot11TxSTBCOptionActivated true, it shall use the basic STBC MCS when it transmits an STBC Beacon frame or when it transmits a group addressed data or management frame that is an STBC frame.

9.7.5.3 Rate selection for other group addressed data and management frames

This subclause describes the rate selection rules for group addressed data and management frames, excluding the following:

- Non-STBC Beacon and non-STBC PSMP frames
- STBC group addressed data and management frames
- Data frames located in an FMS stream (see 10.23.7)

If the BSSBasicRateSet parameter is not empty, a data or management frame (excluding the frames listed above) with a group address in the Address 1 field shall be transmitted in a non-HT PPDU using one of the rates included in the BSSBasicRateSet parameter or the rate chosen by the AP, described in 10.23.7, if the data frames are part of an FMS stream.

If the BSSBasicRateSet parameter is empty and the BSSBasicMCSSet parameter is not empty, the frame shall be transmitted in an HT PPDU using one of the MCSs included in the BSSBasicMCSSet parameter.

If both the BSSBasicRateSet parameter and the BSSBasicMCSSet parameter are empty (e.g., a scanning STA that is not yet associated with a BSS), the frame shall be transmitted in a non-HT PPDU using one of the mandatory PHY rates.

9.7.5.4 Rate selection for polling frames

A data frame of a subtype that includes CF-Poll that does not also include CF-Ack and that is sent in the CP shall be transmitted at a rate selected as follows:

a) If an initial exchange has already established protection and the Duration/ID field in the frame establishing protection covers the entire TXOP, the rate or MCS is selected according to the rules in 9.7.5.6.
b) Otherwise, the data frame shall be transmitted at a rate or MCS as defined in 9.7.5.3, treating the frame as though it has a group address in the Address 1 field, solely for the purpose of determining the appropriate rate or MCS.

9.7.5.5 Rate selection for +CF-Ack frames

For a frame of type (QoS) Data+CF-Ack, (QoS) Data+CF-Poll+CFAck, or (QoS) CF-Poll+CF-Ack, the rate or MCS and TXVECTOR parameter CH_BANDWIDTH used to transmit the frame shall be chosen from among those supported by both the addressed recipient STA and the STA to which the ACK frame is intended.

9.7.5.6 Rate selection for other data and management frames

A data or management frame not identified in 9.7.5.1 through 9.7.5.5 shall be sent using any data rate or MCS subject to the following constraints:

— A STA shall not transmit a frame using a rate or MCS that is not supported by the receiver STA or STAs, as reported in any Supported Rates element, Extended Supported Rates element, or Supported MCS field in management frames transmitted by the receiver STA.
— A STA shall not transmit a frame using a value for the CH_BANDWIDTH parameter of the TXVECTOR that is not supported by the receiver STA.
— A STA shall not initiate transmission of a frame at a data rate higher than the greatest rate in the OperationalRateSet or the HTOperationalMCSset, which are parameters of the MLME-JOIN.request primitive.

When the supported rate set of the receiving STA or STAs is not known, the transmitting STA shall transmit using a rate in the BSSBasicRateSet parameter, or an MCS in the BSSBasicMCSSet parameter, or a rate from the mandatory rate set of the attached PHY if both the BSSBasicRateSet and the BSSBasicMCSSet are empty.

The rules in this subclause also apply to A-MPDUs that aggregate MPDUs of type Data or Management with any other types of MPDU.

9.7.6 Rate selection for control frames

9.7.6.1 General rules for rate selection for control frames

Control frames carried in an A-MPDU shall be sent at a rate selected from the rules defined in 9.7.5.6.

NOTE—The rules defined in 9.7.6.2 through 9.7.6.5 apply only to control frames not carried in an A-MPDU.

The following rules determine whether a control frame is carried in an HT PPDU or non-HT PPDU:

a) A control frame shall be carried in an HT PPDU when the control frame meets any of the following conditions:
    1) The control frame contains an L-SIG duration value (see 9.23.5), or

    2) The control frame is sent using an STBC frame.

b) A control response frame shall be carried in an HT PPDU when the control frame is a response to a frame that meets any of the following conditions:
    1) The frame eliciting the response included an HT Control field with the TRQ field equal to 1 and the NDP Announcement subfield equal to 0, and this responder set the Implicit Transmit Beamforming Receiving Capable field to 1 in its last transmitted HT Capabilities element; or
    2) The frame eliciting the response was an RTS frame carried in an HT PPDU; or
    3) The frame eliciting the response was an STBC frame, and the Dual CTS Protection field was equal to 1 in the last HT Operation element received from its AP or transmitted by the STA (see 9.3.2.7).

c) A control frame may be carried in an HT PPDU when the control frame meets any of the following conditions:
    1) The control frame contains an HT Control field with the MRQ subfield equal to 1, or
    2) The control frame contains an HT Control field with the TRQ field equal to 1.

    NOTE—In these cases, requirements specified in 9.27, 9.28.2, and 9.29 further constrain the choice of non-HT or HT PPDU.

d) Otherwise, the control frame shall be carried in a non-HT PPDU.

Selection of channel width is defined in 9.7.6.6.

A control response frame is a control frame that is transmitted as a response to the reception of a frame a SIFS time after the PPDU containing the frame that elicited the response, e.g. a CTS in response to an RTS reception, an ACK in response to a DATA reception, a BlockAck in response to a BlockAckReq reception. In some situations, the transmission of a control frame is not a control response transmission, such as when a CTS is used to initiate a TXOP.

9.7.6.2 Rate selection for control frames that initiate a TXOP

This subclause describes the rate selection rules for control frames that initiate a TXOP and that are not carried in an A-MPDU.

If a control frame other than a Basic BlockAckReq or Basic BlockAck is carried in a non-HT PPDU, the transmitting STA shall transmit the frame using one of the rates in the BSSBasicRateSet parameter or a rate from the mandatory rate set of the attached PHY if the BSSBasicRateSet is empty.

If a Basic BlockAckReq or Basic BlockAck frame is carried in a non-HT PPDU, the transmitting STA shall transmit the frame using a rate supported by the receiver STA, if known (as reported in the Supported Rates element and/or Extended Supported Rates element in frames transmitted by that STA). If the supported rate set of the receiving STA or STAs is not known, the transmitting STA shall transmit using a rate from the BSSBasicRateSet parameter or using a rate from the mandatory rate set of the attached PHY if the BSSBasicRateSet is empty.

NOTE—Because of their utility in resolving contention and in establishing a NAV, most control subtype frames that initiate a frame exchange are subject to explicit limitations regarding the choice of transmission rate with the intent of ensuring maximum possible coverage and receivability of the frame. But the Basic BlockAckReq and Basic BlockAck frames are subject to fewer restrictions because their use at times mimics a typical data-ACK exchange, where no BSS BasicRateSet rate restriction exists on the data frame. In addition, the Basic BlockAck frame is significantly larger than the other control frames.

When L-SIG TXOP protection is not used for an HT PPDU, an HT STA shall select an MCS from the BSSBasicMCSSet parameter when protection is required (as defined in 9.23) and shall select an MCS from the SupportedMCSSet parameter of the intended receiver when protection is not required.

When L-SIG TXOP protection is used, an HT STA shall select an MCS from the SupportedMCSSet parameter of the intended receiver.

9.7.6.3 Rate selection for CF_End frames

If not operating during the 40 MHz phase of PCO, a STA that transmits a CF-End frame that is not at the end of a TXOP that was obtained through the use of the dual CTS mechanism shall transmit the frame using a rate in BSSBasicRateSet or from the mandatory rate set of the attached PHY if the BSSBasicRateSet is empty.

If operating during the 40 MHz phase of PCO, a STA that transmits a CF-End frame that is not at the end of a TXOP that was obtained through the use of the dual CTS mechanism shall transmit the frame using an MCS from the BSSBasicMCSSet parameter.

A STA that transmits a CF-End frame at the end of a TXOP that was obtained by a non-AP STA through the use of the dual CTS mechanism shall transmit the CF-End frame with the same value for the TXVECTOR parameter STBC, TXVECTOR parameter MCS (if present), and TXVECTOR parameter RATE as was used for the transmission of the matching control frame at the beginning of the TXOP. The matching control frame is defined as follows:

- For the first CF-End transmitted in the TXOP, the matching control frame is the first RTS transmitted in the TXOP.
- For the second CF-End transmitted in the TXOP, the matching control frame is the first CTS that follows the first RTS transmitted in the TXOP.
- For the third CF-End transmitted in the TXOP, the matching control frame is the second CTS that follows the first RTS transmitted in the TXOP.

A STA that transmits a CF-End frame at the end of a TXOP that was obtained by an AP through the use of the dual CTS mechanism shall transmit the CF-End frame with the same value for the TXVECTOR parameter STBC, TXVECTOR parameter MCS (if present), and TXVECTOR parameter RATE as was used for the transmission of the matching control frame at the beginning of the TXOP. The matching control frame is defined as follows:

- For the first CF-End transmitted in the TXOP, the matching control frame is the first CTS-to-self transmitted in the TXOP.
- For the second CF-End transmitted in the TXOP, the matching control frame is the first RTS transmitted in the TXOP.

9.7.6.4 Rate selection for control frames that are not control response frames

This subclause describes the rate selection rules for control frames that are not control response frames, are not the frame that initiates a TXOP, are not the frame that terminates a TXOP, and are not carried in an A-MPDU.

A frame other than a BlockAckReq or BlockAck that is carried in a non-HT PPDU shall be transmitted by the STA using a rate no higher than the highest rate in the BSSBasicRateSet parameter that is less than or equal to the rate or non-HT reference rate (see 9.7.9) of the previously transmitted frame that was directed to the same receiving STA. If no rate in the BSSBasicRateSet parameter meets these conditions, the control frame shall be transmitted at a rate no higher than the highest mandatory rate of the attached PHY that is less than or equal to the rate or non-HT reference rate (see 9.7.9) of the previously transmitted frame that was directed to the same receiving STA.

A BlockAckReq or BlockAck that is carried in a non-HT PPDU shall be transmitted by the STA using a rate supported by the receiver STA, as reported in the Supported Rates element and/or Extended Supported Rates element in frames transmitted by that STA. When the supported rate set of the receiving STA or STAs is not known, the transmitting STA shall transmit using a rate from the BSSBasicRateSet parameter or from the mandatory rate set of the attached PHY if the BSSBasicRateSet is empty.

A frame that is carried in an HT PPDU shall be transmitted by the STA using an MCS supported by the receiver STA, as reported in the Supported MCS field in the HT Capabilities element in management frames transmitted by that STA. When the supported rate set of the receiving STA or STAs is not known, the transmitting STA shall transmit using an MCS in the BSSBasicMCSSet parameter.

9.7.6.5 Rate selection for control response frames

9.7.6.5.1 Introduction

Subclauses 9.7.6.5.2 through 9.7.6.5.5 describe the rate selection rules for control response frames that are not carried in an A-MPDU.

9.7.6.5.2 Selection of a rate or MCS

To allow the transmitting STA to calculate the contents of the Duration/ID field, a STA responding to a received frame transmits its control response frame at a primary rate, or at an alternate rate, or at an MCS, as specified by the following rules:

- If a CTS or ACK control response frame is carried in a non-HT PPDU, the primary rate is defined to be the highest rate in the BSSBasicRateSet parameter that is less than or equal to the rate (or non-HT reference rate; see 9.7.9) of the previous frame. If no rate in the BSSBasicRateSet parameter meets these conditions, the primary rate is defined to be the highest mandatory rate of the attached PHY that is less than or equal to the rate (or non-HT reference rate; see 9.7.9) of the previous frame. The STA may select an alternate rate according to the rules in 9.7.6.5.4. The STA shall transmit the non-HT PPDU CTS or ACK control response frame at either the primary rate or the alternate rate, if one exists.
- If a BlockAck frame is sent as an immediate response to either an implicit BlockAck request or to a BlockAckReq frame that was carried in an HT PPDU and the BlockAck frame is carried in a non-HT PPDU, the primary rate is defined to be the highest rate in the BSSBasicRateSet parameter that is less than or equal to the rate (or non-HT reference rate; see 9.7.9) of the previous frame. If no rate in the BSSBasicRateSet parameter meets these conditions, the primary rate is defined to be the highest mandatory rate of the attached PHY that is less than or equal to the rate (or non-HT reference rate; see 9.7.9) of the previous frame. The STA may select an alternate rate according to the rules in 9.7.6.5.4. The STA shall transmit the non-HT PPDU BlockAck control response frame at either the primary rate or the alternate rate, if one exists.
- If a Basic BlockAck frame is sent as an immediate response to a BlockAckReq frame that was carried in a non-HT PPDU and the Basic BlockAck frame is carried in a non-HT PPDU, the primary rate is defined to be the same rate and modulation class as the BlockAckReq frame, and the STA shall transmit the Basic BlockAck frame at the primary rate.
- If a Compressed BlockAck frame is sent as an immediate response to a BlockAckReq frame that was carried in a non-HT PPDU and the Compressed BlockAck frame is carried in a non-HT PPDU, the primary rate is defined to be the highest rate in the BSSBasicRateSet parameter that is less than or equal to the rate (or non-HT reference rate; see 9.7.9) of the previous frame. If no rate in the BSSBasicRateSet parameter meets these conditions, the primary rate is defined to be the highest mandatory rate of the attached PHY that is less than or equal to the rate (or non-HT reference rate; see 9.7.9) of the previous frame. The STA may select an alternate rate according to the rules in 9.7.6.5.4. The STA shall transmit the non-HT PPDU Compressed BlockAck control response frame at either the primary rate or the alternate rate, if one exists.
- If the control response frame is carried in an HT PPDU, then it is transmitted at an MCS as determined by the procedure defined in 9.7.6.5.3.

