

The Free Network Foundation advocate for the construction of communications infrastructure which is owned and operated cooperatively. We are using the power of pee-to-peer technologies to create a global network which is immune to censorship and resistant to breakdown. We promote freedoms, support innovations and advocate technologies that enhance and enable digital self-determination. This activity is conducted by the organization director, and by volunteers from around the world. These volunteers are systems architects, security experts, and software engineers - they are students and professionals. This activity occurs primarily in cyberspace, because the participants are scattered around the world. The headquarters and mailing address correspond to the home office of the foundation's legal counsel. These activities are charitable and educational, conducted for the good of humanity. Our ability to organize in defense of humanity, justice, peace and security depends on communications infrastructure which is centralized and fragile. By helping to improve this infrastructure through openly licensed technologies, we are helping to secure our liberties. This is the sole mission of the Free Network Foundation, to create a network which is owned and operated by the whole of humanity. We are funded by the contributions of individuals from around the world. We call it crowd-sourcing - lots of people giving what little they can, can add up to a lot. These are the aims and practices of the FNF. We hope that you will visit our website at [www.freenetworkfoundation.org](http://www.freenetworkfoundation.org) to learn more.