The modulation class of the control response frame shall be selected according to the following rules:

- If the received frame is of a modulation class other than HT and the control response frame is carried in a non-HT PPDU, the control response frame shall be transmitted using the same modulation class as the received frame. In addition, the control response frame shall be sent using the same value for the TXVECTOR parameter PREAMBLE_TYPE as the received frame.
- If the received frame is of the modulation class HT and the control response frame is carried in a non-HT PPDU, the control response frame shall be transmitted using one of the ERP-OFDM or OFDM modulation classes.
- If the control response frame is carried in an HT PPDU, the modulation class shall be HT.

The selection of the value for the channel width (CH_BANDWIDTH parameter of the TXVECTOR) of the response transmission is defined in 9.7.6.6.

9.7.6.5.3 Control response frame MCS computation

If a control response frame is to be transmitted within an HT PPDU, the channel width (CH_BANDWIDTH parameter of the TXVECTOR) shall be selected first according to 9.7.6.6, and then the MCS shall be selected from a set of MCSs called the *CandidateMCSSet* as described in this subclause.

The Rx Supported MCS Set of the STA that transmitted the frame eliciting the response is determined from its Supported MCS Set field as follows:

- If a bit in the Rx MCS Bitmask subfield is equal to 0, the corresponding MCS is not supported.
- If a bit in the Rx MCS Bitmask subfield is equal to 1 and the integer part of the data rate (expressed in megabits per second) of the corresponding MCS is less than or equal to the rate represented by the Rx Highest Supported Data Rate subfield, then the MCS is supported by the STA on receive. If the Rx Highest Supported Data Rate subfield is equal to 0 and a bit in the Rx MCS Bitmask is equal to 1, then the corresponding MCS is supported by the STA on receive.

The CandidateMCSSet is determined using the following rules:

- If the frame eliciting the response was an STBC frame and the Dual CTS Protection bit is equal to 1, the CandidateMCSSet shall contain only the basic STBC MCS.
- If the frame eliciting the response had an L-SIG duration value (see 9.23.5) and initiates a TXOP, the CandidateMCSSet is the MCS Set consisting of the intersection of the Rx Supported MCS Set of the STA that sent the frame that is eliciting the response and the set of MCSs that the responding STA is capable of transmitting.
- If none of the above conditions is true, the CandidateMCSSet is the BSSBasicMCSSet parameter. If the BSSBasicMCSSet parameter is empty, the CandidateMCSSet shall consist of the set of mandatory HT PHY MCSs.

MCS values from the CandidateMCSSet that cannot be transmitted with the selected CH_BANDWIDTH parameter value shall be eliminated from the CandidateMCSSet.

The choice of a response MCS is made as follows:

a) If the frame eliciting the response is within a non-HT PPDU,
   1) Eliminate from the CandidateMCSSet all MCSs that have a data rate greater than the data rate of the received PPDU (the mapping of MCS to data rate is defined in 20.6).
   2) Find the highest indexed MCS from the CandidateMCSSet. The index of this MCS is the index of the MCS that is the primary MCS for the response transmission.
   3) If the CandidateMCSSet is empty, the primary MCS is the lowest indexed MCS of the mandatory MCSs.

b) If the frame eliciting the response is within an HT PPDU,

1) Eliminate from the CandidateMCSSet all MCSs that have an index that is higher than the index of the MCS of the received frame.

2) Determine the highest number of spatial streams (N_{SS}) value of the MCSs in the CandidateMCSSet that is less than or equal to the N_{SS} value of the MCS of the received frame. Eliminate all MCSs from the CandidateMCSSet that have an N_{SS} value that is not equal to this N_{SS} value. The mapping from MCS to N_{SS} is dependent on the attached PHY. For the HT PHY, see 20.6.

3) Find the highest indexed MCS of the CandidateMCSSet for which the modulation value of each stream is less than or equal to the modulation value of each stream of the MCS of the received frame and for which the coding rate value is less than or equal to the coding rate value of the MCS from the received frame. The index of this MCS is the index of the MCS that is the primary MCS for the response transmission. The mapping from MCS to modulation and coding rate is dependent on the attached PHY. For the HT PHY, see 20.6. For the purpose of comparing modulation values, the following sequence shows increasing modulation values: BPSK, QPSK, 16-QAM, 64-QAM.

4) If no MCS meets the condition in step 3), remove each MCS from the CandidateMCSSet that has the highest value of N_{SS} in the CandidateMCSSet. If the resulting CandidateMCSSet is empty, then set the CandidateMCSSet to the HT PHY mandatory MCSs. Repeat step 3) using the modified CandidateMCSSet.

Once the primary MCS has been selected, the STA may select an alternate MCS according to 9.7.6.5.4. The STA shall transmit the HT PPDU control response frame using either the primary MCS or the alternate MCS, if one exists.

9.7.6.5.4 Selection of an alternate rate or MCS for a control response frame

An alternate rate may be selected provided that all of the following conditions are met:

— The duration of frame at the alternate rate is the same as the duration of the frame at the primary rate determined by 9.7.6.5.2.

— The alternate rate is in either the BSSBasicRateSet parameter or is a mandatory rate of the attached PHY.

— The modulation class of the frame at the alternate rate is the same class as that of the primary rate selected by 9.7.6.5.2.

An alternate MCS may be selected provided that both of the following conditions are met:

— The duration of the frame at the alternate MCS is the same as the duration of the frame at the primary MCS.

— The alternate MCS is in the CandidateMCSSet that was generated according to the procedure of 9.7.6.5.3.

9.7.6.5.5 Control response frame TXVECTOR parameter restrictions

A STA shall not transmit a control response frame with TXVECTOR parameter GI_TYPE set to SHORT_GI unless it is in response to a reception of a frame with the RXVECTOR parameter GI_TYPE equal to SHORT_GI.

A STA shall not transmit a control response frame with TXVECTOR parameter FEC_CODING set to LDPC_CODING unless it is in response to a reception of a frame with the RXVECTOR parameter FEC_CODING equal to LDPC_CODING.

A STA shall not transmit a control response frame with the TXVECTOR parameter FORMAT set to HT_GF.

9.7.6.6 Channel Width selection for control frames

An HT STA that receives a frame that elicits a control frame transmission shall send the control frame response using a value for the CH_BANDWIDTH parameter that is based on the CH_BANDWIDTH parameter value of the received frame according to Table 9-3.

Table 9-3—CH_BANDWIDTH control frame response mapping

CH_BANDWIDTH RXVECTOR value	CH_BANDWIDTH TXVECTOR value
HT_CBW20	HT_CBW20 or NON_HT_CBW20
HT_CBW40	HT_CBW40 or NON_HT_CBW40
NON_HT_CBW20	HT_CBW20 or NON_HT_CBW20
NON_HT_CBW40	HT_CBW40 or NON_HT_CBW40

NOTE—This rule, combined with the rules in 9.7.6.1, determines the format of control response frames.

A frame that is intended to provide protection is transmitted using a channel width selected by the rules defined in 9.23.

An HT STA that uses a non-HT duplicate frame to establish protection of its TXOP shall send any CF-End frame using a non-HT duplicate frame except during the 40 MHz phase of PCO operation. During the 40 MHz phase of PCO operation, the rules in 10.16 apply.

9.7.6.7 Control frame TXVECTOR parameter restrictions

A STA shall not transmit a control frame that initiates a TXOP with the TXVECTOR parameter GI_TYPE set to a value of SHORT_GI.

A STA shall not transmit a control frame that initiates a TXOP with the TXVECTOR parameter FEC_CODING set to a value of LDPC_CODING.

9.7.7 Multiple BSSID Rate Selection

If the multiple BSSID capability is supported, Beacon frames shall be transmitted using any basic rate valid for all of the BSSs supported. If no such rate exists, then Beacon frames shall be transmitted using any mandatory PHY rate for any PHY type that all BSSs have in common.

9.7.8 Modulation classes

In order to determine the rules for response frames given in 9.7, the following modulation classes are defined in Table 9-4. Each row defines a modulation class. Modulations described within the same row have the same modulation class, while modulations described in different rows have different modulation classes. For Clause 20 PHY transmissions, the modulation class is determined by the FORMAT and NON_HT_MODULATION parameters of the TXVECTOR/RXVECTOR. Otherwise, the modulation class is determined by the clause or subclause number defining that modulation.

Table 9-4—Modulation classes

Modulation class	Description of modulation	Condition that selects this modulation class	
		Clause 14 to Clause 19 PHYs	Clause 20 PHY
1	Infrared (IR)	Clause 15 transmission	N/A
2	Frequency-hopping spread spectrum (FHSS)	Clause 14 transmission	N/A
3	DSSS and HR/DSSS	Clause 16 or Clause 17 transmission	FORMAT is NON_HT. NON_HT_MODULATION is ERP-DSSS or ERP-CCK.
4	ERP-PBCC	19.6 transmission	FORMAT is NON_HT. NON_HT_MODULATION is ERP-PBCC.
5	DSSS-OFDM The use of the DSSS-OFDM option is deprecated, and this option may be removed in a later revision of the standard.	19.7 transmission	FORMAT is NON_HT. NON_HT_MODULATION is DSSS-OFDM.
6	ERP-OFDM	19.5 transmission	FORMAT is NON_HT. NON_HT_MODULATION is ERP-OFDM.
7	OFDM	Clause 18 transmission	FORMAT is NON_HT. NON_HT_MODULATION is OFDM or NON_HT_DUP_OFDM.
8	HT	N/A	FORMAT is HT_MF or HT_GF.

9.7.9 Non-HT basic rate calculation

This subclause defines how to convert an HT MCS to a non-HT basic rate for the purpose of determining the rate of the response frame. It consists of two steps as follows:

a) Use the modulation and coding rate determined from the HT MCS (defined in 20.6) to a non-HT reference rate by lookup into Table 9-5.[27] In the case of an MCS with UEQM, the modulation of stream 1 is used.

b) The non-HT basic rate is the highest rate in the BSSBasicRateSet that is less than or equal to this non-HT reference rate.

[27] For example, if an HT PPDU transmission uses 64-QAM and coding rate of 3/4, the related non-HT reference rate is 54 Mb/s.

Table 9-5—Non-HT reference rate

Modulation	Coding rate (R)	Non-HT reference rate (Mb/s)
BPSK	1/2	6
BPSK	3/4	9
QPSK	1/2	12
QPSK	3/4	18
16-QAM	1/2	24
16-QAM	3/4	36
64-QAM	1/2	48
64-QAM	2/3	48
64-QAM	3/4	54
64-QAM	5/6	54

9.8 MSDU transmission restrictions

To avoid reordering MSDUs between pairs of LLC entities and/or unnecessarily discarding MSDUs, the following restrictions shall be observed by any STA that is able to concurrently process multiple outstanding MSDUs for transmission. The term *outstanding* refers to an MPDU containing all or part of an MSDU or MMPDU for which transmission has been started, and for which delivery of the MSDU or MMPDU has not yet been completed (i.e., an acknowledgement of the final fragment has not been received and the MSDU or MMPDU has not been discarded due to retries, lifetime, or for some other reason). A STA may have any number (greater than or equal to one) of eligible MSDUs outstanding concurrently, subject to the restrictions below.

A non-QoS STA shall not have more than one MSDU or MMPDU from a particular SA to a particular individual RA outstanding at a time.

NOTE—A simpler, more restrictive alternative to the rule in the above paragraph that may be used is that no more than one MSDU with a particular individual RA be outstanding at a time.

For frames that are not sent within the context of a Block Ack agreement, a QoS STA shall not have more than one MSDU or A-MSDU for each TID or MMPDU from a particular SA to a particular individual RA outstanding at any time.

NOTE—A simpler, more restrictive alternative to the rule in the above paragraph that may be used is that no more than one MSDU or A-MSDU with any particular TID with a particular individual RA be outstanding at any time.

In a STA where the optional StrictlyOrdered service class has been implemented, that STA shall not have any group addressed (multidestination) MSDU of the StrictlyOrdered service class outstanding from the SA of any other outstanding MSDU (either individual or group addressed). This is because a group addressed MSDU is implicitly addressed to a collection of peer STAs that could include any individual RA.

It is recommended that the STA select a value of dot11MaxTransmitMSDULifetime that is sufficiently large that the STA does not discard MSDUs or A-MSDUs due to excessive Transmit MSDU timeouts under normal operating conditions.

An A-MSDU shall contain only MSDUs of a single service class and inherits that service class for the purpose of the following rules. For MSDUs or A-MSDUs belonging to the service class of QoSAck when the receiver is a QoS STA, the QoS data frames that are used to send these MSDUs or A-MSDUs shall have the Ack Policy subfield in the QoS Control field set to Normal Ack, Block Ack, Implicit Block Ack Request, or PSMP Ack. For MSDUs or A-MSDUs belonging to the service class of QoSNoAck when the receiver is a QoS STA, the QoS data frames that are used to send these MSDUs or A-MSDUs shall have the Ack Policy subfield in the QoS Control field set to No Ack.

9.9 HT Control field operation

If the value of dot11HTControlFieldSupported is true, a STA shall set the +HTC Support subfield of the HT Extended Capabilities field of the HT Capabilities element to 1 in HT Capabilities elements that it transmits.

A STA that has a value of true for at least one of dot11RDResponderOptionImplemented and dot11MCSFeedbackOptionImplemented shall set dot11HTControlFieldSupported to true.

An HT Control field shall not be present in a frame addressed to a STA unless that STA declares support for +HTC in the HT Extended Capabilities field of its HT Capabilities element (see 8.4.2.58).

NOTE—An HT STA that does not support +HTC that receives a +HTC frame addressed to another STA still performs the CRC on the actual length of the MPDU and uses the Duration/ID field to update the NAV, as described in 9.3.2.4.

If the HT Control field is present in an MPDU aggregated in an A-MPDU, then all MPDUs of the same frame type (i.e., having the same value for the Type subfield of the Frame Control field) aggregated in the same A-MPDU shall contain an HT Control field. The HT Control field of all MPDUs containing the HT Control field aggregated in the same A-MPDU shall be set to the same value.

9.10 Control Wrapper operation

A STA supporting the HT Control field that receives a Control Wrapper frame shall process it as though it received a frame of the subtype of the wrapped frame.

NOTE—A STA supporting the HT Control field can reset the NAV set by a wrapped RTS frame following the rules defined in 9.3.2.4.

9.11 A-MSDU operation

An A-MSDU shall contain only MSDUs whose DA and SA parameter values map to the same RA and TA values.

The constituent MSDUs of an A-MSDU shall all have the same priority parameter value from the corresponding MA-UNITDATA.request primitive.

An A-MSDU shall be carried, without fragmentation, within a single QoS data MPDU.

The Address 1 field of an MPDU carrying an A-MSDU shall be set to an individual address.

The channel access rules for a QoS data MPDU carrying an A-MSDU are the same as a data MPDU carrying an MSDU (or fragment thereof) of the same TID.

The expiration of the A-MSDU lifetime timer occurs only when the lifetime timer of all of the constituent MSDUs of the A-MSDU have expired.

NOTE 1—This rule implicitly allows an MSDU that is a constituent of an A-MSDU to potentially be transmitted after the expiry of its lifetime.

NOTE 2—Selecting any other value for the timeout would result in loss of MSDUs. Selecting the maximum value avoids this loss of MSDUs at the cost of transmitting MSDUs that have exceeded their lifetime.

A STA that has a value of false for dot11HighthroughputOptionImplemented shall not transmit an A-MSDU. A STA shall not transmit an A-MSDU to a STA from which it has not received a frame containing an HT Capabilities element.

Support for the reception of an A-MSDU, where the A-MSDU is carried in a QoS data MPDU with Ack Policy equal to Normal Ack and the A-MSDU is not aggregated within an A-MPDU, is mandatory for an HT STA.

The use of an A-MSDU carried in a QoS data MPDU under a Block Ack agreement is determined per Block Ack agreement. A STA shall not transmit an A-MSDU within a QoS data MPDU under a Block Ack agreement unless the recipient indicates support for A-MSDU by setting the A-MSDU Supported field to 1 in its BlockAck Parameter Set field of the ADDBA Response frame.

A STA shall not transmit an A-MSDU to a STA that exceeds its maximum A-MSDU length capability.

NOTE—Support for A-MSDU aggregation does not affect the maximum size of MSDU transported by the MA-UNITDATA primitives.

9.12 A-MPDU operation

9.12.1 A-MPDU contents

According to its context (defined in Table 8-283), an A-MPDU shall be constrained so that it contains only MPDUs as specified in the relevant table referenced from Table 8-283.

When an A-MPDU contains multiple QoS Control fields, bits 4 and 8–15 of these QoS Control fields shall be identical.

9.12.2 A-MPDU length limit rules

An HT STA indicates a value in the Maximum A-MPDU Length Exponent field in its HT Capabilities element that defines the maximum A-MPDU length that it can receive. The encoding of this field is defined in Table 8-125. Using this field, the STA establishes at association the maximum length of A-MPDUs that can be sent to it. The STA shall be capable of receiving A-MPDUs of length up to the value indicated by this field.

An HT STA shall not transmit an A-MPDU that is longer than the value indicated by the Maximum A-MPDU Length Exponent field declared by the intended receiver.

NOTE—The A-MPDU length limit applies to the maximum length of the PSDU that might be received. If the A-MPDU includes any padding delimiters (i.e., delimiters with the Length field equal to 0) in order to meet the MPDU start spacing requirement, this padding is included in this length limit.

9.12.3 Minimum MPDU Start Spacing field

An HT STA shall not start the transmission of more than one MPDU within the time limit described in the Minimum MPDU Start Spacing field declared by the intended receiver. To satisfy this requirement, the number of octets between the start of two consecutive MPDUs in an A-MPDU, measured at the PHY SAP, shall be equal or greater than

$$t_{MMSS} \times r / 8$$

where

t_{MMSS} is the time (in microseconds) defined in the "Encoding" column of Table 8-125 for the value of the Minimum MPDU Start Spacing field

r is the value of the PHY Data Rate (in megabits per second) defined in 20.6 based on the TXVECTOR parameters: MCS, GI_TYPE, and CH_BANDWIDTH

If necessary, in order to satisfy this requirement, a STA shall add padding between MPDUs in an A-MPDU. Any such padding shall be in the form of one or more MPDU delimiters with the MPDU Length field set to 0.

9.12.4 A-MPDU aggregation of group addressed data frames

An HT STA that is neither an AP nor a mesh STA shall not transmit an A-MPDU containing an MPDU with a group addressed RA.

NOTE—An HT AP and an HT mesh STA can transmit an A-MPDU containing MPDUs with a group addressed RA.

An HT AP and an HT mesh STA shall not transmit an A-MPDU containing group addressed MPDUs if the HT Protection field is equal to non-HT mixed mode.

When an HT AP or an HT mesh STA transmits an A-MPDU containing MPDUs with a group addressed RA, both of the following shall apply:

- The value of maximum A-MPDU length exponent that applies is the minimum value in the Maximum A-MPDU Length Exponent subfield of the A-MPDU Parameters field of the HT Capabilities element across all HT STAs associated with the AP or all peer HT mesh STAs.
- The value of minimum MPDU start spacing that applies is the maximum value in the Minimum MPDU Start Spacing subfield of the A-MPDU Parameters field of the HT Capabilities element across all HT STAs associated with the AP or all peer HT mesh STAs.

9.12.5 Transport of A-MPDU by the PHY data service

An A-MPDU shall be transmitted in a PSDU associated with a PHY-TXSTART.request primitive with the TXVECTOR AGGREGATION parameter set to 1. A received PSDU is determined to be an A-MPDU when the associated PHY-RXSTART.indication primitive RXVECTOR AGGREGATION parameter is equal to 1.

9.13 PPDU duration constraint

An HT STA shall not transmit a PPDU that has a duration (as determined by the PHY-TXTIME.confirm primitive defined in 6.5.7) that is greater than aPPDUMaxTime.

9.14 LDPC operation

An HT STA shall not transmit a frame with the TXVECTOR parameter FORMAT set to HT_MF or HT_GF and the TXVECTOR parameter FEC_CODING set to LDPC_CODING unless the RA of the frame corresponds to a STA for which the LDPC Coding Capability subfield of the most recently received HT Capabilities element from that STA contained a value of 1 and dot11LDPCCodingOptionActivated is true.

Further restrictions on TXVECTOR parameter values may apply due to rules found in 9.23 and 9.7.

9.15 STBC operation

Only a STA that sets the Tx STBC subfield to 1 in the HT Capabilities element may transmit frames with a TXVECTOR parameter STBC set to a nonzero value to a STA from which the most recently received value of the Rx STBC field of the HT Capabilities element is nonzero.

9.16 Short GI operation

A STA may transmit a frame with TXVECTOR parameters CH_BANDWIDTH set to HT_CBW20 and GI_TYPE set to SHORT_GI only if all of the following conditions are met:

- The STA is an HT STA.
- The TXVECTOR parameter FORMAT is equal to HT_MF or HT_GF.
- The RA of the frame corresponds to a STA for which the Short GI for 20 MHz subfield of the most recently received HT Capabilities element contained a value of 1.
- dot11ShortGIOptionInTwentyActivated is present and is true.

A STA may transmit a frame with TXVECTOR parameters CH_BANDWIDTH set to HT_CBW40 and GI_TYPE set to SHORT_GI only if all of the following conditions are met:

- The STA is an HT STA.
- The TXVECTOR parameter FORMAT is equal to HT_MF or HT_GF.
- The RA of the frame corresponds to a STA for which the Short GI for 40 MHz subfield of the most recently received HT Capabilities element contained a value of 1.
- dot11ShortGIOptionInFortyActivated is present and is true.

An HT STA shall not transmit a frame with the TXVECTOR parameter FORMAT set to HT_GF and the GI_TYPE parameter set to SHORT_GI when the MCS parameter indicates a single spatial stream.

Further restrictions on TXVECTOR parameter values may apply due to rules found in 9.23 and 9.7.

9.17 Greenfield operation

An HT STA shall not transmit a frame with the TXVECTOR parameter FORMAT set to HT_GF unless the RA of the frame corresponds to a STA for which the HT-Greenfield subfield of the most recently received HT Capabilities element contained a value of 1 and dot11HTGreenfieldOptionActivated is true. Further restrictions may apply due to rules found in 9.23, 9.7, and 10.9.8.5.

9.18 Operation across regulatory domains

9.18.1 General

The PHY of a WLAN is subject to regulations that might vary significantly from one regulatory domain to another. This subclause provides the framework for operation across regulatory domains and describes the mechanism that supports cross-domain mobility and operation in multiple regulatory domains. When this mechanism is active, the dot11MultiDomainCapabilityActivated attribute shall be true.

NOTE—This subclause does not eliminate the need to obtain type acceptance, regulatory approval, equipment authorization, or equipment certification in each of the regulatory domains in which the equipment operates. The mechanisms described in this subclause provide the information to the STA to identify the regulatory domain in which it is located and to cease operation while in those domains for which it does not have type approval. It is incumbent upon the implementer to provide proof of compliance to the requirements of individual regulatory agencies.

The method for configuring individual STAs is outside the scope of this standard. A STA needs to be properly configured for operation in a particular regulatory domain prior to beginning normal operation. Particular care needs to be taken when operating in an IBSS configuration.

9.18.2 Operation upon entering a regulatory domain

A STA that is enabled for operation across regulatory domains uses passive scanning when it has lost connectivity with its ESS. Passive scanning is performed using only the receive capabilities of the STA and is, thus, compatible with regulatory requirements. The timeout for determining the loss of connectivity is system dependent and beyond the scope of this standard.

When a STA with dot11MultiDomainCapabilityActivated true enters a regulatory domain, before transmitting, it shall passively scan to learn at least one valid channel, i.e., a channel upon which it detects IEEE 802.11 frames. The Beacon frame contains information on the country code, the maximum allowable transmit power, and the channels that may be used for the regulatory domain. Optionally, the Beacon frame may also include in the Country element, on a periodic basis, the regulatory information that would be returned in a Probe Response frame. When DSE dependent STA operation is required in a regulatory domain, a dependent STA may be required to receive a Beacon frame signalling dependent enablement (10.12.5), and until this Beacon frame is received, the STA may continue passive scanning to receive such a Beacon frame directly from an enabling STA. Once the STA has acquired the information so that it is able to meet the transmit requirements of the regulatory domain, it shall transmit a Probe Request to an AP to gain the additional necessary regulatory domain information contained in the Probe Response frame, unless the information was previously received in a Beacon frame. The STA then has sufficient information available to configure its PHY for operation in the regulatory domain.

9.18.3 Determination of hopping patterns for FH PHYs

The mechanisms described in this subclause are obsolete. Consequently, this subclause may be removed in a later revision of the standard.

The Beacon may contain FH Parameters and/or FH Pattern Table elements. If the Beacon contains both FH Parameters and FH Pattern Table elements, both of these elements shall describe the same hopping pattern. Note that the information returned as a result of a Probe Request frame with a Request element may include the FH parameters and/or the FH Pattern Table possibly replicating optional elements identified by orders 12 and 13 in Table 8-27. When operating in a regulatory domain that does not have a method for determining a hopping pattern described in 14.7.8 or a hopping table in Annex I, hopping patterns shall be determined by an AP using HCCs or EHCCs. The HCC hopping sequences are derived from a simple formula that uses field operations on a group. For full details of the HCC placement operator function, please see the references [B11] and [B51]. The placement operator function shall be as shown in Equation (9-8).

$$y_{HCC}(k;a) = \frac{a}{k} \bmod N \qquad \text{for } k, a \in J'_N \tag{9-8}$$

where

N is the prime radix
a is the family index
k is in the group J'_N
J'_N is the group remaining when the element containing the value 0 is removed from the field J_N

Therefore, k does not take the value 0. The value $1/k$ is the multiplicative inverse of k on the field J_N. The multiplicative inverse of k on the group J_N is the integer value w, such that $(k \times w) \bmod N = 1$. The values computed for y_{HCC} are the channel numbers, a corresponds to the hopping pattern number, and k corresponds to the index into the hopping pattern. A code family is the set of *N*–1 hopping patterns generated for the prime radix *N*. There is no value equivalent to the hopping set of Clause 14. Each hopping pattern comprises *N*–1 channels.

As an example, consider a code family that supports 10 channels. The prime radix for such a family is 11. The code family generated by the HCC algorithm is shown below in Table 9-6.

Table 9-6—HCC family – *N* = 11; Family indices (SEQ) 1 to 10

INDEX (k) ---->

SEQ	1	2	3	4	5	6	7	8	9	10
1	1	6	4	3	9	2	8	7	5	10
2	2	1	8	6	7	4	5	3	10	9
3	3	7	1	9	5	6	2	10	4	8
4	4	2	5	1	3	8	10	6	9	7
5	5	8	9	4	1	10	7	2	3	6
6	6	3	2	7	10	1	4	9	8	5
7	7	9	6	10	8	3	1	5	2	4
8	8	4	10	2	6	5	9	1	7	3
9	9	10	3	5	4	7	6	8	1	2
10	10	5	7	8	2	9	3	4	6	1

The HCC method to calculate hopping sequences only generates sequences of a length that is one less than the prime radix. The EHCC algorithm extends the original HCC algorithm to support a larger number of possible hopping sequence lengths. The EHCC algorithm works through a process known as "deletion of the diagonals." This creates hopping patterns with *N*–2 and *N*–3 channels.

Using the same example in Table 9-6, a family of codes cannot be generated for code lengths of 9 or 8 by the HCC algorithm because neither 9 or 8 is equal to a prime number minus one. However, the diagonals of the array in Table 9-6 represent the end points of the group. Thus, code families for code lengths 9 and 8 can be easily generated from the table simply by removing the diagonals. Table 9-7 shows such a code family with a code length of 9 (constructed by removing the diagonal of 10s).

Table 9-7 now contains a near diagonal (upper left to lower right) consisting entirely of ones. This is a necessary mathematical property of the result of removing the initial diagonal of (p–1) in the previous operation, and is exhibited for any prime p.

Table 9-7—EHCC family – Code length = 9, *N* = 11; Family Indices (SEQ) 1 to 9

INDEX (k) ---->

SEQ	1	2	3	4	5	6	7	8	9
1	1	6	4	3	9	2	8	7	5
2	2	1	8	6	7	4	5	3	9
3	3	7	1	9	5	6	2	4	8
4	4	2	5	1	3	8	6	9	7
5	5	8	9	4	1	7	2	3	6
6	6	3	2	7	1	4	9	8	5
7	7	9	6	8	3	1	5	2	4
8	8	4	2	6	5	9	1	7	3
9	9	3	5	4	7	6	8	1	2

Extending the process, Table 9-8 shows a code family with a code length of 8 (constructed from Table 9-7 by removing the entry from each row that has a value of 1, subtracting 1 from each value remaining in the row, and discarding the last row).

Table 9-8—EHCC family – Code length = 8, *N* = 11; Family indices (SEQ) 1 to 8

INDEX (k) ---->

SEQ	1	2	3	4	5	6	7	8
1	5	3	2	8	1	7	6	4
2	1	7	5	6	3	4	2	8
3	2	6	8	4	5	1	3	7
4	3	1	4	2	7	5	8	6
5	4	7	8	3	6	1	2	5
6	5	2	1	6	3	8	7	4
7	6	8	5	7	2	4	1	3
8	7	3	1	5	4	8	6	2

To obtain a code family of length *N*–2, the code family of length *N*–1 calculated by the HCC algorithm shall be modified by deleting the diagonal of the code family with the value of *N*–1 and removing the row of the code family with the family coefficient of *N*–1. This results in a code family represented in a square (*N*–2) by (*N*–2) array.

To obtain a code family of length *N*–3, the code family of length *N*–1 calculated by the HCC algorithm shall be modified by deleting the diagonals of the code family with the values of 1 and *N*–1, removing the rows of the code family with the family coefficients of *N*–1 and *N*–2, and subtracting 1 from all remaining values in the code family array. This results in a code family represented in a square (*N*–3) by (*N*–3) array with array values of 1 to *N*–3.

When using hopping patterns calculated using the HCC or EHCC algorithms, the values in the FH parameter set element shall be set as follows:

a) The Hop Set field shall be 0; the value of 0 for the Hop Set field indicates that the HCC/EHCC algorithm is in use and that the Hop Pattern field contains the HCC/EHCC family index and the Hop Index field contains the HCC/EHCC index.

b) The family index of the code being used shall be placed in the Hop Pattern field.

c) The index shall be placed in the Hop Index field.

9.18.4 Hopping sequence generation using the Frequency Hopping and Hopping Pattern Table elements

The mechanisms described in this subclause are obsolete. Consequently, this subclause may be removed in a later revision of the standard.

Two equations are used to create a hopping sequence from the information in the Frequency Hopping element and the Hopping Pattern Table element. Equation (9-9), the Random Table Method, shall be used when the value of the Flag field of the Hopping Pattern Table element is 1. Equation (9-10), the Hop Index Method, shall be used when the value of the Flag field of the Hopping Pattern Table element is 0.

$$f_x(i) = [b(i) + x]\bmod(m) + q \tag{9-9}$$

$$f_x(i) = [(i-1) \times x]\bmod(m) + q \tag{9-10}$$

where

i is the index.
m is the modulus.
q is the offset
x is given by Equation (9-11)

$$x = n \times p + s - 1 \tag{9-11}$$

where

n is the number of sets.
p is the current pattern.
s is the current set number.

The values of *i, p,* and *s* are found in the Frequency Hopping element. The values of *m, n,* and *q* are found in the Hopping Pattern Table element.

9.18.5 Operation with operating classes

When dot11OperatingClassesImplemented is true, the following statements apply:

- When dot11OperatingClassesRequired is false, or where operating classes domain information is not present in a STA, that STA is not required to change its operation in response to an element or element-specific Information field that contains an operating class.
- When dot11OperatingClassesRequired is true, or where operating classes domain information is present in a STA, the STA shall indicate current operating class information in the Country element and Supported Operating Classes element.
- When dot11OperatingClassesRequired and dot11ExtendedChannelSwitchActivated are true and a STA is capable of operating as specified in more than one operating class, the STA shall include the Supported Operating Classes element in Association frames and Reassociation frames.
- When dot11OperatingClassesRequired is true, or where operating classes domain information is present and the STA parsing a Country element finds an invalid First Channel Number field or Operating Class field with a value that is reserved, the STA shall ignore the remainder of the Country element and shall parse any remaining management frame body for additional elements.

9.18.6 Operation with coverage classes

The default PHY parameters are based on aAirPropagationTime having a value of 1 µs or less, and aSlotTime and other MAC timing are based on the PHY timing parameters, as specified in 9.3.2.3 and 9.3.7. When dot11OperatingClassesRequired is true, it is possible to manage the MAC timing of STAs that can receive Beacon frames or Probe Response frames that contain the Country element (8.4.2.10), to increase fairness in contending for the medium. Radio waves propagate at 300 m/µs in free space, and, for example, 3 µs would be the ceiling for BSS maximum one-way distance of ~450 m (~900 m round trip). The Coverage Class field of the Country element indicates the new value of aAirPropagationTime (see Table 8-56), and the MAC can use the new value to calculate aSlotTime (see 9.3.7). When dot11OperatingClassesRequired and dot11ExtendedChannelSwitchActivated are true and Country elements have been received in Beacon frames or Probe Response frames, associated STAs and dependent STAs shall use MAC timing that corresponds to the new value of aAirPropagationTime (see 9.3.7).

Using the Country element, an AP can change coverage class and maximum transmit power level to enhance operation. When dot11OperatingClassesRequired and dot11ExtendedChannelSwitchActivated are true and the maximum transmit power level is different from the transmit power limit indicated by the operating class, the associated STA or dependent STA shall operate at a transmit power at or below that indicated by the lesser of the two limits.

9.19 HCF

9.19.1 General

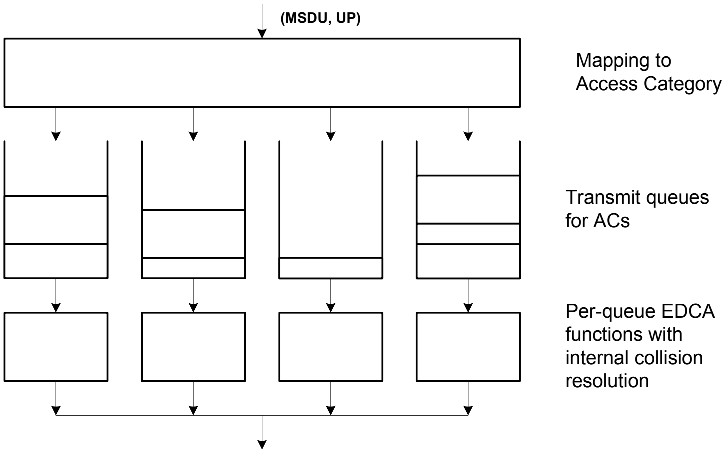
Under HCF, the basic unit of allocation of the right to transmit onto the WM is the TXOP. Each TXOP is defined by a starting time and a defined maximum length. The TXOP may be obtained by a STA winning an instance of EDCA contention (see 9.19.2) during the CP or by a STA receiving a QoS (+)CF-Poll frame (see 9.19.3) during the CP or CFP. The former is called *EDCA TXOP*, while the latter is called *HCCA TXOP* or *polled TXOP*. An HCCA TXOP shall not extend across a TBTT. A TXOP shall not exceed dot11MaxDwellTime (if using an FH PHY). The occurrence of a TBTT implies the end of the HCCA TXOP, after which the regular channel access procedure (EDCA or HCCA) is resumed. It is possible that no frame was transmitted during the TXOP. The shortened termination of the HCCA TXOP does not imply an error condition.

9.19.2 HCF contention-based channel access (EDCA)

9.19.2.1 Reference implementation

The channel access protocol is derived from the DCF procedures described in 9.3.

A model of the reference implementation is shown in Figure 9-19 and illustrates a mapping from frame type or UP to AC: the four transmit queues and the four independent EDCAFs, one for each queue. The mapping of UP to the AC is described in 9.2.4.2 and Table 9-1. The mapping of frame types to ACs is described in 9.2.4.2.



(MSDU, UP)
Mapping to Access Category
Transmit queues for ACs
Per-queue EDCA functions with internal collision resolution

Figure 9-19—Reference implementation model

9.19.2.2 EDCA TXOPs

There are two modes of EDCA TXOP defined, the initiation of the EDCA TXOP and the multiple frame transmission within an EDCA TXOP. An initiation of the TXOP occurs when the EDCA rules permit access to the medium. A multiple frame transmission within the TXOP occurs when an EDCAF retains the right to access the medium following the completion of a frame exchange sequence, such as on receipt of an ACK frame.

The TXOP limit duration values are advertised by the AP in the EDCA Parameter Set element in Beacon and Probe Response frames transmitted by the AP.

A TXOP limit value of 0 indicates that the TXOP holder may transmit or cause to be transmitted (as responses) the following within the current TXOP:

a) A single MSDU, MMPDU, A-MSDU, A-MPDU, or PS-Poll at any rate, subject to the rules in 9.7
b) Any required acknowledgments
c) Any frames required for protection, including one of the following:
    1) An RTS/CTS exchange
    2) CTS to itself
    3) Dual CTS as specified in 9.3.2.7
d) Any frames required for beamforming as specified in 9.27
e) Any frames required for link adaptation as specified in 9.28
f) Any number of BlockAckReq frames

NOTE 1—This is a rule for the TXOP holder. A TXOP responder need not be aware of the TXOP limit nor of when the TXOP was started.

NOTE 2—This rule prevents the use of RD when the TXOP limit is 0.

When dot11OCBActivated is true, TXOP limits shall be 0 for each AC.

STAs shall limit the duration of TXOPs obtained using the EDCA rules to the value specified by the TXOP limit. The duration of a TXOP is the duration during which the TXOP holder maintains uninterrupted control of the medium, and it includes the time required to transmit frames sent as an immediate response to the TXOP holder's transmissions.

When the TXOP limit is nonzero, a STA shall fragment an individually addressed MSDU so that the transmission of the first MPDU of the TXOP does not cause the TXOP limit to be exceeded at the PHY rate selected for the initial transmission attempt of that MPDU. The TXOP limit may be exceeded, when using a lower PHY rate than selected for the initial transmission attempt of the first MPDU, for a retransmission of an MPDU, for the initial transmission of an MPDU if any previous MPDU in the current MSDU has been retransmitted, or for group addressed MSDUs. When the TXOP limit is exceeded due to the retransmission of an MPDU at a reduced PHY rate, the STA shall not transmit more than one MPDU in the TXOP.

It should be noted, that when transmitting multiple frames in a TXOP using acknowledgment mechanisms other than Normal Ack, a protective mechanism should be used (such as RTS/CTS or the protection mechanism described in 9.23). A QoS AP or a mesh STA may send group addressed frames without using any protection mechanism. In a QoS IBSS, group addressed frames shall be sent one at a time, and backoff shall be performed after the transmission of each of the group addressed frames. In an MBSS, a mesh STA may send multiple group addressed frames in a TXOP, bounded by the TXOP limit, without performing backoff after the TXOP is obtained.

A STA shall save the TXOP holder address for the BSS in which it is associated, which is the MAC address from the Address 2 field of the frame that initiated a frame exchange sequence except when this is a CTS frame, in which case the TXOP holder address is the Address 1 field. If an RTS frame is received with the RA address matching the MAC address of the STA and the MAC address in the TA field in the RTS frame matches the saved TXOP holder address, then the STA shall send the CTS frame after SIFS, without regard for, and without resetting, its NAV. When a STA receives a frame addressed to it that requires an immediate response, except in the case of an RTS, it shall transmit the response independent of its NAV. The saved TXOP holder address shall be cleared when the NAV is reset or when the NAV counts down to 0.

9.19.2.3 Obtaining an EDCA TXOP

Each channel access timer shall maintain a backoff function (timer), which has a value measured in backoff slots.

The duration AIFS[AC] is a duration derived from the value AIFSN[AC] by the relation

$$\text{AIFS[AC]} = \text{AIFSN[AC]} \times \text{aSlotTime} + \text{aSIFSTime}.$$

The value of AIFSN[AC] shall be greater than or equal to 2. In an infrastructure BSS, AIFSN[AC] is advertised by the AP in the EDCA Parameter Set element in Beacon and Probe Response frames transmitted by the AP. The value of AIFSN[AC] shall be greater than or equal to 1 for APs. An EDCA TXOP is granted to an EDCAF when the EDCAF determines that it shall initiate the transmission of a frame exchange sequence. Transmission initiation shall be determined according to the following rules:

On specific slot boundaries, each EDCAF shall make a determination to perform one and only one of the following functions:

- Initiate the transmission of a frame exchange sequence for that access function.
- Decrement the backoff timer for that access function.

- Invoke the backoff procedure due to an internal collision.
- Do nothing for that access function.

The specific slot boundaries at which exactly one of these operations shall be performed are defined as follows, for each EDCAF:

a) Following AIFSN[AC] × aSlotTime – aRxTxTurnaroundTime of idle medium after SIFS (not necessarily idle medium during the SIFS duration) after the last busy medium on the antenna that was the result of a reception of a frame with a correct FCS.

b) Following EIFS – DIFS + AIFSN[AC] × aSlotTime + aSIFSTime – aRxTxTurnaroundTime of idle medium after the last indicated busy medium as determined by the physical CS mechanism that was the result of a frame reception that has resulted in FCS error, or PHY-RXEND.indication (RXERROR) primitive where the value of RXERROR is not NoError.

c) When any other EDCAF at this STA transmitted a frame requiring acknowledgment, the earlier of

   1) The end of the ACK-Timeout interval timed from the PHY_TXEND.confirm primitive, followed by AIFSN[AC] x aSlotTime + aSIFSTime – aRxTxTurnaroundTime of idle medium, and

   2) The end of the first AIFSN[AC] × aSlotTime – aRxTxTurnaroundTime of idle medium after SIFS (not necessarily medium idle during the SIFS duration, the start of the SIFS duration implied by the length in the PLCP header of the previous frame) when a PHY-RXEND.indication primitive occurs as specified in 9.3.2.8.

d) Following AIFSN[AC] × aSlotTime – aRxTxTurnaroundTime of idle medium after SIFS (not necessarily medium idle during the SIFS duration) after the last busy medium on the antenna that was the result of a transmission of a frame for any EDCAF and which did not require an acknowledgment.

e) Following AIFSN[AC] × aSlotTime + aSIFSTime – aRxTxTurnaroundTime of idle medium after the last indicated idle medium as indicated by the CS mechanism that is not covered by a) to d).

f) Following aSlotTime of idle medium, which occurs immediately after any of these conditions, a) to f), is met for the EDCAF.

At each of the above-described specific slot boundaries, each EDCAF shall initiate a transmission sequence if

- There is a frame available for transmission at that EDCAF, and
- The backoff timer for that EDCAF has a value of 0, and
- Initiation of a transmission sequence is not allowed to commence at this time for an EDCAF of higher UP.

At each of the above-described specific slot boundaries, each EDCAF shall decrement the backoff timer if the backoff timer for that EDCAF has a nonzero value.

At each of the above-described specific slot boundaries, each EDCAF shall report an internal collision (which is handled in 9.19.2.5) if

- There is a frame available for transmission at that EDCAF, and
- The backoff timer for that EDCAF has a value of 0, and
- Initiation of a transmission sequence is allowed to commence at this time for an EDCAF of higher UP.

An example showing the relationship between AIFS, AIFSN, DIFS, and slot times immediately following a medium busy condition (and assuming that medium busy condition was not caused by a frame in error) is shown in Figure 9-20. In this case, with AIFSN = 2, the EDCAF may decrement the backoff counter for the first time at 2 × aSlotTime following the TXSIFS (where TXSIFS is the time at which the MAC responds to the end of the medium busy condition if it is going to respond “after SIFS”). If, in this example, the backoff counter contained a value of 1 at the time the medium became idle, transmission would start as a result of an EDCA TXOP on-air at a time

aSIFSTime + 3 × aSlotTime

following the end of the medium busy condition.

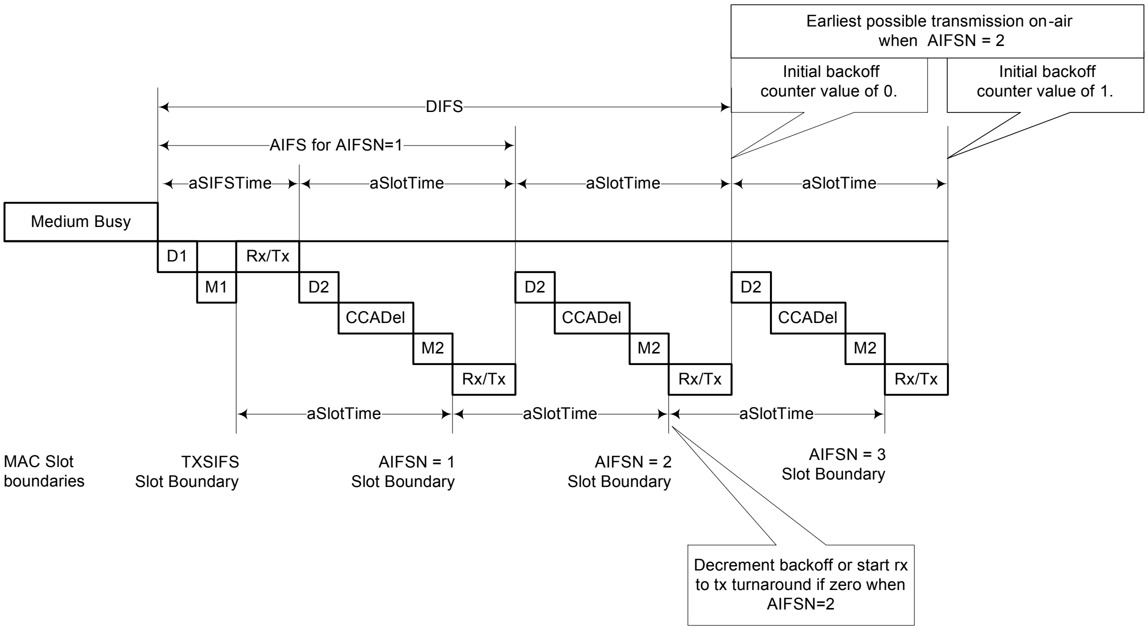


Figure 9-20—EDCA mechanism timing relationships

9.19.2.4 Multiple frame transmission in an EDCA TXOP

Multiple frames may be transmitted in an EDCA TXOP that was acquired following the rules in 9.19.2.3 if there is more than one frame pending in the AC for which the channel has been acquired. However, those frames that are pending in other ACs shall not be transmitted in this EDCA TXOP. If a TXOP holder has in its transmit queue an additional frame of the same AC as the one just transmitted and the duration of transmission of that frame plus any expected acknowledgment for that frame is less than the remaining TXNAV timer value, then the STA may commence transmission of that frame a SIFS (or RIFS, under the conditions defined in 9.3.2.3.2) after the completion of the immediately preceding frame exchange sequence, subject to the TXOP limit restriction as described in 9.19.2.2. An HT STA that is a TXOP holder may transmit multiple MPDUs of the same AC within an A-MPDU as long as the duration of transmission of the A-MPDU plus any expected BlockAck response is less than the remaining TXNAV timer value.

NOTE—An RD responder can transmit multiple MPDUs as described in 9.25.4

The TXNAV timer is a timer that is initialized with the duration from the Duration/ID field in the frame most recently successfully transmitted by the TXOP holder. The TXNAV timer begins counting down from the end of the transmission of the PPDU containing that frame. Following the BlockAck response, the HT STA may start transmission of another MPDU or A-MPDU a SIFS after the completion of the immediately preceding frame exchange sequence. The HT STA may retransmit unacknowledged MPDUs within the same TXOP or in a subsequent TXOP.

After a valid response to the initial frame of a TXOP, if the Duration/ID field is set for multiple frame transmission and there is a subsequent transmission failure, the corresponding channel access function may transmit after the CS mechanism (see 9.3.2.1) indicates that the medium is idle at the TxPIFS slot boundary (defined in 9.3.7) before the expiry of the TXNAV timer. At the expiry of the TXNAV timer, if the channel access function has not regained access to the medium, then the EDCAF shall invoke the backoff procedure that is described in 9.19.2.5. Transmission failure is defined in 9.19.2.5.

All other channel access functions at the STA shall treat the medium as busy until the expiry of the TXNAV timer.

A frame exchange may be a group addressed frame, a frame transmitted with No Ack policy (for which there is no expected acknowledgment), or an individually addressed frame followed by a correctly received ACK frame transmitted by a STA (either a non-AP STA or an AP).

Note that, as for an EDCA TXOP, a multiple frame transmission is granted to an EDCAF, not to a STA, so that the multiple frame transmission is permitted only for the transmission of a frame of the same AC as the frame that was granted the EDCA TXOP, unless the EDCA TXOP obtained is used by an AP for a PSMP sequence. In such a case, this AC transmission restriction does not apply to either the AP or the STAs participating in the PSMP sequence, but the specific restrictions on transmission during a PSMP sequence described in 9.26 do apply.

9.19.2.5 EDCA backoff procedure

Each EDCAF shall maintain a state variable CW[AC], which shall be initialized to the value of the parameter CWmin[AC].

For the purposes of this subclause, successful transmission and transmission failure are defined as follows:

— After transmitting an MPDU (regardless of whether it is carried in an A-MPDU) that requires an immediate frame as a response, the STA shall wait for a timeout interval of duration of aSIFSTime + aSlotTime + aPHY-RX-START-Delay, starting at the PHY-TXEND.confirm primitive. If a PHY-RXSTART.indication primitive does not occur during the timeout interval, the STA concludes that the transmission of the MPDU has failed.

— If a PHY-RXSTART.indication primitive does occur during the timeout interval, the STA shall wait for the corresponding PHY-RXEND.indication primitive to determine whether the MPDU transmission was successful. The recognition of a valid response frame sent by the recipient of the MPDU requiring a response, corresponding to this PHY-RXEND.indication primitive, shall be interpreted as a successful response.

— The recognition of anything else, including any other valid frame, shall be interpreted as failure of the MPDU transmission. The recognition of a valid data frame sent by the recipient of a PS-Poll frame shall also be accepted as successful acknowledgment of the PS-Poll frame. A transmission that does not require an immediate frame as a response is defined as a successful transmission.

The backoff procedure shall be invoked for an EDCAF when any of the following events occurs:

a) A frame with that AC is requested to be transmitted, the medium is busy as indicated by either physical or virtual CS, and the backoff timer has a value of 0 for that AC.

b) The final transmission by the TXOP holder initiated during the TXOP for that AC was successful and the TXNAV timer has expired.

c) The transmission of the initial frame of a TXOP of that AC fails.

d) An internal collision is reported for that EDCAF (see 9.19.2.3).

In addition, the backoff procedure may be invoked for an EDCAF when the transmission of a non-initial frame by the TXOP holder fails.

NOTE—A STA can perform a PIFS recovery, as described in 9.19.2.4, or perform a backoff, as described in the previous paragraph, as a response to transmission failure within a TXOP. How it chooses between these two is implementation dependent.

A STA that performs a backoff within its existing TXOP shall not extend the TXNAV timer value.

NOTE—In other words, the backoff is a continuation of the TXOP, not the start of a new TXOP.

If the backoff procedure is invoked for reason a) above, the value of CW[AC] shall be left unchanged. If the backoff procedure is invoked because of reason b) above, the value of CW[AC] shall be reset to CWmin[AC].

If the backoff procedure is invoked because of a failure event [reason c) or d) above or the transmission failure of a non-initial frame by the TXOP holder], the value of CW[AC] shall be updated as follows before invoking the backoff procedure:

— If the QSRC[AC] or the QLRC[AC] for the QoS STA has reached dot11ShortRetryLimit or dot11LongRetryLimit respectively, CW[AC] shall be reset to CWmin[AC].
— Otherwise,
— If CW[AC] is less than CWmax[AC], CW[AC] shall be set to the value (CW[AC] + 1)×2 – 1.
— If CW[AC] is equal to CWmax[AC], CW[AC] shall remain unchanged for the remainder of any retries.

The backoff timer is set to an integer value chosen randomly with a uniform distribution taking values in the range [0,CW[AC]] inclusive.

All backoff slots occur following an AIFS[AC] period during which the medium is determined to be idle for the duration of the AIFS[AC] period, or following an EIFS – DIFS + AIFS[AC] period during which the medium is determined to be idle for the duration of the EIFS – DIFS + AIFS[AC] period, as appropriate (see 9.3.2.3), except as defined in 9.19.2.3, which allows the medium to be busy during the initial aSIFSTime of this period under certain conditions.

If the backoff procedure is invoked following the transmission of a 40 MHz mask PPDU, the backoff counter shall be decremented based on a medium busy indication that ignores activity in the secondary channel. Additional 40 MHz mask PPDU backoff rules are found in 10.15.9.

9.19.2.6 Retransmit procedures

QoS STAs shall maintain a short retry counter and a long retry counter for each MSDU, A-MSDU, or MMPDU that belongs to a TC requiring acknowledgment. The initial value for the short and long retry counters shall be 0. QoS STAs also maintain a short retry counter and a long retry counter for each AC. They are defined as QSRC[AC] and QLRC[AC], respectively, and each is initialized to a value of 0.

After transmitting a frame that requires an immediate acknowledgment, the STA shall perform either of the acknowledgment procedures, as appropriate, that are defined in 9.3.2.8 and 9.21.3. The short retry count for an MSDU or A-MSDU that is not part of a Block Ack agreement or for an MMPDU shall be incremented every time transmission of a frame of length less than or equal to dot11RTSThreshold fails for that MSDU, A-MSDU, or MMPDU. QSRC[AC] shall be incremented every time transmission of an A-MPDU or frame of length less than or equal to dot11RTSThreshold fails. This short retry count and the QoS STA QSRC[AC] shall be reset when an A-MPDU or frame of length less than or equal to dot11RTSThreshold succeeds. The long retry count for an MSDU or A-MSDU that is not part of a Block Ack agreement or for an MMPDU shall be incremented every time transmission of a MAC frame of length greater than dot11RTSThreshold fails for that MSDU, A-MSDU, or MMPDU. QLRC[AC] shall be incremented every time transmission of an A-MPDU or frame of length greater than or equal to dot11RTSThreshold fails. This long retry count and the QLRC[AC] shall be reset when an A-MPDU or frame of length greater than dot11RTSThreshold succeeds. All retransmission attempts for an MPDU that is not sent under a Block Ack agreement and that has failed the acknowledgment procedure one or more times shall be made with the Retry field set to 1 in the data or management frame.

Retries for failed transmission attempts shall continue until the short retry count for the MSDU, A-MSDU, or MMPDU is equal to dot11ShortRetryLimit or until the long retry count for the MSDU, A-MSDU, or MMPDU is equal to dot11LongRetryLimit. When either of these limits is reached, retry attempts shall cease, and the MSDU, A-MSDU, or MMPDU shall be discarded.

For internal collisions occurring with the EDCA access method, the appropriate retry counters (short retry counter for MSDU, A-MSDU, or MMPDU and QSRC[AC] or long retry counter for MSDU, A-MSDU, or MMPDU and QLRC[AC]) are incremented. For transmissions that use Block Ack, the rules in 9.21.3 also apply. STAs shall retry failed transmissions until the transmission is successful or until the relevant retry limit is reached.

With the exception of a frame belonging to a TID for which Block Ack is set up, a QoS STA shall not initiate the transmission of any management or data frame to a specific RA while the transmission of another management or data frame with the same RA and having been assigned its sequence number from the same sequence counter has not yet completed to the point of success, retry fail, or other MAC discard (e.g., lifetime expiry).

QoS STAs shall maintain a transmit MSDU timer for each MSDU passed to the MAC. dot11EDCATableMSDULifetime specifies the maximum amount of time allowed to transmit an MSDU for a given AC. The transmit MSDU timer shall be started when the MSDU is passed to the MAC. If the value of this timer exceeds the appropriate entry in dot11EDCATableMSDULifetime, then the MSDU, or any remaining, undelivered fragments of that MSDU, shall be discarded by the source STA without any further attempt to complete delivery of that MSDU.

When A-MSDU aggregation is used, the HT STA maintains a single timer for the whole A-MSDU. The timer is restarted each time an MSDU is added to the A-MSDU. The result of this procedure is that no MSDU in the A-MSDU is discarded before a period of dot11EDCATableMSDULifetime has elapsed.

9.19.2.7 Truncation of TXOP

When a STA gains access to the channel using EDCA and empties its transmission queue, it may transmit a CF-End frame provided that the remaining duration is long enough to transmit this frame. By transmitting the CF-End frame, the STA is explicitly indicating the completion of its TXOP.

A TXOP holder that transmits a CF-End frame shall not initiate any further frame exchange sequences within the current TXOP.

A non-AP STA that is not the TXOP holder shall not transmit a CF-End frame.

A STA shall interpret the reception of a CF-End frame as a NAV reset, i.e., it resets its NAV timer to 0 at the end of the PPDU containing this frame. After receiving a CF-End frame with a matching BSSID, an AP may respond by transmitting a CF-End frame after SIFS.

NOTE—The transmission of a single CF-End frame by the TXOP holder resets the NAV of STAs hearing the TXOP holder. There may be STAs that could hear the TXOP responder that had set their NAV that do not hear this NAV reset. Those STAs are prevented from contending for the medium until the original NAV reservation expires.

Figure 9-21 shows an example of TXOP truncation. In this example, the STA accesses the medium using EDCA channel access and then transmits a nav-set sequence (e.g., RTS/CTS) (using the terminology of Annex G). After a SIFS, it then transmits an initiator-sequence, which may involve the exchange of multiple PPDUs between the TXOP holder and a TXOP responder. At the end of the second sequence, the TXOP holder has no more data available to send that fits within the TXOP; therefore, it truncates the TXOP by transmitting a CF-End frame.

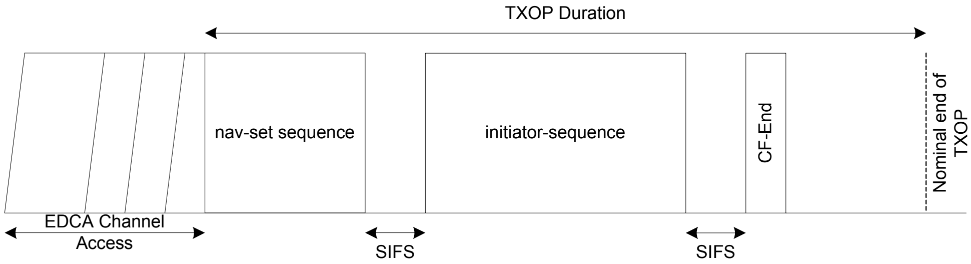

Figure 9-21—Example of TXOP truncation

STAs that receive the CF-End frame reset their NAV and can start contending for the medium without further delay.

TXOP truncation shall not be used in combination with L-SIG TXOP protection when the HT Protection field of the HT Operation element is equal to nonmember protection mode or non-HT mixed mode.

9.19.3 HCCA

9.19.3.1 General

The HCCA mechanism manages access to the WM using an HC that has higher medium access priority than non-AP STAs. This allows it to transfer MSDUs to STAs and to allocate TXOPs to STAs.

The HC is a type of centralized coordinator, but differs from the PC used in PCF in several significant ways, although it may optionally implement the functionality of a PC. Most important is that HCF frame exchange sequences may be used among STAs associated in an infrastructure BSS during both the CP and the CFP. Another significant difference is that the HC grants a STA a polled TXOP with duration specified in a QoS (+)CF-Poll frame. STAs may transmit multiple frame exchange sequences within given polled TXOPs, subject to the limit on TXOP duration.

All STAs inherently obey the NAV rules of the HCF because each frame transmitted under HCF contains a duration value chosen to cause STAs in the BSS to set their NAVs to protect the expected subsequent frames.

All non-AP QoS STAs shall be able to respond to QoS (+)CF-Poll frames received from an HC with the Address 1 field matching their own addresses.

The HC shall perform delivery of buffered group addressed MSDUs/MMPDUs following DTIM Beacon frames. The HC may also operate as a PC, providing (non-QoS) CF-Polls to associated CF-Pollable STAs using the frame formats, frame exchange sequences, and other applicable rules for PCF specified in 9.4.[28]

An HC may perform a backoff following an interruption of a frame exchange sequence due to lack of an expected response under the rules described in 9.19.3.2.4, using the parameters dot11HCCWmin, dot11HCCWmax, and dot11HCCAIFSN and the backoff rules in 9.2 and 9.19.2.5. The decision to perform a backoff by the HC is dependent on conditions such as interference from an overlapping BSS. The mechanism to detect the interference from an overlapping BSS and the decision to perform a backoff, DFS (such as in 11.6), or other techniques (such as inter-BSS scheduling) is beyond the scope of this standard.

[28] Attempting to intersperse HCF frame exchange sequences and PCF frame exchange sequences in a single CFP might be extremely complex.

9.19.3.2 HCCA procedure

9.19.3.2.1 General

The HC gains control of the WM as needed to send QoS traffic and to issue QoS (+)CF-Poll frames to STAs by waiting a shorter time between transmissions than the STAs using the EDCA procedures. The duration values used in QoS frame exchange sequences reserve the medium to permit completion of the current sequence.

The HC may include a CF Parameter Set element in the Beacon frames it generates. This causes the BSS to appear to be a point-coordinated BSS to STAs. This causes STAs to set their NAVs to the CFPDurRemaining value in the CF Parameter Set element value at TBTT, as specified in 9.4.4.3. This prevents most contention in the CFP by preventing nonpolled transmissions by STAs regardless of whether they are CF-Pollable.

9.19.3.2.2 CFP generation

The HC may function as a PC that uses the CFP for delivery, generating a CFP as shown in Figure 9-15, with the restriction that the CFP initiated by an HC shall end with a CF-End frame. The HC may also issue QoS (+)CF-Poll frames to associated STAs during the CFP. However, because the HC can also grant polled TXOPs, by sending QoS (+)CF-Poll frames, during the CP, it is not mandatory for the HC to use the CFP for QoS data transfers.

Only an AP that also issues non-QoS CF-Poll frames to associated CF-Pollable STAs may end a CFP with a CF-End+CF-Ack frame and only when the CF-End+CF-Ack is acknowledging a reception from a CF-Pollable non-QoS STA. The use of a non-QoS CF-Poll frame by an AP to a QoS STA is deprecated (for further discussion; see 8.4.1.4).

9.19.3.2.3 CAP generation

When the HC needs access to the WM to start a CFP or a TXOP in CP, the HC shall sense the WM. When the WM is determined to be idle at the TxPifs slot boundary as defined in 9.3.7, the HC shall transmit the first frame of any permitted frame exchange sequence, with the duration value set to cover the CFP or the TXOP. The first permitted frame in a CFP after a TBTT is the Beacon frame. CAPs along with the CFPs and the CPs are illustrated in Figure 9-22.

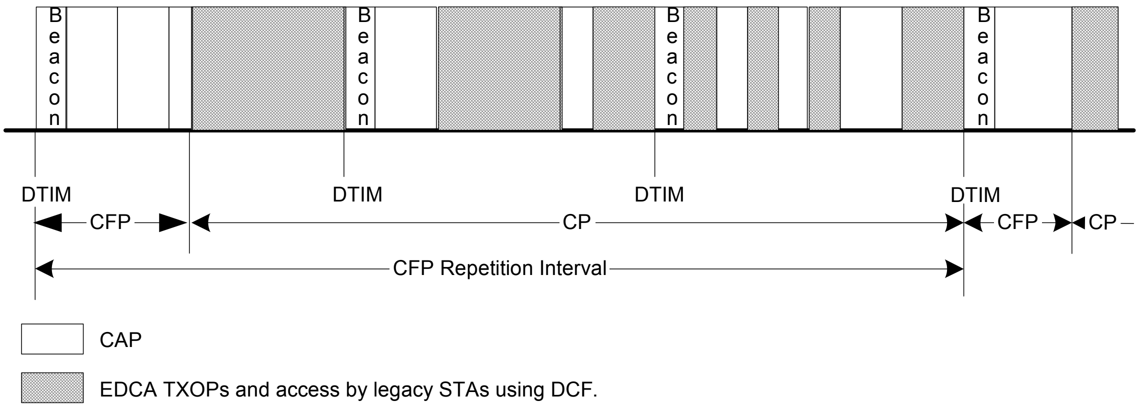

Figure 9-22—CAP/CFP/CP periods

After the last frame of all other nonfinal frame exchange sequences (e.g., sequences that convey individually addressed QoS data or management frames) during a TXOP, the holder of the current TXOP shall wait for one SIFS period before transmitting the first frame of the next frame exchange sequence. The HC may sense the channel and reclaim the channel if the WM is determined to be idle at the TxPifs slot boundary after the TXOP as defined in 9.3.7 A CAP ends when the HC does not reclaim the channel at the TxPifs slot boundary after the end of a TXOP.

9.19.3.2.4 Recovery from the absence of an expected reception

This subclause describes recovery from the absence of an expected reception in a CAP. It should be noted that the recovery rules from the absence of an expected reception are different from EDCA because in this case the NAVs of all the STAs in the BSS have already been set up by the transmissions by the HC. The recovery rules for the multiple frame transmission are different because a STA may always be hidden and may have not set its NAV due to the transmission by another STA. Finally, since an HC is collocated with the AP, the AP may recover using the rules described in this subclause even if the recovery is from the absence of an expected reception.

The beginning of reception of an expected response is detected by the occurrence of PHY-CCA.indication(BUSY,channel-list) primitive at the STA that is expecting the response where

- The channel-list parameter is absent, or
- The channel-list is equal to {primary} and the HT STA expected to transmit the expected response supports 20 MHz operation only, or
- The channel-list is equal to either {primary} or {primary, secondary} and the HT STA expected to transmit the expected response supports both 20 MHz and 40 MHz operation (see 10.15.2).

If the beginning of such reception does not occur during the first slot time following a SIFS, then:[29]

a) If the transmitting STA is the HC, it may initiate recovery by transmitting at the TxPifs slot boundary after the end of the HC's last transmission only if the PHY-CCA.indication primitive is clear during the CCAdel period preceding the TxPifs slot boundary as shown in 9-14.
b) If the transmitting STA is a non-AP QoS STA, and there is an MPDU for transmission, it shall initiate recovery by transmitting at a PIFS after the end of the last transmission, if PHY-CCA.indication primitive is clear, the polled TXOP limit is greater than 0 and at least one frame (re)transmissions can be completed within the remaining duration of a nonzero polled TXOP limit.

If the transmitted frame is not of type QoS (+)CF-Poll and the expected response frame is not received correctly, regardless of the occurrence of the PHY-RXSTART.indication primitive, the QoS STA may initiate recovery following the occurrence of PHY-CCA.indication(idle) primitive so that a SIFS time interval occurs between the last energy on the air and the transmission of the recovery frame.

When there is a transmission failure within a polled TXOP, the long or short retry counter (as described in 9.19.2.6) corresponding to the AC of the failed MSDU or MMPDU shall be incremented. An MPDU belonging to a TC is subject to the respective retry limit as well as the dot11EDCATableMSDULifetime and is discarded when either of them is exceeded. An MPDU belonging to a TS with a specified delay bound is subject to delay bound and is discarded if the MPDU could not be transmitted successfully since it has been delivered to the MAC. An MPDU belonging to a TS with an unspecified delay is subject to dot11MaxTransmitMSDULifetime and is discarded when it is exceeded.

Non-AP STAs that receive a QoS (+)CF-Poll frame shall respond within a SIFS period, regardless of the NAV setting. If a response is not received but a PHY-CCA.indication(busy) primitive occurs during the slot following a SIFS and is followed by a PHY-RXSTART.indication or PHY-RXEND.indication primitive prior to a PHY-CCA.indication(idle) primitive, then the HC assumes that the transmitted QoS (+)CF-Poll frame was successfully received by the polled STA. In the cases of QoS Data+CF-Poll, QoS Data+CF-Ack+CF-Poll, or QoS CF-Ack+CF-Poll, the PHY-CCA.indication(busy) primitive is used only to determine whether the transfer of control of the channel has been successful. The PHY-CCA.indication(busy) primitive is not used for

[29] This restriction is intended to avoid collisions due to inconsistent CCA reports in different STAs, not to optimize the bandwidth usage efficiency.

determining the success or failure of the transmission. If the CF-Poll is piggybacked onto a QoS data frame, the HC may have to retransmit that QoS data frame subsequently.

If an HC receives a frame from a STA with a duration/ID covering only the response frame, the HC shall assume that the STA is terminating its TXOP, and the HC may initiate other transmissions, send a CF-End frame (see 9.19.3.4), or allow the channel to go into the CP.

If a polled QoS STA has no queued traffic to send or if the MPDUs available to send are too long to be transmitted within the specified TXOP limit, the QoS STA shall send a QoS (+)Null frame. In the case of no queued traffic, this QoS (+)Null frame shall have a QoS Control field that reports a queue size of 0 for any TID with the duration/ID set to the time required for the transmission of one ACK frame, plus one SIFS interval. In the case of insufficient TXOP size, such as when the maximum MSDU size is not specified, this QoS (+)Null frame shall have a QoS Control field that contains the TID and TXOP duration or a nonzero queue size needed to send the MPDU that is ready for transmission. When a queue size is transmitted, the HC shall combine the queue size information with the rate of the received QoS (+)Null frame to determine the required size of the requested TXOP.

Within a polled TXOP, the unused portion of TXOPs shall not be used by the STA and may be reallocated by the HC as follows:

a) The recipient of the final frame, with the Ack Policy subfield equal to Normal Ack, shall be the HC if there will be time remaining in the TXOP after the transmission of the final frame and its expected ACK response frame. If there are no frames to be sent to the HC, then the QoS STA shall send to the HC a QoS Null with the Queue Size subfield in the QoS Control field set to 0.
    1) If a PHY-CCA.indication(busy) primitive occurs at the STA that is expecting the ACK response frame during the first slot following a SIFS after the end of the transmission of the final frame, it shall be interpreted as indicating that the channel control has been successfully transferred and no further frames shall be transmitted by the STA in the TXOP, even though the ACK frame from HC may be incorrectly received.[30]
    2) If the beginning of the reception of an expected ACK response frame to the final frame does not occur, detected as the nonoccurrence of PHY-CCA.indication(busy) primitive at the QoS STA that is expecting the response during the first slot time following a SIFS, the QoS STA shall retransmit the frame or transmit a QoS Null frame, with the Ack Policy subfield set to Normal Ack and the Queue Size subfield set to 0, after PIFS from the end of last transmission, until such time that it receives an acknowledgment or when there is not enough time remaining in the TXOP for sending such a frame. [31]

b) If there is not enough time within the unused portion of the TXOP to transmit either the QoS Null frame or the frame with the Duration/ID field covering only the response frame, then the STA shall cease control of the channel.[32]

9.19.3.3 TXOP structure and timing

Any QoS data frame of a subtype that includes CF-Poll contains a TXOP limit in its QoS Control field. The ensuing polled TXOP is protected by the NAV set by the Duration field of the frame that contained the QoS (+)CF-Poll function, as shown in Figure 9-23. Within a polled TXOP, a STA may initiate the transmission of one or more frame exchange sequences, with all such sequences nominally separated by a SIFS interval. The STA shall not initiate transmission of a frame unless the transmission and any acknowledgment or other immediate response expected from the peer MAC entity are able to complete prior to the end of the remaining TXOP duration. All transmissions, including the response frames, within the polled TXOP are considered to be

[30] Note that while PHY-CCA.indication(busy) primitive is used in this instance to determine the control of the channel, it is not used for determining the success or failure of the transmission.

[31] This is to avoid the situation where the HC may not receive the frame and may result in an inefficient use of the channel.

[32] In this case the channel is not accessed until the NAVs expire at all the STAs.

the part of the TXOP, and the HC shall account for these when setting the TXOP limit. If the TXOP Limit subfield in the QoS Control field of the QoS data frame that includes CF-Poll is equal to 0, then the STA to which the frame is directed to shall respond with either one MPDU or one QoS Null frame.

A TXOP or transmission within a TXOP shall not extend across TBTT, dot11CFPMaxDuration (if during CFP), dot11MaxDwellTime (if using an FH PHY), or dot11CAPLimit. The HC shall verify that the full duration of any granted TXOP meets these requirements so that STAs may use the time prior to the TXOP limit of a polled TXOP without checking for these constraints. Subject to these limitations, all decisions regarding what MSDUs, A-MSDUs, and/or MMPDUs are transmitted during any given TXOP are made by the STA that holds the TXOP.[33, 34]

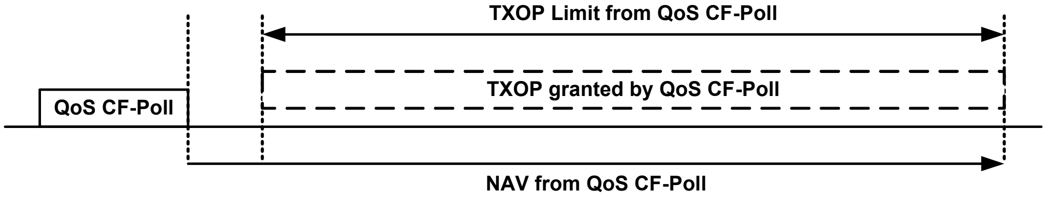

Figure 9-23—Polled TXOP

9.19.3.4 NAV operation during a TXOP

An HC shall set its own NAV to prevent it from transmitting during a TXOP that it has granted to a STA through an HCCA poll. However, the HC may reclaim the TXOP if a STA is not using it or ends the TXOP early (see 9.19.3.2.4).

In a CFP or CP, if the HC has no more STAs to poll and it has no more data, management, BlockAckReq, or BlockAck frames to send, it may reset the NAVs of all QoS STAs in the BSS by sending a QoS CF-Poll frame with the RA matching its own MAC address and with the Duration/ID field set to 0. When the AP contains a PC, during the CFP, it may reset the NAVs of all receiving STAs by sending a CF-End frame, regardless of how the NAVs have been originally set.

A STA that receives a QoS (+)CF-Poll frame with a MAC address in the Address 1 field that matches the HC's MAC address and the Duration/ID field value equal to 0 shall reset the NAV value to 0.

NOTE—A STA resets its NAV when it receives a CF-End or CF-End+ACK frame according to the procedures described in 9.4.3.3.

When a STA receives a QoS (+)CF-Poll frame containing the BSSID of the BSS in which the STA is associated, that STA shall update the NAV if necessary and shall save the TXOP holder address for that BSS, which is the MAC address from the Address 1 field of the frame containing the QoS (+)CF-Poll. If an RTS frame is received with the RA address matching the MAC address of the STA and the MAC address in the TA field in the RTS frame matches the saved TXOP holder address, then the STA shall send the CTS frame after

[33] In certain regulatory domains, channel sensing needs to be done at periodic intervals (for example, in Japan, this period is 4 ms). This means that the duration of a TXOP in these regulatory domains might not be more than this periodic interval. If longer durations are desired, then the TXOP holder needs to sense the channel at least once in the limit imposed in the regulatory domain, by waiting for at least for the duration of one PIFS during which it senses the channel. If it does not detect any energy, it may continue by sending the next frame. In other words, the total TXOP size assigned should include an extra time allocated (i.e., *n* × aSlotTime, where *n* is the number of times the STA needs to sense the channel and is given by Floor(TXOP limit/limit imposed in the regulatory domain).

[34] The TID value in the QoS Control field of a QoS Data+CF-Poll frame pertains only to the MSDU or fragment thereof in the Frame Body field of that frame. This TID value does not pertain to the TXOP limit value and does not place any constraints on what frame(s) the addressed STA may send in the granted TXOP.

SIFS, without regard for, and without resetting, its NAV. The saved TXOP holder address shall be cleared when the NAV is reset or when the NAV counts down to 0.

When a STA receives a frame addressed to it and requires an acknowledgment, it shall respond with an ACK or QoS +CF-Ack frame independent of its NAV. A non-AP STA shall accept a polled TXOP by initiating a frame exchange sequence independent of its NAV.

9.19.3.5 HCCA transfer rules

9.19.3.5.1 General

A TXOP obtained by receiving a QoS (+)CF-Poll frame uses the specified TXOP limit consisting of one or more frame exchange sequences with the sole time-related restriction being that the final sequence shall end not later than the TXOP limit. In QoS CF-Poll and QoS CF-Ack+CF-Poll frames, the TID subfield in the QoS Control field indicates the TS for which the poll is intended. The requirement to respond to that TID is nonbinding, and a STA may respond with any frame. Upon receiving a QoS (+)CF-Poll frame, a STA may send any frames, i.e., QoS data frames belonging to any TID as well as management frames in the obtained TXOP. MSDUs may be fragmented in order to fit within TXOPs.

The QoS CF-Poll frames shall be sent only by an HC. Non-AP STAs are not allowed to send QoS (+)CF-Poll frames. STAs shall not send QoS (+)Data frames in response to any data frame other than the QoS (+)CF-Poll frames.

The TXOP limit is inclusive of the PHY and IFS overhead, and an AP should account for the overhead when granting TXOPs.

If a STA has set up at least one TS for which the Aggregation subfield in the associated TSPEC is equal to 0, the AP shall use only QoS CF-Poll or QoS CF-Ack+CF-Poll frames to poll the STA and shall never use QoS (+)Data+CF-Poll to poll the STA. It should be noted that although QoS (+)CF-Poll is a data frame, but it should be transmitted at one of the rates in the BSSBasicRateSet parameter in order to set the NAV of all STAs that are not being polled (see 9.7). If a CF-Poll is piggybacked with a QoS data frame, then the frame containing all or part of an MSDU or A-MSDU may be transmitted at a rate that is below the negotiated minimum PHY rate in the TSPEC related to that data.

QoS STAs shall use QoS data frames for all MSDU transfers to another QoS STA. The TID in the QoS Control fields of these frames shall indicate the TC or TS to which the MPDU belongs. Furthermore, either the Queue Size subfield shall indicate the amount of queued traffic present in the output queue that the STA uses for traffic belonging to this TC or TS, or the TXOP Duration Requested subfield shall indicate the duration that the STA desires for the next TXOP for traffic belonging to this TC or TS. The queue size value reflects the amount on the appropriate queue not including the present MPDU. A STA that wishes to inform the HC of queue status may use the QoS Null frame indicating the TID and the queue size or TXOP duration request (also see 9.19.3.5.2).

QoS STAs shall be able to receive QoS +CF-Ack frames. The HC may use QoS Data+CF-Ack frames to send frames to the same STA a SIFS after receiving the final transmission of the previous TXOP. The HC may also use QoS Data+CF-Ack frames to send frames to any other STA a SIFS after receiving the final transmission of the previous TXOP, if the STA that sent the final transmission of the previous TXOP has set the Q-Ack subfield in the QoS Capability element in the (Re)Association Request frame to 1. In both CFP and CP, STAs shall respond to QoS data frames having the Ack Policy subfield in the QoS Control field equal to Normal Ack with an ACK frame, unless the acknowledgment is piggybacked in which case it shall use a QoS +CF-Ack frame. Piggybacked frames are allowed only in CFP or within TXOPs initiated by the HC. The HC shall not send a QoS data frame containing a +CF-Ack with an Address 1 that does not correspond to the address of the STA for which the +CF-Ack is intended, unless the STA to which the +CF-Ack is intended, sets the Q-Ack subfield in the QoS Capability element in the (Re)Association Request frame. STAs are not required to be able to transmit QoS data frames with subtypes that include +CF-Ack.

An AP that has dot11QAckOptionImplemented true may allow associations with STAs advertising support for the Q-Ack option. Such associations do not require the AP to employ piggyback acknowledgments directed toward that associated STA in frames that are not directed to that associated STA. QoS STAs shall be able to process received QoS data frames with subtypes that include +CF-Ack when the STA to which the acknowledgment is directed is the same as the STA addressed by the Address 1 field of that data frame. A STA that does not set the Q-Ack subfield to 1 in the QoS Capability element in the (Re)Association Request frame is not required to handle the received QoS (+)Data+CF-Ack frames that are addressed to other STAs. The net effect of these restrictions on the use of QoS +CF-Ack frames is that the principal QoS +CF-Ack subtype that is useful is the QoS Data+CF-Ack frame, which can be sent by a STA as the first frame in a polled TXOP when that TXOP was conveyed in a QoS Data+CF-Poll(+CF-Ack) frame and the outgoing frame is directed to the HC's STA address. QoS (Data+)CF-Poll+CF-Ack frames are useful to allow the HC to grant another TXOP to the same STA a SIFS after receiving the final transmission of that STA's previous TXOP. QoS (Data+)CF-Poll+CF-Ack frames are also useful to allow the HC to grant another TXOP to a different STA a SIFS after receiving the final transmission of a STA's previous TXOP, if the STA that sent the final transmission of the previous TXOP has set the Q-Ack subfield in the QoS Capability element in the (Re)Association Request frame to 1.

HCF contention-based channel access shall not be used to transmit MSDUs belonging to an established TS (with the HC's acceptance of the associated TSPEC), unless the granted TSPEC indicates it is permitted to do so when the Access Policy subfield of the TS Info field is equal to "HCCA, EDCA mixed mode" (HEMM), the polled STA utilized the full TXOP provided by the HC, and it has more MPDUs to send. When this STA sends frames belonging to a TS using contention-based channel access, it shall encode the TID subfield in the QoS data frame with the TID associated with the TS. When the AP grants a TSPEC with the Access Policy subfield equal to HEMM and if the corresponding AC needs admission control, the AP shall include the medium time that specifies the granted time for EDCA access in the ADDTS Response frame.

9.19.3.5.2 TXOP requests

STAs may send TXOP requests during polled TXOPs or EDCA TXOPs using the QoS Control field in a QoS data frame or a QoS Null frame directed to the HC, with the TXOP Duration Requested or Queue Size subfield value and TID subfield value indicated to the HC. APs indicate whether they process TXOP request or queue size in the QoS Info field in the Beacon, Probe Response, and (Re)Association Response frames. APs shall process requests in at least one format. The AP may reallocate TXOPs if the request belongs to TS or update the EDCA parameter set if the above request belongs to TC. STAs shall use only the request format that the AP indicates it can process.

TXOP Duration Requested subfield values are not cumulative. A TXOP duration requested for a particular TID supersedes any prior TXOP duration requested for that TID. A value of 0 in the TXOP Duration Requested subfield may be used to cancel a pending unsatisfied TXOP request when its MSDU is no longer queued for transmission. The TXOP duration requested is inclusive of the PHY and IFS overhead, and a STA should account for this when attempting to determine whether a given transmission fits within a specified TXOP duration.

The AP may choose to assign a TXOP duration shorter than that requested in the TXOP Duration Requested subfield.

Even if the value of TXOP Duration Requested subfield or Queue Size subfield in a QoS data frame is 0, the HC shall continue to poll according to the negotiated schedule.

9.19.3.5.3 Use of RTS/CTS

STAs may send an RTS frame as the first frame of any frame exchange sequence for which improved NAV protection is desired, during either the CP or CFP, and without regard for dot11RTSThreshold.[35]

If a QoS STA sends an RTS frame and does not receive an expected CTS frame, then the recovery rules are as specified in 9.19.3.2.4.

If NAV protection is desired for a transmission to the AP in response to a QoS data frame with a subtype that includes CF-Poll, the polled STA is allowed to send a CTS frame (as a CTS frame is shorter than a QoS data frame and has a higher probability that it will be received by other STAs) with the RA containing its own MAC address in order to set the NAV in its own vicinity without the extra time to send an RTS frame.[36]

9.19.4 Admission Control at the HC

9.19.4.1 General

An IEEE 802.11 network may use admission control to administer policy or regulate the available bandwidth resources. Admission control is also required when a STA desires a guarantee of the amount of time that it has available to access the channel. The HC, which is in the AP, is used to administer admission control in the network. As the QoS facility supports two access mechanisms, there are two distinct admission control mechanisms: one for contention-based access and another for controlled access.

Admission control, in general, depends on vendors' implementation of the scheduler, available channel capacity, link conditions, retransmission limits, and the scheduling requirements of a given stream. All of these criteria affect the admissibility of a given stream. If the HC has admitted no streams that require polling, it may not find it necessary to perform the scheduler or related HC functions.

9.19.4.2 Contention-based admission control procedures

9.19.4.2.1 General

A non-AP STA may support admission control procedures in 9.19.4.2.3 to send frames in the AC where admission control is mandated; but, if it does not support that procedure and dot11RejectUnadmittedTraffic is false or not present, it shall use EDCA parameters of a lower priority AC, as indicated in Table 9-1, that does not require admission control. When a STA uses the EDCA parameters of a lower AC for this purpose, it affects only the EDCA parameters used for channel access, i.e., it has no effect on the contents of the transmitted frame. APs shall support admission control procedures, at least to the minimal extent of advertising that admission is not mandatory on its ACs.

The AP uses the ACM (admission control mandatory) subfields advertised in the EDCA Parameter Set element to indicate whether admission control is required for each of the ACs. While the CWmin, CWmax, AIFS, and TXOP limit parameters may be adjusted over time by the AP, the ACM bit shall be static for the duration of the lifetime of the BSS. An ADDTS Request frame shall be transmitted by a STA to the HC in order to request admission of traffic in any direction (i.e., uplink, downlink, direct, or bidirectional) employing an AC that requires admission control. The ADDTS Request frame shall contain the UP associated with the traffic and

[35] The sending of an RTS frame during the CFP is usually unnecessary, but might be used to confirm that the addressed recipient QoS STA is within range and awake and to elicit a CTS response that sets the NAV at STAs in the vicinity of the addressed recipient. This is useful when there are nearby STAs that are members of other BSSs and are out of range to receive Beacon frames from this BSS. Sending an RTS frame during the CFP is useful only when the recipient is a QoS STA, because a non-QoS STA in the same BSS has its NAV set to protect the CFP, which renders those non-QoS STAs unable to respond. Using the same duration calculation during the CFP as specified for the CP is directly applicable for all cases except when the RTS frame is sent by the HC and the following frame includes a QoS (+)CF-Poll.

[36] This is unnecessary because the NAVs in the vicinity of the QoS AP were set by the QoS (+)CF-Poll frame.

shall indicate EDCA as the access policy. The AP shall associate the received UP of the ADDTS Request frame with the appropriate AC per the UP-to-AC mappings described in 9.2.4.2. The STA may transmit unadmitted traffic for the ACs for which the AP does not require admission control. If a STA desires to send data without admission control using an AC that mandates admission control, the STA shall use EDCA parameters that correspond to a lower priority and do not require admission control unless dot11RejectUnadmittedTraffic is true. When a STA uses a lower priority AC for this purpose, the lower priority AC affects only the EDCA parameters used for channel access, i.e., it has no effect on the contents of the transmitted frame. All ACs with priority higher than that of an AC with an ACM flag equal to 1 should have the ACM flag set to 1. The HC contained within an AP when dot11SSPNInterfaceActivated is true shall admit a non-AP STA's request based on the value of dot11NonAPStationAuthAccessCategories stored in that non-AP STA's dot11InterworkingEntry, which is part of the dot11InterworkingTable. The dot11InterworkingEntry specifies the EDCA access classes and throughput limitations on each access class for which a non-AP STA is permitted to transmit.

9.19.4.2.2 Procedures at the AP

Regardless of the AC’s ACM setting, the AP shall respond to an ADDTS Request frame with an ADDTS Response frame that may be to accept or deny the request. On receipt of an ADDTS Request frame from a non-AP STA, the AP shall make a determination about whether to:

a) Accept the request, or

b) Deny the request.

The algorithm used by the AP to make this determination is implementation dependent. An AP when dot11SSPNInterfaceActivated is true shall use the policies delivered by the SSPN that are stored in the dot11InterworkingEntry, which is part of the dot11InterworkingTable. If the AP decides to accept the request, the AP shall also derive the medium time from the information conveyed in the TSPEC element in the ADDTS Request frame. The AP may use any algorithm in deriving the medium time, but N.2.2 provides a procedure that may be used. Having made such a determination, the AP shall transmit a TSPEC element to the requesting non-AP STA contained in an ADDTS Response frame. If the AP is accepting the request, the Medium Time field shall be specified. If the AP is accepting a request for a downlink TS, the Medium Time field shall be set to 0. If the AP is accepting a request corresponding to an AC for which ACM is 0 (e.g., the TSPEC is to change APSD behavior), the Medium Time field shall be set to 0.

9.19.4.2.3 Procedure at non-AP STAs

Each EDCAF shall maintain two variables: admitted_time and used_time.

The admitted_time and used_time shall be set to 0 at the time of (re)association. The STA may subsequently decide to explicitly request medium time for the AC that is associated with the specified priority.

In order to make such a request, the STA shall transmit a TSPEC element contained in an ADDTS Request frame with the following fields specified (i.e., nonzero): Nominal MSDU Size, Mean Data Rate, Minimum PHY Rate, Inactivity Interval, and Surplus Bandwidth Allowance. The Medium Time field is not used in the request frame and shall be set to 0.

On receipt of a TSPEC element contained in a ADDTS Response frame indicating that the request has been accepted, the STA shall recompute the admitted_time for the specified EDCAF as follows:

admitted_time = admitted_time + dot11EDCAAveragingPeriod × (medium time of TSPEC).

The STA may choose to tear down the explicit request at any time. For the teardown of an explicit admission, the STA shall transmit a DELTS frame containing the TSID and direction that specify the TSPEC to the AP.

If the STA sends or receives a DELTS frame, it shall recompute the admitted_time for the specified EDCAF as follows:

admitted_time = admitted_time – dot11EDCAAveragingPeriod × (medium time of TSPEC).

To describe the behavior at the STA, two parameters are defined. The parameter used_time signifies the amount of time used, in units of 32 µs, by the STA in dot11EDCAAveragingPeriod. The parameter admitted_time is the medium time allowed by the AP, in units of 32 µs, in dot11EDCAAveragingPeriod. The STA shall update the value of used_time:

a) At dot11EDCAAveragingPeriod second intervals

   used_time = max((used_time – admitted_time), 0)

b) After each successful or unsuccessful MPDU (re)transmission attempt,

   used_time = used_time + MPDUExchangeTime

The MPDUExchangeTime equals the time required to transmit the MPDU sequence. For the case of an MPDU transmitted with Normal Ack policy and without RTS/CTS protection, this equals the time required to transmit the MPDU plus the time required to transmit the expected response frame plus one SIFS. Frame exchange sequences for Management frames are excluded from the used_time update. If the used_time value reaches or exceeds the admitted_time value, the corresponding EDCAF shall no longer transmit QoS Data MPDUs or QoS Null MPDUs using the EDCA parameters for that AC as specified in the QoS Parameter Set element. However, a STA may choose to temporarily replace the EDCA parameters for that EDCAF with those specified for an AC of lower priority, if no admission control is required for those ACs.

NOTE—When a frame is transmitted using temporary EDCA parameters, the TID field of that frame is not modified.

If, for example, a STA has made and had accepted an explicit admission for a TS and the channel conditions subsequently worsen, possibly including a change in PHY data rate so that it requires more time to send the same data, the STA may make a request for more admitted_time to the AP and at the same time downgrade the EDCA parameters for that AC for short intervals in order to send some of the traffic at the admitted priority and some at the unadmitted priority, while waiting for a response to the admission request.

9.19.4.3 Controlled-access admission control

This subclause describes the schedule management of the admitted HCCA streams by the HC. When the HC provides controlled channel access to STAs, it is responsible for granting or denying polling service to a TS based on the parameters in the associated TSPEC. If the TS is admitted, the HC is responsible for scheduling channel access to this TS based on the negotiated TSPEC parameters. The HC should not initiate a modification of TSPEC parameters of an admitted TS unless requested by the STA. The HC should not tear down a TS unless explicitly requested by the STA or at the expiry of the inactivity timer. The polling service based on admitted TS provides a “guaranteed channel access” from the scheduler in order to have its QoS requirements met. This is an achievable goal when the WM operates free of external interference (such as operation within the channel by other technologies and co-channel overlapping BSS interference). The nature of wireless communications may preclude absolute guarantees to satisfy QoS requirements. However, in a controlled environment (e.g., no interference), the behavior of the scheduler can be observed and verified to be compliant to meet the service schedule.

The normative behavior of the scheduler is as follows:

- The scheduler shall be implemented so that, under controlled operating conditions, all STAs with admitted TS are offered TXOPs that satisfy the service schedule.
- Specifically, if a TS is admitted by the HC, then the scheduler shall service the STA during an SP. An SP is a contiguous time during which a set of one or more downlink individually addressed frames and/or one or more polled TXOPs are granted to the STA. An SP starts at fixed intervals of time specified in Service Interval field. The first SP starts when the lower order 4 octets of the TSF
